The estimated value of all crops in Wisconsin was $291,000,000 for 1924, $336,000,000 for 1925, and $300,800,000 for 1926. In the latter year the chief crops and their acreage were: tame hay, 3,368,000; oats, 2,577,000; corn 2,119,000; barley, 521,000; rye, 256,000; potatoes, 230,000; wild hay, 228,000; wheat, 128,000; tobacco, 29,000. The total value of each crop (with the value per acre in parenthesis) was as follows: tame hay, $86,130,000 ($25.50); corn, $54,830,000 ($25.88); oats, $38,655,000 ($15.00); potatoes, $32,568,000 ($141.60); tobacco, $4,269,000 ($147.20); wheat, $3,262,000 ($25.48); rye, $3,226,000 ($12.60); wild hay, $2,709,000 ($12.00). There were in addition 12,000 ac. of sugar-beets raised in 1925 valued at $933,000, and 13,000 ac. planted in 1926. Wisconsin's climate is so favourable that anything like a failure of any one crop is unknown.

A very small proportion of Wisconsin's crops is marketed direct, but they are fed to the live stock on the farms, and the farmers receive their income chiefly from live stock products. Chief of these are dairy products, for Wisconsin is the leading dairy State in the United States. In 1923 it was estimated that 53% of all farm income came from farm milk produce. In 1927 Wisconsin ranked third among the States in the total number of cattle owned, the number being 2,975,000 and their value, $178,092,000. Of this number 2,014,000 were milch cows and heifers, valued at $149,036,000, and in the number of milch cows Wisconsin was far in the front of all other States. Doubtless it was the large proportion of Swiss, German and Danish settlers in Wisconsin that gave the cheese-making industry its momentum, for very early these people were making and selling the famous cheeses of their native lands. From 1920 to 1926 Wisconsin annually produced nearly two-thirds of all the cheese made in the United States. It also led in condensed milk products with one-fourth the entire production of the United States. Its butter production was in 1925 and 1926 exceeded only by that of Minnesota. The rapid increase in production of creamery butter, however, is shown by the fact that the 1925 output of 161,369,000 lb. was almost double the 82,860,000 lb. produced in 1918. The entire value of butter, cheese and condensery products in 1925 amounted to $209,260,384 as against $72,859,000 in 1914.

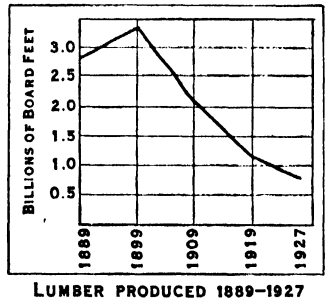
The dairy industry is so dominant in Wisconsin farm life that other live stock is forced into a minor position. Nevertheless in the southern part of the State swine are important. There were in 1927, 1,594,000 swine valued at $27,098,000; they form an important share of the farm income (12% in 1923). Poultry has a similar essential place in the farm organization and adds about 10% to the farm income of the State. Sheep and lambs are much less important, though there is a place for them in the rough, bluff country. In 1927 they numbered 461,000, valued at $4,507,000. The 1926 wool clip was 2,508,000 pounds. Horses and mules on farms numbered 586,000 in 1927 and were valued at $55,208,000.

Manufactures.—Manufacturing, as the result of a remarkable growth, has become the chief industry of the State. The value of its products in 1900 was $360,818,942; in 1914, $695,172,000; in 1925, $1,859,244,000. Of the 1925 valuation it was estimated that $774,496,000 was added by the manufacturing process. Despite the tremendous increase in value of products between 1914 and 1925 the number of manufacturing establishments decreased from 9,104 to 7,262, revealing a clear trend toward fewer and larger factories. The number of wage earners increased from 194,310 in 1914 to 247,341 in 1925, and wages paid from $112,193,000 to $314,883,000. Between 1914 and 1925 Wisconsin consistently held the rank of tenth among the States in value of its manufactured products. Of these ten it was the youngest State.

PROPORTION OF TOTAL UNITED STATES OUTPUT OF CHEESE PRODUCED IN WISCONSIN, 1925

Wisconsin's chief branch of manufactures is that connected with its great dairying industry. In 1925 its butter, cheese, condensed and evaporated milk products were valued at a total of $209,260,384, an amount giving it the leadership among the States in dairy products. The rate of growth is seen when the 1925 amount is compared with $72,859,000 in 1914. This industry is the most widely diffused of all manufacturing industries of the State, its factories being small and close to the supply of raw material. Of the 7,262 manufacturing establishments in the State more than one-third were creameries or cheese factories. Motor vehicles to the value of $155,944,640 were manufactured in 1925. This industry, now second in rank, was not deemed important enough in 1914 by the census bureau to have the value of its products separately reported. Other manufacturing industries, listed in order of importance, with the value of their output in 1925 are: foundry and machine products, $125,063,220 (in 1914, $60,698,000); paper and wood pulp, $97,779,601 (in 1914, $31,205,000); lumber and timber products, $89,306,150 (in 1914, $55,363,000); slaughtering and meat packing $70,793,049 (in 1914, $34,698,000); motor vehicle bodies and motor vehicle parts, $59,403,191 (not listed separately in 1914); knitted goods, $58,086,110 (not listed separately in 1914); boots and shoes, $53,954,002 (in 1914, $17,832,000); furniture, $53,915,957 ($22,587,000 in 1914); engines and water wheels, $53,174,241 (not listed in 1914); electrical machinery and supplies, $46,431,351 ($5,397,000 in 1914); rubber tyres and inner tubes, $46,271,447 (not listed in 1914); leather, $44,591,782 ($42,204,000 in 1914).

In 1910 Milwaukee was responsible for more than one-third of the State's manufacturing output. The total value of this city's products increased from $223,555,000 in 1914 to $541,911,000 in 1925. In the same period, Kenosha, by increasing the value of its output from $28,341,000 in 1914 to $124,748,000 in 1925, passed Racine as the second manufacturing city of the State. Racine's manufactures increased in value from $43,632,000 to $89,165,000 in the same years. The fourth city, Janesville, showed an even more striking growth, its products increasing in value from $5,659,000 in 1914 to $48,093,000 in 1925. Both Racine and Janesville are famous producers of farm implements. Other manufacturing cities in the order of their importance are: West Allis, Madison, Oshkosh, Sheboygan, Beloit, Green Bay, Superior, La Crosse, Manitowoc, Fond du Lac, Eau Claire and Appleton, whose products ranged in value from $45,000,000 to $15,000,000. Madison and Beloit are, together with Janesville, in the Rock river valley which has offered a route for two of the leading railroads from Chicago to the north-west. A more notable concentration of manufacturing cities is in the Fox river valley, including the shores of Lake Winnebago. Here are Oshkosh, Fond du Lac, Appleton and Green bay. Their location makes them the centre for the paper-making and wood-working industries. This is also the region of greatest development in water-power. It is noticeable that only one of the important cities, La Crosse, is on the Mississippi river, and one only, Superior, on Lake Superior.



Mines and Quarries.—Wisconsin's mineral products are varied and though in value they fall far below the farm, forest and factory products of the State, they nevertheless amount to almost $20,000,000 annually. In 1920 they were valued at $19,630,114. A sharp depression in 1921 caused the total to drop

to $9,990,961, but a rapid recovery was made to $19,086,600 by 1923. In 1925 their value was $19,205,000.

The lead mines of south-western Wisconsin were the earliest developed and they reached a peak production in the decade 1840–50 since which they have slowly declined. In 1918 there were produced 4,533 short tons, valued at $643,686. In 1924 the production was but 1,254 short tons, valued at $200,640. Most of the lead is now only a by-product of zinc mining which has become of main importance in the same region. The zinc-bearing ores are chiefly found below the water level and their production was not stimulated greatly until the rise in price of zinc about 1900. The production of this metal amounted to 27,285 tons in 1920, 10,952 in 1922, 14,027 in 1924 and 26,800 in 1926. The value of the 1924 output was $1,823,510. Whereas early lead mining was largely carried on by individuals in shallow mines, the deeper zinc ores are mined almost exclusively by large companies using modern power machinery for mining and milling.

Of the great Lake Superior iron-producing district shared by Minnesota, Wisconsin and Michigan, Wisconsin possesses the smallest part. Two producing ranges extend into north Wisconsin, but the richer portions of each are in the upper peninsula of Michigan. The Wisconsin portion of the Penokee-Gogebic range is in Iron county and a small portion of the Menominee range extends into Florence county. Most of the ore is mined in the former. Production in 1924 amounted to 786,006 tons and in 1925 to 817,000. The 1924 output was valued at $2,044,762. The chief mineral output of Wisconsin is building and ornamental stone, the value of which was $4,590,528 in 1923 and $4,087,133 in 1924. Granite of many different colours is quarried. The lime product of 1924 was valued at $2,129,701. At hundreds of places in the State clay deposits suitable for making brick and tile are to be found, and products of this industry in 1924 were valued at $1,063,164. Another important resource of the State is its mineral waters, especially those from the springs near Waukesha which are bottled and sold widely. The value of bottled waters in 1923 was $2,612,452 which placed Wisconsin foremost among the States in this product.

Forests and Lumbering.—Originally all of Wisconsin, except a few thousand square miles of prairie region in the south, was covered with forests, the heavier timber being in the northern half of the State. Wisconsin's many rivers, fairly even topography and nearness to the Great Lakes and Mississippi river, favoured the rapid exploitation of these forests, and unrestricted and wasteful cutting went on apace. The most valuable original timber, the white pine, is now almost exhausted as a result. The great age of lumbering in Wisconsin was from 1890 to 1905, for the last five years of which Wisconsin was the leading lumber producing State of the United States. The value of rough lumber reached nearly $70,000,000 annually. In 1922 Wisconsin ranked 14th in lumber output. By 1925 the development of forest reserves and fire protection was helping to stabilize the industry, and the State in that year rose to 11th in rank. Lumber amounting to 1,069,000,000 ft. b.m. was cut, besides an output of 54,440,000 shingles, 142,764,000 laths and 599,601 tons of wood pulp. In wood pulp production Wisconsin ranked below only Maine and New York. The State's timber resources are by no means exhausted. In 1923 the State Conservation Commission estimated about 15,326,920,000 ft. b.m. of saw timber to be still standing, besides 41,619,250 cords of fuel wood and 3,634,718 cords of pulp wood. Of this about one-third is hemlock, with maple, birch, basswood, pine and elm next in order.

LUMBER PRODUCED 1889–1927

Commerce and Transport.—In Lake Superior, Lake Michigan and the Mississippi river Wisconsin is supplied upon three sides by unusual facilities for water shipping. In addition to their actual commerce these waterways are of great importance because of the continual check they supply upon land transport rates. Since pioneer days and the building of east-west railways the Mississippi has lost its importance as an actual carrier, but the Great Lakes have not. In 1925 the chief lake ports were as follows:

	Receipts Short tons	Shipments Short tons
Ashland	749,000	7,466,000
Milwaukee	5,611,000	1,297,000
Green Bay	1,166,000	257,000

In addition Wisconsin shared in the business of the great Duluth-Superior port which in 1925 registered receipts of 10,935,000 short tons and shipments of 40,130,000 short tons.

The first railway in the State was constructed from Milwaukee westward in 1851 and completed to the Mississippi river at Prairie du Chien in 1857. The first railways were built east and west with the idea of connecting the waterways as quickly as possible, but as the railways grew more independent the main lines were built in a general north-west and south-east direction so as to connect Chicago and Milwaukee with the cities of St. Paul and Minneapolis by lines as direct as possible. Other lines run from Milwaukee north-west to Ashland, Superior and Duluth. The railway mileage in the State amounted to 7,501 m. in 1926 as compared with 7,638 m. in 1915. The largest systems are the Chicago and North-western, the Chicago, Milwaukee, St. Paul and Pacific and the Minneapolis, St. Paul and Sault Ste. Marie. For passenger service, railway lines have been supplemented since 1923 by an increasing network of motor-bus lines running over the principal highways and connecting the chief cities.

There were in 1926, 78,964 m. of rural roads of which 28,318 m. were surfaced. Of the 10,280 m. in the State highway system in 1927, 6,138 m. were gravel-surfaced and 2,070 m. paved. Expenditures for State highways the same year amounted to $7,785,000. Motor vehicles in the State increased from 79,741 in 1915 to 293,298 in 1920 and 662,282 in 1926.

HISTORY

The region comprising the present State of Wisconsin was first explored by the French, who in their eagerness to find a "North-west Passage" rapidly penetrated the Great Lakes waterways.

French Explorers and Traders.—Jean Nicolet came in 1634, having been sent by Samuel Champlain, then governor-general of New France to investigate rumours of a distant race called the "People of the Sea" who, it was hoped, might be Asiatics. Nicolet landed at a point in Green bay and made a treaty of alliance with the "People of the Sea" whom he found were merely the populous tribe of Winnebago Indians then living in the neighbourhood. Champlain died shortly after Nicolet's return and no further explorations in the West were undertaken for 20 years. In 1654 Pierre Esprit, Sieur de Radisson and Medard Chouart, Sieur des Groseilliers, two French traders, visited Green bay and explored the country west and south. The vagueness of Radisson's journal leaves the interpretation of their itinerary much in doubt. Some scholars are disposed, from certain phases, to accord them the honour of having entirely crossed Wisconsin and discovered the Mississippi river, but this, while possible, is doubtful. The same explorers undertook a second voyage into the west in 1658–60 in which they were the first to skirt the Lake Superior shore of Wisconsin. On Chequamegon bay they built a log hut—the first white habitation, so far as is known, in the State—and the following winter made a long inland trip to the Ottawa villages in northern Wisconsin. In 1660 seven traders, accompanied by the Jesuit, Father René Ménard, the first missionary in Wisconsin, wintered at Chequamegon bay on Lake Superior; and Ménard, the next summer, perished while trying to reach the Huron villages near the sources of the Black river. In 1665 other traders came into Lake Superior and with them came Father Claude Allouez who, on the shores of Chequamegon bay, established the first permanent mission in Wisconsin. In 1668 Jean Peré began a three-year exploration of Lake Superior and its northward connections, and among other things located copper upon its shores.

In 1668 Green bay was again visited, this time by Nicolas Perrot and Toussaint Baudry who made several trips to inland tribes on the Wolf and upper Fox rivers with whom they concluded trading treaties. Other traders came. In 1669 Allouez was succeeded at his Chequamegon mission by Father Marquette and went into the Fox river valley where at the first rapids he founded the mission of St. François Xavier, one of the most successful of those established by the Jesuits in the west. It became the centre for further missionary efforts to all the surrounding tribes. In 1671 Father Marquette was forced by Indian wars to abandon the Chequamegon mission and in 1673, in company with Louis Joliet, he set off down the Fox-Wisconsin water route to discover the Mississippi river of which the Indians had told them. On July 17 they reached the mouth of the Wisconsin and sailed out upon the Mississippi waters.

In 1679 Daniel Greysolon Du Luth explored the upper Mississippi, St. Croix and Black rivers. The same year Michel Accault, accompanied by Father Hennepin, explored the Mississippi along Wisconsin's western boundary until they met Du Luth who returned with them by the Wisconsin-Fox route to the St. François Xavier mission. Du Luth continued his explorations on the Mississippi and Lake Superior until 1689 when he left the west never to return. His work was supplemented by the Mississippi expeditions of Perrot, who in 1686 built Fort St. Antoine on Lake Pepin, an enlargement of the Mississippi river. Perrot was now the French commandant in Wisconsin and most influential with the Indian tribes. In 1671 Saint-Lusson at Sault Ste. Marie had taken formal possession of the Great Lakes region in the name of the king of France; in 1689 Perrot staged a similar ceremony at his Fort St. Antoine on the Mississippi river. The 18 years between the two events had marked the period of French discovery and occupation of Wisconsin. Traders entered the region in increased numbers, and to protect them from the Indians and to control the trade properly a military force was necessary.

In 1712 the slaughter of a band of Foxes near Detroit was the signal for hostilities which lasted almost continuously until 1740, and in which every tribe in the Wisconsin country was sooner or later involved either in alliance with the Foxes or with the French. This war seriously interfered with the French plan of trade and development. The difficulty of maintaining a chain of settlements which might have connected Canada and Louisiana was a contributing cause to the overthrow of French dominion. Wisconsin was little disturbed by the Seven Years' War. However, the French and Indians of Wisconsin contributed a force under the half-breed, Charles Michel de Langlade, which made the long journey to lower Canada to share in the war. With the fall of Montreal (1760), French rule in Wisconsin was over.

British Occupation.—The first period of British occupation was brief for on the outbreak of Pontiac's conspiracy in 1763, the evacuation of the Green bay fort was forced. When the conspiracy was crushed in 1765, Wisconsin was reopened to traders, and not only French and English, but American traders from the colonies entered the region. British prestige among the Indians and the French *habitants* was hurt by a policy of confining the Indian trade to the forts instead of permitting the traders to go into the Indian villages. Little as they cared for their British rulers the French and Indians in the region remained loyal to the British during the Revolutionary War. De Langlade again led his French and Indian forces against the American frontier communities west of the Alleghanies.

The close of the war, although it conveyed the region to the sovereignty of the United States, was not followed by American occupation. The newly formed North-west company, a British fur-trading organization, kept control of the posts, built new ones, extended their trade and dominated the region. The control of these posts was one of the issues in the War of 1812, for American traders were becoming powerful enough to demand that the British traders should be made to withdraw. The end of the war meant the termination of British influence in Wisconsin, and actual military occupation of the country by the United States came in 1816 with the establishment of garrisons at Green bay (Ft. Howard) and Prairie du Chien (Ft. Crawford).

Incorporation with Michigan.—Wisconsin in 1800 had nominally been attached to Indiana Territory; and in 1809, on the admission of Indiana as a State, it was attached to Illinois. In 1818 Illinois was admitted to the Union and Wisconsin was incorporated in Michigan Territory. It was only at the latter date that American civil government in Wisconsin was established on an orderly and permanent basis. Until 1830 the fur-trade, controlled largely by the American Fur company, continued to be the predominating interest in the Wisconsin region, but then the growing lead-mining industry in the south-western part of the State began to overshadow the fur-trade. The lead-mining activity which began in 1824 was the first incentive to genuine settlement in the State since the fur-trade discouraged settlement except around the few trading posts. In 1830 there were about 2,500 miners in the region. Friction between these settlers and the Indians could not be avoided and in 1832 occurred the famous Black Hawk War, which broke the Indian power within the State. In addition the war made Wisconsin better known, and with the Indian menace removed there was an appreciable impetus to settlement. A series of Indian treaties in 1829, 1831, 1832 and 1833 extinguished the Indian titles and opened up vast areas to settlement.

In 1834 two land offices were opened, and by 1836, 878,014 ac. had been sold to settlers and speculators. In 1836 a special census showed a population of 11,000; in 1840 the number was about 40,000. From 1835 to 1845 settlers from the eastern States poured into the south-eastern part of the State, founding Milwaukee and other cities along the lake shore.

Wisconsin Becomes a Separate Territory.—When Michigan entered the Union in 1836 Wisconsin was erected into a separate Territory which at first included not only its present area, but the present Iowa and Minnesota and a portion of North and South Dakota. Henry Dodge was appointed the first territorial governor by President Jackson. The first territorial council met in 1836 at Old Belmont, now Leslie, Lafayette county, but in December of that year after a contest in which Fond du Lac, Milwaukee, Racine, Green bay, Portage and other places contended for the honour, Madison was selected as the capital.

Population increased so rapidly that it was not long before a movement for the admission of Wisconsin as a State was taken up in earnest and on Aug. 10, 1846, an enabling act for that purpose passed Congress and was approved by President Polk. The first Constitution drafted was rejected by the people, however, owing to liberal articles relating to the rights of married women, prohibition of banks, the elective judiciary, etc. A second convention, thought to be more conservative than the first, drafted another Constitution which in 1848 received the approval of both the people and Congress so that the State was admitted. The State governmental officers were sworn into office in June with Nelson Dewey in the governor's chair. In the same year the free public school system was established, and the great stream of German immigration set in. Railway construction began in 1851.

At the time of its admission Wisconsin, still a frontier State, was strongly democratic in spirit. The incoming Germans were likewise of the same sympathies. But Wisconsin was also a strong anti-slavery State and as the Democratic Party affiliated itself more and more completely with the cause of slavery, it lost its hold on Wisconsin. In 1854, one of the first steps in the organization of the Republican Party was taken at Ripon, and in 1856 a Republican governor was elected. In 1854 also the State supreme court rendered a decision which declared the Fugitive Slave Law to be null and void in Wisconsin. In 1860 the State aided in the election of Lincoln and supported his administration during the Civil War. To the Northern armies Wisconsin furnished 91,379 troops out of a total population of 775,881. In 1874 a Democratic liberal reform administration came into office and in the legislative session which followed the Potter Law, one of the first attempts to regulate railway rates, was passed. The Republicans regained control in 1876 and modified the law. In 1889 the passage of the Bennett Law, providing for the enforcement of the teaching of English in all public and parochial schools, roused the Germans, both Catholic and Lutheran,

usually Republicans, so that they voted the Democratic ticket and installed a Democratic administration from 1890 to 1895 which repealed the law. After 1895 the Republican Party grew more secure. It placed on the statute books a series of progressive enactments in regard to railway rate legislation, taxation, publicity of campaign expenditures, civil service, forest conservation, and finally a direct primary law. In all these reforms a leading part was taken by Governor Robert M. La Follette, who was elected to the U.S. Senate in 1905 when the reform movement was at its crest. Opposition to his programme resulted in a serious split in the Republican ranks, the opposition taking the old name of "Stalwarts." La Follette continued to draw enough support from the Democrats to maintain control of the State until 1914 when a political reaction resulted in the election of his opponents. The governmental policy suffered slight change, however. In 1920, the La Follette wing again came into power with the election of John J. Blaine as governor, who was re-elected in 1922 and 1924. La Follette remained in the Senate until his death in 1925 and was succeeded by his son.

BIBLIOGRAPHY.—The various State departments and commissions published reports and bulletins. Chief among them may be mentioned Lawrence Martin, "Physical Geography of Wisconsin," *Bulletin* No. 36 (1916); W. O. Hotchkiss, "A Brief Outline of the Geology, Physical Geography, Geography and Industries of Wisconsin," *Bulletin* No. 67 (1925); and A. R. Whitson, "Soils of Wisconsin," *Bulletin* No. 68 (1927). For archaeology consult *The Wisconsin Archaeologist* (1901 *et seq.*) a quarterly magazine published by the Wisconsin Archaeological Society. WISCONSIN, UNIVERSITY OF, a co-educational institution of higher learning at Madison, Wis., the capital of the State. It was established in 1848, is under State control, is supported largely by the State and is a part of its educational system. The university occupies a picturesque and beautiful site on an irregular tract of 600 ac., including both wooded hills and undulating meadow-lands stretching for a mile along the shores of Lake Mendota. The main building, Bascom Hall, which crowns University hill, is exactly one mile from the State capitol. The university includes a college of letters and science made up of an experimental college, a library school, schools of commerce, education, journalism and music, with general courses in liberal arts and special courses in chemistry and pharmacy; a college of engineering with courses in chemical, civil, electrical, mechanical and mining engineering; a college of agriculture with a Government experimental station, long, middle and short courses in agriculture, a department of home economics, a dairy course, farmers' institutes and an extension service; a law school; a medical school; a graduate school; and an extension division including departments of correspondence study, debating and public discussion, and group and community service. There is a summer session of six weeks for undergraduates, and of nine weeks for graduates. Instruction is given in the summer session in all colleges except the experimental college. Several scientific institutions are associated with the university, including the U.S. forest products laboratory, the U.S. weather bureau, Washburn observatory, Wisconsin psychiatric institute, the Wisconsin geological and natural history survey, the State laboratory of hygiene and the State toxicological laboratory.

In June, 1927, the University library and the State historical library, housed in the State Historical Library building, contained 613,000 bound volumes and 325,000 pamphlets; the special libraries housed in other buildings bring the totals up to 771,000 bound volumes and 378,000 pamphlets. In 1926–27 there were 8,837 students enrolled in the two semesters of the regular year—5,485 men and 3,352 women. The summer session enrolled 5,165 students. The faculty for the regular year for both resident and extension work consisted of 640 men and 136 women, making a total of 776. Admission to the university is by examination or certificate from accredited high schools or academies. Tuition is free for residents of the State. Courses in the first two years are largely prescribed; in the last two years, elective under a prescribed system of majors and minors. The university is governed by a board of regents of whom two—the president of the university and the State superintendent of public instruction—are *ex officio* members, and the others are appointed by the governor for a term of three years, four from the State at large and one from each congressional district. (C. A. S.)

WISCONSIN RAPIDS, a city near the centre of Wisconsin, U.S.A., on the Wisconsin river; the county seat of Wood county. It is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, the Green Bay and Western and the Soo Line railways. Pop. (1920) 7,243 (86% native white); estimated locally at 10,000 in 1928. It is in the heart of a dairy region which ships great quantities of cheese, and there are huge cranberry bogs near the city. Hydro-electric power is generated by local plants. Among the important manufactures are paper and pulp, camp stoves and equipment, refrigeration machinery, men's clothing, dairy products and fibre cartons. The city is headquarters of the U.S. Indian agency for the Winnebago and the Pottawattomie tribes. There is a fish hatchery on Nepco lake, just south of the city. Under the name of Grand Rapids a city on the east bank of the river was chartered in 1869. In 1900 it annexed Centralia, on the west bank; and in 1920 the present name was adopted.

WISDOM, BOOK OF. This book of the Apocrypha was not—as its title runs—composed by King Solomon, but emanates from the more intellectual circles of the Jewish Diaspora in Alexandria. It falls naturally into three parts which may or may not be the work of a single writer: (*a*) chs. li.–vi.–8 in which, in opposition to the views of the ungodly, the author argues that so far as the righteous are concerned, death is not the end: on the contrary "their hope is full immortality"; (*b*) vi. 9–xi. 1 which is written more particularly to portray Wisdom; (*c*) xi. 2–xix. an historical retrospect which is introduced in order to explain the origins and calamitous results of idolatry.

The book belongs to the closing period of the evolution of the Jewish Wisdom Literature (*q.v.*). No part of it would appear to have been written earlier than 150 B.C. Though Thackeray favours 130–100 B.C., Gregg 125–100 and Gfrörer 100 B.C., some modern opinion (*e.g.*, Goodrick) tends to favour a date as late as A.D. 40 (as indeed did Farrar). On the hypothesis of diversity of authorship, Holmes assigns the earlier part of the book to 50–30 B.C. and the last chapters (in his estimation an intentional addition to the first part) to 30 B.C. to A.D. 10. In this case the author was a younger contemporary of Philo (with whom Jerome identified him), slightly a senior of Jesus of Nazareth; and he had not long written his book when it fell into the hands of St. Paul, provided the author of the Epistle to the Hebrews with ideas and with terminology in which to express them, and, somewhat later, influenced, though to a much smaller extent, the authors of Epistles of 1 Peter, St. James and of the Fourth Gospel.

The whole book, as is now generally maintained, originally was written in Greek, and almost certainly in Alexandria by an Alexandrian Jew (or Jews) versed in the Septuagint translation of the Old Testament. To what extent was the author really acquainted with Plato's writings and with Plato's thought, with Pythagorean speculations, with Stoicism and with the Greek mystery cults?

For example, his doctrine of God's transcendence and unity reaches the high-water mark of Jewish theology and piety. He does not abandon the thoroughly Jewish conception of "spirit" as the agent and medium of the transcendent Deity's self-revelation to the Universe and to His chosen people; he even refers twice to the "Word" in this connection without any indication that he has hellenized it as Philo did. But in his description of his favourite intermediary between earth and Heaven, "Wisdom," it is difficult not to suppose that he was (though not so directly as some scholars have urged) influenced by the Stoic doc-

trine of the *anima mundi*. In the end, however, he shows that he has not really gone so far in the direction of hypostatizing "Wisdom" as did the author of Proverbs ch. ix. (*See* especially, Goodrick, *The Book of Wisdom*, Additional Notes D and F, pp. 404–410, 416–419.)

Till comparatively recently the view that the author was an exponent of the doctrine of the pre-existence of souls was unchallenged. The crucial passage is viii. 19, 20, which had hitherto been read in the light of other passages such as i. 4, ix. 15, xi. 17, which might seem to presuppose the evil of matter which was originally "formless" and the body as the prison of the soul in true Platonic fashion. But in 1908 F. C. Porter (*Studies in Memory of W. R. Harper*) put forward the revolutionary thesis that the author's statement in the passage has as its background neither Platonic nor Pythagorean speculations. It is, he urged, a native Hebrew evolution of primitive Semitic beliefs as to the union of the Divine breath with the material clay which results in the production of an individual man.

The tendency of the author's eschatology is equally problematical. It would appear that even if he contents himself with believing in the immortality of the *soul* only, he conceives of this as ensuring the conscious survival of the individual's personality. It is therefore difficult to believe that he does not refer to these same *dead* righteous rather than (as some urge) to the living righteous. It would seem that he did not completely abandon contemporary Jewish eschatological speculations of a materialistic or semi-materialistic nature for Greek ideas as to the immortality of individual souls. He accepted both without evolving a real synthesis of them, probably without grasping the necessity for one, as was obviously his tendency in regard to several other doctrines in which he held to his Jewish beliefs though attracted by their Hellenistic counterparts and the terminology of pagan philosophers who had won his admiration.

Bibliography.—*See* especially Gregg in *Camb. Bible* (1909); Holmes in Charles' *Apocrypha and Pseudepigrapha of the Old Testament*, i. 518-534; Goodrick in *Oxford Church Bible Commentary* (1913), where copious references will be found. (D. C. S.)

WISDOM LITERATURE. The extant writings of the Jewish sages are contained in the books of Job, Proverbs, Ben-Sira, Tobit, Ecclesiastes, Wisdom of Solomon, Fourth Maccabees, to which may be added the first chapter of Pirke Aboth (*q.v.*), certain of the Elephantine Papyri and isolated sections (*e.g.*, the parable of Jotham) and verses in the historical prophetical Books, as well as Pss. viii.; xix. 2–7; xxix. 3–10; xxxvii., xlix., lxxiii., xc. 1–12; xcii. 6–8 (5–7), cvii. 17–32, cxix., cxxxix., cxliv. 3 f., cxlvii. 8 f. The climax of the intellectual element in this movement is to be found in Philo.

Most of the extant literature doubtless dates only from the post-exilic period. But the Book of Proverbs (*q.v.*) contains minor collections of proverbs which are now recognized as pre-exilic in origin, while individual maxims contained in this and other books may be part of the heritage of post-exilic days from a comparatively hoary antiquity. The Wisdom Movement among the Hebrews was, in fact, no isolated phenomenon, and at no period in its development did it exist, as it were, in a watertight compartment. As the mythology of the Hebrews, their earlier religious ideas in general, many of their deities and several elements in their ecclesiastical calendar were shared with and mostly derived by them from neighbouring peoples, so too it was with the aspect of their culture comprised under the general term "Wisdom." From Mesopotamia to Egypt there existed an "international" stock of traditional Wisdom which passed and repassed from nation to nation, each adding its quota to the common stock, and each adapting to the needs and the requirements of its own culture what it received from those of others. Edom was a famous centre of such "Wisdom" activity in Palestine, and the Hebrew Humanists more than once admit their indebtedness to those of Edom. But the great creative centres of "Wisdom" activities were to be found in Babylonia and Egypt.

Doubtless the early Hebrew exponents of Wisdom at times did more than merely borrow, Hebraise, and conserve the proverbs of other nations. Hebrew tradition, at any rate, points to the reigns of Solomon and Hezekiah as epochs of outstanding importance in the development of Hebrew Wisdom literature. Certainly by the reign of Hezekiah the "wise men" formed a definite stratum in Jerusalem society, and like the priests, prophets and military leaders sought to shape, in accordance with their own economic and political ideals, the fortunes of the Jewish state.

But, as the post-exilic period advanced, and Jewish history and theology unfolded themselves, new problems arose for which no satisfactory explanation could be given by the old religion of the pre-exilic type, the new priestly development, the new scribism, and the still newer "Chasidaean" piety. Prophecy of the pre-exilic and exilic type was dead, and the principle of inspiration for which it stood found its expression more especially in Apocalyptic (*q.v.*). The latter, however, made its greatest appeal to the masses. It remained for the exponents of Wisdom to attempt to solve these problems in a form acceptable to men of culture and to specialize in the instruction of the youth of aristocratic families.

Their intellectual instincts led them to look, not to Persia whence Apocalyptic took so much of its imagery and some of its central ideas, but to the new world of the Mediterranean. With this world they were becoming increasingly familiar owing to the conquests of Alexander the Great and his successors, the rise of Greek cities in Palestine and the spread of Greek culture in Palestine and elsewhere, particularly in Egypt where the Jewish community mostly prospered and kept in close touch with their co-religionists in Jerusalem. The book of Wisdom (*q.v.*) emanated from this Alexandrian centre of Wisdom in the first Christian century, just as Egyptian Jewry in pre-hellenistic days had produced the book of Tobit (*q.v.*). Ecclesiastes and Proverbs (*qq.v.*) chs. i.–viii., on the other hand, are examples of the hellenizing Wisdom literature of Palestine, while Ecclesiasticus belongs to the period before Hellenism had contributed much of moment to the sages of Palestine.

The new problems which confronted these later sages were numerous, both in the practical and in the theoretical sphere. In the former, general looseness of life had to be combated. In the latter, they had to face questions such as the following: If God is transcendent, how can He still be held to intervene in mundane matters? If God is the ruler of the whole universe, is it possible, in the face of facts, still to maintain that His government of it is moral? In particular, what is the bearing of the problem of suffering upon this question? If He is the God of the individual soul, does He abandon that individual at death? Each Wisdom writer gave his own answer to these questions. Sometimes there is substantial agreement: sometimes they contradict each other. The answers of the authors of Proverbs i.–viii., Ecclesiasticus and Wisdom were constructive. In Ecclesiastes, in its original form, and in Prov. xxx. 2–4 instances have been preserved of a sceptical element in the Wisdom Movement.

Cheyne, *Job and Solomon, or The Wisdom of the Old Testament* (1887); Friedländer, *Griechische Philosophie in Alten Testament* (1904); Meinhold, *Die Weisheit Israels in Spruch, Sage und Dichtung* (1908); Oesterley, *The Books of the Apocrypha, Their Origin, Teaching and Contents* (1916). *See* further the Bibliographies to Proverbs, Book of (for the earlier aspects) and Wisdom, Book of for the later developments. (D. C. S.)

WISE, HENRY ALEXANDER (1806–1876), American politician and soldier, was born at Drummondtown (or Accomac), Va., on Dec. 3, 1806. He graduated from Washington (now Washington and Jefferson) college, Pa., in 1825, and began to practise law in Nashville, Tenn., in 1828. He returned to Accomac county, Virginia, in 1830, and served in the National House of Representatives in 1833–37 as an anti-nullification Democrat, but broke with the party on the withdrawal of the deposits from the United States Bank, and was re-elected to Congress in 1837, 1839 and 1841 as a Whig, and in 1843 as a Tyler Democrat. From 1844 to 1847 he was minister to Brazil. In 1855 he was elected governor of the State (1856–60) as a Democrat. John Brown's raid occurred during his term, and Wise refused to reprieve Brown after sentence had been passed. He strongly opposed secession, but finally voted for the Virginia ordinance, was commissioned brigadier-general in the Confederate army and served throughout the war. He died at Richmond, Va., on Sept. 12, 1876. He wrote *Seven Decades of the Union 1790–1860* (1872).

See the *Life* of H. A. Wise, by his grandson, B. H. Wise (1899).

WISE, ISAAC MAYER (1819–1900), American-Jewish theologian, was born in Bohemia. From the moment of his arrival in America (1846) his influence made itself felt. In 1854 he was appointed rabbi at Cincinnati. Some of his actions, as his compiling of a new prayer-book, roused considerable opposition. He was opposed to political Zionism, and in keeping with this denial of a Jewish nationality, he believed in national varieties of Judaism, and strove to harmonize the synagogue with local circumstances and sympathies. After a campaign lasting 25 years he was instrumental in founding the Union of American-Hebrew congregations in Cincinnati in 1873, and as a corollary in 1875 the Hebrew Union college, of which he was president and which has trained a large number of the rabbis of America. Wise also organized various general assemblies of rabbis, and in 1889 established the Central Conference of American rabbis. He was the first to introduce family pews in synagogues, and in many other ways "occidentalized" Jewish worship. He was not only a leader in liberal Judaism but also a scholar and the author of many works. He died in Cincinnati on March 26, 1900.

Rabbi Wise's *Reminiscences* (1901) were translated with an intro. by David Philipson (1901), who with Louis Grossman prepared a biographical sketch for the *Selected Writings* (1900). A tentative bibliography was prepared by A. S. Oko. *See* also D. Philipson, *The Reform Movement in Judaism* (1907); M. B. May, *Isaac Mayer Wise* (1916); and Henry Berkowitz, *Intimate Glimpses of the Rabbi's Career* (1921).

WISEMAN, NICHOLAS PATRICK STEPHEN (1802–1865), English cardinal, was born at Seville on Aug. 2, 1802, the child of Anglo-Irish parents recently settled in Spain for business purposes. On his father's death in 1805 he was brought to Waterford. He was educated at Ushaw college, near Durham, and at the English college in Rome, of which he became vice-rector in 1827, and rector in 1828. He held the rectorship for twelve years. From the first a devoted student and antiquary, he studied the oriental mss. in the Vatican library, and a first volume, entitled *Horae Syriacae,* published in 1827, gave promise of a great scholar. Leo XII. appointed him curator of the Arabic mss. in the Vatican, and professor of oriental languages in the Roman university. At this date he had close relations, personal and by correspondence, with Mai, Bunsen, Burgess (bishop of Salisbury), Tholuck and Kluge. His student life was, however, broken by the pope's command to preach to the English in Rome; and he visited England in 1835–1836, and delivered lectures on the principles and main doctrines of Roman Catholicism in the Sardinian Chapel, Lincoln's Inn Fields, and in the church at Moorfields, now pulled down. In 1836 he founded the *Dublin Review.* In the winter of 1838 he was visited in Rome by Macaulay, Manning and Gladstone.

In 1840 he was consecrated bishop, and sent to England as coadjutor to Bishop Walsh, vicar-apostolic of the Central district, and was also appointed president of Oscott College near Birmingham. Oscott, under his presidency, became a centre for English Catholics, where he was also visited by many distinguished men, including foreigners and non-Catholics. The Oxford converts (1845 and later) added considerably to Wiseman's responsibilities. It was by his advice that Newman and his companions spent some time in Rome before undertaking clerical work in England. Shortly after the accession of Pius IX. Wiseman was appointed temporarily vicar-apostolic of the London district, the appointment becoming permanent in February 1849. On his arrival from Rome in 1847 he acted as informal diplomatic envoy from the pope, to ascertain from the government what support England was likely to give in carrying out the liberal policy with which Pius inaugurated his reign. In response Lord Minto was sent to Rome as "an authentic organ of the British Government," but the policy in question proved abortive.

Residing in London in Golden Square, Wiseman threw himself into his new duties with many-sided activity, working especially for the reclamation of Catholic criminals and for the restoration of the lapsed poor to the practice of their religion. He was zealous for the establishment of religious communities, both of men and women, and for the holding of retreats and missions. He preached (July 4, 1848) at the opening of St. George's, Southwark, an occasion unique in England since the Reformation, 14 bishops and 240 priests being present, and six religious orders of men being represented. The progress of Catholicism was undeniable, but yet Wiseman found himself steadily opposed by a minority among his own clergy, who disliked his Ultramontane ideas, his "Romanizing and innovating zeal."

In July 1850 he heard of the pope's intention to create him a cardinal, and expected to be permanently recalled to Rome. But on his arrival there he ascertained that a part of the pope's plan for restoring a diocesan hierarchy in England was that he himself should return to England as cardinal and archbishop of Westminster. The papal brief establishing the hierarchy was dated Sept. 29, 1850, and on Oct. 7 Wiseman wrote a pastoral, dated "from out of the Flaminian Gate"—a form diplomatically correct, but of bombastic tone for Protestant ears—in which he spoke enthusiastically, if also a little pompously, of the "restoration of Catholic England to its orbit in the ecclesiastical firmament." Wiseman travelled slowly to England, via Vienna; and when he reached London (Nov. 11), the whole country was ablaze with indignation at the "papal aggression," which was misunderstood to imply a new and unjustifiable claim to territorial rule. But Wiseman wrote an admirable *Appeal to the English People* in which he explained the nature of the pope's action, and argued that the admitted principle of toleration included leave to establish a diocesan hierarchy. In July 1852 he presided at Oscott over the first provincial synod of Westminster. In 1854 Wiseman was in Rome when the definition of the dogma of the immaculate conception of the Blessed Virgin (Dec. 8), was promulgated. In 1855 he applied for a coadjutor, and George Errington, bishop of Plymouth, his friend since boyhood, was appointed, with the title of archbishop of Trebizond. Two years later Manning was appointed provost of Westminster and he established in Bayswater his community of the "Oblates of St. Charles."

In the summer of 1858 Wiseman paid a visit to Ireland, where, as a cardinal of Irish race, he was received with enthusiasm. In 1863, addressing the Catholic Congress at Malines, he stated that since 1830 the number of priests in England had increased from 434 to 1,242, and of convents of women from 16 to 162, while there were 55 religious houses of men in 1863 and none in 1830. The last two years of his life were troubled by illness and by controversies in which he found himself, under Manning's influence, compelled to adopt a policy less liberal than that which had been his in earlier years. Thus he had to condemn the Association for the Promotion of the Unity of Christendom, with which he had shown some sympathy in its inception in 1857; and to forbid Catholic parents to send their sons to Oxford or Cambridge, though at an earlier date he had hoped (with Newman) that at Oxford at least a college or hall might be assigned to them. He died on Feb. 16, 1865. On Jan. 30, 1907, his body was removed with great ceremony from Kensal Green and reburied in the crypt of the new cathedral at Westminster.

Wiseman was one of the most learned men of his time. He was the friend and correspondent of many foreigners of distinction, among whom may be named Döllinger, Lamennais, Montalembert and Napoleon III. He combined with the principles known as Ultramontane no little liberality of view in matters ecclesiastical. He insisted on a poetical interpretation of the Church's liturgy; and while strenuously maintaining her Divine commission to teach faith and morals, he regarded the Church as in other respects a learner; and he advocated a policy of conciliation.

See the biography by Wilfrid Ward, *The Life and Times of Cardinal Wiseman* (2 vols., 1897; fifth edition, 1900). (A. W. Hu.; X.)

WISHART, GEORGE (*c.* 1513–1546), Scottish reformer, was accused of heresy in 1538, and fled to England, where a similar charge was brought against him at Bristol in the following year. In 1539 or 1540 he started for Germany and Switzerland, and returning to England became a member of Corpus Christi college, Cambridge. In 1543 he went to Scotland in the train of a returning embassy. Wishart began to preach in 1544, at Perth, Edinburgh, Leith and Haddington. At Ormiston, in Dec. 1545, he was seized by the earl of Bothwell, and transferred by order

of the privy council to Edinburgh castle on Jan. 19, 1546. Thence he was handed over to Cardinal Beaton, who had him burnt at St. Andrews on March 1.

See Knox's *Hist.;* Reg. P. C. Scotland; Foxe's *Acts and Monuments;* Hay Fleming's *Martyrs and Confessors of St. Andrews;* Cramond's *Truth about Wishart* (1898) and *Dict. of Nat. Biogr.* vol. lxii.

WISLICENUS, JOHANNES (1835–1902), German chemist, was born on June 24, 1835 at Klein-Eichstedt, in Thuringia, and emigrated to America with his father. In 1855 he was appointed lecturer at the Mechanics' Institute in New York. Returning to Europe in 1856, he continued his studies at Zürich university, where he was subsequently professor of chemistry from 1865 to 1872. He then obtained the chair of chemistry at Würzburg, and in 1885, on the death of A. W. H. Kolbe, was appointed to the same professorship at Leipzig, where he died on Dec. 6, 1902. His work on the lactic acids cleared up many difficulties concerning the combination of acid and alcoholic properties in hydroxy-acids in general, and resulted in the discovery of two substances differing in physical properties though possessing a structure of proved chemical identity. So far back as 1873, before the publication of the doctrine of J. H. van't Hoff and J. A. Le Bel, Wislicenus expressed the opinion that the ordinary constitutional formulae did not afford an adequate explanation of certain carbon compounds, and suggested that account must be taken of the *verschiedene Lagerung ihrer Atome im Raume.* Later (see *Die räumliche Anordnung der Atome in organischen Molekülen,* 1887) he extended the application of the van't Hoff-Le Bel theory to "geometrical isomers"—substances like fumaric and maleic acids which have identical formulae but are dissimilar chemically. Wislicenus and his pupils studied a number of cases of this type of isomerism. He is also known for his work on aceto-acetic ester and its application as a synthetical agent and for his syntheses in the penta-methylene series. He was awarded the Davy medal by the Royal Society in 1898.

WISMAR, a seaport town of Germany, in the republic of Mecklenburg-Schwerin, situated on the Bay of Wismar, one of the best harbours on the Baltic, 20 m. by rail N. of Schwerin. Pop. (1925) 25,397. Wismar is said to have received civic rights in 1229, and came into the possession of Mecklenburg in 1301. In the 13th and 14th centuries it was a flourishing Hanse town, with important woollen factories. A plague carried off 10,000 of the inhabitants in 1376. By the peace of Westphalia in 1648 it passed to Sweden, but in 1803 Sweden pledged it to Mecklenburg, reserving, however, the right of redemption after 100 years.

WISSEMBOURG or **WEISSENBURG,** a town of France, capital of an arrondissement in the department of Bas-Rhin, on the Lauter, at the foot of the eastern slope of the Vosges mts., 42 m. N.E. of Strasbourg by the railway Basle-Strasbourg-Mannheim. Pop. (1926) 4,203. Wissembourg grew up round a Benedictine abbey which was founded in the 7th century by Dagobert II. and became the seat of a famous school. Here Otfrid, who was a native of the district, completed (*c.* 868) his Old High German Gospel book. (*See* GERMAN LITERATURE.)

The town became a free imperial city in 1305. It has been the scene of two memorable battles. In Oct. 1793 the Prussians and Saxons under the Austrian general Wurmser stormed the "Weissembourg Lines." On Aug. 4, 1870, the Germans, under the crown prince of Prussia, gained here the first victory of the Franco-German War (*q.v.*).

WISTARIA, a genus of climbing shrubs of the family Leguminosae, inhabiting China, Japan and eastern North America. The garden wistarias are mostly *W. chinensis,* of China, and *W. floribunda,* of Japan. Their violet-blue flowers, borne in long racemes are very effective floral decorations against a house-wall or on trellis-work. The silky wistaria (*W. venusta*), with velvety leaves and very large white flowers, is a native of China. The North American species, *W. frutescens,* found in the Southern States, has lilac-purple, very fragrant flowers.

WISTER, OWEN (1860–), American writer, was born in Philadelphia, July 14, 1860. On graduating from Harvard in 1882 he intended to devote himself to music. He went abroad for study; but family reasons forced him to return, and he spent several years in Arizona and New Mexico. He then entered the Harvard law school, graduating in 1888, was admitted to the bar in 1889 and for two years practised in Philadelphia. Thereafter he devoted his time to literary work.

His novel *The Virginian* (1902) has the distinction of doing as much to shape the romantic conception of the cowboy West as any other single factor. *Red Men and White* (1896) and *Lin McLean* (1898) also contributed to the legends of the cunning horse thief, the chivalrous rancher and the vanishing red man. *Philosophy 4* (1903), a diverting college story, and the romance *Lady Baltimore* (1906) were very popular. Wister's other publications include *Ulysses S. Grant* (1900), *The Seven Ages of Washington* (1907), *The Pentecost of Calamity* (1915) and *Neighbours Henceforth* (1922).

WITAN or **WITENAGEMOT,** the council of the Anglo-Saxon kings. It was in no sense a popular assembly, and its composition was determined by the king's pleasure. He would naturally wish to consult his greater nobles and his bishops, and such men are normally found in attendance at his councils. The ecclesiastical element was sometimes reinforced by the abbots of important monasteries. The king's household officers were usually present, and the council generally includes a varying number of thegns without specific duties at court. The general character of the council underwent little change throughout the Old English period, though it inevitably tended to become a larger body as the king of Wessex developed into a king of all England. Its essential duty was to advise the king on all matters touching which he chose to ask its opinion. It attested his grants of land to churches or laymen, it consented to his issue of new laws or new statements of ancient custom, and it helped him to deal with rebels and persons suspected of disaffection. King Alfred asked its advice about the testamentary disposition of his private inheritance. In late Old English times the witan had ceremonial functions. It attended the king when he received ambassadors, and in the 11th century, if not earlier, joined him in public feasting at Easter, Whitsuntide, and Christmas, commonly meeting for this purpose at Winchester, Westminster and Gloucester. At other times the king would summon his witan to attend him wherever he might choose. Important meetings of king and council were held in royal manors such as Wantage in Berkshire, Calne in Wiltshire and Andover in Hampshire. In its composition and duties the witan closely resembled its successor, the *Commune Concilium* of the Anglo-Norman kings; the fundamental difference between these bodies being the feudal tie which connected the baronial councillors of the Norman time with the king. (F. M. S.)

WITCHCRAFT. The actual meaning of this word appears to be the art or craft of the wise, as the word "witch" is allied with "wit," *to know.* From about the 15th century the word has been almost exclusively applied to workers of magic, whether male or female. Magicians and sorcerers are known in all parts of the world; among savage communities they are usually credited with supernatural powers by their fellow-tribesmen (*see* MAGIC). Divination (*q.v.*) or foretelling the future is one of the commonest forms of witchcraft; when this is done in the name of the deity of one of the established religions it is called prophecy; when, however, the divination is in the name of a pagan god it is mere witchcraft. This distinction is very clear in the account of the contest between Moses and Pharaoh's magicians as given in Exodus; but in the demotic story, which appears to give the Egyptian version of the incident, the wise priest of Egypt defeats the miserable foreign sorcerer whom he had saved from the water when a child.

Mediaeval Witches.—In England the legal definition of a witch is, according to Lord Coke, "a person who hath conference with the Devil to consult with him or to do some act."

The word "devil" (*q.v.*) is a diminutive from the root "div," from which we also get the word "divine." It merely means "little god." It is a well-known fact that when a new religion is established in any country, the god or gods of the old religion becomes the devil of the new.

When examining the records of the mediaeval witches, we are dealing with the remains of a pagan religion which survived, in England at least, till the 18th century, 1,200 years after the introduction of Christianity. The practices of this ancient faith can

be found in France at the present day, though with the name of the deity changed; and in Italy *la vecchia religione* still numbers many followers in spite of the efforts of the Christian Church.

The number of the witches put to death by the inquisitors and other persecutors in the 16th and 17th centuries is a proof of the obstinate paganism of Europe. Whole villages followed the beliefs of their ancestors; and in many cases the priests, drawn from the peasant class, were only outwardly Christian and carried on the ancient rites; even the bishops and other high ecclesiastics took part. As civilization increased and Christianity became more firmly rooted, the old religion retreated to the less frequented parts of the country and was practised by the more ignorant members of the community. This is very noticeable in the innumerable trials of the 15th to the 18th centuries.

The Witch-cult.—The religion consisted of a belief in a god incarnate in a human being or an animal, and thus resembled in many ways the religions of numerous primitive peoples of the present day. This god, who was always called the Devil by the Christian recorders of the trials, appeared to his worshippers disguised in various animal forms or dressed inconspicuously in black. The earliest form of the animal disguise is the figure of the man clothed in a stag's skin with antlers on his head, which is among the palaeolithic paintings in a cave in Ariège in southern France. Another early example is carved on a slate palette of the prehistoric period of Egypt; in this case the man is disguised as a jackal. The goat disguise is not found in Great Britain though common in France and Germany, where it is probably the survival of the god Cernunnos. In the British Isles the usual forms were the bull, the dog and the cat.

The rites with which this god was worshipped are known to all students of primitive or savage religions, ancient and modern. The sacred dances, the feasts, the chants in honour of the god, the liturgical ritual, and above all the ceremonies to promote fertility, occurred at public assemblies as now in the islands of the Pacific or in Africa. The fertility rites attracted the special attention of the recorders of the legal trials. But to the followers of the old god these rites were as holy as the sacred marriage was to the ancient Greeks; to them, as to the Greeks, it was the outward and visible sign of the fertility of crops and herds which should bring comfort and wealth and life itself.

The assemblies or "Sabbaths" took place four times a year; on Feb. 2 (Candlemas), May-eve (known later as Roodmas), Aug. 1 (Lammas), and November-eve (All Hallow E'en). To these joyous meetings came all the worshippers, from far and near, to the number of many hundreds, old and young, men, women and children, till the scene was like a great fair with dancing and singing and feasting. The celebrations began in the evening, lasted all night, and ended at dawn. These were the great Sabbaths, and the dates show that the year was divided at May and November. This division shows that the religion dates back to a primitive period, probably before the introduction of agriculture though after the domestication of animals, for the festivals emphasize the seasons of the breeding of animals. There were, however, smaller meetings (known in France as *"esbats"*), which took place weekly or at short irregular intervals. To these came the principal members of the cult, who held a position analogous to the priesthood. There were in each district a band of such persons, in number 13, *i.e.*, a chief or "devil" and 12 members. This band was known as a "Coven." They celebrated the religious rites, they practised as healers under the leadership and instruction of their divine master, and were the consultants in all cases where "witchcraft" was required. The earliest record of a Coven is in the *Handlyng Synne*, a work of the early 14th century, in which the (Christian) priest's daughter and 12 "fools" danced in the churchyard as a *coueyne*. The next record is in the 15th century in the trial of Gilles de Rais, where it is apparent that he and his associates were 13 in number in the practice of their rites. In the later trials the word Coven is continually used, and the number in a Coven is always 13.

One of the most impressive and important rites was the sacrifice of the god, which took place at intervals of seven or nine years. The accounts suggest that the sacrifice was by fire (for similar sacrifices *see* Frazer's *Golden Bough*).

The Familiars.—There are two kinds of familiars, the divining familiar and the domestic familiar. The divining familiar is common to the whole of Europe and is found in all records of the trials. In ancient Rome divination by animals, especially by birds, was known as "Augury" (*q.v.*), and was considered a legitimate means of learning the future, but when it was practised by "witches" in the 16th and 17th centuries their persecutors claimed that they were inspired by the Devil. As a rule the witches were instructed by their chief in the method of divining by animals, and he usually appointed the class of animal which each witch was to use. Thus Agnes Sampson of North Berwick divined by dogs, so also did Elizabeth Style in Somerset; John Walsh of Netherberry in Dorset had "a gray blackish culver," and Alexander Hamilton in Lothian divined by a "corbie" or a cat. In France the familiar was always a toad, which was consulted before going on a journey or undertaking any enterprise.

Spells and Charms (*q.v.*).—Forms of words with manual gestures are used in all countries and in all periods to produce results which cannot be obtained by physical means. They may be used for good or evil purposes, for the benefit of the user or for the benefit of someone else. A good harvest, a good catch of fish, a favourable wind for a ship, victory over an enemy, could all be obtained by formulae of words addressed to the appropriate power. But as the power was always incomprehensible, not to say freakish, it was necessary that it should be approached by those who knew the right methods. Sacrifice (*q.v.*) in the temples of the ancient civilization was among the means to propitiate the god and render him favourable to the petitions of his worshippers. When, however, there was more than one god, it is obvious that if a prayer were ineffectual in one temple nothing could be easier than to petition another deity.

Among the ritual methods to destroy an enemy one of the most ancient as well as the most dramatic was the making of an image, generally in wax, to represent the enemy, and gradually destroying it. The earliest record of this charm is in the trial of some women and officers of the harem of Rameses III. in Egypt, about 1100 B.C. They made wax images of the Pharaoh with magical incantations, but unfortunately the record gives only the outline of the trial without details.

Transformation into Animals (*see* LYCANTHROPY).—The belief that certain persons can transform themselves into animals is common to all parts of the world. The power belongs to the *shaman* or priest. A wound inflicted on a human being when in animal shape is believed to be visible when the person resumes his human form. The method of transformation was by putting on the skin of the animal, as did Sigmund the Volsung when he became a wolf. This being the case, it is obvious that the wounds received by the transformed person must certainly have remained when he returned to his proper shape.

The Suppression of Witchcraft.—In comparing the witches and witch-cult of the middle ages with the rites and beliefs of pagan religions, whether ancient or modern, it becomes abundantly clear that in Europe traces of the ancient heathenism survived the adoption of Christianity. It was only when the new religion had gained sufficient strength that it ventured to try conclusions with the old. Backed by the civil law, it overcame the old religion, not only by persuasion but by the use of force, just as it destroyed the ancient religion of Egypt and in later times the religion of the Aztecs. That the old religion was not an ordinary heresy is clearly shown by the fact that in England, Scotland, France, Germany, Italy, Switzerland, the Netherlands and in New England, in the days of Cotton Mather, certain ministers of some Christian bodies were as zealous as the priests of the Roman Church in hunting down and bringing to trial and death persons suspected of witchcraft.

WITCHES' BROOMS, the name, in botany, by which peculiar broom-like outgrowths found on the branches of a number of trees are known. They consist of a closely set mass of short branching twigs formed at one place on a branch as a result of the irritating action of an insect or a fungus. They are very common on the birch, being conspicuous when the tree is in a leafless condition; the "brooms" have then the appearance of birds' nests. They may be caused by the attack of a mite (*Eriophyes rudis*); in other cases they are due to the species of fungus, *Exoascus turgidus*, attacking the birch. An allied fungus (*E. cerasi*) causes brooms of the same kind on cherry.

WITCH-HAZEL, the common name for a North American shrub, *Hamamelis virginica* (family Hamamelidaceae), native to low woods from Nova Scotia to Minnesota and south to Florida and Texas. It grows from 10 to 25 ft. high, with smooth, wavy-toothed leaves, somewhat unequal-sided at the base. The showy bright-yellow flowers, borne in profuse axillary clusters, appear in autumn as the leaves are falling. The fruit, a hard, woody capsule that matures during the ensuing summer, contains two black shining seeds, which are forcibly ejected when ripe. A fluid extract, prepared from the leaves, is used as a tonic and a lotion. The name witch-hazel is derived from the use of the twigs as divining rods, just as hazel twigs were used in England. The North American witch-hazel is occasionally planted for ornament, as are *H. japonica*, of Japan, and *H. mollis*, of China.

WITCH OF AGNESI: *see* CURVE, SPECIAL.

WITHER, GEORGE (1588–1667), English poet and satirist, son of George Wither, of Hampshire, was born at Bentworth, near Alton, on June 11, 1588. He was sent to Magdalen College, Oxford, at the age of fifteen, and then entered one of the Inns of Chancery, eventually obtaining an introduction at court. He wrote an elegy (1612) on the death of Prince Henry, and a volume of gratulatory poems (1613) on the marriage of the princess Elizabeth, but his uncompromising character soon prepared trouble for him. In 1611 he published *Abuses Stript and Whipt*, twenty satires of general application directed against Revenge, Ambition, Lust and other abstractions. In 1613 five editions appeared, and the author was lodged in the Marshalsea prison. The influence of the Princess Elizabeth, supported by a loyal "Satyre" to the king, secured his release at the end of a few months. He had figured as one of the interlocutors, "Roget," in his friend William Browne's *Shepherd's Pipe*, with which were bound up eclogues by other poets, among them one by Wither, and during his imprisonment he wrote what may be regarded as a continuation of Browne's work, *The Shepherd's Hunting* (printed 1615), eclogues in which the two poets appear as "Willie" and "Roget" (in later editions "Philarete"). The fourth of these eclogues contains a famous passage in praise of poetry. After his release he was admitted (1615) to Lincoln's Inn, and in the same year he printed privately *Fidelia*, a love elegy, of which there is a unique copy in the Bodleian. Other editions of this book, which contained the lyric "Shall I, wasting in despair," appeared in 1617 and 1619. In 1621 he returned to the satiric vein with *Wither's Motto. Nec habeo, nec careo, nec curo.* Over 30,000 copies of this poem were sold, according to his own account, within a few months. Like his earlier invective, it was said to be libellous, and Wither was again imprisoned, but shortly afterwards released without formal trial on the plea that the book had been duly licensed. In 1622 appeared his *Faire-Virtue, The Mistress of Phil' Arete.*

Wither began as a moderate in politics and religion, but from this time his Puritan leanings became more and more pronounced, and his later work consists of religious poetry, and of controversial and political tracts. His *Hymnes and Songs of the Church* (1622–1623) were issued under a patent (later disallowed) of King James I. ordaining that they should be bound up with every copy of the authorized metrical psalms offered for sale. (*See* HYMNS.) Wither was in London during the plague of 1625, and in 1628 published *Britain's Remembrancer*, a voluminous poem on the subject, which he had to print with his own hand in consequence of his quarrel with the Stationers' Company. In 1635 he was employed by Henry Taunton, a London publisher, to write English verses illustrative of the allegorical plates of Crispin van Passe, originally designed for Gabriel Rollenhagen's *Nucleus emblematum selectissimorum* (1610–1613). The book was published as a *Collection of Emblemes, Ancient and Moderne*, of which the only perfect copy known is in the British Museum. The best of Wither's religious poetry is contained in *Hallelujah: or Britain's Second Remembrancer*, printed in Holland in 1641. Besides hymns proper, the book contains songs of singular beauty, especially the Cradle-song ("Sleep, baby, sleep, what ails my dear").

Wither had served as captain of horse in 1639 in the expedition of Charles I. against the Scottish Covenanters, but three years after the Scottish expedition, at the outbreak of the Great Rebellion, he is found definitely siding with the parliament. He sold his estate to raise a troop of horse, and was placed by a parliamentary committee in command of Farnham Castle. After a few days' occupation he left the place undefended, and marched to London. His own house near Farnham was plundered, and he himself was captured by a troop of Royalist horse, owing his life to the intervention of Sir John Denham on the ground that so long as Wither lived he himself could not be accounted the worst poet in England. After this episode he was promoted to the rank of major. He was present at the siege of Gloucester (1643) and at Naseby (1645). He had been deprived in 1643 of his nominal command, and of his commission as justice of the peace, in consequence of an attack upon Sir Richard Onslow, who was, he maintained, responsible for the Farnham disaster. In the same year parliament made him a grant of £2,000 for the loss of his property, but he apparently never received the full amount. An order was made to settle a yearly income of £150 on Wither, chargeable on Sir John Denham's sequestrated estate, but there is no evidence that he ever received it. A small place given him by the Protector was forfeited "by declaring unto him (Cromwell) those truths which he was not willing to hear of." At the Restoration he was arrested, and remained in prison for three years. He died in London on May 2, 1667.

His extant writings, catalogued in Park's *British Bibliographer*, number over a hundred. Sir S. E. Brydges published *The Shepherd's Hunting* (1814), *Fidelia* (1815) and *Fair Virtue* (1818), and a selection appeared in Stanford's *Works of the British Poets*, vol. v. (1819). Most of Wither's works were edited in twenty volumes for the Spenser Society (1871–1882); a selection was included by Henry Morley in his *Companion Poets* (1891); *Fidelia* and *Fair Virtue* are included in Edward Arber's *English Garner* (vol. iv., 1882; vol. vi. 1883), and an excellent edition of *The Poetry of George Wither* was edited by F. Sidgwick in 1902.

WITHERITE, a mineral consisting of barium carbonate ($BaCO_3$), crystallizing in the orthorhombic system, and named after W. Withering, who in 1784 recognized it to be chemically distinct from barytes. The crystals are invariably twinned together in groups of three, giving rise to pseudo-hexagonal forms somewhat resembling bipyramidal crystals of quartz; the faces are usually rough and striated horizontally. The colour is dull white or sometimes greyish, the hardness is 3·5 and specific gravity 4·3. The mineral occurs in veins of lead ore near Hexham in Northumberland, Alston in Cumberland, Anglezark, near Chorley, Lancs., and a few other localities. It is the chief source of barium salts, and is mined in considerable amounts in Northumberland. It is used for the preparation of rat poison, in the manufacture of glass and porcelain, and formerly for refining sugar. (L. J. S.)

WITHERSPOON, JOHN (1723–1794), Scottish-American divine and educator, was born at Gifford, Yester Parish, Scotland, probably on Feb. 5, 1722 or 1723. He was educated at the Haddington grammar school and the University of Edinburgh (M.A.,

1739), where he completed his theological studies in 1743. He was called to the parish of Beith in 1745 and in 1757 became pastor at Paisley. His militant tendencies, which made him a prominent figure during the American Revolution, manifested themselves at the invasion of the Young Pretender and in his ecclesiastical controversies. These he waged by sermon, debate, pamphlet and essay, revealing himself as a keen dialectician, an effective satirist and a convincing and entertaining speaker. Among his chief publications of this period are *Ecclesiastical Characteristics* (1753), *Essay on Justification* (1756) and a three-volume collection of his essays and doctrinal sermons (1764).

Witherspoon's popularity as a preacher is shown by his refusal of calls to Dundee, Dublin and Rotterdam; but his acceptance of a second call to the presidency of Princeton in 1768 marked a turning-point in his career. Thereafter, although he was received warmly by the American Presbyterian Church and although he took a prominent part in the meetings of the synod and was first moderator of the general assembly which he had advocated, he was more distinguished as an educator and as a statesman than as a clergyman. He seems to have brought to the struggling little college centred in Nassau Hall a vision of its potentialities as a cultural agency as well as a training-school for ministers. He opened a grammar school, announced graduate courses, encouraged the undergraduate societies, added Hebrew and French to the curriculum, provided scientific equipment and set out immediately on a quest for more money and more students. From arrival he was an enthusiast about America. He encouraged Scottish immigration, and in the dispute with the mother country ranged himself uncompromisingly on the side of the colonists. He presided over the Somerset county committee of correspondence in 1775–76; was a member of two provincial Congresses and of the New Jersey constitutional convention in the spring of 1776; and in 1776–79 and 1780–82 he was a member of the Continental Congress. He was the only clergyman to sign the Declaration of Independence; and in general he played a creditable part in the congressional body both in debate and on committees. He was especially distinguished for the soundness of his financial views, some of which were published later in his *Essay on Money* (1786). He died on his farm, Tusculum, near Princeton, Nov. 15, 1794.

The first edition of Dr. Witherspoon's *Works* was published in four volumes in Philadelphia in 1800 with a biographical account by Dr. John Rodgers. A nine volume edition was published in Edinburgh in 1804–05. *See* his *Lectures on Moral Philosophy* (1918), edited by V. L. Collins, and the biography by the latter (2 vols., 1925).

WITNESS, in law, a person who is able from his knowledge or experience to make statements relevant to matters of fact in dispute in a court of justice. The relevancy and probative effect of the statements which he makes belong to the law of evidence (*q v.*). In the present article it is only proposed to deal with matters concerning the position of the witness himself. In England, in the earlier stages of the common law, the jurors seem to have been the witnesses, for they were originally chosen for their knowledge or presumed knowledge of the facts in dispute, and they could (and can) be challenged and excluded from the jury if related to the parties or otherwise likely to show bias (*see* JURY).

Competency.—Modern views as to the persons competent to give evidence are very different from those of Roman law and the systems derived from it. In Roman law the testimony of many persons was not admissible without the application of torture, and a large body of possible witnesses was excluded for reasons which have now ceased to be considered expedient, and witnesses were subject to rules which have long become obsolete. Witnesses must be *idonei* or duly qualified. Minors, certain heretics, infamous persons (such as women convicted of adultery), and those interested in the result of the trial were inadmissible. Parents and children could not testify against one another, nor could slaves against their masters, nor those at enmity with the party against whom their evidence was offered. Women and slaves could not act as witnesses to a will. There were also some hard and fast rules as to number. Seven witnesses were necessary for a will, five for a *mancipatio* or manumission, or to determine the question whether a person were free or a slave. As under the Mosaic law, two witnesses were generally necessary as a minimum to prove any fact. *Unius responsio testis omnino non audiatur* are the words of a constitution of Constantine. The evidence of a single witness was simply *semi-plena probatio*, to be supplemented in default of a second witness, by torture or reference to oath. The canon law followed the Roman law as to competence, but extended the disabilities to excommunicated persons and to a layman in a criminal charge against a clerk, unless he were actually the prosecutor. The evidence of a notary was generally equivalent to that of two ordinary witnesses. The evidence of the pope and that of a witness who simply proved baptism or heresy (according to some authorities) are perhaps the only other cases in which canon law dispensed with confirmatory evidence. It is probable that the incompetence of Jews as witnesses in Spain in the 14th and 15th centuries was based on what is termed "want of religion," *i.e.*, heresy or unwillingness to take the Christian oath on the gospels. But in England until their expulsion they were on the status of slaves (*captivi*) of the king. A policy similar to that of the Roman law was followed for centuries in England by excluding the testimony of parties or persons interested, of witnesses for a prisoner, and of infamous persons, such as those who had been attainted or had been vanquished in the trial by battle, or had stood in the pillory. All these were said *vocem non habere*. In the days of trial by battle a party could render a witness against him incompetent by challenging and defeating him in the judicial combat. Women were generally regarded as wholly or partially incompetent. English law had also certain rules as to the number of witnesses necessary. Thus under a statute of 1383 (6 Rich. II. st. 2 c, 5) the number of compurgators necessary to free an accused person from complicity in the peasant revolt was fixed at three or four. Five was the number necessary under the *Liber feudorum* for proving ingratitude to the lord.

In the course of the gradual development of the law of evidence, which is in a sense peculiar to the English system, the fetters of the Roman rules as to witnesses were gradually shaken off. In civil cases all disabilities by interest, relationship, sex or crime have been swept away. The witness need not be *idoneous* in the Roman sense, and objections which in Roman law went to his competence, in English law go to his credibility. The only general test of competency is now understanding. It excludes lunatics, idiots, dotards and children of tender years; a person convicted of perjury is said to be competent if convicted at common law, but incompetent if convicted under the act of Elizabeth. No trial ever takes place now under this act, and on this point the act seems to have been virtually repealed by Lord Denman's act (1843; 6 and 7 Vict. c. 85). The disqualification is not absolute as to lunatics; as to children it is sometimes made to depend on whether they are able to understand the nature of the witness's oath. And in certain cases within the Criminal Law Amendment Act, 1885, and the Prevention of Cruelty to Children Act, 1904, the unsworn evidence of children of tender years is admissible but needs corroboration.

Non-judicial witnesses are those who attest an act of unusual importance, for the due execution of which evidence may afterwards be required. They are either made necessary by law, as the witnesses to marriages and wills, or used by general custom, as the witnesses to deeds. In some cases the attestation has become a mere form, such as the attestation of the lord chancellor to a writ of summons. (*See* WRIT.)

Number.—The rule of English law as to the number of witnesses necessary is expressed in the phrase *testes ponderantur non numerantur*. But there are certain exceptions, all statutory. Two witnesses are necessary to make a will valid; two are required to be present at a marriage and to attest the entry in the marriage register; and in the case of blasphemy, perjury, personation and most forms of treason, two or more witnesses are necessary to justify conviction. Witnesses to bills of sale under the Bills of Sale Act, 1882, and witnesses on a charge of personation at elections, are required to be "credible." And in the case of dishonour of a foreign bill of exchange the evidence of a notary public is required, probably a survival from the law merchant or a concession to Continental practice. A warrant of attorney must

be attested by a solicitor, and certain conveyances of property held on charitable uses must be attested by two solicitors. In certain civil cases the evidence of a single witness is not sufficient unless corroborated in some material particular—not necessarily by another witness—*e.g.*, in actions of breach of promise of marriage, or affiliation proceedings and matrimonial causes, or where unsworn evidence of children is admissible. In practice, but not in strict law, the evidence of an accomplice is required to be corroborated.

In criminal cases an accused person could not formerly be sworn as a witness or examined by the court, though he was free to make statements. The origin of this rule is by some traced to the maxim *nemo tenetur prodere seipsum*, by others to the theory that the petty jury were the prisoner's witnesses. Moreover, witnesses for the defence could not be examined on oath in cases of treason and felony until 1702 in England, 1711 in Ireland and 1735 in Scotland. The husband or wife of the accused could not be examined on oath as a witness either for the prosecution or the defence except in prosecutions for treason or for personal injuries done by one spouse to the other. This exclusion was in accord with the disqualification of parties to civil causes; but there was a lack of reciprocity, for the prosecutor was a competent witness because the Crown is the nominal prosecutor. The rule had to a certain extent a beneficial effect for the defence, in saving the accused from cross-examination, which in certain periods and in political trials would have led to abuse. On the abolition of other disqualifications that of the accused was left. This inconsistency led to much legal discussion and to piecemeal and, ultimately, complete change in the law. Between 1872 and 1897 some 26 acts were passed rendering accused persons and their wives or husbands competent (but not in general compellable) witnesses in particular criminal cases; and finally, by the Criminal Evidence Act, 1898, which abrogates the common law rule above, and in practice supersedes, but does not repeal, the particular statutes just mentioned, and does not apply to Ireland, every person charged with an offence, whether solely or jointly, and the wife or husband of such person is rendered a competent witness for the defence, subject to certain specified conditions. For these conditions, and for the rules regulating the attendance, oaths, examination, and privileges of witnesses, *see* EVIDENCE.

The attestation of documents out of courts of justice is ordinarily not on oath; but where the documents have to be proved in court the attesting witnesses are sworn like others, and the only judicial exception is that of witnesses ordered to produce documents (called in Scotland "havers") who are not sworn unless they have to verify the documents produced. Questions as to competence (including questions of the right to affirm instead of swearing or as to the proper form of oath) are settled by examination by the court without oath on what is termed the *voir dire*. The evidences of judicial witnesses is taken *viva voce* at the trial, except in interlocutory proceedings and in certain matters in the chancery division and in bankruptcy courts. Where the witness cannot attend the court or is abroad his evidence may be taken in writing by a commissioner delegated by the court, or by a foreign tribunal under letters of request issued by the court in which the cause is pending. The depositions are returned by the delegated authority to the court of trial. Under English law evidence must be taken *viva voce* in a criminal trial, with a few exceptions, *e.g.*, where a witness who has made a deposition before a magistrate at an earlier stage in the case is dead or unable to travel, or in certain cases within the Merchant Shipping Acts, or of offences in India or by Crown officials out of England. In Europe *commissions vogatoires* are freely used to obtain written depositions for the purpose of criminal trials, and are allowed to be executed in England.

On charges of treason lists of the witnesses to be called by the Crown must be supplied to the accused. In ordinary indictable cases there is no such obligation, but the names of the witnesses for the Crown are written on the back of the indictment; and where the witnesses have not been examined at the preliminary enquiry it is now established practice to require notice to the accused of their names, and a précis of what they will be called to prove. In Scotland, in all indictable cases, a list of witnesses must be served on the accused (the panel) (1887, c. 35), and the same rule is observed in France. In the United States the same course is adopted where a capital offence is charged.

(W. F. C.; S. L. PH.)

WITNEY, a market town in the Banbury parliamentary division of Oxfordshire, England, on the river Windrush, a tributary of the Thames, 75½ m. W.N.W. of London on a branch of the G.W. railway. Pop. of urban district (1921) 3,365. Witney is the seat of an old-established industry in blanket-making, and gloves and other woollen goods are also made. The great church of St. Mary is cruciform with a lofty central tower and spire. The tower is Early English, but the church exhibits the other styles, including a remarkable Norman porch.

The manor of Witney was held by the see of Winchester before the Conquest. It was sold in 1649, but was given back to the bishopric at the Restoration. In the middle of the 18th century it was leased by the bishop of Winchester to the duke of Marlborough. Witney was a borough by prescription at least as early as 1278, and sent representatives to parliament with more or less regularity from 1304 to 1330. There is reference to a fulling mill in a charter of King Edgar dated 909. In 1641 the blanket-makers petitioned the crown against vexatious trade regulations; in 1673 the town is described as "driving a good trade for blankets and rugs." In 1711 the blanket-makers obtained a charter making them into a company, consisting of a master, assistants, two wardens and a commonalty.

See J. A. Giles, *History of Witney* (1852); *Victoria County History, Oxon;* W. J. Monk, *History of Witney* (1894).

WITOWT or WITOLD (1350–1430), grand-duke of Lithuania, son of Kiejstut, prince of Samogitia, first appears prominently in 1382, when the Teutonic Order set him up as a candidate for the throne of Lithuania in opposition to his cousin Jagiello (*see* WLADISLAUS), who had treacherously murdered Witowt's father and seized his estates. Witowt, however, convinced himself that the German knights were far more dangerous than his Lithuanian rival; he accepted pacific overtures from Jagiello and became his ally. When Jagiello ascended the throne of Poland as Wladislaus II. in 1386, Witowt was at first content with the principality of Grodno; but jealousy of Skirgiello, one of Jagiello's brothers, to whom Jagiello committed the government of Lithuania, induced Witowt to ally himself once more with the Teutonic Order (treaty of Königsberg, May 24, 1390). He strengthened his position by giving his daughter Sophia in marriage to Vasily, grand-duke of Muscovy; but he never felt secure beneath the wing of the Teutonic Order, and when Jagiello removed Skirgiello from the government of Lithuania and offered it to Witowt, the compact of Ostrow (5th of August 1392) settled all differences between them.

Nevertheless, subsequent attempts on the part of Poland to subordinate Lithuania drove Witowt for the third time into the arms of the Order, and by the treaty of Salin in 1398, Witowt, who now styled himself *Supremus Dux Lithuaniae*, ceded his ancestral province of Samogitia to the knights, and formed an alliance with them for the conquest and partition of Pskov and Great Novgorod. He nourished the grandiose idea of driving out the hordes of Tamerlane, freeing all Russia from the Tatar yoke, and proclaiming himself emperor of the North and East. This dream of empire was dissipated by his terrible defeat on the Lower Dnieper by the Tatars on Aug. 12, 1399. He was now convinced that the true policy of Lithuania was the closest possible alliance with Poland. A union between the two countries was effected at Vilna on Jan. 18, 1401, and was confirmed and extended by subsequent treaties. Witowt was to reign over Lithuania as an independent grand-duke, but the two states were to be indissolubly united by a common policy. The result was a whole series of wars with the Teutonic Order, which now acknowledged Swidrygiello, another brother of Jagiello, as grand-duke of Lithuania; and though Swidrygiello was defeated and driven out by Witowt, the Order retained possession of Samogitia, and their barbarous methods of "converting" the wretched inhabitants finally induced Witowt to rescue his fellow-country-

men at any cost from the tender mercies of the knights.

In the beginning of 1409 Witowt concluded a treaty with Jagiello at Novogrudok for the purpose, and on July 19, 1410, the combined Polish-Lithuanian forces, reinforced by Hussite auxiliaries, crossed the Prussian border. The rival forces encountered at Grünewald, or Tannenberg, and there on July 14 or 15, 1410, was fought one of the decisive battles of the world, for the Teutonic Knights suffered a crushing blow from which they never recovered. After this battle Poland-Lithuania began to be regarded in the west as a great power, and Witowt stood in high favour with the Roman curia. In 1429, instigated by the emperor Sigismund, whom he magnificently entertained at his court at Lutsk, Witowt revived his claim to a kingly crown, and Jagiello reluctantly consented to his cousin's coronation; but before it could be accomplished Witowt died at Troki, on Oct. 27, 1430.

(Lemberg, 1850–1856); Teodor Narbutt, *History of the Lithuanian Nation* (Pol.) (Wilna, 1835–1836); *Codex epistolaris Witoldi Magni* (ed. Prochaska, Cracow, 1882). (R. N. B.)

WITTE, SERGE JULIEVICH, COUNT (1849–1915), Russian statesman, was born at Tiflis, where his father (of Dutch extraction) was a member of the Viceregal Council of the Caucasus. After completing his studies at Odessa University and devoting some time to journalism in close relations with the Slavophils and M. Katkov, he entered in 1877 the service of the Odessa State railway, and facilitated the transport of troops to Turkey in 1877–8. He now became general traffic manager of the South-Western railway of Russia and member of an Imperial commission which had to study the whole question of railway construction and management throughout the empire. Vishnegradski, minister of finance, recognized his ability and made him head of the railway department in the finance ministry. In 1892 he was promoted to be minister of ways of communication, and in 1893 he succeeded Vishnegradski, as minister of finance.

Witte was an ardent disciple of Friedrich List and sought to develop home industries by means of moderate protection and the introduction of foreign capital for industrial purposes. At the same time he succeeded by drastic measures in putting a stop to the great fluctuations in the value of the paper currency and in resuming specie payments. The rapid extension of the railway system was also largely due to his energy and financial ingenuity, and he embarked on a crusade against the evils of drunkenness by organizing a government monopoly for the sale of alcohol. In foreign policy he extended Russian influence in northern China and Persia. Witte struggled for what he considered the liberation of his country from the economic bondage of foreign nations. During his ten years' tenure of the finance ministry he nearly doubled the revenues of the empire, but he made for himself a host of enemies. He was transferred, therefore, in 1903 from the influential post of finance minister to the ornamental position of president of the committee of ministers.

The disasters of the war with Japan, and the rising tide of revolutionary agitation, compelled the government to think of appeasing popular discontent by granting administrative reforms, and the reform projects were revised and amended by the body over which M. Witte presided. But the Witte reforms were obstructed by the other departments, especially by the police. Naturally the influence of a strong man made itself felt, and the president became virtually prime minister; but, before he had advanced far in this legislative work, he was suddenly transformed into a diplomatist and sent to Portsmouth, N.H., U.S.A., in August 1905, to negotiate terms of peace with the Japanese delegates. In these negotiations he showed great energy and decision, and contributed largely to bringing about the peace. On his return to St. Petersburg he had to deal, as president of the first ministry under the new constitutional régime, with a very difficult political situation (*see* RUSSIA: *History*); he was no longer able to obtain support, and early in 1906 he was dismissed. His last service to the emperor had been to raise a large loan in France which made the government practically independent of the Duma. He died at St. Petersburg (Leningrad) on March 12, 1915.

See *Memoirs of Count Witte* ed. A. Garmolinsky (London and New York, 1921), indispensable to the study of the period; also a study of his career as minister of finance by D. A. Lutokhin (1915), and his diaries, posthumously published in *Pravda* (1918).

WITTELSBACH, the name of an important German family, taken from the castle of Wittelsbach, which formerly stood near Aichach on the Paar in Bavaria. In 1124, Otto V., count of Scheyern (d. 1155), removed the residence of his family to Wittelsbach, and called himself by this name. His descendants bore simply the title of counts of Scheyern until about 1116, when the emperor Henry V. recognized Count Otto V. as count palatine in Bavaria. His son, Count Otto VI., who succeeded his father in 1155, accompanied the German king, Frederick I., to Italy in 1154, where he distinguished himself by his courage, and later rendered valuable assistance to Frederick in Germany. When Henry the Lion, duke of Saxony and Bavaria, was placed under the imperial ban in 1180, Otto's services were rewarded by the investiture of the dukedom of Bavaria at Altenburg. Bavaria was ruled by the Wittelsbachs from that time onwards until the revolution of 1918, and the history of the house is closely connected with the history of Bavaria (*q.v.*). The ancestral castle of Wittelsbach was destroyed in 1208.

In 1329 the most important of various divisions of the Wittelsbach lands took place. By the treaty of Pavia in this year, Louis IV., German king, formerly duke of Bavaria, granted the Palatinate of the Rhine and the upper Palatinate of Bavaria to his brother's sons, Rudolph II. (d. 1353) and Rupert I. Rupert, who from 1353 to 1390 was sole ruler, gained the electoral dignity for the Palatinate of the Rhine in 1356 by a grant of some lands in upper Bavaria to the emperor Charles IV. It had been exercised from the division of 1329 by both branches in turn. The descendants of Louis IV. retained the rest of Bavaria, but made several divisions of their territory, the most important of which was in 1392, when the branches of Ingoldstadt, Munich and Landshut were founded. These were reunited under Albert IV., duke of Bavaria-Munich (1447–1508) and the upper Palatinate was added to them in 1628. Albert's descendants ruled over a united Bavaria, until the death of Duke Maximilian III. in 1777, when it passed to the Elector Palatine, Charles Theodore. The Palatinate of the Rhine, after the death of Rupert I. in 1390, passed to his nephew, Rupert II., and in 1398 to his son, Rupert III., who was German king from 1400 to 1410. On his death it was divided into four branches. Three of these had died out by 1559, and their possessions were inherited by the fourth or Simmern line, among whom the Palatinate was again divided. (*See* PALATINATE.)

In 1742, after the extinction of the two senior lines of this family, the Sulzbach branch became the senior line, and its head, the elector Charles Theodore, inherited Bavaria in 1777. He died in 1799, and Maximilian Joseph, the head of the Zweibrücken branch, inherited Bavaria and the Palatinate. He took the title of king as Maximilian I.

The Wittelsbachs gave three kings to Germany, Louis IV., Rupert and Charles VII. Members of the family were also margraves of Brandenburg from 1323 to 1373, and kings of Sweden from 1654 to 1718.

Wittmann, *Monumenta Wittelsbacensia* (Urkundenbuch, Munich, 1857–1861); K. T. Heigel, *Die Wittelsbacher* (Munich, 1880); F. Leitschuh, *Die Wittelsbacher in Bayern* (Bamberg, 1894).

WITTENBERG, a town in the Prussian province of Saxony, situated on the Elbe, 59 m. by rail south-west of Berlin, on the main line to Halle and at the junction of railways to Falkenberg, Torgau and Rosslau. Pop. (1925) 23,426.

Wittenberg is mentioned as early as 1180. It was the capital of the little duchy of Saxe-Wittenberg, the rulers of which afterwards became electors of Saxony. The Capitulation of Wittenberg (1547) is the name given to the treaty by which John Frederick the Magnanimous was compelled to resign the electoral dignity and most of his territory to the Albertine branch of the

Saxon family. It was occupied by the French in 1806, and re-fortified in 1813 by command of Napoleon; but in 1814 it was stormed by the Prussians. Its defences were dismantled in 1873.

Wittenberg is interesting chiefly on account of its close connection with Luther and the dawn of the Reformation, and several of its buildings are associated with the events of that time. Part of the Augustinian monastery in which Luther dwelt, at first as a monk and in later life as owner with his wife and family, has been fitted up as a Luther museum. The Augusteum was built in 1564–83 on the site of the monastery. The Schlosskirche, to the doors of which Luther nailed his famous 95 theses in 1517, dates from 1439–99; it was, however, seriously damaged by fire during the bombardment of 1760, was practically rebuilt, and has since been restored. The old wooden doors, burnt in 1760, were replaced in 1858 by bronze doors, bearing the Latin text of the theses. In the interior of the church are the tombs of Luther and Melanchthon. The parish church, in which Luther often preached, was built in the 14th century, but has been much altered. It contains a magnificent painting by Lucas Cranach the elder, representing the Lord's Supper, Baptism and Confession, also a font by Herman Vischer (1457). The university of Wittenberg, founded in 1502, was merged in the university of Halle in 1815. Luther was appointed professor of philosophy here in 1508; and the new university rapidly acquired a considerable reputation from its connection with the early Reformers. In opposition to the strict Lutheran orthodoxy of Jena it represented the more moderate doctrines of Melanchthon. The ancient electoral palace is another of the buildings that suffered severely in 1760; it now contains archives. Melanchthon's house and the house of Lucas Cranach the elder (1472–1553), who was burgomaster of Wittenberg, are also pointed out. The spot, outside the Elster gate, where Luther publicly burned the papal bull in 1520, is marked by an oak tree.

WITTINGAU: *see* TŘEBOŇ.

WITU or VITU, a sultanate of East Africa included in the Tanaland province of Kenya Colony. It extends along the coast from the town of Kipini at the mouth of the Ozi river (2° 30′ S.) to the northern limit of Manda bay (2° S.); area 1,200 sq.m. The chief town, Witu, is 16 m. N. of Kipini. The state was founded by Ahmed-bin-Fumo Luti, the last Nabhan sultan of Patta (an island off the coast), who was defeated by Seyyid Majid of Zanzibar. Ahmed, about 1860, took refuge in the forest district, and made himself an independent chief, acquiring the title of Simba or the Lion. In 1885 Ahmed was induced to place his country under German protection, but in 1890 as the result of the Anglo-German agreement of that year the protectorate was transferred to Great Britain. In 1894 Omar-bin-Hamed of the Nabhan dynasty—an ancient race of Asiatic origin—was recognized as sultan, and Witu settled down to a peaceful life.

WIVELISCOMBE (wĭv'ĕls-kŭm), a market town in the western parliamentary division of Somerset, England, 9½ m. W. of Taunton by the G.W.R. Pop. (1921) 1,255.

Traces of a large Roman camp may still be seen to the south-east of Wiveliscombe (*Wellescombe, Wilscombe, Wiviscombe*), which is near the line of a Roman road, and hoards of Roman coins have been discovered in the neighbourhood. The town probably owed its origin to the suitability of its position for defence, and it was the site of a Danish fort, later replaced by a Saxon settlement. The overlords were the bishops of Bath and Wells.

WLADISLAUS (WLADISLAW), the name of four kings of Poland and two Polish kings of Hungary[1].

[1]In Hungarian history the Polish Wladislaus (Mag. Ulászló) is distinguished from the Hungarian Ladislaus (László). They are reckoned separately for purposes of numbering. Besides the Wladislaus kings of Poland, there were three earlier dukes of this name: Wladislaus I. (d. 1102), Wladislaus II. (of Cracow, d. 1163) and Wladislaus III., duke of Great Poland and Cracow (d. 1231). By some historians these are included in the numbering of the Polish sovereigns, King Wladislaus I. being thus IV. and so on.

WLADISLAUS I. (1260–1333), king of Poland, called Lokietek, or "Span-long," from his diminutive stature, was the re-creator of the Polish realm, which at the end of the 13th century had split up into 14 independent principalities, and become an easy prey to her neighbours, Bohemia, Lithuania and the Teutonic Order. In 1296 the gentry of Great Poland elected Wladislaus, then prince of Cujavia, to reign over them; but later changing their minds, placed themselves under the protection of Wenceslaus, king of Bohemia, who was crowned at Gnesen in 1300. Wladislaus obtained the support of Pope Boniface VIII., and on the death of Wenceslaus in 1305 Wladislaus succeeded in uniting beneath his sway the principalities of Little and Great Poland. He had a long struggle with the towns and the prelates headed by Muskata, bishop of Cracow. He managed to suppress the magistrates of Cracow, but had to invoke the aid of the Teutonic Order to save Danzig from the margraves of Brandenburg; whereupon the Order not only proceeded to treat Danzig as a conquered city, but claimed possession of the whole of Pomerania. Wladislaus appealed to Pope John XXII. (1317) and ultimately (Feb. 9, 1321) obtained locally a judgment with costs against the Order, which however, appealed to Rome and got the judgment reversed. The result was a six years' war (1327–33) between Poland and the Order, in which all the princes of Central Europe took part, Hungary and Lithuania siding with Wladislaus, and Bohemia, Masovia and Silesia with the Order. It was early on Sept. 27, 1332, that Wladislaus, with his Hungarian allies, inflicted upon the knights their first serious reverse, at Plowce. In March 1333 he died. He had laid the foundations of a strong Polish monarchy, and with the consent of the pope revived the royal dignity, being crowned king of Poland at Cracow on Jan. 20, 1320.

See Max Perlbach, *Preussisch-polnische Studien zur Geschichte des Mittelalters* (Halle, 1886); Julius A. G. von Pflugk-Harttung, *Der deutsche Orden im Kampfe Ludwigs des Bayern mit der Kurie* (1900).

WLADISLAUS II., JAGIELLO (1350–1434), king of Poland, was one of the 12 sons of Olgierd, grand-duke of Lithuania, whom he succeeded in 1377. From the first Jagiello was involved in disputes with the Teutonic Order, and with his uncle, Kiejstut, who ruled Samogitia independently. By the Treaty of Dawidyszek (June 1, 1380) he contracted an alliance with the knights, and two years later, enticed Kiejstut and his consort to Krewo and there treacherously murdered them (Aug. 15, 1382). This foul deed naturally drove Witowt (*q.v.*), the son of Kiejstut, into alliance with the Order. But the two soon made common cause against the knights and invaded Prussian territory. In search of allies, Wladislaus in 1384 offered his hand to Jadwiga, the young queen of Poland, on condition they shared the Polish crown. Jadwiga renounced her previous fiancé, William of Austria. Jagiello was elected king of Poland as Wladislaus II.; on Feb. 15, 1386, he adopted the Catholic faith, and on Feb. 18 he married Jadwiga. He at once proceeded to convert Lithuania to his new faith. At Vilna, on Feb. 17, 1387, a stately concourse of nobles and prelates, headed by the king, proceeded to the grove of secular oaks beneath which stood the statue of Perkunos and other idols, and in the presence of an immense multitude hewed down the oaks, destroyed the idols, extinguished the sacred fire and elevated the cross on the desecrated heathen altars, 30,000 Lithuanians receiving Christian baptism. A Catholic hierarchy was immediately set up. Ruthenia with its capital Lemberg was persuaded to acknowledge the dominion of Poland; and there on Sept. 27, 1387, the hospodars of Walachia and Moldavia submitted voluntarily to Polish suzerainty.

The knights endeavoured to re-establish their position by sowing dissensions between Poland and Lithuania. In this for a time they succeeded (*see* WITOWT); but in 1401 Jagiello recognized Witowt as independent grand-duke of Lithuania (union of Vilna, Jan. 18, 1401), and their union was cemented in the battle of Grünewald, which shook the fabric of the Order to its foundations.

Jagiello was married four times. At the dying request of the childless Jadwiga he espoused a Styrian lady, Maria Cillei, who bore him a daughter, also called Jadwiga. His third wife, Elizabeth Grabowska, died without issue, and in 1422 Jagiello married Sonia, princess of Vyazma, a Russian lady rechristened Sophia, who bore him two sons, Wladislaus and Casimir, both of whom

ultimately succeeded him. Jagiello died at Grodko near Lemberg in 1434. During his reign Poland had risen to the rank of a great power, a position she was to retain for nearly 200 years.

WLADISLAUS III. (1424–1444), king of Poland and Hungary, the eldest son of Wladislaus II., Jagiello, by his fourth wife, Sophia of Vyazma, was born at Cracow, Oct. 31, 1424, succeeding to the throne in his tenth year. He had a turbulent minority; but Poland was wisely controlled by Zbigniew Olesnicki, while Wladislaus himself defeated the arch-traitor Spytek of Melztyn at Grotnik on May 4, 1439. On the sudden death of the emperor Albert, who was also king of Bohemia and Hungary, the Hungarians elected Wladislaus king, and he was crowned at Buda in July 1440. For three years, however, he had to fight against the partisans of the widowed Empress Elizabeth, till Pope Eugenius IV. mediated between them to enable Wladislaus to lead a crusade against the Turks. At the head of 40,000 men, mostly Magyars, and with Hunyadi commanding under him, Wladislaus made a glorious campaign in the Balkans in 1443, and by the Peace of Szeged (July 1, 1444), the Sultan Murad II., engaged to surrender Serbia, Albania and whatever territory the Ottomans had ever conquered from Hungary, including 24 fortresses, besides paying an indemnity of 100,000 florins in gold. After swearing to observe the treaty, however, Wladislaus broke it two days later in the name of religion, and invaded the Balkans a second time, losing his life and more than a fourth of his army at Varna on Nov. 10, 1444. (*See* also POLAND and HUNGARY.)

WLADISLAUS IV. (1595–1648), king of Poland, son of Sigismund III., king of Poland, and Anne of Austria, succeeded his father on the throne in 1632. He had already served with distinction under Zolkiewski in the Muscovite campaigns of 1610–12, and under Chodkiewicz in 1617–18; and his first official act was to march against the Muscovites, who had declared war against Poland immediately after Sigismund's death, forcing the Muscovite general, after bloody engagements (Aug. 7–22, 1632), to raise the siege of Smolensk and surrender (March 1, 1634). Wladislaus then concluded peace (May 28), conceding the title of tsar to Michael Romanov, who renounced all his claims upon Livonia, Estonia and Courland, besides paying a war indemnity of 200,000 rubles. Wladislaus then marched to Lemberg, and under threat of invasion the Porte offered terms, which were accepted in October, whereby each Power engaged to keep its borderers, the Cossacks and Tatars, in order, and divide between them the suzerainty of Moldavia and Walachia, the sultan binding himself always to place philo-Polish hospodars on those thrones. In the following year the long-pending differences with Sweden were settled, very much to the advantage of Poland, by the truce of Stumdorf (Sept. 12, 1635). Thus externally Poland was everywhere triumphant. Internally, however, things were in their usual deplorable state owing to the suspicion, jealousy and parsimony of the estates. When Danzig rebelled openly against dues lawfully imposed by the king, and a Danish admiral broke the blockade and almost destroyed the flotilla Wladislaus had sent against the rebellious city, the *Sejm* connived at the destruction of the national navy and the depletion of the treasury, "lest warships should make the crown too powerful." For some years after this humiliation, Wladislaus sank into a sort of apathy; but the birth of his son Sigismund (by his first wife, Cecilia Renata of Austria, in 1640) gave him fresh hopes and energy. With the aim of bringing about a royalist reaction, he founded the Order of the Immaculate Conception, consisting of 72 young noblemen who swore a special oath of allegiance to the Crown, and were to form the nucleus of a patriotic movement antagonistic to the constant usurpations of the diet. After the *Sejm* had frustrated this attempt, Wladislaus, assisted by the grand hetman of the Crown, Stanislaw Koniecpolski, tried to use the Cossacks, who were deeply attached to him, to chastise the *szlachta*, at the same time forcing a war with Turkey, which would make his military genius indispensable to the republic. Simultaneously Wladislaus contracted an offensive and defensive alliance with Venice against the Porte, a treaty directly contrary, indeed, to the *pacta conventa* he had sworn to observe. The ill-prepared enterprise fell through; and the king, worn out, disillusioned and broken-hearted at the death of his son (by his second wife, Marie Ludwika of Angoulême, Wladislaus had no issue), died at Merecz on May 20, 1648.

See W. Czermak, *The Plans of the Turkish Wars of Wladislaus IV.* (Pol.) (Cracow, 1895); V. V. Volk-Karachevsky, *The Struggle of Poland with the Cossacks* (Rus.) (Kiev, 1899); *Letters and other Writings of Wladislaus IV.* (Pol.) (Cracow, 1845).

WLOCLAWEK, a town of Poland in the province of Warsaw. Pop. (1921) 40,300. Situated on the left bank of the Vistula, about 100 m. below Warsaw, 25 m. below Plock, and 25 m. above Torun, Wloclawek has always been an important city, being the capital of the district of Kujawia and the seat of one of the ancient Catholic bishoprics. The mediaeval cathedral, built in the "Vistula Gothic" style, still exists. The region suffered much in the 14th century from the invasions of the Teutonic Knights. The diocese of the bishops included all eastern Pomerania.

WLODIMIERZ-WOLYNSKI or **WLODZIMIERZ,** town of Poland, province of Volhynia; population, mainly Jewish. The town is the ancient capital of Volhynia, but it soon declined in importance on the rise of Luck and other towns. Near the town are the ruins of a church supposed to have been built by Vladimir, grand prince of Kiev in 973. It became the capital of the independent princes of Volhynia. Its name was Latinized as Lodomeria by the Austrians when they occupied it. The town contains a good archaeological museum.

WOAD, a herbaceous plant, known botanically as *Isatis tinctoria* (family Cruciferae), which occurs sporadically in England in fields, on banks and chalk-pits. The erect branched stem, 1 to 3 ft. in height, bears sessile leaves and terminal clusters of small yellow flowers; the brown pendulous pods are ½ in. long. The ancient Britons stained themselves with this plant. It is still cultivated in Lincolnshire.

WOBURN, a city of Middlesex county, Massachusetts, U.S.A., 10 m. N.N.W. of Boston; served by the Boston and Maine railroad. Pop. (1920) 16,574 (24% foreign-born white); 1928 local estimate 20,000. The city has an area of 12·6 sq.m., and embraces several villages. Its manufacturing industries, concentrated in a small territory, had an output in 1925 valued at $14,487,457. Woburn is the principal leather-manufacturing centre in New England. In the burial-ground are the graves of ancestors of four presidents (Cleveland, Harrison, Pierce and Garfield). The public library, on the Common, was designed by H. H. Richardson. Among the colonial houses are the birthplace of Count Rumford (built about 1714, and kept as a museum) and the Baldwin mansion (1661), the home of Loammi Baldwin (1780–1838), "the father of civil engineering in America." Woburn was settled about 1638–40, and in 1642 was set off from Charlestown and incorporated as a town. The town was chartered as a city in 1888.

WOCHUA, a pygmy people of Africa, living in the forests of the Mabode district, south of the Welle. They were discovered (1880–1883) by Dr. W. Junker, who described them as "well proportioned, though the oval-shaped head seemed somewhat too large for the size of the body." Some are of light complexion, like the Akka and Batwa, but as a general rule they belong to the darker, crisper-haired, more genuine negro stock.

WODEN, a deity of the Anglo-Saxons, the name being the Anglo-Saxon counterpart of the Scandinavian Odin (*q.v.*). In German he was Wodan or Wuotan. Information is lacking as to how far the character and adventures attributed to Odin were known to other Teutonic peoples. Clearly, however, the god was credited with special skill in magic, both in England and Germany, and was also represented (*see* LOMBARDS) as the dispenser of victory. By the Romans he was early identified with Mercurius; "Wednesday" (Woden's day) is *dies Mercurii.*

WODROW, ROBERT (1679–1734), Scottish historian, was born at Glasgow, being a son of James Wodrow, professor of divinity. He was educated at the university and was librarian from 1697 to 1701. From 1703 till his death, on March 21, 1734, he was parish minister at Eastwood, near Glasgow. He had 16 children, his son Patrick being the "auld Wodrow" of Burns's poem "Twa Herds." His great work is *The History of the Suffer-*

ings of the Church of Scotland from the Restoration to the Revolution (2 vols., 1721–22; new ed. with a life of Wodrow by Robert Burns, D.D., 1807–08).

WOFFINGTON, MARGARET [PEG] (1714?–1760), English actress, was born at Dublin, of poor parents on Oct. 18, probably in 1714. As a child of ten she played Polly Peachum in a Lilliputian presentation of *The Beggar's Opera,* and danced and acted in Dublin theatres until 1740, when her success as Sir Harry Wildair in *The Constant Couple* secured her a London engagement. In this, and as Sylvia in *The Recruiting Officer,* she had a great success; and at Drury Lane and Covent Garden, as well as in Dublin, she appeared in all the plays of the day. Among her best impersonations were the elegant women of fashion, like Lady Betty Modish and Lady Townley, and in "breeches parts" she was unapproachable. She built and endowed almshouses at Teddington, where she lived after her retirement in 1757. She died there in 1760.

See Austin Dobson's introduction to Charles Reade's novel *Peg Woffington* (1899), and Augustin Daly's *Woffington: a Tribute to the Actress and the Woman* (1888).

WÖHLER, FRIEDRICH (1800–1882), German chemist, was born at Eschersheim, near Frankfort-on-the-Main, on July 31, 1800. In 1814 he began to attend the gymnasium at Frankfort, where he carried out experiments with his friend Dr. J. J. C. Buch. In 1820 he entered Marburg university, and next year removed to Heidelberg, where he worked in Gmelin's laboratory. Intending to practise as a physician, he took his degree in medicine and surgery (1823), but was persuaded by Gmelin to devote himself to chemistry. He studied in Berzelius's laboratory at Stockholm, and there began a lifelong friendship with the Swedish chemist. He then taught in the technical schools of Berlin (1825–31) and Cassel (1831–36). In 1836 he was appointed to the chair of chemistry in the medical faculty at Göttingen, holding also the office of inspector-general of pharmacies in the kingdom of Hanover. This professorship he held until his death on Sept. 23, 1882.

In 1827 Wöhler first obtained metallic aluminium by heating the chloride with potassium, and in the following year he isolated beryllium by the same method. His great contribution to the development of chemistry was the synthesis of the natural product urea (*q.v.*) in 1828. He worked with Liebig in a number of important investigations. One of the earliest was the investigation, published in 1830, which proved the polymerism of cyanic and cyanuric acid, but the most famous were those on the oil of bitter almonds (benzaldehyde) and the radicle benzoyl (1832), and on uric acid (1837), which are of fundamental importance in the history of organic chemistry. Most of Wöhler's work, however, lay in the field of inorganic chemistry. Together with Sainte-Claire Deville, he obtained "Adamantine boron," and with H. Buff he investigated compounds of silicon and prepared a hydride of that element. He also obtained pure titanium and showed the similarity between this element and silicon and carbon.

The Royal Society's *Catalogue* enumerates 276 separate memoirs written by him, apart from 43 in which he collaborated with others. In 1841 he published *Grundriss der anorganischen Chemie,* and in 1840 *Grundriss der organischen Chemie.* Still more valuable for teaching purposes was his *Mineralanalyse in Beispielen* (1861), which first appeared in 1853 as *Praktische Übungen in der chemischen Analyse.* He translated three editions of the *Lehrbuch* of Berzelius and all the successive volumes of the *Jahresbericht* into German from the original Swedish. He assisted Liebig and Poggendorff in the *Handwörterbuch der reinen und angewandten Chemie,* and was joint-editor with Liebig of the *Annalen der Chemie und Pharmacie.*

A memoir by Hofmann appeared in the *Ber. deut. chem. Gesellsch.* (1882), reprinted in *Zur Erinnerung an vorangegangene Freunde* (1888).

WOHLGEMUTH, MICHAEL (1434–1519), German painter, was born at Nuremberg in 1434. In 1472 he married the widow of the painter Hans Pleydenwurff, whose son Wilhelm worked as an assistant to his stepfather. Wohlgemuth was the head of a large workshop, in which many different branches of the fine arts were carried on by a great number of pupil-assistants, including Albert Dürer. In this *atelier* not only large altar-pieces and other sacred paintings were executed, but also elaborate retables in carved wood, consisting of crowded subjects in high relief, richly decorated with gold and colour. Wood-engraving was also carried on in the same workshop, the blocks being cut from Wohlgemuth's designs. The *Schatzbehalter der wahren Reichthümer des Heils,* printed by Koburger in 1491; and the *Historia mundi,* by Schedel, 1493–1494, usually known as the *Nuremberg Chronicle,* are both illustrated by woodcuts by Wohlgemuth and Pleydenwurff.

By Wohlgemuth are the retable dated 1465, now in the Munich gallery; the retable of the high altar in the church of St. Mary at Zwickau (1479); and the great retable painted for the Austin friars at Nuremberg, now in the museum. This last consists of a great many panels. He died at Nuremberg in 1519.

See Bürger Schmitz Beth, *Die deutsche Malerei der Renaissance* (1919).

WOKING, a market town in the Farnham parliamentary division of Surrey, England, 24 m. S.W. of London by the S. railway. Pop. of urban district (1891) 9,786; (1921) 26,423. The modern town, which is growing rapidly, has sprung up near the site of an older town. The river Wey and the Basingstoke canal pass through the parish. St. Peter's church dates from the 13th century. Modern structures include a public hall, and an Oriental institute including a museum of Eastern antiquities, a mosque built in 1889 and residences for Orientals. In the vicinity are a crematorium and Brookwood cemetery.

WOLCOT, JOHN (1738–1819), English satirist and poet, known under the pseudonym of PETER PINDAR, was baptized at Dodbrooke, Devonshire, on May 9, 1738. He was apprenticed to his uncle, John Wolcot, a surgeon at Fowey, and he took his degree of M.D. at Aberdeen in 1767. In 1769 he was ordained, and went to Jamaica with Sir William Trelawny, the governor. In 1772 he became incumbent of Vere, Jamaica, but on the death of his patron (1772) he returned to England, and settled as a physician at Truro. In 1781 Wolcot went to London, and took with him the young Cornish artist, John Opie, whose talents in painting he had been the first to recognize. He soon achieved fame by a succession of pungent satires on George III. Two of Wolcot's happiest satires on the "farmer king" depicted the royal survey of Whitbread's brewery, and the king's naïve wonder how the apples got into the dumplings. He had a broad sense of humour, a keen eye for the ridiculous, and great felicity of imagery and expression. Some of his serious pieces—his rendering of Thomas Warton's epigram on *Sleep* and his *Lord Gregory,* for example—reveal an unexpected fund of genuine tenderness. He died at Latham Place, Somers Town, London, on Jan. 14, 1819, and was buried near Samuel Butler, the author of *Hudibras,* in St. Paul's, Covent Garden.

Polwhele, the Cornish historian, was well acquainted with Wolcot in his early life, and the best account of his residence in the west is found in vol. i. of Polwhele's *Traditions* and in Polwhele's *Biographical Sketches,* vol. ii. Cyrus Redding was a frequent visitor at the old man's house, and has described Wolcot's later days in his *Past Celebrities,* vol. i., and his *Fifty Years' Recollections,* vols. i. and ii.

WOLCOTT, ROGER (1679–1767), American administrator, was born in Windsor (Conn.), Jan. 4, 1679, the son of Simon Wolcott (died 1687). He was a grandson of Henry Wolcott (1578–1655), who emigrated to New England in 1628; assisted John Mason and others to found Windsor (Conn.), in 1635; and was a member of the first general assembly of Connecticut in 1637 and of the house of magistrates from 1643 to his death. (Henry Wolcott the younger [died 1680] was one of the patentees of Connecticut under the charter of 1662.) Roger Wolcott was a member of the Connecticut general assembly in 1709, one of the bench of justices in 1710, commissary of the Connecticut forces in the expedition of 1711 against Canada, a member of the council in 1714, judge of the county court in 1721, and of the superior court in 1732, and deputy governor and chief justice of the superior court in 1741. He was second in command to Sir William Pepperrell, with rank of major general in the expedition (1745) against Louisbourg, and was governor of Connecticut in 1751–54. He died in what is now East Windsor, on May 17, 1767.

He wrote *Poetical Meditations* (1725), an epic on *The Agency*

of the Honourable John Winthrop in the Court of King Charles the Second (printed in vol. iv., series 1, *Collections* of Massachusetts Historical Society). His *Journal at the Siege of Louisbourg* is printed in pp. 131–161 of vol. i (1860) of the *Collections* of the Connecticut Historical Society.

His son OLIVER WOLCOTT (1726–1797) was graduated from Yale in 1747 and studied medicine with his brother Alexander (1712–95). In 1751 he was made sheriff of the newly established Litchfield county and practised law in Litchfield. He was a member of the council in 1774–86 and of the Continental Congress in 1775–76, 1778 and 1780–84, and a commissioner of Indian affairs for the northern department in 1775. During the War of Independence he was active in raising militia in Connecticut. He was one of the signers of the Declaration of Independence; commanded Connecticut militia that helped to defend New York city in Aug. 1776; in 1777 organized more Connecticut volunteers and took part in the campaign against Gen. John Burgoyne; and in 1779 commanded the militia during the British invasion of Connecticut. In 1784, as one of the commissioners of Indian affairs for the northern department, he negotiated the treaty of Fort Stanwix (Oct. 22) settling the boundaries of the Six Nations. In 1786–96 he was lieutenant governor of Connecticut, and in Nov. 1787 was a member of the Connecticut convention which ratified the Federal Constitution. He became governor in 1796 upon the death (Jan. 15) of Samuel Huntington, and served until his death on Dec. 1, 1797.

His son Oliver wrote a sketch of him in Sanderson's *Biography of the Signers of the Declaration of Independence* (Philadelphia, 1820–27).

Oliver's son, OLIVER WOLCOTT, Jr. (1760–1833), was graduated from Yale in 1778, studied law in Litchfield, and was admitted to the bar in 1781. With Oliver Ellsworth he was appointed (May 1784) a commissioner to adjust the claims of Connecticut against the United States. He was controller of public accounts of Connecticut and auditor of the Federal Treasury. In June 1791 he became controller of the Treasury, and in Feb. 1795 succeeded Alexander Hamilton as secretary of the Treasury. At the end of 1800 he resigned after a bitter attack by the press. He re-entered politics as a leader of the "Toleration Republicans," and in 1817 presided over the State convention which adopted a new constitution, and in the same year was elected governor, serving until 1827. He died in New York city June 1, 1833.

His grandson George Gibbs (1815–1873) in 1846 edited *Memoirs of the Administration of Washington and John Adams . . . from the Papers of Oliver Wolcott, Secretary of the Treasury*. Wolcott wrote *British Influence on the Affairs of the United States Proved and Explained* (1804).

WOLF, FRIEDRICH AUGUST (1759–1824), German philologist and critic, was born on Feb. 15, 1759, at Hainrode, in the province of Hanover. He was educated at Nordhausen grammar school and Göttingen university. There he chose philology as his faculty, which then had no existence, and succeeded in carrying his point. He was dissatisfied with Heyne's treatment of Homer, and the two fell out. Later his edition of the *Symposium* obtained for him a chair at Halle. The moment was a critical one in the history of education. The literary impulse of the Renaissance was almost spent; scholarship had become dry and trivial. A new school, that of Locke and Rousseau, sought to make teaching more modern and more human, but at the sacrifice of mental discipline and scientific aim. Wolf was eager to throw himself into the contest on the side of antiquity. In Halle (1783–1807), by the force of his will and the enlightened aid of the ministers of Frederick the Great, he was able to carry out his long-cherished ideas and found the science of philology.

During his time at Halle Wolf published his commentary on the *Leptines* of Demosthenes (1789) and a little later the celebrated *Prolegomena* to Homer (1795). This book, the work with which his name is chiefly associated, was thrown off in comparative haste to meet an immediate need. It has all the merits of a great piece of oral teaching—command of method, suggestiveness, breadth of view. From it originated the great Homeric controversy and Wolf's main points, oral tradition, deliberate revision after reduction to writing, and plurality of authorship, are still the crucial questions. The French invasion swept away the university, and the rest of his life was spent at Berlin, where he had another professorship. His most finished work, the *Darstellung der Altertumswissenschaft*, though published at Berlin (1807), belongs essentially to the Halle time. At length his health gave way. He was advised to try the south of France. He got as far as Marseilles, and died there on Aug. 8, 1824.

Mark Pattison wrote an admirable sketch of Wolf's life and work in the *North British Review* of June 1865, reproduced in his *Essays* (1889); *see* also J. E. Sandys, *Hist. of Class. Schol.* iii. (1908), pp. 51–60. Wolf's *Kleine Schriften* were edited by G. Bernhardy (Halle, 1869). Works not included are the *Prolegomena*, the *Letters to Heyne* (1797), the commentary on the *Leptines* (Halle, 1789) and a translation of the *Clouds* of Aristophanes (1811).

WOLF, HUGO (1860–1903), German composer, was born on the 13th of March 1860 at Windischgraz in Styria. His father, who was in the leather trade, was a keen musician. From him Hugo learned the rudiments of the piano and the violin. After an unhappy school life, in which he showed little aptitude for anything but music, he went in 1875 to the Conservatoire. He appears to have learned very little there, and was dismissed in 1877 because of a practical joke in the form of a threatening letter to the director, for which he was perhaps unjustly held responsible. In 1884 he became musical critic to the *Salonblatt*, a Viennese society paper, and contrived by his uncompromisingly trenchant and sarcastic style to win notoriety.

The publication at the end of 1887 of twelve of his songs seems to have definitely decided the course of his genius, for about this time he retired from the *Salonblatt*, and resolved to devote his whole energies to song-composition. The nine years which followed practically represent his life as a composer. They were marked by periods of feverish creative activity, alternating with periods of mental and physical exhaustion, during which he was sometimes unable even to bear the sound of music. By the end of 1891 he had composed the bulk of his works, on which his fame chiefly rests, 43 Mörike Lieder, 20 Eichendorff Lieder, 51 Goethe Lieder, 44 Lieder from Geibel and Heyse's *Spanisches Liederspiel*, and 22 from Heyse's *Italienisches Liederbuch*, a second part consisting of 24 songs being added in 1896. Besides these were 13 settings of lyrics by different authors, incidental music to Ibsen's *Fest auf Solhaug*, a few choral and instrumental works, an opera in four acts, *Der Corregidor*, successfully produced at Mannheim in June 1896, and finally settings of three sonnets by Michelangelo in March 1897. In September of this year the malady which had long threatened descended upon him; he was placed in an asylum, released in the following January, only to be immured again some months later by his own wish, after an attempt to drown himself in the Traunsee. Four painful years elapsed before his death on the 22nd of February 1903.

What little success he obtained was due to the efforts of friends, critics and singers, to make his songs known, to the support of the Vienna Wagner-Verein, and to the formation in 1895 of the Hugo-Wolf-Verein in Berlin. No doubt it was also a good thing for his reputation that the firm of Schott undertook in 1891 the publication of his songs, but the financial result after five years amounted to 85 marks 35 pfennigs (about £4 10s.). He lived in cheap lodgings till in 1896 the generosity of his friends provided him with a house, which he enjoyed for one year.

Wolf's place among the greatest song-writers is due to the essential truth and originality of his creations, and to the vivid intensity with which he has presented them. No other composer has exhibited so scrupulous a reverence for the poems which he set. To displace an accent was for him as heinous an act of sacrilege as to misinterpret a conception or to ignore an essential suggestion. Fineness of declamation has never reached a higher point than in Wolf's songs. (W. A. J. F.)

WOLF (*Canis lupus*), wild member of the typical section of the genus *Canis* (*see* CARNIVORA). Excluding some varieties of domestic dogs, wolves are the largest members of the genus, and have a wide geographical range, extending over nearly the whole of Europe and Asia, and North America from Greenland to Mexico, but are not found in South America or Africa, where they

are replaced by other members of the family. They present great diversities of size, length and thickness of fur, and coloration, although resembling each other in all important structural characters. In North America there is a second smaller species, called the coyote (*q.v.*) or prairie-wolf (*C. latrans*). The wolf enters the north-west corner of India, but in the peninsula is replaced by the more jackal-like *C. pallipes*.

The ordinary colour of the wolf is grey. In northern countries the fur is longer and thicker, and the animal larger and more powerful than farther south. It is especially known to man in the countries it inhabits as the devastator of sheep flocks. Wolves catch their prey by running it down in open chase, which their speed and remarkable endurance enable them to do. Except during summer when the young families of cubs are being separately provided for by their parents they assemble in troops or packs, and by their combined efforts are able to overpower and kill deer, antelopes and wounded animals of all sizes.

The history of the wolf in the British Isles and its gradual extirpation has been thoroughly investigated by J. E. Harting in his *Extinct British Animals*. Wolf-hunting was a favourite pursuit of the ancient Britons as well as of the Anglo-Saxons, and it was not until the reign of Henry VII. (1485–1509) that wolves appear to have become extinct in England. In Scotland the wolf maintained its hold for a much longer period. There is a well-known story of the last of the race being killed by Sir Ewen Cameron of Lochiel in 1680, but there is evidence of wolves having survived in Sutherlandshire well into the following century. In Ireland the date of their extinction has been placed, upon the evidence of doubtful traditions, as late as 1766.

It is owing to their position that the British Islands have been able to clear themselves of these animals, for France, with no natural barriers to prevent their incursions from the east, is liable every winter to visits. In America wolves are now unknown east of the Mississippi and Lake Huron, but are numerous in the Rockies, on the Pacific coast and in North Canada. In Russia during the last few years wolves have not only been abundant, but numerous cases of rabies have occurred among them. In Tasmania, the name wolf is applied to the thylacine (*q.v.*).

WOLFDIETRICH, German hero of romance. The tale of Wolfdietrich is connected with the Merovingian princes, Theodoric and Theodebert, son and grandson of Clovis; but in the Middle High German poems of *Ortnit* and *Wolfdietrich* in the *Heldenbuch* (*q.v.*) Wolfdietrich is the son of Hugdietrich, emperor of Constantinople. Repudiated and exposed by his father, the child was spared by the wolves of the forest, and was educated by the faithful Berchtung of Meran. After the emperor's death Wolfdietrich was driven from his inheritance by his brothers. Berchtung and his 16 sons stood by Wolfdietrich. Six of these were slain and the other ten imprisoned. After long exile in Lombardy at the court of King Ortnit the hero returned to deliver the captives and regain his kingdom. Wolfdietrich's exile and return suggested a parallel with the history of Dietrich of Bern, with whom he was often actually identified; and in the *Anhang* to the *Heldenbuch* it is stated, in despite of all historical considerations, that Wolfdietrich was the grandfather of the Veronese hero. Among the exploits of Wolfdietrich was the slaughter of the dragon which had slain Ortnit (*q.v.*). He thus took the place of Hardheri, the original hero of this feat. The myth attached itself to the family of Clovis, around which epic tradition rapidly gathered. Hugdietrich is generally considered to be the epic counterpart of Theodoric (Dietrich), eldest son of Clovis. After his father's death he divided the kingdom with his brothers. Wolfdietrich represents his son Theodebert (d. 548), whose succession was disputed by his uncles, but was secured by the loyalty of the Frankish nobles. But father and son are merged by a process of epic fusion in Wolfdietrich.

Ortnit and *Wolfdietrich* have been edited by Dr. J. L. Edlen von Lindhausen (Tübingen, 1906). G. Sarrazin, in *Zeitschr. für deutsche Phil.* (1896), compared the legend of Wolfdietrich with the history of Gundovald, as given by Gregory of Tours in books vi. and vii. of his *Hist. Francorum*.

WOLFE, CHARLES (1791–1823), Irish poet, son of Theobald Wolfe of Blackhall, Co. Kildare, was born on Dec. 14, 1791. He was educated at English schools and at Trinity college, Dublin, where he matriculated in 1809 and graduated in 1814. He was ordained priest in 1817, and obtained the curacy of Ballyclog, Co. Tyrone, which he shortly exchanged for that of Donoughmore in the same county. He died at Cork on Feb. 21, 1823, in his 32nd year. Wolfe is remembered solely by his stirring stanzas on the "Burial of Sir John Moore" written in 1816 in the rooms of Samuel O'Sullivan, a college friend, and printed in the *Newry Telegraph*.

WOLFE, HUMBERT (1885–), C.B. (1925), poet and writer, was born in Milan on Jan. 5, 1885, and educated at Bradford Grammar School and Wadham College, Oxford. He entered the civil service in 1908, and in 1918 was appointed principal assistant secretary to the ministry of labour. He is also substitute member on the governing body of the International Labour Office. His first publications were *London Sonnets* and *Shylock reasons with Mr. Chesterton* (both published in 1920); these were followed by *Circular Saws*, a volume of tales, in 1923. He showed great promise in *Kensington Gardens* (1924) and *The Unknown Goddess* (1925), which contained poems, delicate, original and moving; *Lampoons* (1925) and *News of the Devil* (1926) proved his powers as a writer of satire. His output of verse since then has been plentiful and regular: after *Humoresque* in 1926 came *Others Abide* (translations from the Greek Anthology), *Requiem* and *Cursory Rhymes* (1927), and *The Silver Cat* and *This Blind Rose* (1928); in these his talent is thought by some to have lost freshness without gaining power. In prose he has written an article on labour supply and regulation for the *Encyclopædia Britannica*, printed separately in 1922, and *Dialogues and Monologues*, a volume of literary criticism (1928).

WOLFE, JAMES (1727–1759), was born at Westerham, Kent, on Jan. 2, 1727. He was the elder son of Lt.-col. Edward Wolfe, an experienced soldier, who afterwards rose to the rank of lieutenant-general, and of Henrietta, daughter of Edward Thompson, of Long Marston, Yorks. He received his brief education at private schools, the first at Westerham, the second at Greenwich. From his earliest years he was determined to be a soldier, despite his weak health, which just prevented him from sailing as a volunteer with the ill-fated Cartagena expedition of 1740. In 1741 he received a commission in the Marines, but, having transferred into the line, he was sent to Flanders in the spring of 1742 as an ensign in the 12th Foot. Until the close of the War of the Austrian Succession, he was continuously on active service, being present at the battles of Dettingen, Falkirk, Culloden and Laffeldt, where he was wounded. His zeal, intelligence and gallantry won him the regard of his superiors, notably the duke of Cumberland. In 1743 he was appointed adjutant of the 12th; next year he received a captain's commission in the 4th; in 1745 and 1747 he served as brigade-major; while in Scotland he was aide-de-camp to Gen. Hawley.

In 1749 Wolfe, with the rank of major, was appointed acting-commander of the 20th Foot, whose lieutenant-colonel he became in the following year. He was with this regiment for eight years, during which it was stationed at several towns in Scotland and, from 1753, at various places in the south of England.

In 1757 Wolfe was appointed quartermaster-general in Ireland, but before entering upon his duties he was chosen by Pitt for the same position in the expedition against Rochefort. Though the enterprise failed utterly, Pitt and the English public had substantial grounds for their belief that it would have succeeded if plans for landing suggested by Wolfe had been acted upon by the commanders-in-chief. Wolfe was consequently selected to serve as brigadier under Amherst in the force which was to attempt the capture of Cape Breton and Quebec in 1758. At the siege of Louisbourg he played a conspicuous and brilliant part.

Meanwhile, Wolfe had been made colonel of the 67th, but soon after his return home Pitt gave him the command of the expedition which was to renew the attempt to take Quebec. He was to have the local rank of major-general, and, though technically under Amherst, to enjoy full discretion in his conduct of operations. Leaving England in Feb. 1759, Wolfe mustered his troops, rather more than 9,000 in number, at Louisbourg; and thanks to

the marvellous seamanship and the unselfish co-operation of Admiral Saunders, they arrived without mishap before Quebec in the last week of June. Wolfe's first intention was to land above, though near, the town, so as to attack the weak fortifications from the plains of Abraham; but the plan was abandoned, probably owing to the misgivings of Saunders. The British, however, seized the heights on the south shore of the St. Lawrence, opposite Quebec, which they were thus able to bombard, and established a camp at the mouth of the Montmorency river, between which and the city, Montcalm had entrenched nearly all his army. Perplexed by Montcalm's deliberate inactivity, Wolfe, on July 31, made an ill-conceived, unsuccessful and costly assault on the French lines. Wolfe, at this crisis, felt it his duty to consult his three brigadiers. When they counselled a landing to the west of Quebec, he readily concurred, and in a few days more than 3,000 men were transferred to ships above the town. Instead, however, of landing 10 m., or even 20 m. above Quebec, as the brigadiers thought of doing, Wolfe resolved to take a force downstream and disembark it secretly at the Ause du Foulon, a cove only 1½ m. from the city. This operation he successfully carried out in the early hours of Sept. 13. Montcalm was constrained to make a precipitate attack on Wolfe's force, and, as Wolfe had expected, the terrible efficiency of the British musketry decided the issue in a few minutes. Wolfe himself, however, was mortally wounded by a musket-ball, and died just after the French line gave way. Quebec fell five days later; and its capture, if the British could hold it, meant the conquest of Canada.

R. Wright, *Life of James Wolfe* (1864), still most valuable; F. Parkman, *Montcalm and Wolfe* (2 vols., 1885); A. G. Doughty and G. W. Parmelee, *The Siege of Quebec and Battle of the Plains of Abraham* (6 vols., 1901–03); W. Wood, *The Fight for Canada* (1905); H. R. Casgrain, *Wolfe and Montcalm* (Makers of Canada) (1905); B. Willson, *The Life and Letters of James Wolfe* (1909); *Logs of the Conquest of Canada* (edit. W. Wood, 1909); *Capt. Knox's Journal*, edit. A. G. Doughty (3 vols., 1913); A. Wolfe-Aylward, *Pictorial Life of James Wolfe* (1926).

WOLFENBÜTTEL, a town of Germany, in the republic of Brunswick, situated on both banks of the Oker, 7 m. S. of Brunswick on the railway to Harzburg. Pop. (1925) 18,479. The library is rich in Bibles and books of the early Reformation period, and contains some fragments of the Gothic bible of Ulfilas.

A castle is said to have been founded on the site of Wolfenbüttel by a margrave of Meissen about 1046. When this began in 1267 to be the residence of the early Brunswick or Wolfenbüttel line of counts, a town gradually grew up around it. The town passed wholly into the possession of the Brunswick-Wolfenbüttel family in 1671, and for nearly one hundred years was the ducal capital. In 1754, however, Duke Charles transferred his residence to Brunswick.

WOLFF (less correctly WOLF), **CHRISTIAN** (1679–1754), German philosopher and mathematician, the son of a tanner, was born at Breslau on Jan. 24, 1679. At the University of Jena he studied first mathematics and physics, to which he soon added philosophy. In 1703 he qualified as *Privatdozent* in the University of Leipzig, where he lectured till 1706, when he became professor of mathematics and natural philosophy at Halle through the influence of Leibniz, of whose philosophy his own system is a modification. In Halle Wolff limited himself at first to mathematics, but presently added physics, and eventually all the main philosophical disciplines. But the claims which Wolff advanced on behalf of the philosophic reason (*see* RATIONALISM) appeared impious to his theological colleagues. Halle was the headquarters of Pietism, which, after a long struggle against Lutheran dogmatism, had itself assumed the characteristics of a new orthodoxy. Wolff's professed ideal was to base theological truths on evidence of mathematical certitude, and strife with the Pietists broke out openly in 1721, when Wolff, on the occasion of laying down the office of pro-rector, delivered an oration "On the Practical Philosophy of the Chinese" (Eng. trans. 1750), in which he instanced the moral precepts of Confucius as evidence of the power of human reason to attain by its own efforts to moral truth. For ten years Wolff was subjected to attack, until in a fit of exasperation he appealed to the court for protection. His enemies, however, told Frederick William I. that, if Wolff's determinism were recognized, no soldier who deserted could be punished, since he would only have acted as it was predetermined that he should. Wolff was at once deprived of office and ordered to leave Prussia on pain of death. He crossed over into Saxony, where the landgrave of Hesse received him with every mark of distinction, and the circumstances of his expulsion drew universal attention to his teaching at Marburg, where he was now established. Over 200 books and pamphlets appeared for or against Wolff's doctrine before 1737, not reckoning the systematic treatises of Wolff and his followers. One of the first acts of Frederick the Great was to recall Wolff (1740) to Halle. In 1743 he became chancellor of the university, and in 1745 he received the title of *Freiherr* from the elector of Bavaria. But his matter was no longer fresh, he had outlived his power of attracting students, and his class-rooms remained empty. He died on April 9, 1754.

Wolff's most important works are as follows: *Anfangsgründe aller mathematischen Wissenschaften* (1710; in Latin, *Elementa matheseos universae*, 1713–15); *Vernünftige Gedanken von den Kräften des menschlichen Verstandes* (1712; Eng. trans. 1770); *Vern. Ged. von Gott, der Welt und der Seele des Menschen* (1719); *Vern. Ged. von der Menschen Thun und Lassen* (1720); *Vern. Ged. von dem gesellschaftlichen Leben der Menschen* (1721); *Vern. Ged. von den Wirkungen der Natur* (1723); *Vern. Ged. von den Absichten der natürlichen Dinge* (1724); *Vern. Ged. von dem Gebrauche der Theile in Menschen, Thieren und Pflanzen* (1725). The last seven may be described briefly as treatises on logic, metaphysics, moral philosophy, political philosophy, theoretical physics, teleology, physiology: *Philosophia rationalis, sive logica* (1728); *Philosophia prima, sive Ontologia* (1729); *Cosmologia generalis* (1731); *Psychologia empirica* (1732); *Psychologia rationalis* (1734); *Theologia naturalis* (1736–37); *Philosophia practica universalis* (1738–39); *Jus naturae* and *Jus Gentium* (1740–49); *Philosophia moralis* (1750–53). His *Kleine philosophische Schriften* have been collected and edited by G. F. Hagen (1736–40).

In addition to Wolff's autobiography (*Eigene Lebensbeschreibung*, ed. H. Wuttke, 1841) and the usual histories of philosophy, *see* W. Schrader in *Allgemeine deutsche Biographie*, xliv.; C. G. Ludovici, *Ausführlicher Entwurf einer vollständigen Historie der Wolff'schen Philosophie* (1736–38); J. Deschamps, *Cours abrégé de la philosophie wolffienne* (1743); F. W. Kluge, *Christian von Wolff der Philosoph* (1831); W. Arnsperger, *Christian Wolffs Verhältnis zu Leibniz* (1897); H. Pichler, *Über Christian Wolffs Ontologie* (Leipzig, 1910); H. Ostertag, *Der philosophische Gehalt des Wolff-Manteuffelschen Briefwechsels* (Leipzig, 1910).

WOLFF, SIR HENRY DRUMMOND (1830–1908), English diplomatist and Conservative politician, son of Joseph Wolff (*q.v.*), entered the foreign office as a clerk. In 1874–1880 he sat in parliament for Christchurch, and in 1880–1885 for Portsmouth, being one of the small group known as the "Fourth Party." In 1885 he went on a special mission to Constantinople in connection with the Egyptian question, and as the result various awkward difficulties, hinging on the sultan's suzerainty, were got over. In 1888 he was sent as minister to Tehran, and from 1892 to 1900 was ambassador at Madrid. He died on the 11th of October 1908. Sir Henry, who received the K.C.M.G. in 1862, and other honours later, was a chief mover in founding the Primrose League.

WOLFF, PIERRE (1865–), French dramatist, was born at Paris, Jan. 1, 1865. He began his literary career under the auspices of his uncle, the brilliant and witty journalist Albert Wolff. Like most of the outstanding playwrights of his time, he wrote his first plays for the Théâtre Libre, where his *Jacques Bouchard* was produced in 1890. *Leurs Filles* (1891) is in a similar vein of mordant and provocative irony. In his later works, Wolff tended more and more to take an indulgent if not optimistic view of human relations. He achieved fame in the early years of the 20th century with *Le Secret de Polichinelle* (1903), *L'Age d'aimer* (1904), and, above all, *Le Ruisseau* (1907), which deals with the moral recovery of a fallen creature. *Les Marionnettes* was produced at the Comédie Française in 1910, and established his popularity. The best of his post-war plays is undoubtedly *Les Ailes brisées* (1920). Wolff has collaborated with Dunernois, with

whom he wrote *Après l'amour*, in which Lucien Guitry achieved one of his last successes.

WOLF-FERRARI, ERNANNO (1876–), Italian composer, was born at Venice on Jan. 12, 1876, his father being a distinguished German painter and his mother an Italian. He studied with Rheinberger at Munich, and on his return to Venice brought out his oratorio, *La Sulamite*. He then went to Germany and revised his early opera, *Cinderella*, for production at Bremen in 1902. This was followed by *Le dame curiose* and *I quattro rusteghi* (1906), both of which were performed at Munich. His first great success came with *Il segreto di Susanna*, a one-act comedy, first given at Munich in 1909 and quickly taken up in other places. Still more popular was *The Jewels of the Madonna* (Berlin 1911), which gave him an international reputation. He has also written a chamber symphony, *Rispetti* for soprano, op. 11, and a pianoforte quintet (1920). From 1902–12 Wolf-Ferrari was director of the Liceo Benedetto Marcello in Venice.

WOLFRAMITE or **WOLFRAM,** a mineral consisting of an isomorphous mixture in varying proportions of the tungstates of iron and manganese, $FeWO_4$ and $MnWO_4$. Varieties with dominant iron are often called ferberite, with dominant manganese, hübnerite, but since iron and manganese have nearly the same atomic weight the percentage of tungsten reckoned as WO_3 (about 76%) shows little variation and the difference is of no commercial importance. Wolframite crystallizes in the monoclinic system, usually in prismatic forms, without end-faces, and there is a very perfect pinacoidal cleavage. The colour is dark brown or black, with a metallic lustre especially on cleavage faces. Hardness 5–5·5 and density 7·2–7·5.

Wolframite is very commonly associated with tin-ore in lodes and veins in and around granites. This form occurs in Cornwall; north-west Spain and north Portugal; Saxony; Tavoy (Lower Burma); the Malay Peninsula; Queensland; Tasmania. In the United States the biggest producer is Boulder Co., Colorado, where there is no tin, but many gold veins.

Wolframite is the chief ore of the metal tungsten, which is used as a constituent of high-speed and other special steels, as well as certain non-ferrous alloys; for the filaments of electric lamps; and for various other technical uses, often as sodium tungstate. During the World War there was a tremendous demand for tungsten steel for munition making, and many new sources of wolframite were developed. (R. H. Ra.)

WOLFRAM VON ESCHENBACH, the most important and individual poet of mediaeval Germany, flourished during the end of the 12th and beginning of the 13th century. He was one of the brilliant group of Minnesingers whom the Landgrave Herrmann of Thuringia gathered round him at the historic castle of the Wartburg. We know by his own statement that he was a Bavarian, and came of a knightly race, counting his achievements with spear and shield far above his poetical gifts. The Eschenbach from which he derived his name was most probably Ober-Eschenbach, not far from Pleinfeld and Nuremberg; there is no doubt that this was the place of his burial, and so late as the 17th century his tomb was to be seen in the church of Ober-Eschenbach, which was then the burial place of the Teutonic knights. Wolfram probably belonged to the small nobility, for he alludes to men of importance, such as the counts of Abenberg, and of Wertheim, as if he had been in their service. Certainly he was a poor man, for he makes frequent and jesting allusions to his poverty. Bartsch concludes that he was a younger son, and that while the family seat was at Eschenbach, Wolfram's home was the insignificant estate of Wildenburg (to which he alludes), now the village of Wehlenberg. Wolfram seems to have disdained all literary accomplishments, and in fact insists on his unlettered condition both in *Parzival* and in *Willehalm*. But this is somewhat perplexing, for these poems are beyond all doubt renderings of French originals. Were the poems read to him, and did he dictate his translation to a scribe? The date of Wolfram's death is uncertain. We know that he was alive in 1216, as in *Willehalm* he laments the death of the Landgrave Herrmann, which took place in that year.

Wolfram von Eschenbach lives in, and is revealed by, his work. He has left two long epic poems, *Parzival* and *Willehalm* (the latter a translation of the French chanson de geste *Aliscans*), certain fragments, *Titurel* (apparently intended as an introduction to the *Parzival*), and a group of lyrical poems, *Wächter-Lieder*. These last derive their name from the fact that they record the feelings of lovers who, having passed the night in each other's company, are called to separate by the cry of the watchman, heralding the dawn. These *Tage Lieder*, or *Wächter Lieder*, are a feature of Old German folk-poetry, of which Wagner has preserved the tradition in the warning cry of Brangaene in the second act of *Tristan*.

The problem of the source of the *Parzival* is the crux of mediaeval literary criticism. (*See* PERCEVAL.) The *Parzival* is a soul-drama; the conflict between light and darkness, faith and doubt, is its theme, and the evolution of the hero's character is steadily and consistently worked out. The teaching is of a character strangely at variance with the other romances of the cycle. Instead of an asceticism, based upon a fundamentally low and degrading view of women, Wolfram upholds a sane and healthy morality; chastity, rather than celibacy, is his ideal, and a loyal observance of the marriage bond is, in his eyes, the very highest virtue.

Wolfram has moments of the highest poetical inspiration, but his meaning, even for his compatriots, is often obscure. He is in no sense a master of language, as was Gottfried von Strassbourg. This latter, in a very interesting passage of the *Tristan*, passes in review the poets of the day, awarding to the majority praise for the excellence of their style, but one he does not name, only blaming him as being so obscure and involved that none can tell what his meaning may be; this un-named poet has always been understood to be Wolfram von Eschenbach, and in a passage of *Willehalm* the author refers to the unfavourable criticisms passed on *Parzival*. Wolfram and Gottfried were both true poets, but of widely differing style. Wolfram was, above all, a man of deeply religious character, and it seems to have been this which specially impressed the mind of his compatriots; in the 13th-century poem of *Der Wartburg-Krieg* it is Wolfram who is chosen as the representative of Christianity, to oppose the enchanter Klingsor von Ungerland. (J. L. W.)

Parzival was printed at Augsburg in 1477; other editions were issued at Magdeburg (1833) and Leipzig (2 vols., 1858) by A. Schulz, and at Berlin (1898) by W. Hertz. *Titurel* was also printed, probably at Augsburg, in 1477; *the Leben und Dichten Wolfram's von Eschenbach* was edited by San Marte (A. Schulz) (2 vols., Magdeburg, 1836–41), and *Wolfram von Eschenbach* (*Werke*) by A. Leitzmann (Munich, 1902 etc.). *See* also S. Singer, *Wolframs Willehalm* (1918); A. Schreiber, *Neue Bausteine zu einer Lebensgeschichte Wolframs von Eschenbach* (1922); M. F. Richey, *Gahmuret Anschevin: a contribution to the study of W. von Eschenbach* (1923); W. Kupferschmid, *Ueber den Wortschatz der Berner Parzival-Handschrift* (1923); I. Buechel, *Die Bezeichnungen für psychologische Begriffe in Wolframs Parzival* (1925); K. Laserstein, *Wolfram von Eschenbach germanische Sendung* (1928).

WOLGAST, a seaport town in the Prussian province of Pomerania, situated on the river Peene, which separates it from the island of Usedom, 30 m. by rail E. of Greifswald. Pop. (1925) 7,198. Wolgast became a town in 1247, and after being the residence of the duke of Pomerania-Wolgast, it was ceded to Sweden in 1648. It was captured in 1675 by Frederick William, elector of Brandenburg. It was restored to Germany in 1815.

WOLLASTON, WILLIAM HYDE (1766–1828), English chemist and natural philosopher, was born at East Dereham, Norfolk, on April 6, 1766. Wollaston was educated at Charterhouse, and afterwards at Caius college, Cambridge. He was elected a fellow of the Royal Society in 1793 and became its secretary in 1806. He died in London on Dec. 22, 1828.

Most of Wollaston's original work deals more or less directly with chemical subjects, but diverges on all sides into optics, acoustics, mineralogy, astronomy, physiology, botany and even art. In chemistry he made a specialty of the platinum metals. Platinum itself he discovered how to work on a practical scale, and he is said to have made a fortune from the secret, which, however, he disclosed in a posthumous paper (1829); and he was the first to detect the metals palladium (1804) and rhodium (1805) in crude platinum. In 1809 he proved the elementary char-

acter of columbium (niobium) and titanium. In optics he was the first, in 1802, to observe the dark lines in the solar spectrum. Of the seven lines he saw, he regarded the five most prominent as the natural boundaries or dividing lines of the pure simple colours of the prismatic spectrum, which he supposed to have four primary divisions. He described the reflecting goniometer in 1809 and the camera lucida in 1812, provided microscopists with the "Wollaston doublet," and applied concavo-convex lenses to the purposes of the oculist. His cryophorus was described in 1813, in a paper "On a method of freezing at a distance." In 1821, after H. C. Oersted (1777–1851) had shown that a magnetic needle is deflected by an electric current, Wollaston attempted to transform that deflection into a continuous rotation, and also to obtain the reciprocal effect of a current rotating round a magnet. He failed in both respects, and when Michael Faraday, who overheard a portion of his conversation with Davy on the subject, was subsequently more successful, he was inclined to assert the merit of priority, to which Faraday did not admit his claim.

In geological circles Wollaston is famous for the medal which bears his name, and which (together with a donation fund) is annually awarded by the council of the Geological Society of London, being the result of the interest on £1,000 bequeathed by Wollaston for "promoting researches concerning the mineral structure of the earth." The first award was made in 1831.

An appreciative essay on Wollaston will be found in George Wilson's *Religio Chemici* (1862).

WOLLASTONITE, a rock-forming mineral consisting of calcium metasilicate, $CaSiO_3$, crystallizing in the monoclinic system and belonging to the pyroxene (*q.v.*) group. It differs, however, from other members of this group in having cleavages, not parallel to the prism-faces, but in two directions perpendicular to the plane of symmetry. Crystals are usually elongated parallel to the axis of symmetry and flattened parallel to the ortho-pinacoid, hence the early name "tabular spar"; the name wollastonite is after W. H. Wollaston. The mineral usually occurs as white cleavage masses. The hardness is 5, and specific gravity 2·85. It is a characteristic product of contact-metamorphism, occurring, especially with garnet, diopside, etc., in crystalline limestones. Crystals are found in the cavities of the ejected limestone blocks of Monte Somma, Vesuvius. At Santa Fé in the State of Chiapas, Mexico, a large rock-mass of wollastonite carries ores of gold and copper; here are found large pink crystals which are often partially or wholly altered to opal. (L. J. S.)

WOLLIN, an island of Germany, in the Prussian province of Pomerania, the more easterly of the islands at the mouth of the Oder which separate the Stettinisches Haff from the Baltic sea. It is divided from the mainland on the east by the Dievenow channel, and from Usedom on the west by the Swine. It has an area of 95 sq.m. Heath and sand alternate with swamps, lakes and forest on its surface, which is flat, except for low hills in the south-west. Cattle-rearing and fishing are the chief resources of the inhabitants. Some of the villages are summer bathing resorts. Wollin, the only town, is situated on the Dievenow, and carries on the industries of a small seaport. Pop. (1925) 4,720.

Near the modern town once stood the ancient and opulent Wendish city of Wolin or Jumne, called Julin by the Danes, and Winetha or Vineta (*i.e.*, Wendish town) by the Germans. The Northmen made a settlement here about 970, and built a fortress on the "silver hill," called Jomsburg, which is often mentioned in the sagas. The stronghold of Jomsburg was destroyed in 1098 by King Magnus Barfod of Norway. This is probably the origin of the legend that Vineta was overthrown by a storm or earthquake and overwhelmed by the sea. Some submarine granite rocks near Damerow in Usedom are still popularly regarded as its ruins. The town of Wollin became in 1140 the seat of the Pomeranian bishopric, which was transferred to Kammin about 1170. Wollin was burnt by Canute VI. of Denmark in 1183, and was taken by the Swedes in 1630 and 1759 and by the Brandenburgers in 1659 and 1675.

WOLLONGONG, an important town and seaport of New South Wales, Australia. Pop. 7,600. It lies in, and is typical of, the Illawarra district which extends south of Sydney from near Clifton to the Shoalhaven River (*c.* 48 miles). Tectonic and erosional processes have produced a narrow strip (2–12 miles broad, widening southwards) of lowlands backed by steep and often precipitous scarp (Illawarra "Range": Mount Kembla: 1,752 ft.). Along this stream-dissected scarp the seams of the Sydney coal basin are frequently exposed and can be worked by horizontal adits. The lowlands with their mild and equable climate (av. ann. temps. *c.* 70–54° F; av. ann. rainfall: 38–47 in.), hilly terrain, fertile soils and favourable position made this one of the earliest, and later one of the leading, dairying districts of Australia, and agriculture also flourishes in parts. Coal is mined at Bulli (*q.v.*), Mount Kembla, Clifton and other places, though the exposed nature of the coast tends to hamper direct loading on to vessels.

WOLOWSKI, LOUIS FRANÇOIS MICHEL RAYMOND (1810–1876), French economist and politician, was born in Warsaw and educated in Paris, but returned to Warsaw and took part in the revolution of 1830. Sent to Paris as secretary to the legation by the provisional government, he settled there on the suppression of the Polish rebellion and was naturalized in 1834. In 1833 he founded the *Revue de législation et de jurisprudence,* and wrote voluminously on economic and financial subjects. He established the first Crédit Foncier in France in 1852, and in 1855 became professor of political economy at the Conservatoire in succession to J. A. Blanqui. He was a member of the national assembly from 1848 to 1851, and again from 1871 till his election as a senator in 1876. He was a free-trader and bimetallist.

Of his works the following are the more important: *Mobilisation du crédit fancier* (1839); *De l'organisation industrielle de la France avant Colbert* (1842); *Les Finances de la Russie* (1864); *La Question des banques* (1864); *La Liberté commerciale* (1869); *L'Or et l'argent* (1870).

See also E. Levasseur, *La Vie et les travaux de Wolowski* (1877); Ant. Rouillet, *Wolowski, sa vie et ses travaux* (1880); T. Rambaud, *L'oeuvre économique de L. Wolowski* (1882).

WOLSELEY, GARNET JOSEPH WOLSELEY, Viscount (1833–1913), British field marshal, eldest son of Major Garnet Joseph Wolseley of the King's Own Borderers (25th Foot), was born at Golden Bridge, Co. Dublin, on June 4, 1833. Educated at Dublin, he obtained a commission as ensign in the 12th Foot in March 1852, and was transferred to the 80th Foot, with which he served in the second Burmese War. Promoted to be lieutenant and invalided home, he exchanged into the 90th Light Infantry, then in Dublin. He accompanied the regiment to the Crimea, and did duty with the Royal Engineers in the trenches before Sevastopol. After the fall of Sevastopol Wolseley was employed on the quartermaster-general's staff and was one of the last to leave the Crimea in July 1856. After six months' duty with the 90th Foot at Aldershot, he went with it again, in March 1857, to join the expedition to China under Major-General the Hon. T. Ashburnham. Wolseley embarked in command of three companies in the transport "Transit," which was wrecked in the Strait of Banka. The troops were saved, and were taken to Singapore, whence, on account of the Indian Mutiny, they were despatched with all haste to Calcutta. Wolseley served at the relief of Lucknow under Sir Colin Campbell in November, and in the defence of the Alambagh position under Outram, taking part in the actions of Dec. 22, 1857, Jan. 12 and 16, 1858, and the repulse of the grand attack of Feb. 21. In March he served at the final siege and capture of Lucknow. He was then appointed D.A.Q.G. on the staff of Sir Hope Grant's Oudh division, and was engaged in all the operations of the campaign. In the autumn and winter of 1858 he took part in the Baiswara, trans-Gogra and trans-Rapti campaigns, ending with the complete suppression of the rebellion. Having received his Crimean majority in March 1858, he was in April 1859 promoted to be lieutenant-colonel, and received the Mutiny medal and clasp. When Grant was nominated to the command of the British troops in the Anglo-French expedition to China in 1860, Wolseley accompanied him as D.A.Q.G. On his return home he published the *Narrative of the War with China in 1860.* In 1867 he was appointed deputy quartermaster-general in Canada. In 1869 his *Soldiers' Pocket Book for Field Service* was published, and has since run through many editions. In 1870 he commanded the Red river expedition to put down a rising under

Louis Riel (*q.v.*).

Appointed assistant adjutant-general at the war office in 1871 he worked hard in furthering the Cardwell schemes of army reform. From this time till he became commander-in-chief Wolseley was the prime mover and the deciding influence in practically all the steps taken at the war office for promoting the efficiency of the army under the altered conditions of the day. In 1873 he commanded the expedition to Ashanti, and, having made all his arrangements at the Gold Coast before the arrival of the white troops in January 1874, was able to complete the campaign in two months, and re-embark them for home before the unhealthy season began. This campaign made his name a household word in England. He fought the battle of Amoaful on Jan. 31, and, after five days' fighting, ending with the battle of Ordahsu, entered Kumasi, which he burned. He received the thanks of both Houses of Parliament, a grant of £25,000, promotion, and other honours. On his return home he was appointed inspector-general of auxiliary forces, but had not held the post for a year when he was sent to Natal as governor and general commanding. In 1878 he went as high-commissioner to the newly acquired possession of Cyprus, and in 1879 to South Africa to supersede Lord Chelmsford in command of the forces in the Zulu War, and as governor of Natal and the Transvaal and high commissioner of South-East Africa. On his arrival at Durban in July he found that the war in Zululand was practically over, and after effecting a temporary settlement he went to the Transvaal. Having reorganized the administration there and reduced the powerful chief Sikukuni to submission, he returned home in May 1880 and was appointed quartermaster-general.

In 1882 he was appointed adjutant-general, and in August of that year was given the command of the British forces in Egypt to suppress the rebellion of Arabi Pasha. (*See* EGYPT: *Military Operations.*) Having seized the Suez Canal, he disembarked his troops at Ismailia, and after a very short and brilliant campaign completely defeated Arabi Pasha at Tel-el-Kebir, and suppressed the rebellion. He was promoted general for distinguished service in the field, and raised to the peerage as Baron Wolseley of Cairo and Wolseley. In 1884 he was again called away to command the Nile expedition for the relief of General Gordon and the besieged garrison of Khartum. The expedition arrived too late: Khartum had fallen, and Gordon was dead; and in the spring of 1885 complications with Russia over the Penjdeh incident occurred, and the withdrawal of the expedition followed. Wolseley was now created a viscount and a knight of St. Patrick. He continued at the war office as adjutant-general until 1890, when he was given the command in Ireland. He was promoted to be field marshal in 1894, and was nominated colonel of the Royal Horse Guards in 1895, in which year he was appointed commander-in-chief. His powers were, however, limited by a new order in council, and after holding the appointment for over five years, he handed over the office to Earl Roberts in 1901.

Lord Wolseley married in 1867 Louisa, daughter of A. Erskine. He published *The Decline and Fall of Napoleon* (1895), *The Life of John Churchill, Duke of Marlborough, to the Accession of Queene Anne* (1894), and *The Story of a Soldier's Life* (1903).

He died at Mentone March 25, 1913, the title going by special remainder to his only daughter, Frances. He was buried in St. Paul's Cathedral, and an equestrian statue of him on the Horse Guards' Parade, Whitehall, London, was unveiled in 1920.

WOLSEY, THOMAS (*c.* 1475–1530), English cardinal and statesman, born at Ipswich about 1475, was son of Robert Wolsey (or Wuley, as his name was always spelt) by his wife Joan.

Thomas was educated at Magdalen college, Oxford. He is said to have graduated B.A. at the age of fifteen (*i.e.*, about 1490); but his earliest definite appearance in the records is as junior bursar of Magdalen college in 1498–1499, and senior bursar in 1499–1500, an office he was compelled to resign for applying funds to the completion of the great tower without sufficient authority (W. D. Macray, *Reg. of Magdalen College*, i. 29–30, 133–134). He must have been elected fellow of Magdalen some years before. As master of Magdalen college school he had under his charge three sons of Thomas Grey, first marquess of Dorset, who presented him (1509) to the rectory of Limington in Somerset. He had been ordained priest in 1498.

Rapid Rise.—At Limington he came into conflict with the sheriff, Sir Amias Paulet, who is said by Cavendish to have placed Wolsey in the stocks; Wolsey retaliated long afterwards by confining Paulet to his chambers in the Temple for five or six years. Dorset died in 1501, but Wolsey found other patrons. Before the end of that year he obtained a dispensation to hold two livings in conjunction with Limington, and Archbishop Deane appointed him his domestic chaplain. After Deane's death in 1503, Wolsey became chaplain to Sir Richard Nanfan, deputy of Calais, who apparently recommended him to Henry VII. Nanfan died in 1507, but the king made Wolsey his chaplain and employed him in diplomatic work. In 1508 he was sent to James IV. of Scotland, and in the same year he pleased Henry by his expeditious despatch of the business in connection with the king's proposal of marriage to Margaret of Savoy. His ecclesiastical preferments, of which he received several in 1506–1509, culminated in his appointment by Henry to the deanery of Lincoln on Feb. 2, 1509.

Henry VIII. made Wolsey his almoner immediately on his accession, and the receipt of some half-dozen further ecclesiastical preferments in the first two years of the reign marks his growth in royal favour. In 1511 Wolsey became a privy councillor, and secured a controlling voice in the government. The control of affairs had been shared between the clerical and peace party led by Richard Fox (*q.v.*) and Archbishop Warham, and the secular and war party led by Surrey. Wolsey turned the balance in favour of war, and his administrative energy found scope in the preparations for the English expedition to Biscay in 1512, and for the campaign in northern France in 1513. He arranged peace with France and a marriage between Mary Tudor and Louis XII. in 1514, and reaped his reward in the bishoprics of Lincoln and Tournai, the archbishopric of York, which was conferred on him by papal bull in September, and the cardinalate, which he had sent Polydore Vergil to beg from Leo X. in May 1514, but did not receive till the following year. Nevertheless, when Francis I. in 1515 succeeded Louis XII. and won the battle of Marignano, Wolsey took the lead in assisting the emperor Maximilian to oppose him; and this revival of warlike designs was resented by Fox and Warham, who retired from the government, leaving Wolsey supreme. Maximilian proved a broken reed, and in 1518 Wolsey brought about a general pacification, securing at the same time his appointment as legate *a latere* in England. He thus superseded Warham, who was *legatus natus*, in ecclesiastical authority; and though legates *a latere* were supposed to exercise only special and temporary powers, Wolsey secured the practical permanence of his office.

Foreign Policy.—The foreign policy followed after the election of Charles V. (*see* HENRY VIII.) as emperor, was Wolsey's policy. Friendship with the emperor served Wolsey's personal interests, and at the conference of Calais in 1521 Wolsey had ranged himself with the emperor. Parliament had in 1513–1515 showed signs of strong anti-clerical feeling; Wolsey probably hoped to distract attention from the church by a spirited foreign policy, as Henry V. had done a century before. He had, moreover, received assurances from the emperor that he would further Wolsey's candidature for the papacy; and although he protested to Henry VIII. that he would rather continue in his service than be ten popes, that did not prevent him from secretly instructing his agents at Rome to press his claims. Charles, however, paid Wolsey the sincere compliment of thinking that he would not be sufficiently subservient on the papal throne; while he wrote letters in Wolsey's favour, he took care that they should not reach their destination in time; and Wolsey failed to secure election both in 1521 and 1524. This ambition distinguishes his foreign policy from that of Henry VII., to which it has been likened. Henry VII. cared only for England; Wolsey's object was to play a great part on the European stage.

In any case the decision taken in 1521 was a blunder. Wolsey's assistance helped Charles V. to that position of predominance which was strikingly illustrated by the defeat and capture of Francis I. at Pavia in 1525; and the balance of power upon which

England's influence rested was destroyed. Her efforts to restore it in 1526–1528 were ineffectual; her prestige had depended upon her reputation for wealth derived from the fact that she had acted in recent years as the paymaster of Europe. But Henry VII.'s accumulations had disappeared; parliament resisted in 1523 the imposition of new taxation; and the attempts to raise forced loans and benevolences in 1526–1528 created a storm of opposition. Still more unpopular was the brief war with Charles V. in which Wolsey involved England in 1528. The sack of Rome in 1527 and the defeat of the French before Naples in 1528 confirmed Charles V.'s supremacy. Peace was made in 1529 between the two rivals without England being consulted, and her influence at Wolsey's fall was less than it had been at his accession to power.

The Divorce.—This failure reacted upon Wolsey's position at home. His domestic was sounder than his foreign policy. By his development of the star chamber, by his firm administration of justice and maintenance of order, and by his repression of feudal jurisdiction, he rendered great services to the monarchy. But the inevitable opposition of the nobility to this policy was not mitigated by the fact that it was carried out by a churchman; the result was to embitter the antagonism of the secular party to the church and to concentrate it upon Wolsey's head. The control of the papacy by Charles V., moreover, made it impossible for Wolsey to succeed in his efforts to obtain from Clement VII. the divorce which Henry VIII. was seeking from Charles' aunt, Catherine of Aragon. Wolsey has been said to have been the originator of the divorce scheme. There is no evidence that he first suggested it, though when he found that Henry was bent upon it, he pressed for two points: (i.) that an application should be made to Rome, instead of deciding the matter in England, and (ii.) that Henry, when divorced, should marry a French princess. The appeal to Rome was a natural course to be advocated by Wolsey, whose despotism over the English church depended upon an authority derived from Rome; but its success depended upon the problematical destruction of Charles V.'s power in Italy. At first this seemed not improbable; French armies marched south on Naples, and the pope sent Campeggio with full powers to pronounce the divorce in England. But he had hardly started when the French were defeated in 1528. Their ruin was completed in 1529, and Clement VII. was obliged to come to terms with Charles V., which included Campeggio's recall in Aug. 1529.

Wolsey's Fall.—Wolsey clearly foresaw his own fall, the consequent attack on the church and the triumph of the secular party. Parliament, which he had kept at arm's length, was hostile; he was hated by the nobility, and his general unpopularity is reflected in Skelton's satires and in Hall's *Chronicle*. Even churchmen had been alienated by his suppression of monasteries and by his monopoly of ecclesiastical power; and his only support was the king, who had now developed a determination to rule himself. He surrendered all his offices and all his preferments except the archbishopric of York, receiving in return a pension of 1,000 marks (equal to six or seven thousand pounds a year in modern currency) from the bishopric of Winchester, and retired to his see, which he had never before visited. A bill of attainder, passed by the Lords, was rejected at Cromwell's instigation and probably with Henry's goodwill by the Commons. The last few months of his life were spent in the exemplary discharge of his archiepiscopal duties; but a not altogether unfounded suspicion that he had invoked the assistance of Francis I., if not of Charles V. and the pope, to prevent his fall involved him in a charge of treason. He was summoned to London, but died on his way at Leicester abbey on November 30, 1530, and was buried there.

Character.—The completeness of Wolsey's fall enhanced his former appearance of greatness, and, indeed, he is one of the outstanding figures in English history. His qualities and his defects were alike exhibited on a generous scale; and if his greed and arrogance were colossal, so were his administrative capacity and his appetite for work. "He is," wrote the Venetian ambassador Giustiniani, "very handsome, learned, extremely eloquent, of vast ability and indefatigable. He alone transacts the business which occupies all the magistrates and councils of Venice, both civil and criminal; and all state affairs are managed by him, let their nature be what it may. He is grave, and has the reputation of being extremely just; he favours the people exceedingly, and especially the poor, hearing their suits and seeking to despatch them instantly." As a diplomatist he has had few rivals and perhaps no superiors. But his pride was equal to his abilities. The familiar charge, repeated in Shakespeare, of having written *Ego et meus rex*, while true in fact, is false in intention, because no Latin scholar could put the words in any other order; but it reflects faithfully enough Wolsey's mental attitude. Giustiniani explains that he had to make proposals to the cardinal before he broached them to Henry, lest Wolsey "should resent the precedence conceded to the king." "He is," wrote another diplomatist, "the proudest prelate that ever breathed." He arrogated to himself the privileges of royalty, made servants attend him upon their knees, compelled bishops to tie his shoe-latchets and dukes to hold the basin while he washed his hands, and considered it condescension when he allowed ambassadors to kiss his fingers; he paid little heed to their sacrosanct character, and himself laid violent hands on a papal nuncio. His egotism equalled Henry VIII.'s; his jealousy and ill-treatment of Richard Pace, dean of St. Paul's, referred to by Shakespeare but vehemently denied by Dr. Brewer, have been proved by the publication of the Spanish state papers; and Polydore Vergil, the historian, and Sir R. Sheffield, speaker of the House of Commons, were both sent to the Tower for complaining of his conduct. His morals were of the laxest description, and he had as many illegitimate children as Henry VIII. himself. For his son, before he was eighteen years old, he procured a deanery, four archdeaconries, five prebends and a chancellorship, and he sought to thrust him into the bishopric of Durham. For himself he obtained, in addition to his archbishopric and lord chancellorship, the abbey of St. Albans, reputed to be the richest in England, and the bishopric first of Bath and Wells, then of Durham, and finally that of Winchester. He also used his power to extort enormous pensions from Charles V. and Francis I. and lavish gifts from English suitors.

During the first half of his government he materially strengthened the Tudor monarchy by the vigorous administration of justice at home and by the brilliance of his foreign policy abroad. But the prestige he secured by 1521 was delusive; its decline was as rapid as its growth, and the expense of the policy involved taxation which seriously weakened the loyalty of the people. The concentration of civil and ecclesiastical power by Wolsey in the hands of a churchman provided a precedent for its concentration by Henry VIII. in the hands of the crown; and the personal example of lavish ostentation and loose morals which the cardinal-archbishop exhibited cannot have been without influence on the king, who grew to maturity under Wolsey's guidance.

The *Letters and Papers of Henry VIII.*, vols. i.–iv., supplemented by the *Spanish and Venetian Calendars*, contain almost all that is known of Wolsey's public career, though additional light on the divorce has been thrown by Stephen Ehses' *Römische Dokumente* (1893). Cavendish's brief *Life*, which is almost contemporary, has been often edited. Fiddes's huge tome (1724) is fairly exhaustive. Brewer, in his elaborate prefaces to the *Letters and Papers* (reissued as his *History of the Reign of Henry VIII.*), originated modern admiration for Wolsey; and his views are reflected in Creighton's *Wolsey* in the "Twelve English Statesmen" series, and in Dr. Gairdner's careful articles in the *Dict. Nat. Biog.* and *Cambridge Modern History*. A less enthusiastic view is adopted in H. A. L. Fisher's volume (v.) in Longmans' *Political History* (1906) and in A. F. Pollard's *Henry VIII.* (1902 and 1905). *See* also E. Law, *England's First Great War Minister: how Wolsey made a new army and navy* (1916) and *Cardinal Wolsey at Hampton Court* (1923).

WOLVERHAMPTON, market town; municipal, county and parliamentary borough, Staffordshire, England, 125m. N.W. of London, on the L.M.S. and G.W. railways. Pop. (1921) 102,342. It lies at the north-western edge of the group of great manufacturing towns extending south-east to Birmingham, but there are residential suburbs to the west, where the country is well wooded. The situation is elevated and healthy. The church of St. Peter is a fine cruciform building, part being 13th century work, part 15th, part 17th, the remainder in 1865. A free grammar school, founded in 1515 by Sir Stephen Jermyns, occupies modern buildings (1876). There are a Blue Coat school (1710) and a school

of art. In the South Staffordshire coalfield, coal and iron are extensively mined. There are enormous iron foundries and the town manufactures ironmongery and steel goods, especially locks, machinery, tools, cycles, enamel and galvanized ware, papier-mâché, rubber goods, chemicals, colours, varnishes, etc. Market gardening is carried on in the west and north of the town. An annual fair is held at Whitsuntide. The parliamentary borough of Wolverhampton has three divisions, each returning one member. Wednesfield (pop. 7,446), Heath Town or Wednesfield Heath (12,430) and Willenhall (19,665) are neighbouring urban districts, with populations employed in similar manufactures.

The town of Wolverhampton (*Handone, Wolvernehamptone, Wollernehampton*) grew up round the church of St. Mary, probably founded in 996 by Wulfruna, who endowed it with extensive lands. The estates are enumerated in Domesday. In 1204 John granted the manor of Wolverhampton to the church, and at the Reformation it was held by the dean of the collegiate body; in 1553 Edward VI. granted the college and manor to Dudley, duke of Northumberland, but Mary refounded the college and restored its property, and this was confirmed by Elizabeth. Henry III. (1258) granted the Wednesday market, which is still held, and a fair for eight days, beginning on the eve of the feast of SS. Peter and Paul (June 29). During the Great Rebellion Wolverhampton was royalist. In 1751 its chief and noted manufacture was locks. In 1848 it was incorporated a municipal borough and a county borough in 1888. It was first represented in parliament in 1832, sending two members, but since 1885 it has sent three.

WOLVERINE: *see* GLUTTON.

WOLVERTON, a town in the Buckingham parliamentary division of Buckinghamshire, England, near the river Ouse, 52½ m. N.W. by N. of London by the L.M.S. railway. Pop. (1921) 7,237. Its modern growth and importance are the result of the establishment of carriage works by the railway company.

WOMBAT, the typical representative of the marsupial family *Phascolomyidae* (*see* MARSUPIALIA). All the teeth are of continuous growth, having persistent pulps. The incisors are large and chisel-like, much as in rodents. The body is broad and depressed, the neck short, the head large and flat, the eyes small, and the tail vestigial. The limbs are equal, stout and short. The feet have broad, naked soles; the forefeet with five toes, each with a long nail. The hind-feet have a short nailless first toe; the second, third, and fourth toes partially united by skin, the fifth distinct and shorter; these four with long nails. The wombat of Tasmania (*P. ursinus*) and the similar but larger *P. platyrhinus* of southern Australia belong to the typical group of the genus, with short ears, coarse fur, and naked muzzle. On the other hand, in the hairy-nosed wombat (*P. latifrons*) of South Australia, the fur is silky, the ears more pointed, and the muzzle hairy.

WOMBAT (PHASCOLOMYIDAE PLATYRHINUS), THE AUSTRALIAN BEAR

In form and action wombats resemble small bears, having a similar shuffling walk, but they are shorter in the legs and have broader backs. They live on the ground, or in burrows or holes among rocks, and feed on grass, roots, and other vegetable substances. They sleep during the day but wander forth at night in search of food. They are shy and gentle, though they bite strongly when provoked. The prevailing colour is brownish grey. The large wombat of the mainland is variable in colour, some individuals being pale yellowish brown, others dark grey and some black. The length of the head and body is about 3ft. Fossil wombats, some of larger size than any now existing, have been found in the Pleistocene of Australia.

WOMBWELL, an urban district in the West Riding of Yorkshire, England, 4 m. S.E. of Barnsley on the L.M.S. and L.N.E. railways. Pop. (1921) 19,041. The population is employed chiefly in the extensive collieries.

WOMEN, DISEASES OF: *see* GYNAECOLOGY.

WOMEN, EDUCATION OF. Prior to the middle of the 19th century there was little provision for women or girls to engage in serious study except in the early middle ages. Between the 6th and 10th centuries there were good scholars and Latinists among the nuns, and the convents provided instruction to girls in the same subjects as that given to boys. Later the education received in the convent schools became increasingly meagre. The wave of enthusiasm for learning in the 16th century affected a limited number of women, mainly among the aristocracy.

Great Britain.—The movement for effecting a reform in Great Britain began in several quarters. In 1848 Queen's college (F. D. Maurice) led the way in providing scholarly intellectual training for girls. Bedford college (Mrs. Jesser Reid) followed in 1849: the North London collegiate school (Miss Buss) in 1850. Cheltenham Ladies' college (Miss Beale) first provided sound education under a boarding school system on the lines of that of the great public schools for boys. Between 1860 and 1870 the movement was promoted in various ways: (1) The schools inquiry commission (1864–67) threw light on the miserable deficiencies in the education of girls. (2) Various associations were formed:—*e.g.*, the North of England Council for promoting the Higher Education of Women (1867); the London Schoolmistresses' Association (1866); the Association for promoting the Higher Education of Women in Cambridge (1869). (3) Local examinations were opened to women (Cambridge 1865, Oxford 1870).

From 1870 things moved fast. The Education Act of that year made education compulsory for girls ("the three Rs"; domestic arts) as well as boys. Girton college (Miss Emily Davies) already started at Hitchin in 1869, was established close to Cambridge in 1873. In 1871 Merton hall, Cambridge (Henry Sidgwick, Miss A. J. Clough) was opened, to become Newnham hall in 1876 and Newnham college in 1880. In 1871 the Women's Education Union (Mrs. William Grey) was begun, parent of the Girls' Public Day School Company (the Misses Gurney) which between 1873 and 1901 founded 38 day schools where girls could receive an education parallel with the best afforded to boys. The reorganization of trusts facilitated by the Endowed Schools Act of 1869 provided excellent schools at low fees by devoting to girls a new and increased share of the funds at their disposal—*e.g.*, Harpur trust, Bedford (1873), Grey Coat and Christ's hospitals, King Edward's schools, Birmingham, Hulme trust, Manchester, St. Paul's, etc. Good boarding schools were started (*e.g.*, Miss Lawrence's, Brighton—now Roedean—1885). The Education Act of 1902 included girls in all its provisions for new secondary schools.

In all provided and grant-earning schools and those recognised as efficient the curriculum is now like that in boys' schools; the same examinations are entered for. In general less stress is laid on the classics, mathematics and physical science. Some periods are set aside for cookery, needlework, etc. The provision of science teaching and science laboratories has recently been much improved. In some schools a business training is afforded after the matriculation stage alternative to advanced courses for those who proceed to the universities. In 1926–27 there were 160,022 girls in grant-earning schools, the average leaving age being 16 years 2 months. The efficiency of the schools was made possible by the opening of the universities to women—at first as regards lectures and examinations only, later by full membership of every British university except Cambridge, which bestows only titular degrees on women. At first the proportion of graduate to non-graduate teachers was low, now in all recognised schools there is a small minority only of non-graduate mistresses. Most head mistresses demand training as well as a degree from their mistresses. Secondary training is afforded in the university departments of education; at the Maria Grey training college (1878) and St. Mary's college, London; the Cambridge training college (1884). Government grants for training are made to women as to men with a less maintenance allowance. Women sit equally with men on the teachers' registration council. The number of women in the universities has steadily increased in the present century. In 1926–27 in the faculties of art, science and medicine they numbered 7,873 (Oxford 800, Cambridge 472, London 3,136, provincial universities 3,465). State and county scholarships and four-year-scholar-

ships for intending teachers have contributed to this increase. All teaching posts are nominally open to women. Only in London and Wales have women held professorships.

In Scotland the universities are open to women. Glasgow has the largest number of women students of all British universities (1,464). In the Secondary day schools, boys and girls work side by side. There are good boarding schools for girls only; *e.g.*—St. Leonard's school, St. Andrews (1877); George Watson's, Edinburgh. (*See* also EDUCATION: *England,* etc.; *Secondary Education,* etc.)

The Continent.—On the continent the universities are, generally speaking, open to women. Girls receive a solid education in state schools in France, Germany, the Scandinavian countries and Holland. Educational legislation of the last few years shows a tendency to assimilate the curricula in girls' schools to those for boys except in countries where dual schools have been the rule (*e.g.,* Italy, Czechoslovakia) where the tendency has been in a contrary direction. In France the assimilation is absolutely complete. Competition for all certificates and "agrégations" is now secured to women, though posts in boys' secondary schools and in the universities are still practically confined to men. (*See* also EDUCATION: *France, Germany,* etc.).

Clough* (1897) (includes history of the movement for Higher Education [1] in the north of England, [2] in Cambridge, with the rise and development of Newnham College); Mannus, *The Jubilee Book of the Girls' Public Day School Trust* (1923); Stephen, *Emily Davies and Girton College* (1926) (includes an account of girls' education in the early Victorian period and of the pioneer work of Emily Davies, Madame Bodichon, Mrs. Garrett Anderson, etc.). (M. J. T.)

UNITED STATES

The first settlers brought with them from Europe the traditional belief that marriage was the only reputable vocation for women. During the colonial period the dame schools appear to be the first place and up to a short time prior to the Revolution practically the only place outside the home where girls might secure elementary instruction, though they were organized to prepare boys for the grammar schools. In certain localities girls were favoured. In New Hampshire when Hampton engaged a schoolmaster in 1649, and when Dover did likewise in 1658, it was with the understanding that instruction be given to all children both male and female. In Philadelphia in 1689 the Society of Friends established their public school, the predecessor of the famous William Penn charter school which was open to all classes and to both sexes. At Nazareth, Pa., the Moravians organized a school for girls in 1750. These, however, were the exception. In time the grammar schools greatly increased in number, though only a few admitted girls and then only at certain hours or at certain times of the year. In 1784 Dorchester, Mass., permitted girls to attend from June 6 to Oct. 1. In 1789 Boston established the "double-headed school," and a private school for girls, the "academy," was opened at Medford, Mass., which was the forerunner of similar institutions eventually established in large numbers.

In 1821 Emma Willard established her Female Seminary at Troy, N.Y., and in 1837 Mary Lyon founded Mt. Holyoke seminary at South Hadley, Mass. Similar schools followed in New England and in the South. By the middle of the 19th century the public high school had developed to provide secondary education for the great mass of the people and very largely to displace the academy and the seminary. Co-education is almost universal in the public schools; the number of girls attending them has become slightly in excess of that of boys, and equal educational opportunities are provided for both sexes. For the benefit of girls, courses in home economics have been added in practically all high schools and in the upper grades of the best grammar schools.

Higher Education for Women.—In 1833 Oberlin college, founded in Oberlin, O., signified its willingness to admit women. In 1865 Vassar college was established at Poughkeepsie, N.Y., and was the first separate college of unquestioned standing for women. In 1839 the first State normal school was established at Lexington, Mass., and in 1842 the New England Female Medical college was founded.

Preparation in the fields of medicine, journalism, dentistry, law, science, architecture and engineering is obtainable in the universities and technical schools. Secondary and higher liberal education is passing through a period of readjustment. Professional education is being standardized in the hope of producing more liberal and better trained persons. Vocational education is developing rapidly. (M. S. D.)

WOMEN'S COLLEGES

The history of the women's college in America may be said to fall into three periods, each of the first two covering 40 years, the third from 1915 on. The first period, roughly estimated from 1835 to 1875, was the age of beginnings. The institutions of this period were almost without exception seminaries; among them, Wheaton at Norton, Mass., opened in 1835, and Mount Holyoke at South Hadley, in 1837. Both were founded as permanent institutions for women. Mount Holyoke's first curriculum was evidence of Mary Lyon's intention that although not called a college, it should furnish to women as good educational opportunities as the colleges for men then offered. Several other women's colleges of to-day were established as seminaries during this period, Wells, Lake Erie, the Western, Mills, Rockford, Milwaukee-Downer. The South shared in this interest, a development cut short by the Civil War. Hollins college in Virginia, a co-educational seminary, in 1852 dropped the course for boys, thus becoming the first chartered institution for girls in the State.

Among the earliest institutions authorized to grant degrees to women were the Wesleyan Female college at Macon, Ga., founded in the '30s, and Elmira college in Elmira, N.Y., opened in 1855. The first women's college having an endowment and curriculum sufficient, from the point of view of the times, to realize this ideal, was Vassar college, incorporated in 1861 and opened in Poughkeepsie, N.Y., in 1865.

The Second Period.—The period 1875 to 1915 was one of expansion, and was marked by an advance in the education of women, such as the world had never before seen. Three types of institution were developed: the separate college for women; the woman's college affiliated with the university; co-education. Coincident with the beginning of this period came the opening of two important colleges, both in Massachusetts: Smith at Northampton, established by Sophia Smith; Wellesley at Wellesley, founded by Mr. and Mrs. Henry F. Durant in memory of their only son. Ten years later Bryn Mawr college, founded by Joseph W. Taylor, was opened at Bryn Mawr, Pa. The same year the Woman's College of Baltimore City was incorporated, under the auspices of the Methodist Church, with Dr. Goucher, the first president, after whom it was subsequently named, as the chief factor. In 1888 Mount Holyoke obtained its college charter, five years later withdrawing the seminary course.

During this period several of the earlier seminaries became colleges: Rockford in Illinois, Lake Erie and the Western in Ohio, Milwaukee-Downer in Wisconsin, Mills in California, the Woman's College of Pennsylvania at Pittsburgh. Wells college in Aurora, N.Y., secured its college charter in 1870 after two years as a seminary. The leading Southern colleges for women date from this period: Agnes Scott college at Decatur, Ga. (1889), Randolph-Macon College for Women at Lynchburg, Va. (1893) and Sweet Briar at Sweet Briar, Va. (1906).

An outstanding illustration of another type of college for women is Simmons college in Boston, established by the will of John Simmons "as an institution in which might be given instruction in such branches of art, science and industry as would best enable women to earn an independent livelihood," and granted a charter in 1899. Somewhat like Simmons college are Skidmore at Saratoga Springs (1911), and Russell Sage at Troy, N.Y. (1916).

The Connecticut College for Women, at New London, Conn., opened in 1915, "owes its foundation to the wish and purpose of people of Connecticut to provide within the State adequate facilities for the higher education of women," the movement for its establishment being begun by the College Club of Hartford.

Holding a place midway between the college on a separate foundation and co-education is the women's college affiliated with the university. The first one of this type was the H. Sophie Newcomb Memorial, opened at Tulane university in New Orleans in 1887. It was followed in 1888 by the Women's college at Western Reserve university, Cleveland, the outgrowth of an informal system of co-education, dating from 1872; Barnard at Columbia in 1889, ten years after President Barnard had urged co-education at Columbia college; the Women's college of Brown university, authorized in 1892 to confer the Brown degree and made a department of the university in 1897. Radcliffe college, incorporated in 1894 and authorized to confer the bachelor's and master's degrees and Ph.D. subject to the approval of the president and fellows of Harvard college, dates from the organization in 1879 of the Society for the Collegiate Instruction of Women "for the purpose of providing systematic instruction for women by professors and other instructors in Harvard university."

Since the beginning of the present century, other "affiliated colleges" have been established, such as the William Smith college in Geneva, N.Y., opened as "co-ordinate" with Hobart college, in 1908; and in 1910, Jackson college, taking the place of entire co-education at Tufts college, Mass. By the so-called "segregation policy," started at the University of Chicago in 1902, and meaning separate instruction for women during the first two years of their undergraduate course, the university provision for women comes partially under the head of the affiliated college.

The Third Period.—The third period of the women's college in the United States—from 1915 on—bids fair to be as distinctive as the preceding epochs. It is not likely that the number of senior colleges will increase in the same proportion, even if the numbers seeking admission should continue, since the cost of establishing a college and the conception of necessary equipment are so much greater. A possible exception is along the line of the junior college. A development of the last few years, the junior college idea has taken possession of some of the long-established institutions for girls, such as Bradford academy, as well as being the type of an interesting new experiment—the Sarah Lawrence college for women in Bronxville, N.Y. It has been most widely developed in the co-educational sections of the country—the middle and far West, especially on the Pacific coast. The success of a junior college like Stephens college in Columbia, Mo., modelled on the women's college of the East, indicates a swing of the pendulum toward that form of education, at least for the first half of the college course.

Other indications are the establishment of Scripps college, opened in 1927 as the first one of the projected group of "Claremont colleges" in Claremont, Calif., of which Pomona, a long-established co-educational institution, is the "mother," and the division of Occidental college in Pasadena into two institutions, one for men and one for women. Until these recent developments, Mills college was the only separate college for women on the Pacific coast.

Popularity of Women's Colleges.—An outstanding characteristic of the college for women has been its increasing popularity. The fact that the leading colleges have had a large number of applicants from whom to choose has probably had an influence in several "trends." (1) The careful selection of candidates for admission has resulted in a group qualified for the most part to do college work and in turning into other fields those not fitted for the liberal arts course, a benefit to the individual as well as to college and community. (2) It has helped the college to hold to its own field of work. Since the World War, there has been a marked strengthening of the liberal arts course, a course which the colleges for women have continued more consistently than any other institution of higher education. The curriculum has been enriched and made more flexible but with slight concession to the strictly vocational. (3) It has led to stress on the education of the individual, rather than education *en masse*. The introduction of the "honour" as well as the "pass" course; the general examination in the major subject; an approach to the tutorial system; sectioning on the basis of ability—these and other developments, resulting in greater attention to the individual student, have been marked changes. (4) There has been an increase in the number of graduates going in for advanced work in various lines. (5) There has been an increase in the variety of professions and employments entered by graduates of the women's colleges. There have been a large number of graduates of women's colleges holding distinguished academic positions, distinguished posts in medicine, scientific research, journalism, social work and the arts, as well as in national and international organizations.

Small, "Girls in Colonial Schools," *Education* (1902); E. G. Dexter, *A History of Education in the United States* (1906); R. G. Bonne, *Education in the United States* (1907). (M. E. W.)

WOMEN, LEGAL POSITION OF. Within the last seventy-five years by a gradual process, slower for the married than for the unmarried woman, and very rapidly accelerated since the partial political enfranchisement of women in 1918, the greater number of the common law old established disabilities of women have been abolished, so that in England and Wales, in 1929, there is an approximation to a legal equality between men and women, politically, professionally and educationally. On the other hand, during these same years, a number of new statutory restrictions or legal regulations and conditions applicable only to women have been introduced, of which the greater number either affect the capacity of a woman as an industrial worker, or fix a wage lower for women than for men for the same job.

Sovereign: Peeresses: Privy Council.—A woman, married or unmarried, may be sovereign with all the rights and powers of a male sovereign, but the sons of a sovereign and their issue succeed before a daughter (Act of Settlement 1700). A woman may be a peeress in her own right but the majority of peerages descend only to males. Certain ancient peerages are held by females in default of males and certain new peerages pass to a daughter of the first peer in default of sons. Notwithstanding the Sex Disqualification Act 1919 (*see* below) a woman who holds one of these recently created peerages by special remainder is not entitled to receive a writ of summons or to sit in the House of Lords (Viscountess Rhondda's Claim 1922, 2 A.C. 339). It has not been decided whether a Scottish peeress in her own right is entitled to vote in the election of Scottish Peers to the House of Lords or is eligible for election thereto. Unlike a male peer a peeress in her own right may vote for a member of the House of Commons. A woman may be a Privy Councillor.

Franchises and Eligibility: League of Nations.—A woman, married or unmarried, is entitled to vote for, and is eligible to be elected to, the House of Commons, a Town or County Council or other local governing body on the same terms as a man (Representation of the People [Equal Franchise] Act 1928 ss. 1 and 9; Sex Disqualification [Removal] Act 1919; and Parliament [Qualification of Women] Act 1918 s. 1). By the Covenant of the League of Nations, which is the First Part of the Treaty of Versailles, "all positions under or in connection with the League, including the secretariat, shall be equally open to men and women" (Article 7[3]). By Part XIII. of the same Treaty, which sets up the international Labour Organization, "the principle that men and women shall receive equal remuneration for work of equal value" is laid down as well fitted to guide the policy of the League (Article 427, Principle 7).

Other Political, Professional and Educational Rights.—A woman may be registered as a medical practitioner (1876, 39 and 40 Vict. c. 41). All the Universities admit women to degrees with certain exceptions; and, except Cambridge, to membership. Midwifery has the status of a profession by the Midwives Acts 1902 and 1918 and nursing by the Registration of Nurses Act 1919. A sweeping change is made by the Sex Disqualification (Removal) Act 1919, section 1, as follows:—

> A person shall not be disqualified by sex or marriage from the exercise of any public function, or from being appointed to or holding any civil or judicial office or post, or from entering or assuming or carrying on any civil profession or vocation, or for admission to any incorporated society (whether incorporated by Royal Charter or

otherwise) and a person shall not be exempted by sex or marriage from the liability to serve as a juror:

Provided:—

(a) notwithstanding anything in this section His Majesty may by Order in Council authorise regulations to be made providing for and prescribing the mode of admission of women to the civil service of His Majesty, and the conditions on which women admitted to that service may be appointed to or continue to hold posts therein, and giving power to reserve to men any branch of or posts in the civil service in any of His Majesty's possessions overseas, or in any foreign country; and (b) any judge, chairman of quarter sessions, recorder or other person before whom a case may be heard may, in his discretion, on an application made by or on behalf of the parties (including in criminal proceedings the prosecution and the accused) or any of them, or at his own instance, make an order that the jury shall be composed of men only or of women only as the case may require, or may, on an application made by a woman to be exempted from service on a jury in respect of any case by reason of the nature of the evidence to be given or of the issues to be tried, grant such exemption.

Following on this Act the professions of barrister, solicitor, veterinary surgeon and the highest grade of the home civil service have been opened to women but they have not been admitted to the consular or diplomatic services. Many have since been appointed justices of the peace; women now regularly serve on juries; and have also been admitted to the Police force with the same powers as men constables. They have also recently been admitted to the Institute of Actuaries, the Society of Naval Architects, the Institute of Bankers, the Auctioneers' and Estate Agents' Institute, the Land Agents' Society, the Surveyors' Institute. The Church of England does not admit women to the priesthood but there are women clergymen in the Congregational, the Baptist and the Unitarian Churches and the Wesleyan Church has authorised their admission.

Pay in the Civil Service and Local Government Employment.—Within the civil service, with one or two exceptions, women are paid at a lower rate than men for the same work. Women are required to resign on marriage. Under local authorities, while there is no statute defining the respective salaries of men and women grants under conditions are made by the central government. For example, in the teaching profession, grants depend on the payment of salaries on the Burnham scale, which lays down a lower rate for women than for men. Till recently it had been assumed that it was within the discretion of a local authority to pay women at the same rate as men for the same job. But this has become somewhat doubtful since the action of the authorities at Woolwich, which would seem, if left unquestioned, to affect the legal position of all women local government employees. The Borough Council there had decided to give equal pay to its men and women lavatory attendants and were allowed to pay the rate they had fixed to the men, who were stated by the Government auditor at the audit of July 6th, 1928, to be "doing work of no greater value than that of the women lavatory attendants." But the Auditor disallowed, as illegal, the payment to the women of the sum by which the men's rate exceeded what he considered it was reasonable should be paid to a woman. The Council was therefore, by reason of the penalties attached to a surcharge, compelled to reduce the women's rate.

Industrial Employment.—The following are among the *legal* restrictions and regulations affecting industrial employment which apply to women only. A woman may not be employed below ground in a mine (Coal Mines Act 1911 s. 91); or above ground in connection with a mine in moving railway wagons or in lifting weights likely to cause her injury, or for more than 54 hours a week or continuously for more than five hours (ibid. s. 92); or in a textile factory for more than 56 hours a week (Factory and Workshops Act 1901 s. 24); or in a non-textile factory or workshop for more than 60 hours a week (ibid. s. 26); or in a factory or workshop to clean mill-gearing machinery in motion (ibid. s. 13); or with certain exceptions on Sundays (ibid. s. 34); or on certain holidays (ibid. s. 35); or inside and outside the factory on the same day (ibid. s. 31); or during meal times and she must have her meals at the same time as other workers (ibid. s. 33); or at wetspinning except under certain conditions (ibid. s. 76); or in any factory or workshop for 4 weeks after the birth of her child (ibid. s. 61); or in any industrial undertaking at night with certain exceptions (Employment of Women and Children Act 1920); or in certain lead processes (Women and Young Persons [Employment in Lead Processes] Act 1920); or in the painting of buildings with lead paint (Lead Paint Protection against Poisoning Act 1926 s. 2) except at "wall or ceiling paintings or any similar work of decorative design" (Order of 14th Nov. 1926). Under s. 79 of the Factories and Workshops Act 1901 the Secretary of State has power to schedule processes as dangerous or injurious and by Order in Council to forbid them generally or to women only. Under this power the employment of women, but not of men, has been forbidden in a number of processes in the manufacture of pottery (Statutory Rules and Orders, 1913, No. 2); in the casting of brass (ibid. 1908, No. 484); in working between the fixed and traversing parts of mule spinning machinery (ibid. 1905, No. 1103); in manipulating lead colour (ibid. 1907, No. 17); in lifting more than 65 pounds in woollen and worsted textile factories (ibid. 1926, No. 1463); in certain rubber processes involving the use of lead (ibid. 1922, No. 329); in the manufacture of electric accumulators where manipulating red oxide of lead or pasting is carried on (ibid. 1915, No. 28). (*See* also LABOUR LAW.)

Trade Boards.—Under the Trade Boards Acts 1909 to 1918 minimum rates of wages may be fixed by Order in Council for any class of worker and this has been interpreted as giving power to fix different rates for men and women. Such minimum rates then become legally enforceable by the worker against his employer. In a very few processes women are given the right to enforce the payment of as high a rate of wage as men, *e.g.*, in the chain trade, but there men are generally employed in the jobs for which the higher rates have been fixed, and in the lace finishing trade where chiefly women are employed. At October 1928 minimum rates had been fixed in 39 trades. In the following 37 trades the rate per hour enforceable by the lowest grade of woman worker is in general little more than half that enforceable by the lowest grade of man worker:—aerated waters; boot and floor polish; boot and shoe repairing; brush and broom; button manufacturing; coffin, furniture and cerement making; corset; cotton waste reclamation; dressmaking and women's light clothing; drift nets mending; flax and hemp; fur; general waste materials reclamation; hair, bass and fibre; hat, cap and millinery; hollow ware; jute; laundry; linen and cotton handkerchief and household goods and linen piece goods; made up textiles; milk distribution; ostrich and fancy feather and artificial flowers; paper bag; paper box; perambulator and infant carriage; pin, hook and eye and snap fastener; ready made and wholesale bespoke tailoring; retail bespoke tailoring; rope twine and net; sack and bag; shirtmaking; stamped and pressed metal wares; sugar, confectionery and food preserving; tin box; tobacco; toy; and wholesale mantle and costume. The only trade in which the lowest grade female workers' rate approaches the male rate is in the boot and shoe repairing trade where the male rate is thirteen pence halfpenny an hour and the female tenpence. In this trade the rate is payable to both from the age of 21, while, in general, the rate is payable to the woman from 18 and to the man from 21 years. (*See* TRADE BOARDS.)

National Insurance.—A woman who has an insured husband, even if not herself insured, is entitled to a cash maternity benefit at the time of the birth of a child, to a pension of ten shillings when she is 65 if her husband is 65, and, after the death of her husband, to a pension of ten shillings a week and to weekly cash benefits for her children of school age. On the other hand a woman in the employment of her husband is excluded from national insurance and a married woman is not allowed to be a voluntary contributor under the scheme, while the employments of domestic service and female nurses are excluded from unemployment insurance. (*See* NATIONAL INSURANCE.)

Marriage.—A woman is capable of marrying at 16, the same age as a man. A woman may sue a man, or a man a woman (Harrison *v.* Cage 1698 Lord Raym. 386), for breach of promise of marriage. The domicile of a married woman is that of her husband. A husband cannot force his wife to live

with him (Rex. *v.* Jackson 1891, 1 Q.B. 671 C.A.). A husband (Winsmore *v.* Greenbank [1745] Willes 577) or a wife (Gray *v.* Gee 1923, 39 T.L.R. 429) has an action for damages against a third party who without just cause entices his or her spouse away. A husband is required to maintain his wife. If he does not, she may pledge his credit for necessaries suitable to his station in life (Johnston *v.* Sumner [1858] 3 H.&N. 261). If he wilfully refuses or neglects to do so by not providing money, or not working, and she becomes chargeable under the poor law he is liable (Vagrancy Act 1824 s. 3) and the guardians may apply for an order against him for her support (Poor Law Amendment Act 1868 s. 33). The guardians can similarly apply for an order against a woman with separate property for payment for the support of her husband who has become chargeable to the parish (Married Woman's Property Act 1882 s. 20), but he cannot pledge his wife's credit. A husband married after January 1st, 1883, is liable for debts contracted by, or contracts entered into, or torts committed by, his wife before marriage to the extent of property he has acquired through her (*ibid.* s. 14) but a wife has no corresponding liability. A husband is liable for a tort committed by his wife during marriage unless the tort arises out of a contract (Edwards *v.* Porter 1925, A.C. 1) but a wife has no corresponding liability.

A married woman is capable of acquiring, holding and disposing by will, or otherwise, of any real or personal property as if she were unmarried (M.W.P. Acts 1882 & 1893). But there may be attached to property given to a woman, but not to that of a man, a restraint on anticipation. The restraint does not operate while the woman is a spinster or a widow, and during such time she can remove the restraint by deed, or dispose of the property, but the restraint will attach during marriage. The restraint makes void any attempted alienation or disposition of the restrained property before it falls due. The court, however, may order that payments be made from restrained property in four cases:—to the woman's creditors when she is bankrupt, having regard to the means of support of herself and her children (Bankruptcy Act 1914, s. 52); for her benefit with her consent (Law of Property Act 1925, s. 169); for the cost of litigation she may have instituted (M.W.P.A. 1893, s. 2); and for the variation of settlements after divorce (Churchwarden *v.* Churchwarden 1910, P. 195).

A married woman is capable of entering into and rendering herself liable on any contract in respect of her separate property, not restrained from anticipation, which at the time of the contract or afterwards she may be entitled to; and she is capable of suing and being sued in contract, and in tort, or otherwise, in all respects as if she were unmarried (M.W.P. Acts 1882 & 1893). Certain judgments cannot be enforced against a married woman by committal or attachment (Annual Practice 1929 pp. 2063 & 2064). A married woman is under a legal incapacity with respect to income tax (Income Tax Act 1918, s. 237). Her income is deemed to be her husband's. A married woman is incapable of acting as a guardian ad litem except in certain cases. (*See* Annual Practice 1929 p. 256.)

By the Guardianship of Infants Act 1925 a mother is given the same rights of guardianship as the father in any case brought before the courts. She is also given equal rights in giving consent to the marriage of her child and in the naming of a guardian to act after her death. (*See* INFANTS.)

Nationality of Married Women.—Before 1870 a British woman with an alien husband did not lose her British nationality. Now a married woman is under a statutory disability as to nationality (British Nationality and Status of Aliens Act 1914, as amended in 1918 and 1922, s. 27). She is deemed to be British if her husband is British and alien if he is alien (*ibid.* s. 10). But there are three exceptions, namely:—a woman, with a British husband, who changes his nationality during the marriage, has the right to declare that she will retain her British nationality; in time of war a woman, British by birth with an enemy husband, may by declaration and with the consent of the Secretary of State resume British nationality (*ibid.* s. 10); and a woman with a husband, who is a naturalised British subject deprived of his British nationality, remains British unless either the Secretary of State orders that she shall also be deprived of British nationality, or she herself makes a declaration of alienage, but, if such woman is herself British born, the Secretary of State cannot deprive her of British nationality unless he is satisfied that she herself is disaffected or disloyal (*ibid.* 7 A). A married woman cannot naturalise in her own right (*ibid.* s. 27 & s. 5[3]). A woman who has lost her British nationality by marriage remains an alien after the dissolution of such marriage by death or divorce (*ibid.* s. 11). But with the consent of the Secretary of State she may be readmitted into British nationality on the same conditions as an alien becoming naturalised as a British subject, except that she is not required to satisfy the conditions as to residence in British territory (*ibid.* s. 2[5]).

Separation and Divorce.—A separation order may be granted by a Court of Summary Jurisdiction to either a husband or a wife on the ground that the other spouse (a) is an habitual drunkard (Licensing Act 1902 s. 5); or (b) has been guilty of persistent cruelty to the children (Summary Jurisdiction [Separation and Maintenance] Act 1925 s. 1). And such order may be granted to a wife, but not to a husband, on any of the following additional grounds:—that her husband (c) has been convicted summarily of an aggravated assault upon her; or (d) has been convicted on indictment of an assault upon her and sentenced to a fine of more than five pounds, or to more than two months' imprisonment; or (e) has deserted her; or (f) has been persistently cruel to her; or (g) has wilfully neglected to provide reasonable maintenance for her and her infant children; or (h) has, while knowingly suffering from venereal disease, insisted on having intercourse with her; or (i) has compelled her to submit herself to prostitution (Summary Jurisdiction [Married Women] Acts 1895 & 1925). Such order may include maintenance for the wife up to £2 a week (1895 Act s. 5 [c]), and this even if she be the guilty party. It may also include an order for the custody of the children, and, if this is given to the wife (*ibid.* s. 5[b]), that the husband shall pay a weekly sum for each child till the age of sixteen, not exceeding 10/– a week (Married Women [Maintenance] Act 1920); and such orders are enforceable in any of the British dominions which have adopted the Maintenance Orders (Facilities for Enforcement) Act 1920.

The High Court may grant a decree of judicial separation to either a husband or a wife on the ground that the other spouse has been guilty of adultery; or of cruelty; or of desertion for not less than three years (Judicature Consolidation Act 1925 s. 185). It may grant a decree of divorce to a husband on the ground of his wife's adultery: or to a wife on the ground (a) of her husband's adultery after the 17th of July 1923; or (b) of her husband's adultery before that date coupled with either cruelty, or desertion for two years, or incest, or bigamy; or (c) of his having committed unnatural crime (*ibid.* s. 176). The custody of the children is in general given to the innocent party.

Unmarried Parents.—The mother of an illegitimate child is bound to maintain it till it is sixteen (Poor Law Amendment Act 1834 s. 71). If married, her husband must maintain it. The father is not bound to maintain such child, except that, on the application of the mother and if paternity is proved he may be ordered to pay (Bastardy Laws Amendment Act 1872, s. 4) not more than 20/– a week for its maintenance (Bastardy Act 1923, s. 2). The mother has the custody of the child. An illegitimate child inherits from its mother, if she dies intestate and without other issue, as if it were legitimate (Legitimacy Act 1926, s. 9[1]), but not from its father. The subsequent marriage of the parents of an illegitimate child whose father is domiciled in England legitimates such child, if at the time of its birth both the parents were unmarried (*ibid.* s. 1[1]).

Succession.—A man or woman may will away all his or her property from a surviving spouse and children. The intestacy laws have been equal as between males and females except with respect to an entailed interest since the Administration of Estates Act 1925 came into force. (*See* INTESTACY.)

Criminal Law.—Among crimes which can be committed only against women are rape; carnal knowledge of a girl under six-

teen; procuration for immoral purposes; abduction of a girl under sixteen. Among offences which can only be, or are in general, committed by a woman are abortion; concealment of birth; infanticide. Only prostitutes can be convicted of certain street offences. And prostitutes are under certain disabilities as to the use of places of refreshment which do not apply to male profligates. A woman may not be whipped (1820, 1 Geo. IV., C. 57). The hair of a woman prisoner may not be cut. A woman condemned to death who pleads pregnancy has the question decided by a jury of matrons. A married woman who commits an offence in her husband's presence is not now presumed to have acted under his coercion but this defence is open to her (Criminal Justice Administration Act 1925 s. 47). A husband, but not a wife, may be convicted of knowingly receiving property stolen by his or her spouse. A husband may, but a wife may not, be an accessory after the fact to a felony committed by his or her spouse.

Special Civil Actions Concerning Women.—By the Slander of Women Act 1891 a woman has an action of damages against anyone who imputes unchastity to her without requiring to prove that she has suffered special damage. A father or master deprived of the services of a daughter or servant who has been seduced has an action for damages against the seducer, but the woman herself has no such action.

Scotland.—The legal position of women in Scotland is in general similar to that in England and changes have been parallel. By the Married Women's Property (Scotland) Act 1920, section 1, the husband's right of administration is "wholly abolished" and "a married woman shall with regard to her estate have the same power of disposal as if she were unmarried." And by section 3 "a married woman shall be capable of entering into contracts and incurring obligations and be capable of suing and being sued as if she were not married and her husband shall not be liable in respect of any contract she may enter into or obligation she may incur on her own behalf."

Neither a husband nor a wife can will away his or her property from a surviving spouse or children. The surviving wife is entitled to one third of the moveable estate of her deceased husband, if there are children, and to one half, if there are no children (*jus relictae*), and in addition to one third of the rents of her husband's heritage for life (*terce*). The surviving husband is entitled to the same share of his deceased wife's moveables (*jus relicti*) and to the liferent of his deceased wife's heritage, if there has been a living child of the marriage (courtesy). Sons and daughters are entitled to equal shares in the moveable estate of a deceased parent but the oldest son is entitled to the heritage. Where a husband dies intestate and without lawful issue, the surviving wife is entitled to £500 of her husband's estate and in addition to her rights of *jus relictae* and *terce* in the residue (Intestate Husband's Estate Act 1911). The grounds of divorce have been the same for husband and wife since the reformation, namely: (a) desertion for the space of four years or (b) adultery (Green's *Encyclopaedia of Scots Law*, 2nd Ed. v. 4, p. 541 *et seq.*). The innocent wife on divorce is entitled to *jus relictae* and *terce* as if the guilty husband had died; while the innocent husband is entitled to courtesy but not to *jus relicti* (*ibid.*). (C. MN.)

THE UNITED STATES

With the progressive breaking down of the legal conception of the household as an entity ruled from within by a head, and as an agency of social control, it becomes necessary to give legal recognition and protection to individual interests of women in the domestic relations, which at common law were supposed to be secure through the internal economy of the household, or were left unsecured in view of a paramount social interest in the household as a social institution. Summarily, these may be put as *parental* interests—interests of women in the relation of parent and child, and *marital* interests—interests of women in the relation of husband and wife.

Parent and Child.—At common law the father was entitled to the custody of his minor child and the mother had a right to custody only after the father's death. In form this still stands in the books as law, but in substance there has been a complete change within a generation. Equity long ago refused to give effect to the father's common law right of custody as against the interest of the child, and by taking the equitable doctrine of regard for the interest of the child over into the law, the courts have been able to put father and mother upon an equality for practical purposes in almost all jurisdictions. Yet the common law doctrine remains theoretically in force in the absence of legislation, and legislation is still far from universal. One decision, as late as 1905, holds that the father has a legal right to control the religious training of the children (*Hernandez* v. *Thomas*, 50 *Florida Reports*, 522, 536).

Husband and Wife.—Marital interests of women include claims against the world at large growing out of the relation of husband and wife, and claims of wives against husbands because of that relation. As interests of personality a wife has claims to the society of her husband, quite apart from any economic advantage; to the affection of her husband, analogous to the legally recognized claim of the husband to the society and affection of the wife; and to the chastity and constancy of the husband as involving her self-respect and honour. These interests, however, are not yet recognized to their full extent and are not fully secured even in legal theory. The first and second are now protected by an action for alienating the husband's affections, which has come to be allowed by the overwhelming weight of American authority (*Turner* v. *Heavrin*, 182 *Kentucky Reports*, 65, 1918). The third was recognized more recently in New York (*Oppenheim* v. *Kridel*, 236 *New York Reports*, 156). Generally it is at most but partially recognized and indirectly secured; but it should be said that the obvious inutility of the husband's means of redress, which should be applied by analogy to make the law logically complete, has had much to do with the apparent backwardness of the law on this subject.

As an interest of substance the wife may claim to be secured in the marriage relation as an economically advantageous relation, providing her with support and shelter. Where the husband is enticed or induced to abandon his wife or to divert earnings which should be devoted to her support, the courts are coming to recognize this interest directly. (The wife's action was allowed in *Flandermeyer* v. *Cooper*, 85 *Ohio State Reports*, 327, 1912; it was denied in *Brown* v. *Kistleman*, 177 *Indiana Reports*, 692, 1912.) On the other hand, in case of physical injury to, or abduction of, the husband, the wife is still usually denied an action, although the husband may recover in the converse case for "loss of service." The claim of the wife to support was recognized fully and secured adequately at common law. Legislation setting up domestic relations courts and providing for criminal prosecution in case of non-support has only put more effective administrative machinery behind existing legal duties of the husband.

The most serious inequalities in this connection were in the procedural difficulties encountered in enforcing the wife's legal rights. Domestic relations courts, which have had a considerable development in the United States, are adapted especially to removing these obstacles (*see* Smith, *Justice and the Poor*, chap. ii.). Modern legislation, although taking away from the husband all control over the wife's property and earnings and committing it solely to the wife, has left untouched the common law duty of the husband to support the wife even if she has property and he has none. Some courts go so far as to allow a wife possessed of means who has supported herself out of her separate estate to sue the husband and obtain restitution of the amount thus contributed (*De Bauwere* v. *De Bauwere*, 203 *New York Reports*, 460, 1911). A few Western States, however, now impose upon a wife of means and ability a duty of supporting an indigent and infirm husband, and allow an action by the husband to enforce this duty (*Hagert* v. *Hagert*, 22 *North Dakota Reports*, 290, 1911). American courts now recognize the separate domicile of the wife substantially to the full extent of her individual interest in free self-assertion (*Williamson* v. *Osenton*, 232 *U.S. Reports*, 619 1914).

So also with respect to actions by the wife against the husband.

The older Married Women's Acts, which in form merely removed disabilities as to property and contract, were long construed as not allowing such actions since they did not do so expressly, and a policy against aggravation of domestic troubles by dragging them into court was taken to be in the way. This sacrifice of the individual interests of the wife to the supposed exigencies of a social interest has now definitely given way, and conservative courts are allowing such actions even under statutes in terms dealing with property rights only (*Brown* v. *Brown*, 88 *Connecticut Reports*, 42, 1914). The more recent type of statute, providing that a married woman shall have the same legal existence and personality after marriage as before marriage, necessarily permits such litigation (*Fielder* v. *Fielder*, 42 *Oklahoma Reports*, 124, 1914). As to capacity to own, acquire, use and enjoy property, very little remains of the old law, and there are but few jurisdictions where legislation might still be able to accomplish anything.

In one respect, however, improvement by judicial decision is still going forward. A number of States, by derivation directly or indirectly from Spanish law, have the institution of "community property," in which with respect to certain property, and especially property acquired after marriage, husband and wife are treated legally as a sort of property-owning entity. The older view was that the husband was the administering agent of this collectivity during their joint lives, and hence could dispose of it, alter its form, and charge it with his personal debts; and that it could even be taken in execution for his wrongful acts. Recent decisions in some of these jurisdictions, recognizing the individual interest of the wife, hold that the community property is not liable for acts done by the husband outside of the reasonable scope of his authority as agent of the community (*Schramm* v. *Steele*, 97 *Washington Reports*, 309, 1917). Yet even there a claim for an injury to the wife, being an acquisition after marriage and community property, she is not allowed to sue therefor if her husband refuses to join (*Hynes* v. *Colman Dock Co.*, 108 *Washington Reports*, 642, 1919).

Protection of Women in Industry.—Courts have hesitated to uphold legislation restricting freedom of contract on the part of women in industry with respect to hours and conditions of labour and minimum wage. When such statutes were first enacted, they were held unconstitutional, as being arbitrary and unreasonable interferences with liberty of contract by a court which had no hesitation in keeping alive common law disabilities that had long ceased to secure any individual or social interest. That decision has been overruled (*Ritchie* v. *Wayman*, 244 *Illinois Reports*, 509, 1910), and it seems to be settled that legislation may take account of the facts of women's physical make-up and secure the social interest in a healthy womanhood by regulating the hours of labour of adult females (*Muller* v. *Oregon*, 208 *U.S. Reports*, 412, 1908; *Bunting* v. *Oregon*, 243 *U.S. Reports*, 416, 1917). But it is now held that this may not be carried to the extent of fixing a minimum wage for women employees (*Adkins* v. *Children's Hospital*, 261 *United States Reports*, 525).

The political and legal emancipation of women is urged as a reason against such legislation, as if the removal of political and legal disabilities had any relation to, or effect upon, the physical handicaps upon women in industry which are the occasion of these statutes.

In 1917 California provided for the drawing of women upon juries (*Laws of 1917*, p. 1283). Since the adoption of the 19th amendment of the Federal Constitution providing for woman suffrage, 1920, it has been assumed generally that women are to sit upon juries and such has come to be the prevailing practice. But in some jurisdictions, out of caution, it was felt that the courts should await express legislation and there have been differences in legislative policy as to how far jury service by women should be made compulsory. (R. Po.)

WOMEN, WAR WORK OF. It is impossible here to attempt to describe the special work done by women of all the belligerent countries in 1914–18; this article, therefore, is confined to an outline of women's war work as organized in the United Kingdom and the United States.

I. IN GREAT BRITAIN

On Aug. 3, before the official declaration of war, the executive committee of the National Union of Women's Suffrage Societies decided to suspend political action and devote the organizing capacity of the Union to meet the changed conditions. The London branch started a free bureau under the name of "Women's Service" to direct the efforts of the thousands of non-professional women eagerly desirous of finding useful work. Many young women began at once to prepare themselves for nursing, joined voluntary aid detachments and worked in auxiliary hospitals. The raising of funds and making of comforts for the units of the original Expeditionary Force absorbed others, and the arrival of the Belgian refugees in England before the end of August caused the formation of 2,500 local Belgian relief committees, of whom the members were mostly women. Clubs to help the wives of soldiers and sailors were started.

By the spring of 1915, when the country began to feel the drain on its man-power, the Marchioness of Londonderry founded the Women's Legion, which from the first was intended to be a corps of paid women replacing paid men. A khaki uniform was worn and the women were subject to regulations and discipline. Ultimately over 40,000 were enrolled. This corps was the link between the independent voluntary associations of women, such as the Emergency Corps, formed on the outbreak of the war, and the official women's services, two of which were sections of the Women's Legion.

Work on Land.—Throughout 1915 and 1916 efforts were made by voluntary organizations, such as the Women's Legion and the Women's Defence Relief Corps, as well as by the Government, through the war agricultural committees of the Board of Trade, to induce women to offer their services on the land and to persuade farmers to accept them. The Women's Land Army was instituted early in 1917 as a women's branch of the Ministry of Agriculture.

Munition Making.—By the spring of 1915 shell work for women was beginning; in March women tram conductors started work at Glasgow, and girls were employed as telegraph operators in Liverpool. In connection with the demand for skilled workers, the London Society for Women's Suffrage, which promoted the introduction of women into occupations hitherto reserved for men, started a munitions and aircraft department in July 1915, and arranged the first training classes in oxy-acetylene welding. The pupils were the first women welders to enter the engineering trade, and after two years the Ministry of Munitions assumed financial responsibility for the school. Messrs. Beardmore in Glasgow and Messrs. Vickers at Barrow-in-Furness and at Erith employed women on shell-making in the spring of 1915.

Enrolled and Non-enrolled Women.—The women's services were of two types. First came those composed of enrolled women in the legal sense, who were in the direct employment of the war departments, and whose contracts brought them within the regulations of the Defence of the Realm Act. The women could be enrolled as mobile workers for home service only, or for service at home and abroad; or as immobile workers, recruited for local employment, who could not be required to move away from the district. Secondly came those composed of non-enrolled women in the legal sense, who did not render themselves liable to penalties under the Defence of the Realm Act and might be engaged on an annual or weekly contract. Some services enrolled their women for a year only; others for the duration of the war.

The enrolled women consisted of the various army nursing services; the Military Massage Service, which started its career in Aug. 1914, under the name of the Almeric Paget Massage Corps; the Women's Forage Corps; Queen Mary's Army Auxiliary Corps; the Women's Royal Naval Service, commonly known as the "Wrens"; and the Women's Royal Air Force. (*See* NURSING.)

In Queen Mary's Army Auxiliary Corps which was at first the Women's Army Auxiliary Corps or familiarly the Waacs, the women were enrolled as mobiles for home service only, or for home or foreign service, and for the duration of the war; they received a special rate of pay, not civilian or military, and were

not enlisted under the Army Act. At first substitution overseas only had been contemplated, but by March the number of women recruited by the Department of National Service was so great that home commands were included in the scheme. Recruiting was afterwards carried on through the employment department of the Ministry of Labour. In Dec. 1917, owing to the shrinkage of available woman power, an immobile branch was formed. Women employed in the Ordnance Army Pay Department and Record offices at home were not made to join the Corps. In all there were 1,200 officials and 56,000 women, of whom 9,500 were the outside number employed in France at any one time.

As regards the Women's Royal Air Force, 566 officers and 31,764 other ranks passed through the service, the strength at the time of the Armistice being rather over 25,000. The service consisted of mobiles and immobiles in approximately equal proportions.

Non-enrolled women included the Anti-Gas Department, the Army Pay Corps, the Army Remount Department and the Navy and Army Canteen Board. Practically the whole of the work on gas-mask manufacture was performed by women. There were 34 factories employing 12,000 under the immediate control of the Anti-Gas Department, and 160 contractors employed a further 90,000 on work for the department.

Army Pay Corps.—The Army Pay department was one of the earliest in the army to substitute female clerks. In July 1915, 479 were working and by Jan. 1, 1916, there were 4,556 female clerks and 13 lady superintendents. The engagement was a weekly one and there was no form of contract till Aug. 1917.

Navy and Army Canteen Board.—When the Navy and Army Canteen Board (then called the Army Canteen Committee) started operations in April 1916, only 20 women clerks were employed. During 1917 the Board's activities were enormously expanded to include catering for the Imperial Overseas forces and for the American and Allied troops. It was decided in March 1917 to institute a N.A.C.B. Women's Corps in mobile and immobile sections, and by the date of the Armistice the women employed in connection with canteen organization in the mobile corps numbered 10,000 and the clerical staff in the immobile corps, 2,000.

II. IN THE UNITED STATES

When the United States entered the World War in April 1917, but one organization depending mainly on the efforts of women was officially recognized by the Government, the Red Cross. Its upwards of 8,000,000 regular volunteer women workers in 3,500 chapters produced in 20 months over 371,000,000 relief articles, including surgical dressings, garments for the wounded and the refugees, and a variety of comforts and conveniences for soldiers and sailors. The value of their output was about $94,000,000. The Red Cross enrolled during the war 23,822 women as nurses. They served in the military and naval hospitals in the United States, Europe and the Near East, as well as in convalescent homes for soldiers and sailors and in relief work for adults and children both in the United States and overseas. They worked in 700 Red Cross canteens in the United States and 130 in France, serving refreshments to moving troops, giving them medical care and transferring them when sick.

When war was declared many large national organizations of women applied to the Government for instructions. The Council of National Defense appointed, at the end of April 1917, a committee of nine women (afterwards increased to eleven), to form a plan by which the women of the country could be utilized. This committee selected a woman in each State as a temporary chairman. She called together the heads of all national organizations of women in her territory to elect permanent officers for a State division. In turn the State division organized county committees and each county was to form a division in each city and town. By December 1917 the county organization was complete in 23 States, and a year later more than 80% of all the counties in the country had county chairmen.

The Women's Committee through ten national departments penetrated by means of this network throughout the country. It registered women for service in key industries to replace men, Michigan enrolling 98% of its women; it conserved food, 5,223,850 pledge cards being signed in 39 States in the first few weeks of the campaign; it helped to safeguard the health of the children; it assisted in keeping up the morale of the country by distributing news letters, 40,000 pamphlets and bulletins and sending out speakers to counteract rumours; it helped with the Liberty Loan campaigns; it inspired its volunteers to home and foreign relief.

The War Department asked the Y.M.C.A. in August, 1917, to organize a group of women for welfare work with the American Army somewhat similar to that of the Women's Auxiliary Army Corps for the British troops. The American "Y" women served in the United States, France, Belgium, Italy, Germany, Constantinople and Siberia, 1,665 enrolled in the home camps and 3,480 going overseas, 561 of the latter entertainers. A special unit of coloured women was sent for work with the negro troops. The "Y" women remained on after the armistice, serving with the Army of Occupation from December 1918 until it was withdrawn and afterwards with the American Forces in Germany. The Y.W.C.A. organized in June 1917 a war council, under which it developed a variety of clubs, both in the United States and overseas, particularly France, behind the lines. The hostess houses of the association at the home camps of both white and coloured soldiers looked after women visitors, a service which proved of such value that the War Department at the close of the war took the work under its educational and recreational branch. Some 50 buildings were turned over to the Government by the war work council of the Y.W.C.A. Overseas the association conducted clubs which served Red Cross nurses and other women workers.

WOMEN'S CLUBS, THE GENERAL FEDERATION OF, a federation of approximately 14,000 clubs in the United States, 20 U.S. Territories and foreign countries. It was organized and a constitution adopted on April 24, 1890 after a preliminary meeting of women's clubs held in New York in 1889. It was incorporated under the laws of New Jersey in 1895, and a charter was granted by Congress in 1901. Membership in the federation is open to any women's club or organization which requires no sectarian or political test for membership, is not a secret society, does not tolerate violation of national or State laws, and agrees to the constitution and by-laws of the General Federation. While the membership of the organization extends into millions, no exact figure can be given owing to overlapping memberships.

While the first clubs existed largely for self-culture, there was unquestionably in the inner consciousness of the founders a realization that, since the great economic changes of the world were removing many tasks from the home, women must prepare to play a new part in the affairs of their community, State and country. That they looked forward to a programme of practical, civic, educational and welfare work is plainly recorded in their early writings.

The officers are elected by delegates from the member clubs at a biennial convention. At this meeting and at the biennial council, which meets on the alternate years, the members express themselves nationally in their endorsement of such movements or legislation as they consider important to the national welfare. The individual clubs and State federations plan and carry on their own activities. Some of the causes which the General Federation has supported are: greater educational opportunities, scholarship loan funds for girls, home economics teaching, home demonstration agents, public libraries, travelling libraries, greater appreciation of music, painting and sculpture, the eradication of illiteracy, training in citizenship, Americanization of aliens, better working conditions for women and children, the abolition of child labour, prison reform, adequate pure food laws, recognition by the U.S. Census of home-making as an occupation, the raising of the standard of home equipment, conservation of our natural resources, the creation of national parks, prohibition, peace, and a better understanding of international relations. (M. SH.)

WOMEN'S SUFFRAGE. The Women's Suffrage Movement dates, for all practical purposes from the middle of the 19th century. The systems of government of the ancient world were all based upon the theory that women could take no part in political matters, except when they became reigning queens.

In Great Britain.—In spite of Plato and a few other political theorists, it was not until the French Revolution that the idea that women might share in political power gained any support. Then, however, Condorcet upheld it, and Mary Wollstonecraft wrote her great book *A Vindication of the Rights of Women* in 1792. The French Revolution speedily became unpopular in England, however, and although in the next 40 years a few isolated advocates appeared, it was not until the Chartist Movement began that it again attracted attention. The first draft of the "Charter of Rights and Liberties" was composed in 1838, and is stated to have included Women's Suffrage; but it was not allowed to remain, as it was thought likely to bring ridicule upon the agitation.

Between 1840 and 1850 a certain number of politicians mentioned the subject in their speeches, in particular Richard Cobden, who strongly supported it, and Disraeli, who spoke in its favour when a resolution was introduced into the House of Commons by Joseph Hume. The election of John Stuart Mill to parliament in 1865 marked its real beginning.

Mill was a convinced believer in the importance of this reform, and it occupied a foremost place in his election address. His return to parliament therefore encouraged those women who were thinking about the subject, and in 1866, when it was found that almost all the 50 members of the Kensington Ladies' Discussion Society were its supporters, a group of them, led by Barbara Leigh Smith (Mme. Bodichon), Elizabeth Garrett (Mrs. Garrett Anderson), Emily Davies and Bessie Rayner Parkes (Mme. Belloc) decided to form a provisional women's suffrage committee. Its first work was to collect a petition to parliament, and 1,499 names were secured. This petition, the first of a long series, was presented by Mill in 1867, and in the same year he moved an amendment to the Reform bill by which women were to be enfranchised.

A number of suffrage societies came into existence about this time in London, Manchester, Bristol, Edinburgh and Birmingham, and a real effort at propaganda was undertaken. Mill published *The Subjection of Women,* which he had written seven years earlier, and serious organization was begun. The leader in the north of England was Miss Lydia Becker, a woman of unusual political insight; and her first care was to make certain that women were not already enfranchised under the existing law. Over 4,000 claims to be put on the parliamentary register were sent in by women ratepayers in Manchester, and the same thing was done in other parts of the country. The test case (Chorlton *v.* Lings) was tried before the court of common pleas in 1868, and the decision was that women were disqualified, and attention was thereafter directed to promoting a bill in parliament. In 1869 the municipal franchise was extended to women ratepayers, and in the following year, when the school boards were created, women were made eligible and were actually elected to them.

In 1870 Jacob Bright brought forward a bill for extending the parliamentary franchise to women, and it passed its second reading, but was not allowed time to proceed further. The suffragists then began to hold meetings in various parts of the country.

In 1880 the vote was given to women owners in the Isle of Man, and it was subsequently extended to occupiers also.

During the years before the introduction of the Reform bill of 1884 the suffragists were very active. The political parties seemed to be favourable, and a majority of the members of the House of Commons was individually pledged, but W. E. Gladstone killed their chances of securing the amendment they hoped for. He announced that women would "overweight the Bill" and must be "thrown overboard," and accordingly 104 Liberal members broke their pledges, and the thing was done. The women at last realized the difficulty of trying to secure reform while they were themselves without political power. In 1888, when the county councils were created, women were included among the electorate. Two women were elected to the first London County Council, but their eligibility was challenged, and rejected by the courts, and it was not until 1907 that an act was passed making them eligible to serve on these bodies, and also to hold the office of mayor. The first woman mayor in Great Britain was Mrs. Garrett Anderson, mayor of Aldburgh in 1908.

The suffrage movement passed through a period of comparative discouragement after 1884, and though propaganda continued, and huge petitions were yearly sent in, no fresh developments took place. In the '90s a successful effort was made to interest the working women of the north, and although no progress was apparent in parliament the volume of support for the movement steadily grew. In 1897 the scattered societies united in a National Union, under the presidency of Mrs. Henry Fawcett, and their efficiency greatly increased.

In 1903 an event occurred which was both a symptom of renewed interest and a cause of further progress, namely the formation of the Women's Social and Political Union. Before many years were over this society, led by Mrs. Pankhurst, had developed "militant tactics."

The real development of this policy began in 1906, when the Liberal Party came into power. The older societies were asking for pledges from individual candidates, but the new society believed that the only hope lay in the action of the Government. At a meeting in the Free Trade hall, Manchester, Christabel Pankhurst and Annie Kenney asked what the attitude of the new Government would be. Instead of an answer to their perfectly legitimate question, however, the two girls were seized by the stewards and thrown roughly into the street; and when they held an indignation meeting they were arrested for obstruction, and sentenced to fine or imprisonment. Both chose to go to prison; and the sensation caused by these events was an enormous advertisement to the cause. Thereafter the "militants" adopted the policy of heckling cabinet ministers, of marching with petitions to parliament, and of sending deputations to Downing street. Disturbances and arrests followed, and with every such demonstration the strength of their society grew.

From 1906 the movement entered upon its stage of greatest effort. Organised societies expanded with great rapidity, and the agitation they carried on became incessant. The meetings which multiplied in halls and drawing rooms, in schools and chapels, at street corners and on village greens were missionary meetings, and new converts flocked into the ranks. In 1907 the first public demonstration in the streets was organized, and on a wet afternoon 3,000 women took part in the "mud march" through London. Nothing dreadful happened to them, and the demonstration was repeated in other places. As time went on the scale increased, and vast crowds gathered again and again in the Albert hall, in Hyde park and in other open spaces, and processions, miles long, marched with bands and banners through the streets. Both suffragists and suffragettes developed great ingenuity in propaganda. They turned everything to their uses, and their war-cry, "votes for women," cropped up in the most unexpected places. They chalked the pavements, paraded in sandwich boards, sold their newspapers in the streets, picketed the House of Commons and flooded the streets with leaflets and handbills.

All this commotion put the Government into a very uncomfortable position, since H. H. Asquith, the prime minister, was a violent opponent of the cause. He was determined not to yield; and yet nothing but the granting of the vote seemed likely to stop the agitation. The militants courted arrest, and continued their protests in prison. They adopted the method of hunger striking, and after painful attempts at forcible feeding, which they invariably resisted, the authorities were obliged to release them. While the propaganda of both sections of suffragists developed, the political situation remained unaltered. Private members' bills were introduced, but owing to the opposition of the Government they were either defeated or blocked. In 1910 a serious effort was made to find a solution of the problem, and a conciliation committee of M.P.s with Lord Lytton as its chairman and H. N. Brailsford as its secretary was set up. This committee drafted a bill acceptable to all sections of suffragist opinion, and the second reading was carried in the same year by 110 votes. Asquith refused further facilities, but after the second general election of 1910 the same bill was brought forward again, and was again carried by an increased majority. But still the Liberal Government would not grant facilities, and in the autumn of 1911 Asquith announced that he proposed to introduce a franchise bill "for male persons only." This naturally enraged the suffragists,

and the militants began a campaign of greater violence, destroying property and breaking windows to mark their protest. Early in 1912 the conciliation bill again came forward, but this time, owing to the prospect of the franchise bill and the known wishes of the prime minister, it was defeated by 14 votes—and that in the same parliament as had carried the same bill by 167 votes not a year before. This treatment of their cause still further angered and stiffened the suffragists, but they fixed their hopes upon the coming reform bill, which Asquith had promised would be open to amendments including women.

In Jan. 1913 the committee stage of the reform bill was reached, and the women's suffrage amendments were tabled. Then followed a parliamentary surprise; for, by the Speaker's ruling these amendments were declared so to alter the bill as to make it a different one from that which had already passed its second reading. The consequence was that the whole bill had to be withdrawn, and the chances of women's suffrage seemed to be hopeless.

The militant outbreak which followed was met by the Government with severely repressive measures. An act was passed, officially known as the Prisoners (Temporary Discharge for Ill Health) Act, but commonly known as the Cat and Mouse Act, whereby released hunger strikers could be re-arrested and sent back to prison when their health was restored. Many prisoners were recaptured under this act, and Mrs. Pankhurst, who was sentenced to three years in 1913 was re-imprisoned eight times; yet even so she only served 30 days in the first year.

After the fiasco of the reform bill the National Union adopted the election policy of supporting the party which officially advocated their cause and at that time the only party to do so was the Labour Party. In 1913 the National Union organised a pilgrimage of women, which marched upon London from all over the country, and culminated in a monster meeting in Hyde park. The reception of the pilgrims all along the route was so friendly, and the meetings they held in the towns and villages they passed through were so enthusiastic that they began to feel sure that public opinion was won, and that success was near at hand.

The course of the movement was interrupted in August 1914 by the outbreak of the European war, and the members of the suffrage societies at once turned their energies to helping the country through the economic difficulties of the time. "Let us prove ourselves worthy of citizenship" said Mrs. Fawcett in a message to her followers, "whether our claim be recognised or not." The suffragette prisoners were pardoned and the Women's Social and Political Union ceased to exist, but the National Union remained as an organised body and undertook relief work of many kinds.

For a time it seemed as if the suffrage question was lost to sight; but the war work which women were able to do was of such value, and they revealed such unsuspected powers and abilities that public opinion became very favourable to them. In 1916 the question of a new registration bill arose owing to the impossibility of re-registering the men who were absent on war service under the old act; and when the suffragists pointed out that any change in the basis of registration would be a change in the franchise, and that if it were made the women's question ought at the same time to be considered, they found not only the Coalition Government, but the whole press and people of the country in agreement with them. After several unsuccessful efforts to settle the matter without raising the whole franchise issue, H. H. Asquith invited the Speaker to call a conference representative of all the parties. The conference reported in Jan. 1917 in favour of a limited form of women's suffrage to householders and the wives of householders provided they had reached the age of 30 or 35 years; and this proposal, with the lower of the age limits, was inserted into the bill which D. Lloyd George's Government introduced. In June 1917 the clause enfranchising women was carried in the House of Commons by a majority of 7 to 1, with the general approval of the whole country. Early in the following year it passed the House of Lords, and received the royal assent.

The reason for the insertion of the age limit and the other differences between the franchises of men and women was to reduce the numbers of women voters, so that they should not be in a majority; and the suffrage societies, although continuing to work for equality, accepted this as a first step. In Nov. 1918 the act making women eligible for election to Parliament was passed, and at the election of that year women not only voted for the first time, but stood as candidates. The only one elected was the Countess Markievicz, who, being a Sinn Feiner did not take her seat; but in 1919 the Viscountess Astor was elected.

It immediately became evident that there was no danger of the formation of a "Woman's Party," and the extension of the franchise worked so smoothly that within a year or two all three political parties declared themselves in favour of extending the vote to women upon equal terms. In March 1928 the Conservative Government brought forward a new Representation of the People bill for this purpose. This was carried with only ten dissentients in the House of Commons, by 387 to 10. The bill passed the House of Lords in May with a majority of 79, and received the royal assent on July 2, 1928. With its passage into law complete political equality was granted to women, and the Women's Suffrage Movement in Great Britain came to an end.

In the British Dominions.—In all the British Dominions except South Africa some form of women's suffrage is in force. New Zealand enfranchised its women in 1893, and the commonwealth of Australia in 1902, South Australia having previously granted state suffrage in 1894, and West Australia in 1899. New South Wales granted it in the same year as the commonwealth, Tasmania followed in 1903 and Queensland and Victoria in 1905 and 1908. Canada acted in the matter almost at the same time as Great Britain. All the provinces except Quebec adopted it in 1916, and the Dominion followed in 1917. In Newfoundland women vote at municipal elections on the same terms as men, but at the age of 25 instead of 21 at parliamentary elections. In the Irish Free State equal franchise and eligibility are in force. In India the Government of India Act specifically left the question to be decided province by province by the elected legislatures. Cochin, Travancore and Jehalwar adopted it in 1921, Mysore in 1923, Assam in 1924, Bengal in 1925 and the Central Provinces in 1927. Burmah also adopted women's suffrage in 1922 when it became a province of India. Jamaica, South Rhodesia and British East Africa gave votes to women in 1919 and 1920. At Trinidad, Tobago and the Windward islands women vote at 30 and men at 21, and women are not eligible for election, and in the Channel islands they vote on equal terms, but are eligible only in Guernsey.

In Other Countries.—Before the World War there were only four countries where women exercised the franchise. In 1928 it is the practice in the great majority of the countries of the world, the principal exceptions being France, Italy and Spain. The position in 1928, in countries other than Great Britain and the Dominions, is as follows: Equal suffrage and eligibility for all elected bodies prevail in Austria, Czechoslovakia, Denmark, Esthonia, Finland, Germany, Iceland, Lettonia, Lithuania, Luxemburg, the Netherlands, Norway, Poland, Russia and Sweden. In Hungary women have the municipal franchise and the parliamentary franchise at the age of 30 with eligibility. Municipal suffrage is granted in Spain, in the Argentine (province of San Juan), in Brazil (province of Rio Grande do Norte) and in Belgium, where women are also eligible for Parliament, but without the right to vote (except in the case of a limited class of war sufferers). In Greece limited municipal suffrage without eligibility was passed to come into force in 1927, but the necessary decree has not been issued. In Italy a limited measure of municipal suffrage has been granted, but is inoperative. In Palestine women have equal suffrage and eligibility for the Jewish National Assembly, but have no voting rights under the constitution.

BIBLIOGRAPHY.—*Women's Suffrage* (1912) and *The Women's Victory and After* (1920) by Dame Millicent Fawcett describe the progress of the Suffrage campaigns. Sylvia Pankhurst, *The Suffragette* (1911) and Mrs. Emmeline Pankhurst, *My Own Story* (1914) deal with the militant movement, as does also *Prisons and Prisoners* (1914) by Lady Constance Lytton. Ray Strachey, *The Cause: A Short History of the Women's Movement in Great Britain* (1928) covers the whole field, and contains a bibliography. (M. G. F.; R. St.)

THE UNITED STATES

As the first experiment in a so-called democracy was made in the new Government known as the United States, it seemed most

fitting that there it should reach its full fruition in complete and universal suffrage. The earliest colonists recognized the value of a vote for the law-makers and the laws, but in the beginning it was very closely restricted to the members of certain specified churches and to those whose names were on the tax list, while in some cases a slight educational requirement was made. Women, even though qualified, were almost universally excluded.

After the Revolutionary War when the convention met in Philadelphia to organize the States no question aroused such vehement discussion as that of the suffrage. It was so long continued that finally the only solution possible was to omit the subject from the National Constitution and leave each State free to make its own qualifications for voting.

Meanwhile women were receiving the rudiments of an education and slowly acquiring a voice. By 1832 the anti-slavery question was becoming acute. Women were intensely interested and were developing so much power as public speakers that the question of allowing them on its platform had divided the Anti-Slavery Association, the Garrison-Phillips branch standing by Lucretia Mott and her contemporaries. Among these were the "Quakers" who always had recognized the equal rights of women. In later years Elizabeth Cady Stanton, of Revolutionary ancestry, had joined the anti-slavery forces and she and Lucretia Mott decided that the rights of women as well as those of the negro slave needed redressing. In July 1848, at a Friends' Yearly Meeting in Western New York, they issued a call for the first Woman's Rights Convention in all history. It met in Seneca Falls, Mrs. Stanton's home, on July 19, and after a two days' session adjourned to Rochester.

This may be regarded as the beginning of the movement for woman suffrage not only in the United States but in the world. It received the wide publicity of the New York *Tribune* under Horace Greeley and was followed in 1850 by a convention in Worcester, Mass., under the auspices of Lucy Stone and a distinguished group of Eastern suffragists. The movement, however, still lacked the dynamic force which was to put it into effective action and this was soon supplied by Susan B. Anthony. In 1851 she first met Mrs. Stanton and the friendship began which remained unbroken for over 50 years. Each was the needed complement of the other. Miss Anthony attended her first woman's rights convention in Syracuse in 1852, her last in Baltimore in 1906, one month before her death.

At first no way of extending suffrage was known except through amendments to State constitutions, which required the consent of a majority of the male voters. The first attempt was made in Kansas in 1867, immediately after the close of the Civil War, in which for four years women had borne an heroic part. An amendment was submitted at the same time to enfranchise the newly-liberated male slaves, who had flocked into that State. Both were defeated but the latter had a much larger majority in its favour. The women then had their first lesson in what was before them. All the States had the word "white" in the suffrage clause of their Constitutions, and legislatures in a number of them submitted amendments to the voters to take it out. In every instance they were defeated and it was evident that some other method must be found if the negro men were to vote, which the Republican Party was very desirous that they should do. This Party was in power in all the States and a measure was decided on that had not been attempted since early days, which was for the Congress to submit an amendment to the National Constitution.

As soon as this intention was announced Miss Anthony and some of the woman suffrage leaders rose up in arms and demanded that this proposed amendment should not enfranchise only coloured men but all women. Most of the men who had been the strongest advocates of woman suffrage opposed this demand and they were supported by some of the women, all of whom feared that it would imperil the success of the amendment. Women were not included in this 14th amendment, and later, when a 15th was found necessary to strengthen it, they were also excluded.

The woman suffrage leaders, however, perceived a new method, which did not seem so utterly hopeless as amending the Constitution of every State by consent of a majority of the voters. In New York city in 1869, at the close of the May anniversary of the Equal Rights association, which had been formed soon after the war to protect the negro men, they formed a National Woman Suffrage association. Representatives from 19 States were present and its object was declared by resolution to be to secure the ballot for women by a 16th amendment to the Federal Constitution. Mrs. Stanton was elected president and Miss Anthony chairman of the executive committee. This organization held a national convention every year thereafter for 50 years and went before committees of every Congress asking for this amendment. Its leaders soon learned that pressure from the States on their representatives in the Congress would be absolutely necessary and so they began to organize the States to work on the legislatures until every State was organized. In the autumn of 1869 another distinguished group, headed by Lucy Stone, organized a national association called the American, solely for this purpose. In 1890 the two organizations united under the name of National American, which worked for both objects for almost 30 years.

Mrs. Stanton, Miss Anthony and their heroic contemporaries passed away, leaving the work to be finished by their successors in office, Dr. Anna Howard Shaw and Mrs. Carrie Chapman Catt, who now headed a determined army of women eventually increased to many thousands. Individual States began to yield and enfranchise their women and each one increased the members of Congress elected partly by women, who were thus obliged to vote for an amendment to the National Constitution. The revenues increased annually, $120,000 being subscribed in 1919 to the work of the National Association, exclusive of the amounts raised by the various States for their own work.

It was found that legislatures could give women the vote for presidential electors and in some States the municipal and various forms of local franchise. Those of Arkansas and Texas gave the primary suffrage, equivalent to a full vote. Meanwhile campaigns were being vigorously conducted to persuade the legislatures to submit to the voters amendments to the State Constitutions conferring the full suffrage in State affairs. This was accomplished in New York in 1917 and was the greatest victory yet achieved. By 1918 women had thus acquired equal suffrage with men in 15 States, offering the only instance in the world where the voters themselves gave the franchise to women.

Meanwhile other associations national in character had been formed. The Federal Association was organized in 1892, of which the Rev. Olympia Brown was president for 17 years and many prominent men and women were members. Its object was the passage of a law by the Congress authorizing women to vote for members of the lower house, which would have been constitutional. The College Equal Suffrage League was organized in 1908 with Dr. M. Cary Thomas, president of Bryn Mawr college, at its head during the nine years of its existence, and it co-operated with the National American Association. This was true also of the Friends' (Quakers') Association. Mississippi Valley Conferences were organized in 1912 and Southern Women's Conferences the following year, which did effective work in their sections as auxiliaries of the National American as long as it was needed. A Congressional Union was formed in Washington in the spring of 1913 to support the work of the association's Congressional Committee, but in December it became an independent organization with headquarters in Washington and Miss Alice Paul as its head. Its object was a Federal amendment, which it attempted to secure by aggressive and militant methods never before employed in the United States. At the time of the National Republican Convention in Chicago in 1916 it adopted the name National Woman's Party. Later it established permanent headquarters in Washington through a gift of Mrs. Oliver H. P. Belmont, who became its president. In 1911 a National Men's League for Woman Suffrage was organized in New York and soon had many State branches officered by prominent men.

By 1918 the United States had entered the World War, and the nation-wide response of the women to every demand made on them and their valuable work broke down the barriers of the opposition. All the political parties were committed to their enfranchisement, but there was still enough opposition in the

Congress to delay the final vote of both Houses to submit the amendment to the legislatures until June 1919. The tremendous struggle was then ahead of securing the ratification of three-fourths of the legislatures in time for the women to vote at the presidential election of Nov. 1920. Most of them had adjourned and this would have to be done by special sessions. It was accomplished and the last certificate, that of Tennessee, was delivered to Secretary of State Bainbridge Colby at 4 o'clock in the morning of Aug. 26, 1920. At 9 o'clock he issued the official proclamation that the 19th amendment having been duly ratified by 36 State legislatures "has become valid to all intents and purposes as a part of the Constitution of the United States." It reads as follows: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex." From that hour complete and universal woman suffrage was the law of the land.

WONOSOBO, a town in Central Java, residency Kedu, the "capital" of Java's beautiful highland district known as the Dieng Plateau, is 7,000 ft. high and surrounded by mountains. Wonosobo is 3,400 ft. high and is connected by steam tramway with the main railways of Java. Pop. 7,300. It has a delightful climate and is visited mostly as a starting-point for excursions to the Plateau. A motor road runs from Wonosobo to Garung, five m. distant, and from there to the Plateau a rough road, traversed on foot, or by sedan chair, leads, by way of the charming lake of Mendjer, to Kejajar. A climb from here leads past the native villages of Tieng, Lowang, Wadasputi and Parikesit, on to the Plateau, where there is a small hotel and a government rest-house (*pasangrahan*). The Plateau has a cold and bracing climate, almost Alpine scenery, small lakes, several Arjuna temples of Hindu construction (*see* JAVA).

WOOD, ANTHONY À[1] (1632–1695), English antiquary, was the fourth son of Thomas Wood (1580–1643), B.C.L. of Oxford, where Anthony was born on Dec. 17, 1632. He was sent to New College school in 1641, and at the age of twelve was removed to the free grammar school at Thame, where his studies were interrupted by civil war skirmishes. He was then placed under the tuition of his brother Edward (1627–1655), of Trinity college. He was entered at Merton college in 1647, and made postmaster. In 1652 he amused himself with ploughing and bell-ringing, and "having had from his most tender years an extraordinary ravishing delight in music," began to teach himself the violin, and was examined for the degree of B.A. He engaged a music-master, and obtained permission to use the Bodleian, "which he took to be the happiness of his life." He was admitted M.A. in 1655, and in the following year published a volume of sermons by his late brother Edward. He began systematically to copy monumental inscriptions and to search for antiquities in the city and neighbourhood. He went through the Christ Church registers, "at this time being resolved to set himself to the study of antiquities." Dr. John Wallis, the keeper, allowed him free access to the university registers in 1660; "here he layd the foundation of that book which was fourteen years afterwards published, viz., *Hist. et Antiq. Univ. Oxon.*" He also came to know the Oxford collections of Brian Twyne to which he was greatly indebted. He steadily investigated the muniments of all the colleges, and in 1667 made his first journey to London, where he visited Dugdale, who introduced him into the Cottonian library, and Prynne showed him the same civility for the Tower records. On Oct. 22, 1669, he was sent for by the delegates of the press, who arranged to publish his work. In 1674 appeared *Historia et antiquitates Universitatis Oxoniensis,* handsomely reprinted "e Theatro Sheldoniano," in two folio volumes, the first devoted to the university in general and the second to the colleges. His great work was produced by a London publisher in 1691–1692, 2 vols. folio, *Athenae Oxonienses: an Exact History of all the Writers and Bishops who have had their Education in the University of Oxford from 1500 to 1690, to which are added the Fasti, or Annals for the said time.* On July 29, 1693 he was condemned in the vice-chancellor's court for certain libels against the late earl of Clarendon, fined, banished from the university until he recanted, and the offending pages burnt. Wood died on Nov. 28, 1695, and was buried in the outer chapel of St. John Baptist (Merton college), in Oxford, where he superintended the digging of his own grave but a few days before.

Wood's original manuscript (purchased by the Bodleian in 1846) was first published by John Gutch as *The History and Antiquities of the Colleges and Halls in the University of Oxford, with a continuation* (1786–90, 2 vols. 4to), and *The History and Antiquities of the University of Oxford* (1792–96, 3 vols. 4to), with portrait of Wood. To these should be added *The Antient and Present State of the City of Oxford, chiefly collected by A. à Wood, with additions by the Rev. Sir J. Peshall* (1773, 4to; the text is garbled and the editing very imperfect). An admirable edition of the *Survey of the Antiquities of the City of Oxford, composed in 1661–66 by Anthony Wood,* edited by Andrew Clark, was issued by the Oxford Historical Society (1889–99, 3 vols. 8vo.). Wood bequeathed his library (127 MSS. and 970 printed books) to the Ashmolean Museum, and the keeper, William Huddesford, printed a catalogue of the MSS. in 1761. In 1858 the whole collection was transferred to the Bodleian, where 25 volumes of Wood's MSS. had been since 1690.

We are intimately acquainted with the most minute particulars of Wood's life from his *Diaries* (1657–95) and autobiography; all earlier editions are now superseded by the elaborate work of Andrew Clark, *The Life and Times of Anthony Wood, Antiquary, of Oxford, 1632–1695, described by himself* (Oxford Historical Society, 1891–1900, 5 vols. 8vo). *See* also *Reliquiae Hearnianae,* ed. Bliss (2nd ed., 1869, 3 vols. 12mo.); Hearne's *Remarks and Collections* (Oxford Historical Society, 1885–1907), vols. i.–viii.; Macray's *Annals of the Bodleian Library* (2nd ed., 1890); Nichols's *Literary Anecdotes* (9 vols., 1812–15), i. iv. v. viii.; T. Granger's *Biogr. History of England* (3 vols., 1806, ed. by Noble), i.

WOOD, MRS. HENRY [ELLEN] (1814–1887), English novelist, was born at Worcester on Jan. 17, 1814. Her maiden name was Price; her father was a glove manufacturer in Worcester. She married Henry Wood in 1836, and after her marriage lived for the most part in France, her husband, who died in 1866, being at the head of a large shipping and banking firm. In 1860 she wrote a temperance tale, *Danesbury House.* Her first great success was made with *East Lynne* (1861) which was translated into several languages, and was dramatized with great success. Other novels followed. She became proprietor and editor of the *Argosy* magazine in 1867. She died on Feb. 20, 1887.

Memorials of Mrs. Henry Wood, by her son, were published in 1894.

WOOD, SIR HENRY EVELYN (1838–1919), British field marshal, was born at Braintree, Essex, on Feb. 9, 1838, the youngest son of Sir John Page Wood, Bart. Educated at Marlborough, he entered the Royal Navy in 1852, and served as a midshipman in the Crimean War. He then transferred into the army. Wood served in the Indian mutiny, and returned from India with a V.C. and a growing reputation. In 1878 he became regimental lieutenant-colonel of the 90th, which he immediately joined in South Africa. In January 1879 he was in command of the left column of the army that crossed the Zulu frontier. At the close of the war Sir Evelyn Wood was appointed to command the Chatham district. But in January 1881 he was again in South Africa with the local rank of major-general, and after Sir G. P. Colley's death at Majuba he negotiated the armistice with General Joubert. He returned to the Chatham command in 1882, having meantime been promoted substantive major-general. In 1882 he commanded a brigade in the Egyptian expedition. Wood remained in Egypt for six years. From 1883 to 1885 he was Sirdar of the Egyptian army, which he reorganized and in fact created. During the Nile operations of 1884–85 he commanded the forces on the line of communication of Lord

[1] In the *Life* he speaks of himself and his family as Wood or à Wood, the last form being a pedantic return to old usage adopted by himself. A pedigree is given in Clark's edition.

Wolseley's army. In 1886 he returned to an English command, and in January 1889, he was appointed to the Aldershot command. In 1891 he went to the War Office as quartermaster-general. Four years afterwards he became adjutant-general. He was promoted full general in 1895. He commanded the II. Army Corps and Southern Command from 1901 to 1904, being promoted field marshal on April 8, 1903. In 1907 he became colonel of the Royal Horse Guards. After retiring from active service he took a leading part, as chairman of the Association for the City of London, in the organization of the Territorial Force. He died on Dec. 2, 1919. Sir Evelyn Wood published several works, perhaps the best known of which to the soldier are *Achievements of Cavalry* (1897) and *Cavalry in the Waterloo Campaign* (1896). He also wrote *The Crimea in 1854 and in 1894;* an autobiography, *From Midshipman to Field Marshal;* and *The Revolt in Hindostan.* In 1917 he published a volume of reminiscences entitled *Winnowed Memories.*

WOOD, SIR HENRY JOSEPH (1869–), English conductor and musician, was born in London on March 3, 1869. His musical education was largely received at the Royal Academy of Music, and at the age of ten he became deputy organist at St. Mary's Aldermanbury. As a conductor he first appeared in 1889 with Rousbey opera company, and for some years he toured with various companies, including the Carl Rosa (1891). His name has been closely bound up with the musical life of London since 1895, when the Queen's Hall Promenade concerts were started under a system of guarantees, with himself as conductor and Robert Newman as manager. These increasingly popular concerts, held nightly during August and part of September, have been conducted by Sir Henry Wood throughout, although the management has thrice changed hands and the concerts have, since 1927, been under the direction of the British Broadcasting Corporation. The educative results of Sir Henry's liberal programme policy have been very remarkable. As conductor of the Queen's Hall Symphony concerts, established in 1897, he has made for himself a high international reputation and has greatly raised the standard of orchestral playing in England. He was knighted in 1911.

WOOD, JOHN (*c.* 1705–1754), British architect, was born about 1705, probably in Yorkshire. He settled in Bath in 1727, and is known as "Wood of Bath." He paid several earlier visits to Bath for the purpose of constructing roads. As an architect he was particularly successful in his designs for streets or groups of houses, and became well known as a follower of the Palladian school. His designs in Bath include Queen's square; Prior park, built for Ralph Allen; and the Royal crescent, designed by himself, but built under the direction of his son. The Bristol (1740–43) and Liverpool (1748–55) exchanges were also designed by Wood, and he restored Llandaff cathedral. His best work is, however, to be seen in Bath, where his classical style harmonized with the spirit of the town as he found it. He died on May 23, 1754. Many of his designs were carried out after his death by his son John (d. 1782), who also, in addition to many groups of houses, built the Hot bath and the Royal Private baths.

The elder Wood wrote *Choir Gaure* (Stonehenge, 1747); *Essay Towards a Description of Bath* (2 vols., 1742; reprinted, 1749 and 1765); and several other works on architecture.

WOOD, LEONARD (1860–1927), American soldier, was born at Winchester, N.H., Oct. 9, 1860. He graduated from the Harvard medical school in 1884, was appointed acting assistant surgeon, U.S. army, in 1885, becoming assistant surgeon with the rank of first-lieutenant in 1886, when he was assigned to Capt. Lawton's expedition against the Apaches in the South-west, resulting in the capture of Geronimo. For distinguished services he was awarded the Congressional Medal of Honour. In 1891 he was promoted captain and full surgeon, and later, while stationed in Washington, D.C., became the close friend of Theodore Roosevelt, then Assistant-Secretary of the Navy. On the outbreak of the Spanish-American War in 1898 Wood was commissioned colonel 1st U.S. Volunteer Cavalry (the famous Rough Riders) with Roosevelt as lieutenant-colonel. For conduct at Las Guasimas and San Juan Hill, Wood was promoted brigadier-general, July 1898, and in Dec. major-general of volunteers. He was military governor of Cuba from 1899 to 1902, when the Cuban Republic was established. He was appointed brigadier-general U.S.A. Feb. 1901. In 1903 he was sent to the Philippines and appointed governor of the Moro province, being promoted major-general in that year. In 1908 he returned to America as commander of the Eastern Department. In 1910 he was appointed chief of staff, U.S. Army, serving until 1914, when he was again given command of the Eastern Department.

Gen. Wood as early as 1908 had urged preparedness. To him was largely due the establishment of a summer camp at Plattsburg for training civilian officers, which was taken as a model for other camps of the kind after America's entrance into the World War. Just before America's entrance into the World War in 1917 Gen. Wood was assigned to the South-eastern Division but was later transferred to Camp Funston, where he trained the 89th Div., N.A., the 10th Div. of the regular army and other troops. In 1919 he was put in command of the Central Department, with headquarters at Chicago. In 1920 he was a prominent candidate for the presidential nomination at the Republican National Convention. Harding, a "dark horse," was nominated on the 10th ballot, with 692½ votes to 156 for Gen. Wood. In 1921 Gen. Wood was sent at the head of the Wood-Forbes mission to the Philippine islands. Prior to leaving he was appointed head of the University of Pennsylvania, but did not assume charge because of the President's desire that he should remain in the Philippines as governor-general, a position which he held from Oct. 1921 until his death which occurred in Boston, Mass., on Aug. 7, 1927. Wood was the author of *The Military Obligation of Citizenship,* lectures at Princeton and elsewhere (1915); *Our Military History, Its Facts and Fallacies* (1916); *Universal Military Training* (1917); and *America's Duty as Shown by Our Military History* (1921).

See I. F. Marcosson, *Leonard Wood, Prophet of Preparedness* (1917); Joseph H. Sears, *The Career of Leonard Wood* (1919); and *Leonard Wood on National Issues* (1920), compiled by Evan J. David; Herman Hagedorn, *That Human Being, Leonard Wood* (1920); Walter Robb, *The Khaki Cabinet and Old Manila* (1926).

WOOD, ROBERT WILLIAMS (1868–), American physicist, born in Concord, Mass., May 2, 1868. He graduated at Harvard in 1891, studied a year at Johns Hopkins university and two years at the University of Berlin (1892–94). He was assistant professor in physics at the University of Wisconsin, 1897–1901, and then became professor of experimental physics at Johns Hopkins. A method which he originated in 1898 of thawing frozen water mains and service pipes by passing an electric current through them has been widely adopted. He was awarded the Rumford medal for investigations in light, particularly for his work upon the optical properties of metallic vapours, and the John Scott Legacy medal for his diffraction process of colour photography. Besides scientific papers and monographs he is the author of *Physical Optics* (1905; rev. ed., 1911) and *Researches in Physical Optics* (2 vols., 1913–19).

WOOD. In all classes of plants, including for instance ferns, more highly organized than mosses, wood occurs in all members of the plant and is continuous from the finest rootlets up the root and stem, into the leaves and flowers or the equivalents of these. Wood performs two functions in the plant's life: first, it serves for the transport of water and contained salts, absorbed by the roots, to parts where this "raw sap" is needed and especially to the leaves; secondly it gives mechanical strength to the plant.

In palms and bamboos the wood of the leaves is string-like in form and is confined to the nerves or veins; from these the strings extend into the trunk or stem, where they descend but join one another at intervals thus producing a more or less basket-like or loose loofah-like complex, which is embedded in the general mass of tissue composing the rest of the trunk. Thus it is this linked net-like complex of woody strings that corresponds to the solid mass of wood of a pine or oak.

Wood that has attained only slight thickness and accordingly cannot be termed timber, is nevertheless utilized, for instance in the form of thin branches and twigs to make besoms and baskets. Even when wood attains greater thickness it is not always timber,

since there are some woods so soft, light in weight, and weak that they have little or no value as structural material upon which there is a demand for strength: such wood supplies means of flotation for fishing-nets and buoys, and insulation, while the lightest of all are pith-like and are the materials of which sun-helmets are composed. Some of these hats are known as "solar topees," yet the word "solar" has no relation to the sun as it is a perversion of the East Indian name, solah, of the aquatic plant producing this wood. (*See* also TIMBER.) (P. GM.)

WOODBINE, a plant name, applied in England to the honeysuckle (*q.v.*) and in America to the Virginia creeper (*q.v.*).

WOODBRIDGE, a market town in Suffolk, England; 79 m. N.E. by E. from London by the L.N.E.R. Pop. (1921) 4,595. Woodbridge Abbey, built by Seekford, occupies the site of an Augustinian foundation of the 12th century. There is a large agricultural trade, and general fairs and horse fairs are held.

WOODBURY, LEVI (1789–1851), American political leader, was born at Francestown, N.H., on Dec. 22, 1789. He graduated from Dartmouth college in 1809, was admitted to the bar in 1812, and was a judge of the superior court from 1816 to 1823. In 1823–24 he was governor of the State, in 1825 was a member and speaker of the State house of representatives, and in 1825–31 and again in 1841–45 was a member of the U.S. Senate. He was secretary of the Navy in 1831–34, secretary of the Treasury in 1834–41, and associate justice of the U.S. Supreme Court from 1846 until his death at Portsmouth, N.H., Sept. 4, 1851.

WOOD-CARVING, the process whereby wood is ornamented with design by means of sharp cutting tools held in the hand. The term includes anything within the limit of sculpture in the round up to hand-worked mouldings such as help to compose the tracery of screens, etc. (For the technique of this art, *see* SCULPTURE TECHNIQUE, WOOD-CARVING.) (X.)

AFRICAN

In dealing with African woodwork, a distinction must be drawn between the Mohammedan and the fetishistic countries.

Mohammedan Art.—In the Mohammedan countries, which are mainly in the north, the art has remained decorative, and statuary has been excluded; this is due partly to the natural bent of the Semitic race, which, coming from Arabia, has dominated these regions since the time of Mohammed, and partly to specific commandments in the Koran. Objects in daily use, furniture, and semi-architectural work are consequently almost the only forms of art for which the natives have used wood in Egypt, Tripoli, Tunis, Algeria, and Morocco, and among the scattered tribes north of Lake Chad and the Niger. Among objects in daily use, mention may be made of the powder-flasks of the Berber tribes of northern Morocco, carved with geometrical designs, and in some cases ornamented with copper studs and filigree-work; rifle-stocks inlaid with silver, ivory, and mother-of-pearl; mirrors, small chests, and boxes, similarly inlaid, particularly among the peoples more directly influenced by Egypt and the East.

Special attention has been paid by the Egyptians to furniture, and they have always excelled in inlaying, marquetry, and turned-wood work. There are but few types, however. Some are of a liturgical character, like the *kursi,* or Koran reading-desk, and the *minbar,* or pulpit, while others are for household purposes, like the *sanduq* or clothes-chest and the *marfoa* or dresser. These have often, particularly in Morocco, been carved with palm-leaves or conches and painted in gay colours. The Moors had also bed-ends, small cupboards, and large armchairs used at marriage-feasts, of chased wood, painted with delicate floral and geometrical designs. But it is in large-scale architectural decoration that the African Muslims have displayed the highest degree of skill.

The *mqarbe* or bees'-nest process consists in constructing arches, niches, or cupolas by placing together a large number of small wooden pales, all capable of reduction to seven fundamental forms, and each projecting corbel-wise in the manner of a trumpet. A series of these little trumpets is formed into vaults or portions of vaults hollowed out into hundreds of cells and bristling with stalactites, producing the most opulent effect.

Another process is the large-scale mosaic in wood, used mainly for ceilings and doors in magnificent buildings. For ceilings it is used in two ways: (1) The beams being left visible and assembled in lines agreeable to the eye, panels of various shapes being interposed between them at intervals to produce a large mosaic presenting various combinations and geometrical flourishes. (2) A rough framework, which is not visible, having inlaid upon it panels of wood on which baguettes and leaves of wood are applied so as to form a mosaic in relief. In the case of doors the processes are much the same, except that uprights and lintels take the place of beams and joists. This art of wood mosaic has been practised with great success, especially in Morocco and Egypt. In Morocco it has almost always been embellished with very delicate arabesques, painted with size, varnished, and gilded. In Egypt, in the best periods, it was adorned with elements in ivory, ebony, or even precious metal, with thin sheets of wood here and there.

Turned woodwork has been used mainly for balustrades and partitions. The native method is to fit little twirls between turned baguettes. Both twirls and baguettes are made on primitive lines, with a wire saw wielded in one hand, the other hand holding a chisel which is guided with the foot. The method is still in use among the Spaniards in certain Andalusian towns. Partitions of turned wood have been used chiefly by the Egyptians, for the kind of loggia called *musharrabieh* which gives so picturesque an appearance to the streets of old Cairo.

The Muslims have produced some most beautiful interior decoration in the form of wood-carving. In Morocco more especially, the inner courtyards of the houses in the 14th, 15th and 16th centuries were ornamented throughout with corbelled penthouses, friezes, lintels, and mural facings in carved wood. The carving is not very deep; it is a bas-relief, with sometimes an intermediate plane between the foundation and the most salient parts. The decorative motifs are floral twines composed of two-branched palm-leaves, interspersed with conches and pineapples. There are also inscriptions in Arabic characters artistically intertwined with the floral elements. The depth of the hollows is from 3 to 4 centimetres. Very often, however, especially in more modern buildings, the wood has been simply engraved on the surface, so as to accentuate the painting a little more heavily.

In practice these different methods of decoration are often combined. So in doors or very elaborate ceilings in wood mosaic, the boards may be carved with interlaced palm-leaves. The panels of which inlaid ceilings are composed are not always ornamented with mosaic; many of them are merely engraved with rectilinear geometrical designs. Again, partitions of turned wood are frequently embellished with baguettes forming combinations or even inscriptions in stylized Cufic characters.

It should be added that all these methods of woodworking have also been applied to objects not directly concerned with architecture, such as *mihrabs* (niches indicating the direction of Mecca in mosques), and in particular to some *minbars* (pulpits).

At the present day the native woodwork is not so excellent as it used to be; but highly-skilled joiners, carpenters, and wood-carvers are still to be met with in Morocco. Marshal Lyautey, while he was administrator attached to Sultan Mulay Yussef, helped to preserve these traditions of craftsmanship. Among the best-known examples are: At Cairo, the rich collections of the museum of Arab art, several doors and minbars of mosques, lids of tombs, etc.; at Kairuan (Tunis), the minbar (9th century) and the maqsura (11th century) of the Sidi-Okba mosque; at Algiers, the minbar of the chief mosque (11th century); at Fez, the splendid decorations in the inner courtyards of the Medersas of Buanania, El Attarin, El Mesbahiya, Es Sahrij (14th century), and Esh Sharrabin (16th century); at Marrakesh, the minbar of the mosque of El Kutubia, the wall-facings and friezes of the Ben-Yussef Medersa (16th century), and the stalactite vault of the mausoleum of the Saadian princes (16th century).

Fetishistic Art.—In the Fetishistic countries, peopled by black races, the development of art has been entirely opposite to that in the Mohammedan countries; it has been concerned mainly with the representation of living beings. This art is essentially religious. The carved wooden images are mostly

statuettes of gods and goddesses and masks for ritual dances. Drinking-cups, seats, head-rests, etc., are also met with. Though long regarded as purely barbarous, in recent years negro art has attracted the attention of a large number of enthusiastic collectors, who recognize in it not merely an unusual and individual character, but qualities of construction, synthesis, and even frequently expression, together with a striking decorative power and delicacy of ornament in objects of daily use. Few of the examples that have reached us are of any great age, the oldest dating back only some two or three centuries. According to the closest students, however, they follow for the most part traditional types the canons of which were established in very remote times. One of the features of the human effigies is the intentional smallness of the lower limbs. Some say that this deformity is intended to represent the primitive inhabitants of Africa, the Pygmies or Negrillos, who are supposed to have been deified by the negroes.

Roughly, the chief centres of negro art are: Benin, where local traditions have mingled with Portuguese influences dating from the 14th and 15th centuries, with engaging results; the Ogowé, in the north of Gaboon, where wooden fetishes sheathed in copper plating are the chief feature, the human form being completely conventionalized into a geometrical figure; Dahomey, where the human figures are much more realistic; the Congo, where there are statuettes covering a fairly wide range of types, and also, in the Kasai basin, objects of daily use which are remarkable both in form and in ornamentation—goblets, drinking-cups, musical instruments, chairs, etc.

Guinea, the Oil rivers, the Sudan, the Ivory coast, the Gold coast, Dahomey, Liberia, the Cameroons, Gaboon, etc., have produced statues and masks displaying the most painstaking workmanship. Wood-carving is also found in Loango and Angola. The finest collections of negro art are in the British museum, the Trocadéro museum at Paris, the Tervueren museum near Brussels, and various museums in Germany. (J. GAL.)

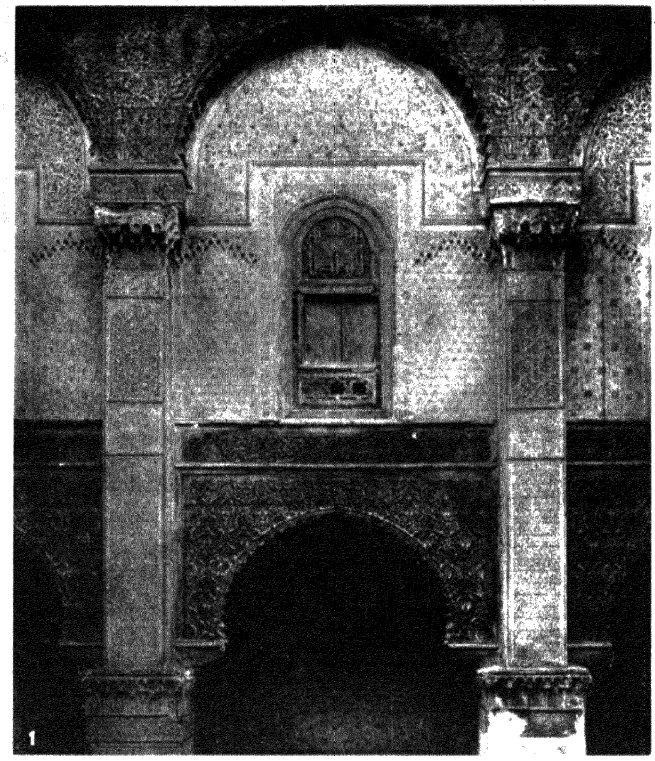
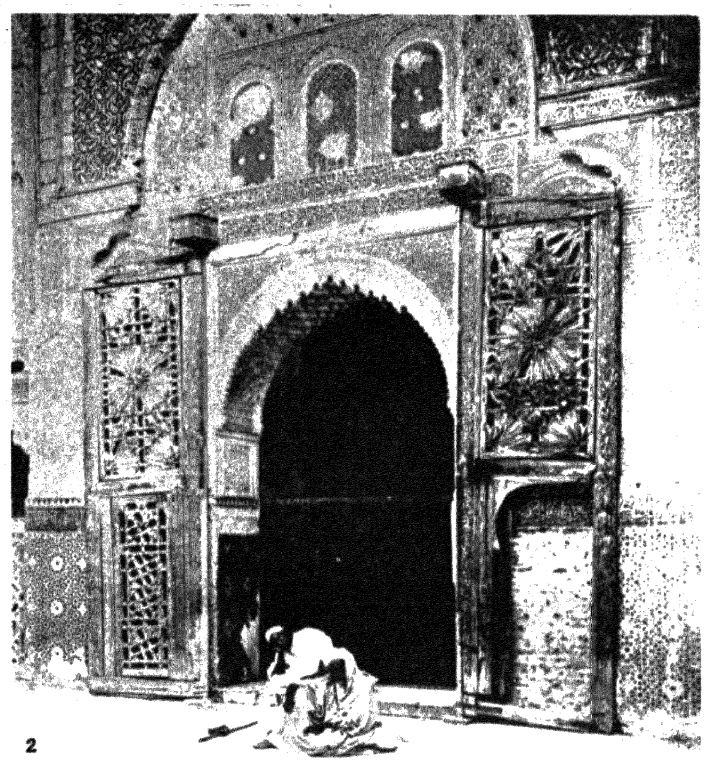
FAR EASTERN

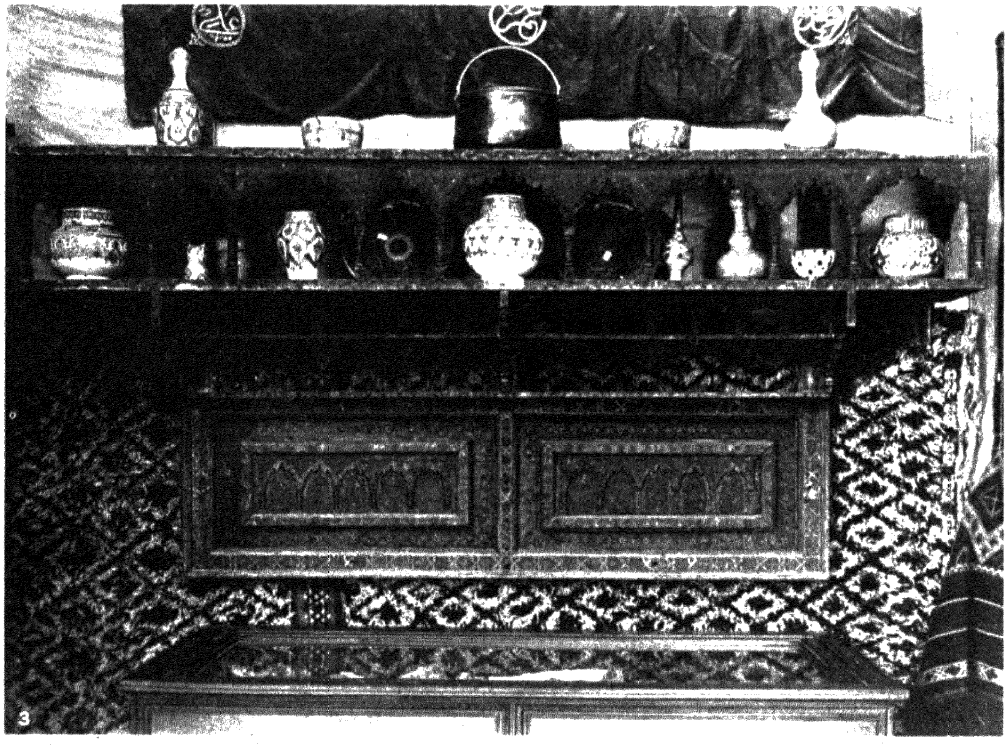
Splendid examples of Japanese 8th century wood-carving may be found in the phoenix and musical angels adorning the canopy hung in the Kondō of Hōryuji and in the *gigaku* masks carved in paulownia wood and preserved in the Imperial treasure-house Shōsōin, the Hōryuji monastery and other ancient temples in Japan. The *gigaku* masks in the Shōsōin, numbering 164, the majority of which are in wood, the most of which are in paulownia, if not all, the rest being in dry-lacquer, are believed to have been used in connection with religious services observed at Tōdaiji, especially at the inauguration ceremony of the Great Buddha which took place on April 9, 752. The belief is substantiated by the carvers' signatures and dates written on the inside of the masks, and also on the original bags which contained them. Inscriptions on some of the masks indicate the number of days spent in carving the mask, some being 5 and 7 and others 9 days. The wooden masks used in *bugaku*, the music of which is still preserved and occasionally performed in the Palace, are smaller and less grotesque in appearance, as may be seen from the old masks scheduled as "national treasures" and preserved in some temples. The *no* masks, all carved in wood, which came into existence in the 16th century, taxed the resources of the talented carvers, and a large number of masterpieces are now in possession of the head families of the different schools of *no* drama.



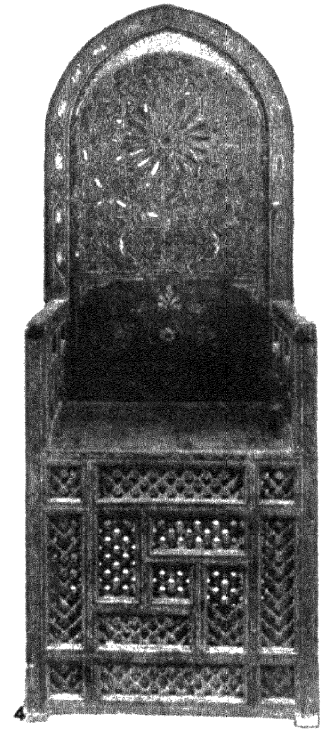
Up to the 15th century, the work of the wood-carver was confined to the embellishment of the temples: carvings on the pedestals, nimbus, and baldachins of Buddhist figures, and some slight ornamentations on the building itself, such as the carving of the beam-ends into animal heads and the use of the *kaeru-mata*, a simple decoration between the beams. But in the second half of the 16th century, the decorative wood-carving came to assume an importance in palatial mansions of the shōguns and in shrines where wood carvings were inserted into the *kaeru-mata* between the beams, attached under the rafters, used as the panels of the gate, etc., a large number of which may still be seen at Kitano Jinsha and Nishi Hongwanji of Kyoto, Chikubushima Jinsha in Lake Biwa, etc. The predominance of wood-carving as an architectural decoration in the 17th century may be seen at the mausoleums of the Tokugawa shōguns at Shiba, Tokyo, and at Nikko, where both the interior and exterior of the buildings are profusely covered with wood-carvings ranging over a wide variety of subjects faithfully executed and realistically coloured.



The taste for simplicity has not tolerated wood-carving in the architecture of dwelling houses. The only place the carver could display his art was in *ramma*, the ventilating panel in the narrow partition wall over the sliding screens that separate one room from another. The *ramma* carving has made a special development of its own, all sorts of subjects being treated: flowers and birds, animals and insects, figures in history and romance, landscapes and mists, clouds and waves, etc., carved on board to give, together with the decoration on the sliding screens, a character to the room.



Some fine carving in wood, the temple decoration in miniature scale, may be seen in the family shrine (*butsu-dan*) where the ancestral tablets are kept, generally fitted into a recess in the room. In their profuse and minute decoration some of the portable shrines (*mikoshi*), used in the procession at the festival, are also beautiful examples of the art of wood-carving. So also are the small ornaments for cabinet decoration or for the *tokonoma*, the recess in the guest room for objects of art. Some wonderful workmanship in wood has been produced by the *netsuke* (ornamental button for suspending a pouch or medicine case) carvers when many of the talented sculptors in wood turned their attention from carving Buddhist figures to the production of smaller objects in greater demand.



The Chinese have utilized the wood-carving more lavishly than the Japanese in their home architecture. They have carved their heavy beams on the ceiling and the massive pillars as well with delicate tracery. The simplest of their chairs and tables are invariably carved in the "key"-pattern, some simpler than others, and the doors are in delicate trelliswork design or ornamented with carvings in low relief. Lanterns with diapers or some other interesting designs in pierced work are held by brackets or arms carved in forms of dragon heads. Although rich in variety, the designs used in the wood-carving, show a fondness for geometric patterns that is distinctly Chinese. The following are some of the other motives resorted to by the wood-carvers: emblems of richness and happiness, clouds and thunder patterns, the curious mask of a creature "TaoTieh," "The Eight Trigrams" or "Pa Kwa," "The Four Quadrants," "The Five Elements," etc. Sacred scenes and figures incised in floral scrolls, intermingled with series of conventional emblems of one religion or another form subjects for wood-carvers in decorating the Buddhist, Taoist and Confucian temples. Sacred to Buddhism are the eight symbols, the chief among which is the lotus, an emblem of purity, chosen because the lotus lifts out of the mud its rosy or white blossoms unsullied, forming a fitting resting place for the Buddha. Taoists have their symbols of eight immortals and derive many floral emblems of longevity from sacred plants, the most prominent among which is the peach, the tree of life of their paradise, bearing fruits ripening but once in 3,000 years which confer immortality to those who partake of it. While Confucianism has no distinct emblem of its own, the symbol of culture and examples of filial piety, such as the well known 24 examples of filial piety, are sometimes attributed to it.

Artistic vitality characterizes even the highly conventionalized designs of the Japanese wood-carvers, but the bulk of the Chinese work reveals a sense of laborious and mechanical execution. On

the whole, the Chinese wood-carvings are more effective as a design and ornament compared with the Japanese work, which, while the thing carved on is well decorated, carry a far less decorative value. The former aims more for the effect, while the latter pays much greater attention to the mode of execution and technical skill. The former covers the carving with paint or lacquer, while the latter delights in appreciating, whenever possible, the clear cut chisel marks in natural wood. Even the decorative panels in the temples and shrines which are coloured, show traces of the Japanese wood-carver's pleasure and satisfaction derived from the clear cuts of his chisel. There is a tendency in both for an effort to surmount formidable difficulties in design and execution, defying time and labour, with little regard for the artistic merit in the result achieved. GOTHIC

Such meagre fragments of woodwork as have come down to us from the 11th and 12th centuries, tend to show that the woodworker was following the stoneworker in every particular, and that where he failed to be constructive, he had to call in the help of the metalworker to make his ware hold together. The stoneworker was paramount until about the 15th century. From that time onward it was the woodworker who became predominant. By that time he had found that wood should be treated in quite a different manner from stone, and, inspired by new ideas and new motives, he invented new methods for the construction and embellishment of his work. The wood-carver, then, no longer followed the patterns and designs of the stone-carver, but he made them for himself in a manner to suit the material and tools he worked with, in fact he began to influence the stoneworkers in such a way as sometimes to divert them from their intrinsic principles.

Early Period.—The earliest examples of wood-carving are some remnants of Scandinavian carving dating from the ninth and tenth centuries. They are carved framings of doorways made of thick planks of pinewood. They follow the same form of designs as are found on Celtic stone crosses, or in the elaborate initial letters of early illuminated manuscripts. This carving is in low relief, and it is always kept up to the surface of the material out of which it is made. The designs are of interlacing stems sometimes foliated, and often terminating in a monster's head. Occasionally the stem is doubled and criss-crossed, and invariably the space which is decorated is so much filled with pattern as to leave scarcely any ground showing. An example of this kind of carving is shown in the reproduction of a Norwegian chair of the 9th or 10th century. (Pl. V., fig. 1.)

Of the Norman period in England only a few isolated pieces remain, and these are only enriched with a row of moulded arches, as in the railing at Compton church, Surrey, or the desks at Rochester, or the tomb at Pitchford church, Shropshire, which has also a shield carved in oak in each arch of the arcaded side of the tomb, supporting the carved wood effigy of Sir John Pitchford, which was made at the very end of the Norman period. It may be conjectured that the characteristic feature of Norman wood-carving is the rounded surface of most of the foliated forms, which appear to have avoided hollows. The leaves were often a series of lobes with a V-shaped sinking round the edge. Even in the mouldings, beads or rounds preponderated over hollows, and in the grotesque beaked heads carved on the arches to many a doorway the surface treatment is generally a series of ribs or small rolls, rather than a succession of hollows or V cuts as was the case in Byzantine ornament. Sometimes the stems of the foliage were enriched by a small bead carved on either side of a rounded stem, as may be seen on the Prior's doorway at Ely cathedral.

Of the early English period which lasted roughly from 1190 to 1310—a little over 100 years,—there is not a great deal of wood-carving remaining, though there is sufficient to tell us what it was like, even in elaborate work, as in the stalls at Winchester cathedral. These however were executed at the very end of the 13th century. They are carved with the utmost care and skilfulness but the work follows the idiosyncrasies of the stonemason and carver, inasmuch as it is cut out of solid blocks of oak and the forms and designs are identical with that of stonework. Some of the designs for foliage follow the typical early English forms, whilst others might be taken for the work of the next great divisional period of architecture which followed. The miserere seat from the Priory church at Christchurch, Hampshire is a good example of early English carving. (Pl. V., fig. 2.) Others may be found in Henry VII.'s Chapel at Westminster, and at Exeter.

In the traditional carvings of the 13th century the curves of the foliage are very simple. The leaves start from a fairly thick stem which is generally cut very square in section. Sometimes the curve of the stem is reversed as it nears the end of the spray, but more often than not it is one simple curve which quickens as it reaches the end of the leaf, and finally buries itself in a deep pocket in the centre lobe. The variations of this form of foliage are wonderful and beautiful in the extreme. The building where this form of carving may best be studied in England is Wells cathedral. Towards the end of the 13th century the wood workers were coming into greater prominence. There is an example of a groined roof with carved bosses at the junction of the ribs at Warmington, Northamptonshire, and of carved roof beams at Bradfield, Berkshire; and Rochester cathedral has a lean-to roof with moulded beams.

Decorated Style.—The next phase of Gothic work, which began about 1300, is known in England as the Decorated style. It lasted for the comparatively short time of 70 years, before it gave place to another type. Even during these 70 years carving had more than one character. At first there was a tendency to follow more closely naturalistic forms, though treating them conventionally, but this is rather more apparent in the stone-carver's work than in the wood-carver's. This faithful portraying of natural forms does not appear to have lasted for more than 10 to 20 years. What succeeded was a very conventional and exaggerated treatment of the surface of foliage applied indiscriminately to leaves of every description. It consisted of a large bump in the middle of the leaf, a smaller one in the centre of each lobe and a still smaller one on every serration. The effect of this arrangement was a deep hollow round each protuberance in the centre of the leaf, partly broken by the lip or raised edge to the circular eyes which divide the main lobes of the leaf.

The Fifteenth Century.—The 15th century was productive of the finest quality and of the largest amount of decorative Gothic woodwork that the world has even seen. Although there was a distinct style pervading the whole period, there was more variety in expressing it than had been the case in any of the previous developments in architecture. This period of work which is known as the Perpendicular style began about the year 1390 and continued until about 1550; after that date it was practised in a debased form for another 100 years.

It was a time of prosperity. Spacious and noble churches were built and sumptuously furnished and decorated. Not only did one parish vie with another in erecting churches with costly and elaborate fittings richly painted and gilded, but the merchants also built noble houses for themselves. There was no difference in the style of building between domestic and ecclesiastical edifices, save that many houses were constructed of timber. Screens, pulpits and font covers were invariably prepared with gesso and sometimes minute decoration added to the faces of the buttresses, as at Southwold, and then gilded, and sprays of flowers painted on the broad hollows. The beadings were picked out with a chevron, or a twist of two or more colours like a barber's pole. The corner posts generally received a greater or less degree of carved ornamentation such as is here shown from a house in Suffolk (Pl. V., fig. 4).

The most noticeable features of the work of this period are that carving became flatter, tracery was built up of several boards as one order was superimposed upon another and not cut out of one thick piece of oak as had formerly been done. It will be seen that in the emblems of S.S. John and Matthew (Pl. V.,

fig. 3), the work is applied and that a broad simple treatment is the outstanding characteristic of these vigorous carvings. Whereas in Decorated carving the prominent projections on the surface of leaves were made into round bumps, in Perpendicular carving these projections were made to take a rectangular form. Above all the carver worked in a manner that suited his tools and material. In the latter half of the 15th century some of the carved foliage is composed almost entirely of hollows divided by a V cut to represent the stem of the leaf, or by a softly carved raised stem. The edges of the leaves are kept up and the serrations are produced by a vertical cut with a gouge at right angles to the edge of the leaf and a hollow cut with the same tool on the edge of the leaf, getting deeper until the chip falls out as the cut meets the first incision. The inner edge of these gouge cuts form the centre stems of the serrations. The Poppy-head from Walpole St. Peter (Pl. V., fig. 5) partly illustrates this. It will be seen from this how very different is the carver's expression to what it was when every serration was elaborately carved with a swelling in the middle and a hollow round it. One type of leaf which was invented, for there is nothing in nature like it, was that in which the corners of the leaf ended in a tightly rolled ball, as may be seen in the left hand leaf on the miserere seat from Ripon cathedral, on which Samson is shown carrying away the gates of Gaza (Pl. V., fig. 6).

The wealth of pattern and fanciful design in crestings, strings, bosses, tracery, poppy-heads, bench ends, etc., is wonderful, and the rendering of fables and biblical stories in the miserere seats inimitable. The repeating patterns in carved tracery and cresting, etc., are always interesting, because although there is a sameness, there is never an exactitude. The curves of tracery are never mechanical but are drawn freely, and great care was taken to get a breadth of effect. The hollows of the tracery are very flat, and not like the cast iron effect produced by some revivalists who make the section of the hollow almost a quarter of a circle. In a few of the East Anglican churches an effect of great richness is produced by carving the back of the top rail of each bench with a simple band of ornament, as in Dennington church, Suffolk (Pl. V., fig. 8). As band beyond band is seen when viewed from the west end the impression it gives is quite startling.

An extraordinary development took place at this period in the erection of timber roofs. The skill and imagination of the carpenter together with the conception of the figure and foliage carvers produced a wealth of grand architectural effects that has never been surpassed. The roof of Westminster Hall will for ever be a wonder for its construction and magnitude.

In England the type of work differs considerably in different parts of the country. There is a great deal of beautiful oak carving of this period to be seen in France, Germany and Flanders. In St. Paul's church at Abbeville, there is a beautiful reredos (Pl. V., fig. 10) which is Flemish in character, illustrating the lace-like effect so often found in French carvings. Perhaps the most striking piece of work on account of its vast amount, its completeness, and its elaboration is the stalls at Amiens cathedral, which were begun in 1508 and completed in 1522. One characteristic feature of French Gothic tracery carving is that the section is often but little more than a chamfer and when there is a double order it is often made by dividing the chamfer by a square incision. Most of the foliage carving is expressed by the use of the gouge, that is to say it is composed of broad hollows. In German work the tendency is for the designs to be more intricate and to contain less breadth and freedom in the carving. Most of this work is very much undercut and the chief aim appears to have been definition of outline and strong shadows.

At the end of the 15th century Renaissance influence begins to make its appearance, and although the structural parts of woodwork remain purely Gothic in design, it is in the carvings that the innovation first makes its presence known. The four oak panels (Pl. VI.) are dated 1540 and indicate the effect the new style is beginning to have on the carver. The suggestion is that carvers were introduced from Flanders with which there was constant intercourse in connection with the trade in wool, and it is from this source that the splendid traditions of the Gothic period were undermined. When the fashion for this new form of art took hold of the popular imagination, the end of Gothic was not far off; although tradition born of centuries is hard to kill; for it was not quite dead until the middle of the sixteenth century. (*See* SCULPTURE TECHNIQUE: *Wood-carving;* GOTHIC ART.)

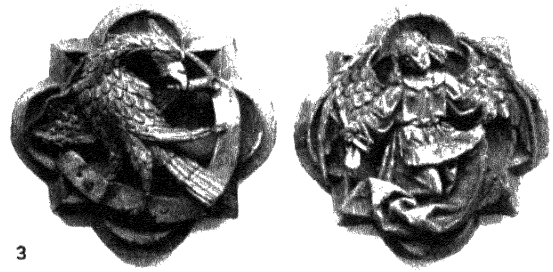
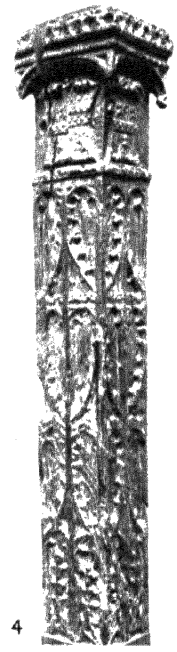
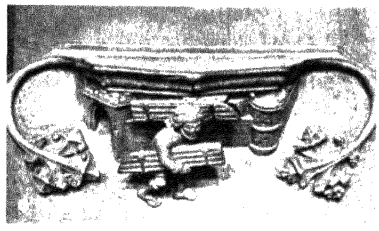
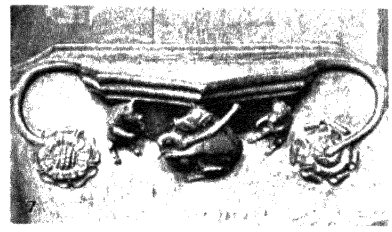
MODERN

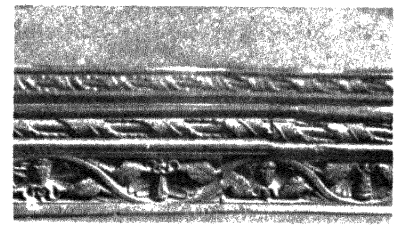


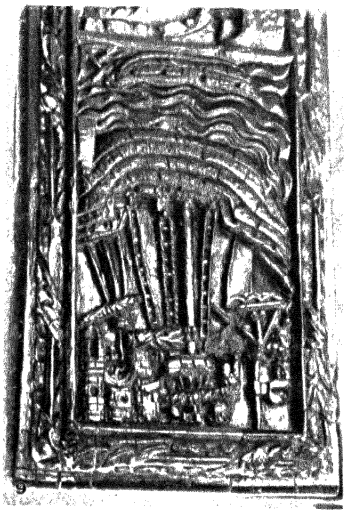


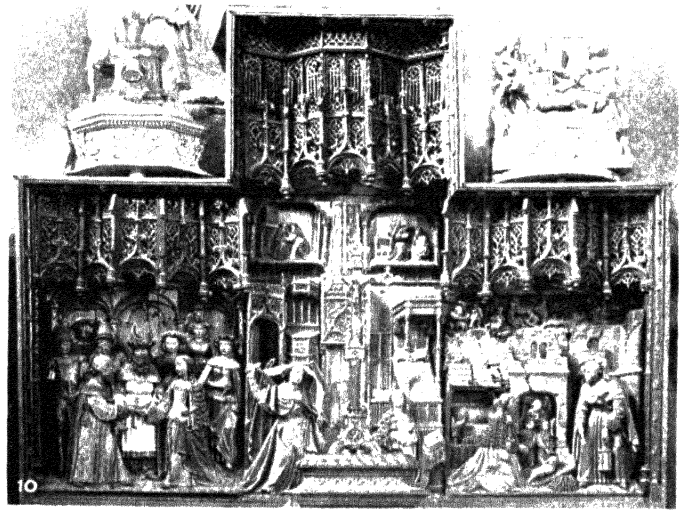
With the passing of the Gothic the symbolism that inspired the wood-carver gave place to ornament almost devoid of ideas. Under the influence of the builders it functioned to give expression to proportion and structural design, and to convey something of the joy of life in those effects with which man delights to surround himself. When symbolism or aesthetic understanding is not guiding the decorative instinct, manipulative skill becomes easily a snare, hence, the styles of decoration which have arisen throughout Europe since the Renaissance have provoked a constant struggle between sincerity and technical dexterity. Especially has this been the case with wood-carving. Wood is an intractable material to carve but, in skilful hands, lends itself to the production of *tours de force*. The wood-carver's method of cutting with gouges leaves the trace of the tool on modelled surfaces to a greater or lesser degree, according to the vigour and spontaneity of his work.

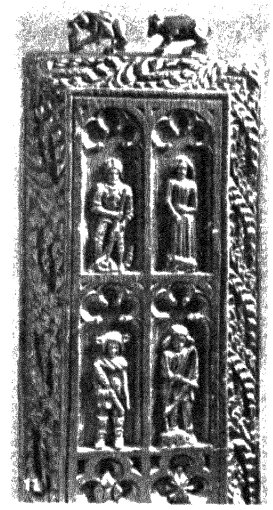












The Renaissance.—The wood-carving of the Renaissance was chiefly in walnut, and is best understood if it be realized that the structural design of the woodwork was reminiscent of building and that structural features such as pilasters, capitals, etc., were employed decoratively. Further, the Renaissance being in essence the revival of classic *motifs*, familiarized by ancient examples in marble, which material was especially understood in Italy, it is not surprising that much of the work lacks a distinctive wood-like effect. Nevertheless the release from the domination of the middle ages with their limited symbolism brought a freedom and vitality into design that made the Italian carving the inspiration of the greater part of Europe for many centuries, and the inventiveness and opulence displayed have never been excelled or rarely equalled elsewhere. Its *motifs* taken freely from nature and treated naturalistically to an extent unknown in the classic prototypes on which the Renaissance was founded, were combined with arabesques, woven into designs by means of sinuous and scroll movements, and modelled to produce to the utmost a play of light and shade.

Towards the end of the 15th century, France felt the inspiration of the Renaissance. It was there welcomed avidly by the carvers, who had the Gothic insight to a degree never attained by the Italians. Perhaps the highest beauty achieved by the Renaissance was in the admixture of the new details and Gothic structure, so common in France, suggesting that it is during transitional periods in art that man is most vital and creative. The French understood the treatment of wood and, although sometimes over-lavish and small in detail, their technique was easy and unsophisticated, and in the designs of the best examples provision was made freely for surfaces broad enough to display the grain and beauty of the wood. A characteristic example of the period are the doors of St. Maclou, Rouen, which are attributed to Jean Gougon and if this work be compared with much of the stonework of the time it would appear that stone was influenced by wood.

The work of nearly the whole of Europe was gradually influenced by Italy either directly or through an intervening country. The influence was too vital to incite mere reproduction, even had the means existed to make this possible, so that, except where the craftsman was imported, the expression of Renaissance ideas in each country had its distinctive idiom. The Plateresque of Spain is noteworthy for the exceptional profusion

EXAMPLES OF MODERN WOOD-CARVING

1. "Black Mare," carved in mahogany and lacquered black by William G. Simonds. 2. "Mother and Child," carved in limewood by Charles Wheeler. "Madonna" by Eugene Borga, held to be a remarkable example of carving in wood. 6. "Oxen of Siena," a carved wood panel pierced, painted and

of small surface detail, sometimes of great refinement. In Germany, the Netherlands and England the Renaissance carving is associated with the development of strapwork, in some examples of which it scrolls vigorously while in others groups of fruit, grotesque masks and figures sculptured in high relief, enrich it. At a later date the Baroque carving of large figures was in Germany more remarkable for skill than taste and in Italy for wildness in its application to its architectural setting. Of great interest to the wood-carver as further examples of his art when uncontrolled by architectural considerations are a number of the pulpits of Belgium. That by Verbruggen, 1699, in St. Gudule, Brussels, is the most extravagant of the school and it was not improved by the addition of the elaborate railing in 1780.

The Eighteenth Century.—The most radical change in style after the Renaissance was the so-called Rococo (*q.v.*) of the reigns of Louis XIV. and XV. It reflects the artificiality and extravagance of its time and is distinguished by its arrangements of "C" scrolls and attenuated foliage for structural as well as decorative purposes, and for the substitution of richly ornamented broken curved movements for straight horizontal lines. Its draftsmanship is superb, and for effect it relies upon the perfect technique of its somewhat fantastic designs.

The inception of the 18th century in England, which is singularly remarkable for the fertility of its designers and carvers, witnessed the development of the art of Grinling Gibbons who fashioned wood with a freedom and delicacy unprecedented. His work has provoked controversy as to the suitability of wood for masses of fruit and flowers in such high relief and so freely undercut. The preservation of his work, in spite of the ravages of the wood-worm justifies the apparent liberties he took with his material and his freedom from the shackles of tradition; the variety of his designs and his sense of decoration proclaim him a great artist and craftsman. His most restrained work and probably his best, was done in association with Sir Christopher Wren for the choir of St. Paul's cathedral, London.

The effects of the French Rococo were disastrous everywhere. In Italy and Germany the character of the style was interpreted with a crudeness that almost amounted to a burlesque; and only in England, notably in the hands of Chippendale, were its suggestions controlled by refinement and discretion. The swing of the pendulum led to the production of the ornament of Louis XVI. in France, Biedermeyer in Germany, and the Adams brothers in England. These styles were a return to more severe classic ideals, and the enrichments involved the repetition of small patterns and *motifs* that had been exhausted in the past.

Decline of Wood-carving.—Since the end of the 18th century, wood-carving all over Europe and America has been almost confined to the reproduction of the styles of the past without any regard for nationality or the expression of individuality. *L'art nouveau* of France towards the close of the 19th century had its repercussions elsewhere but passed away rapidly because its tones were untrue to material; its wood-carving conveying the impression of metal or modelled clay. The carver works with the architect and furniture designer, and the tendencies of modern Europe influencing these in the direction of simplicity of structure and effect, his art has languished. In Scandinavia, where modern architecture is achieving triumphs, it is exceptional for carved wood to be employed as decoration.

In America the wood-carver has not produced anything national but there, as in Europe, are signs of activity and impending fruition. He is producing *objets d'art* and entering the domain of sculpture, hitherto almost monopolized by bronze and marble; and in harmony with the modern spirit in decoration which is rediscovering the nature of materials that may be fashioned artistically, he is using woods which have been carved rarely in the past, because of their grains and markings, and carving them with the partial object of bringing out these peculiar features. The general tendency is towards severe conventions, economy of method and occasional colouring, but is otherwise too individual to be categoried. The greatest encouragement is being given to this work in Germany and Czecho-Slovakia but there the animating motive is derived from a revolt against pre-war ideals and consequently, being largely a negative impulse, it would be devoid of promise but for the stimulating and modifying influences which in modern times circulate internationally.

WOODCHUCK, the North American representative of the marmots (*see* MARMOT), scientifically known as *Marmota monax*. The woodchuck measures about 18 in. in length. In colour it is usually brownish black above, with the nose, chin, cheeks and throat tending to whitish, and the under parts brownish chestnut; while the feet and tail are black and blackish. Like other marmots it is a burrower.

WOODCOCK, a bird in high favour with the sportsman and the epicure. It has a long bill, large eyes, and a mottled plumage of black, browns, greys, buff, and white, the latter confined to the tip of the lower side of the tail quills. There is much variation in the individual plumage, which is highly protective. The woodcock (*Scolopax rusticula*) breeds in suitable localities from Ireland to Japan, migrating southward in autumn, reaching India, Ceylon and northern Africa. It feeds largely on earthworms, which it gets by probing soft ground with its sensitive bill.

The nest is made on the ground, and the four eggs, laid during March, are yellowish in colour, blotched and spotted with reddish brown. During this season the male performs a remarkable flight (called in England "roding"). At dawn and at sunset he flies in a great triangle, often a mile in perimeter, travelling fast by means of slow, steady wing beats, and uttering a drumming sound at intervals. The young birds are carried between the thighs of their parents to suitable feeding grounds.

In North America there is a similar but smaller woodcock, *S. minor*, having its three outer primaries attenuated.

WOODCRAFT, the knowledge of forest conditions which enables one to enjoy and to supply oneself with the crude comforts of life in the wilderness. It includes a sufficient knowledge of mechanics to enable one to manufacture tools and weapons; to make stone axes; to dress and prepare skins; to build rafts and canoes of logs, bark or skins; to make baskets and cooking utensils; to procure food, drink, shelter and clothing, and to build and maintain fires for cooking and warmth from the materials supplied by the wilderness itself.

For untold centuries primitive man has understood the habits of animals and the causes which impel them to action; a knowledge absolutely necessary for primitive man's existence, a knowledge which is a fundamental of woodcraft. It was necessity as a task master, nature and the red men as instructors, which developed woodcraft in the United States to a fine art and produced such master woodsman as Boone, Kenton, Crockett and Carson.

In woodcraft one must be able to forecast the weather from the action of birds and mammals, as well as from the wind, and the appearance of the sky. Every language supplies weather proverbs, originally from wilderness folks.

On a gloomy, overcast day an old scout was asked to point north. He looked slowly up at the sky, up at the trees, around at the ground. Then, with his hand outstretched, his index finger pointed to the true direction. He was unable to tell how he made his decision because he did not know how to describe his own process of reasoning. It was not that spider webs are on the south side of trees; that fallen timber indicates the direction of ancient storms; that the limbs of the trees are heavier on the south side and thicker in diameter; that oak, ash, mesquite, hickory and

elm trees have moss or mould on the north side; that leaves are longer, darker green with lighter veins on the north side; that flying squirrels' holes favour the east side; that gum is soft and dusty on the south side of coniferous trees, or any one of these signs, but rather the accumulated evidence which impressed him.

On very hot days fishermen versed in woodcraft look for fish in the cool depths, in the shade of rocks or marine plants, knowing that fish, like cattle, seek shade in hot weather. One should understand birds, their calls and their actions. Birds understand certain weather signs and from their higher and more extended viewpoint are able to detect the approaching storm before a man on the ground can see the signs. The beach combers and sea-faring men know that atmospheric conditions affect the sea birds and that they invariably seek the shelter on shore from the onrushing storm. It was the great number of sea birds flocking in from Mobile bay, some years ago, that gave the first alarm of an approaching devastating storm.

The location of water holes and springs in desert and dry places; the knowledge which tells the traveller of the succulent plants with which he may quench his thirst and where to find such plants is an essential part of woodcraft. So also is the ability to find a trail and to know by the conformation of the land where trails must exist; to know that land inhabited by large game animals always has trails which can be traversed by man. The experienced woodcrafter knows that nothing can pass through the forest without leaving telltale marks on its trail; it may be only the misplaced leaf or the stone which has been lately turned over. Even the grass or weeds show where they have been pushed in front of travelling beasts. The trailer can point out the trail made by large animals early in the winter and since covered by succeeding falls of snow, because at a little distance, the slight depressions are marked by faint blue shadows.

The expert in woodcraft knows the language of the woods. He is familiar with the cry of alarm given by the different birds and different animals. He also knows from experience that that cry is understood by all the other denizens of the woods. When the squirrels are playing among the branches of the trees and the crow, detecting the approach of a trespasser, gives its cry of alarm, every squirrel will immediately disappear into its hiding place.

The fallen tree by the brook side showing the marks of large chisel-like teeth told the woodcrafter that beaver had cut and felled the tree. The bark gnawed from another sapling by smaller chisel-like teeth told him that porcupines had been there. The torn bark of a black spruce, commencing at a point as high as a man can reach, exposing the fleshy part of the tree, from which sticky sap is exuding, proclaims a large bear has been there; it is the habit of these animals to rear up and scratch the trees with their claws. It also gives an accurate measure of the size of the bear. The bleeding tree indicates recent wounds.

A maple stripped and displaying marks of horse-like teeth shows the work of moose; whereas another tree which has been scarred, and from which the splinters of the wood are protruding from the lower edge of the scar, is evidence that the lynx, or wild cat, has, like the bear, "sharpened his claws." The freshly dismantled and broken rotten log is, to the expert, a note from Bruin saying, "Here I lately dined on ants' eggs."

To know how to build shelters; how to make and mend snow shoes, moccasins and wearing apparel from the material found in the woods; what to do in time of flood and storm; what to do when overtaken by a blizzard; how to avoid danger of avalanches and the knowledge that the danger from them is greater when the sun is high than in cool evenings and mornings, is essential.

It was the settlement of the United States which produced a renaissance of woodcraft or rather a new and more vigorous art. The tide rift of adventuresome pioneers preceding the advance of civilization were compelled to learn when and how to cut logs for their cabins; what wood was best for rails for their fences, how to substitute the semi-transparent skins of animals for glass in their windows. From the Indians, frontiersmen learned how to grind corn with stone, to parch corn for trail rations, to make cakes, to make maple syrup and sugar, to jerk meat or to make pemmican for emergencies.

It was the free trappers and the employees of the fur companies who learned how to trail like blood hounds and hide their own trails with skill surpassing that of the fox, by walking on stony places and wading the beds of streams. They developed their five senses to a superlative degree. (D. C. B.)

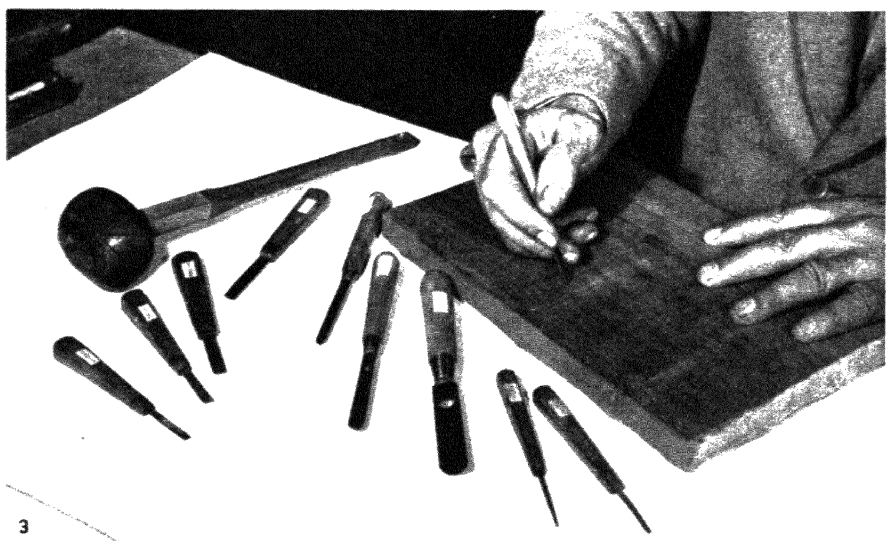
WOODCUTS AND WOOD-ENGRAVING. To-day the woodcut is used as a direct expression of artists who themselves cut and print the block. During the greater part of its history the medium has been used quite differently. It has been a reproductive process; a craft rather than an art. Craftsmen have cut out of the block drawings made for the purpose by artists and then passed the block to other craftsmen for printing. This is comparable to our photo-engraving reproductive process—the difference being that the older method was done by hand whereas the present one is mechanical. In both cases the method was merely a means to an end and quite detached from the original conceptions of the artists involved. In making drawings for reproduction, either by woodcut or photo-engraving, artists are thinking in terms of ink or pencil lines on paper—not of lines which their hands are carving out of wood. A work so detached from its medium does not exploit the peculiar quality of that medium. It lacks unity and completeness. It loses force. For some ten centuries of its known history the woodcut, as a process, has been so handicapped. Only during the last thirty or forty years has it arrived at what might be called its full functioning maturity.

TECHNICAL PROCESSES

Technically speaking the woodcut is pictorial type. It prints pictures as type prints letters of the alphabet, by raised lines or areas that catch ink from a roller and deposit it on paper under moderate and more or less even pressure. This analogy roots in history as well as fact. The first printed letters were woodcut type carved into pictorial woodcut blocks in explanation of the picture. The first movable type was a cutting up of this block type in order to save labour by rearrangement and re-using. The woodcut raised line is the opposite of the intaglio, or sunken line, which is etched or engraved on copper. (*See* INTAGLIO.) In the print etched or engraved lines catch the light and cast minute shadows, thus giving a life or sparkle to the work that is impossible with any other mediums. The woodcut gives a flat surface print, with an interplay of solid black and white, and a slightly varying texture and intensity that is quite unique.

The raised line of the woodcut is simply a part of the original untouched surface of a block or plank of wood; if no cutting away were done the print from this block would be solid black. Each stroke of the tool removes a section of the ink-holding surface, thus preventing its printing and letting the white of the unprinted paper into the black of the printed. Like the world at dawn, the woodcut-picture actually emerges from blackness into light.

There are two kinds of woodcuts, the black line and the white line. The black line, or woodcut proper, is one for which a drawing is made on the block and all spaces between lines gouged out or cut away. In other words a black line drawing is reproduced in approximate (but never complete) facsimile. The black lines are conscious lines. The white lines or spaces are left-overs which receive either secondary or no consideration *per se*. In the white line cut, or engraving, the reverse holds; the white line that is gouged out will receive first attention, the black lines and spaces between, second. In the first case the artist conceives his drawing as starting with white paper and growing towards black; in the second as emerging from black into light, as in actual fact it does. Both systems have their advantages but the second, or white line, being the natural method, because it makes a positive instead of a negative use of each gouge or cut, would seem to be the most logical.



Cutting the Block.—The black line cut is ordinarily made on a plank or block of soft wood like beach, apple, pear, cherry, sycamore or whitewood cut parallel to the grain as in ordinary lumber. Preferably it is of type height (about $\frac{7}{8}$ in. as shown in fig. 2), planed and sanded to a perfectly smooth and level surface, and cut with a sharp knife. An ordinary pen knife will serve as a makeshift, but the carver (fig. 1) set in a cord-wrapped handle

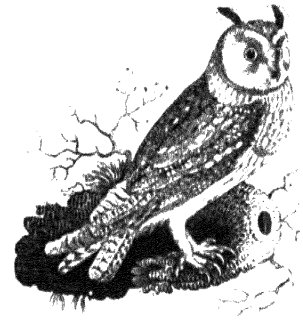
4

THE PROCESS OF WOOD-CARVING

1. Correct position of the burin for engraving on wood. The knuckles of the hand should rest on the block. Tool should be pushed forward or backward by a contracting of the palm
2. Engraving into the hard end grain of a box-wood block with the burin. Various shaped burins and tools are on the table. Note leather cushion for holding block steady
3. Holding knife for cutting on the flat side of a plank block. On the table are various shaped gouges and flat chisels used for removing large or small areas of wood
4. Cutting a block of wood with the knife held in the sloping position. This gives a widened base to each black line left raised above the cut away portion

WOOD ENGRAVING



EARLY WOODCUTS

1. "The Buxheim St. Christopher," from a facsimile reproduced by the American Institute of Graphic Arts; earliest dated woodcut in Europe, made 1420. 2. Early Florentine woodcut. 3. Woodcut from Hans Holbein's "Dance of Death Series." 4. "Crucifixion" by Albrecht Dürer. 5. Frontispiece to Breydenbach's "Pilgrimage to Jerusalem," 1486. First known woodcut in which cross-hatching was used. 6. Print made about 1560, typical of the decorative Italian style. 7. A woodcut of an owl from an illustration in Thomas Bewick's "History of British Birds," published in 1825. 8. White line woodcut by William Blake, one of the first woodcuts to have the qualities of the art today

is better. The knife makes a sloping cut which tapers upward along each side of each line, thus supporting the line on a widened base (as shown in fig. 2).

When two lines are close together and parallel the sloping cuts on adjacent sides of each would remove a V-section between them. This V-cut can be made with one stroke instead of two by using the "V" or parting tool shown in fig. 1. Larger areas are

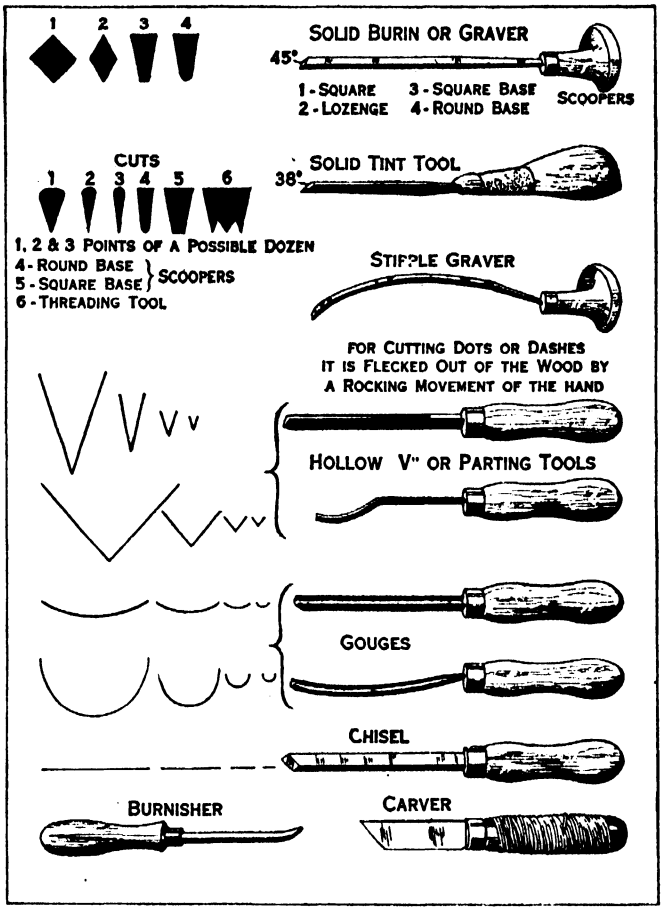


FIG. 1.—TYPES OF TOOLS USED IN WOOD ENGRAVING, AND SHAPES OF CUTS

removed with gouges of varying widths and depths (fig. 1). The method requires, as is readily seen, two or more cuts to release a single black line—two if the lines are in a parallel and close-together series, four if a line is segregated, and anywhere up to eight if the lines are cross-hatched. (*See* A, B, and C, respectively, fig. 2.) Laborious, round-about, forced—such is the reproductive black-line method.

The white line is engraved, rather than cut, into the end-grain of very fine hard wood, usually box-wood. The box-wood blocks are about $\frac{7}{8}$ in. high and across the grain. Into this hard fine grain lines are gouged out with hollow V- or U-shaped parting tools or gouges, or with solid metal burins or scoopers. All these tools are shown in their varying widths, depths and shapes in fig. 1. The burins, tint-tools and scoopers are held in the palm of the hand (Plate I.), and pushed forward; the threading tool cuts several lines at once. The knife in cutting is pulled toward the body and may be held as shown in Plate I., fig. 3 or grasped as one would grasp a dagger. Chisels may be pushed by the hand or hit with a wooden mallet. In the process of cutting, the block is held on a leather bag filled with sand. The left hand holds and turns the block easily against the pressure of the cutting tool in the right. (Plate I., fig. 2.)

Fundamentally, the methods of the white and the black line woodcuts are the same in the actual technical process and the ultimate end achieved. In the black line cut the cutter is conscious only of the black lines he is reproducing; in the white line engraving he is exploiting the white lines, at the same time being fully conscious of the blacks by which he must obtain the whites. Xylography is a general title that covers both methods.

In etching and pencil drawing (*qq.v.*) the point glides easily over a smooth surface, flexibility and freedom being the consequent result. In copper-plate and wood-engraving there is resistance to a cutting tool which must be forced through resisting material. This tends to give a certain directness and rigidity to all lines, straight and curved. A slow uniformly changing curve would be more natural than a jerky, hectic, quickly curving one. The medium, therefore, lends itself to an abstract quality peculiarly adapted to contemporary creative expression. This adaptability, no doubt, explains the preponderance of woodcuts among the so-called "modern" works in prints.

Artists of Western civilisation, it is interesting to note, have never made use of the potentially different characteristics inherent in lines of different types as have the artists of Japan and China. In Japanese art, for instance, there are the eighteen types of lines varying from stiff wiry ones expressing the starched garments of court nobles to the jagged ones expressing the rags of beggars. Among Western woodcutters, John J. A. Murphy has probably canvassed such possibilities more thoroughly than any other artist.

Drawing on Block.—There are a number of ways of drawing on the block. For a black line cut the drawing to be reproduced can be made with India ink, or Chinese black, with corrections in Chinese white. For a white line-cut the simplest and most flexible method, in that it allows erasing as easily as on paper, is with a lead pencil. The pencil drawing can be fully developed and then translated into white lines as the cutting proceeds. When mechanical exactness is required the subject can be photographed directly on a block prepared by the proper sensitizing of its surface. Photographs or wash drawings on the block have been commonly used during the latter part of the reproductive period—*i.e.*, up to the end of the last century. Timothy Cole, for instance, so photographed his subjects onto his block and then proceeded to interpret the photograph into white lines.

Printing.—Woodcut printing is of two kinds, black and colour, and may be done either by hand or on a regular type-printing press. For black printing the finest obtainable quality of proving ink ground in oil is used. The ink is spread on a glass or marble slab with a special composition hand-roller (of the same type as used in printing presses). After a thorough working onto the

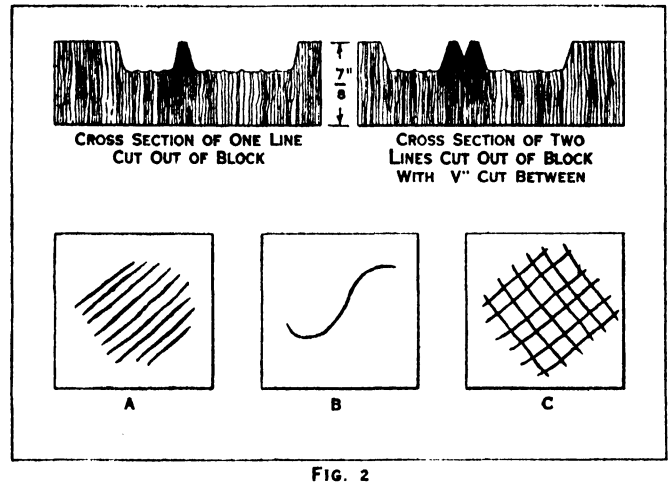

FIG. 2

roller in a uniform and exceedingly thin layer the ink is transferred to the surface of the block by several movements of the roller across the block in different directions. The paper may be India in several textures or soft hand-made Japanese such as the Gifu. Or it can be the less enduring machine-made domestic in many varieties. The India is adapted to the white line engraving, the harder textures to the finer lined blocks; the Japanese and domestic to the coarser lined blocks.

In the case of a hand print, the right sized sheet is laid over the inked block and pressed down with a sheet of cardboard. A second

cardboard coated with beeswax to make it slide easily, a steel burnisher, as in fig. 1, or a Japanese baren, is then rubbed over the first with considerable pressure which will vary in different sections of the block as the nature of the work demands. Less pressure means greyer and less even blacks, more means blacker blacks. This flexible control of pressure by the printer allows a quality of varied tone and texture in the hand-made print that can never be rivalled by any other method. In distinguished printing of this character a single print will take from 15 minutes to 3 hours of printing time. Corners of the print may be lifted to test results during this hand process.

In the case of a machine print the block is mounted in a printing press like any type form and the print made with uniform pressure. This pressure, however, can be varied artificially by the same overlay and underlay system used in type printing. When darker blacks are required thin sheets of paper are cut to proper size and pasted to the proper spot under the block itself or on the tympan against which the paper lies, in a registered position. The thicker these are the heavier the pressure in that spot, the darker the resulting black and the greyer the surrounding blacks.

Colour Printing.—Colour printing may be done from one block or a series of blocks. When printed from one block the colours are painted with a brush into the desired section of the uncut surface as in the case of a monotype. Each print thus becomes an original painting which is transferred by pressure to paper. If the colour is to be in spots no lines are necessary except guide lines. It facilitates the process of painting the block if these guide lines are white lines gouged out of the block around separate patches of colour. In the print the white unprinted line becomes part of the decorative pattern, giving a hint of mosaic effect. This process could never be used for a realistic picture. A regular line block could of course be printed in colour instead of black, thus getting a different effect. When many blocks are used for one print we have the Japanese colour printing process undoubtedly the highest developed art of colour printing the world has so far produced. (*See* JAPANESE PAINTING AND PRINTS.)

In this process there is a key line block to be printed in black or any desired colour. Each succeeding block, then, prints one, or sometimes two or three well-separated (so they do not overlap in painting on the black) colours onto the same key-block print. The number of blocks so printed may run all the way from two or three to a dozen or fifteen, gaining in range and subtlety as the number increases. The blocks are larger than the actual print thus including an unprinted margin in which two sunken notches are cut into the block to take one corner and one edge of the paper and thus provide accurate registration. All the blocks, of course, are printed in succession on the same piece of paper.

Colour printing ink is made of any kind of finely ground dry ink colour mixed with water instead of oil. It is applied with brushes of varying widths, a separate one for each colour, which paint over the entire block high and low sections alike. The brush charged with colour is dipped into a paste made of finely ground rice flour either before it is applied to the block or immediately after, the paste and the water-paint being thoroughly mixed by a sufficient brushing on the block. This paste changes the character of the colour from a mat finish to a more brilliant one. Also it gives adhesive quality which under the pressure of printing incorporates it thoroughly with the paper. Carefully dampened paper is laid on the block and rubbed directly on the paper with a Japanese bamboo-covered, stiff, slightly convex pad called a baren. (Plate I.) The amount of pressure determines the intensity of the colour of the print. (*See* JAPANESE PAINTING AND PRINTS.)

Chiaroscuro (clear-obscure).—In Europe during the 16th century another type of colour printing developed called chiaroscuro. The method comprised two prints from two blocks on one paper. One was a usual black line print, which as a line picture was complete in itself. The other was a tone block to be printed as one solid ground-colour in sepia, soft warm grey or other colours from which certain spots were gouged out to leave significant white highlights in the print. The final result resembled the wash-drawings of the masters and undoubtedly came into use as a means of approximating their effect.

The method is said to have been invented by Jobst de Negker at Augsburg. In Germany Hans Baldung Grien (1475–1552), Lucas Cranach (1472–1553) and Burgkmair (1473–1531) were among the first to practice it. In Italy Ugo da Carpi who worked in Venice and whose first print was dated 1518 was its foremost exponent. After dying out it was revived in Germany at the end of the 18th century and has persisted to the present. In the United States Rudolph Ruzika, A. Allen Lewis and others are practising the method today.

Uses.—"The possibilities of the wood block," says Frank Weitenkampf in his *How to Appreciate Prints*, "have been exploited to a remarkable degree. It has rendered line and tone, given the precision of the pen and ink sketch or the etching, and the free, granular irregularity of the charcoal smudge, translated paintings with the set regularity of the line engraving on copper or, abandoning the line *per se*, with an attention to tone and colour and texture, which often gave even the illusion of brush marks. It has been used for the rudest handbills and for the most elaborate reproductions of famous works of art; it has served as an original art, as a direct means of expression, and, crossing the bounds of black and white, it has imitated wash-drawings in two or three tints, and has entered the domain of colour printing in elaborate reproductions, as well as in the highly sensitive form of art exemplified in the Japanese chromoxylograph. It has been employed to illustrate in the rudest form the songs and ballads hawked about the streets, and in perfection of craftsmanship works such as the Doré Bible; it has been put to the practical use of reproducing wallpaper, and it has brought forth works treasured by the collector, though so different in style as the engravings of Dürer or Holbein, and those which are the work of some of the modern disciples of art in the United States."

HISTORY OF THE WOODCUT

The principle of cutting relief characters in metal, wood or stone has been practised far back toward the dawn of history. Cut metal plates were used in Egypt, India, Greece and Rome. Carved stamps or dyes were used for pressing letters into the moist clay of bricks in Egypt and for branding slaves in Rome. Both intaglio and relief carvings were known and used for these various purposes. Woodcuts were used in the Middle Ages to stamp monograms and to print colour designs on textiles, a custom practised in the Orient from time immemorial.

The earliest prints on paper so far found come from China of the T'ang dynasty (A.D. 618–905) when woodcuts in one colour were produced in great quantities as cheap substitutes for religious paintings. The oldest of such cuts now known is dated A.D. 868 and was found by Sir Aurel Stein in 1907 in the caves of a thousand Buddhas at Tun-huang in Chinese Turkistan. Throughout their history in China no artist of any note designed expressly for the woodcut. Even when the complex colour printing from many blocks came into use, beginning, so far as is known, about the time that colour printing began in the Chiaroscuro prints of Europe, *i.e.*, in the 17th century, this medium was used by craftsmen for the reproduction of paintings. The earliest known Chinese colour print is from a book called "Shih chu chai Shu hua p'u" and is dated 1625.

The method spread to Japan in the 8th century and for a long time was confined to reproducing popular religious figures. In Japan, however, there arose a whole school of artists who, though like the Chinese, still valuing painting as the supreme medium, did design expressly for the woodcut, thus conceiving their designs in terms of the carved line and colour block. The best of these were masters of the first rank.

For the greater part of their entire history, then, particularly as a reproductive process, woodcuts have been a widely used pictorial medium. Cheap in price, printed in quantity, close to the hearts and minds of common people in their choice of subject and story, they were used not as the collectors' items they have become today, but in every home as part of the furniture of actual life.

CONTEMPORARY WOOD CUTS

1. "Frauenkopf" by Karl Schmidt-Rottluff (1884–), German
2. "The Way of the Cross" by Eric Gill (1882–), English
3. A wood cut by John Nash (1893–), English
4. "Memories" by John J. A. Murphy (1888–), American
5. "Weib vom Manne begehrt" by Max Pechstein (1880–), German
6. "The Dance" by Cecil Buller, American, contemporary
7. "Lovers Surprised by Storm" by Douglas Percy Bliss (1900–), English
8. "Dunes—Pheasants" by B. Essers, Dutch, Contemporary
9. "Twilight of Man" by Rockwell Kent (1882–), American

They were looked at, studied, talked about, absorbed. They took the part of picture books when books were still the hand-lettered creations of monks, chained to the "library" tables of churches and kings. They were books in embryo, in fact.

In the religious cuts (and in the beginning practically all were religious) the people could see the characters of the Christian drama intimately in a form different from but related to the great paintings in the churches. Brief printed captions began to appear beneath the pictures telling the story of their heroes. These cut into the block were the first type. Later, about 1436, when Gutenberg invented printing, cut into separate letters, they became the first movable type. When the printing of books began the woodcut inevitably became the means of illustration. Being pictorial type it went with letter-press type. In fact the harmony between text and illustration of the 15th and 16th centuries has never since been equalled in general practice. So right was the combination that even when, in the 18th century, taste ran to the greater elegance of copper plate engraving and the almost total abandonment of the woodcut, the latter still kept alive in incredibly rude form in chap books and other popular literature. It carried over in fact to the revival in the 19th century when again it became the main medium of illustration in press and books. Memory in this country can easily go back to its general use in magazines and elsewhere. The form was decadent as it gradually died out before the advance of the cheaper photo-engraving process, but it was still the medium of the people as it had always been. Taking its history as a whole through its great period in the 16th century, decline in the 17th, decay in the 18th and revival in the weakened form of the white line toned picture in the 19th, the woodcut is undoubtedly a close second to the book in the role of entertainer, instructor and guide to the human race in the last 500 years of its struggle toward its present civilization.

In Europe the earliest known woodcuts were playing-cards dating back to the beginning of the 15th century. Pictorial prints go back as far as 1410. The earliest dated pictorial print is generally (but not always) admitted to be the St. Christopher of 1423. It is simple, crude, and naïve. It was done with single lines, almost an outline drawing, for its full effect it, and practically all prints of its time, depended upon hand-colouring after the print was made.

From 1423 to 1490 the black line woodcut developed from a crude beginning through the block-books that immediately preceded type printing to a mastering of the medium that has not been surpassed in that department to this day. The block books originated in Germany and the Netherlands—the oldest ones being *Biblia Pauperum* (*c.* 1450) of German origin, and the *Apocalypse,* the *Canticum Canticorem* and *Biblia Pauperum* (*c.* 1470) of the Netherlands. Dürer's drawings on the block made from 1492 to 1526 and cut laboriously by craftsmen woodcarvers, were complex, sophisticated, varied in quality of line and texture, yet they attained this complexity with lines that were most natural to the medium, that avoided, except in the darkest shadows, the forced (in this medium) cross hatching of pen and ink drawings. Here, then, at the time that America was being discovered was a mature art in mediaeval Germany, which set the pace for other nations. The subjects were mostly religious.

Dürer (*q.v.*) was the first great master to use the woodcut extensively as a way of reproducing drawings made for it. Without attaining the unity of means and expression typical of today he refined and widened the process. He had many followers, among them the little masters Altdorfer, the Behams, Pencz and others who forgot the usual religious subjects to record, with a touch of un-German decorative quality learned from Italy, the labours, merriment or debauchery of the everyday life of their time. Influence flowed back and forth between Italy and Germany, Dürer influencing leading Italians like Marcantonio Raimondi (1480–1530), and vice versa. By 1490 in the north countries individual blocks were giving way to blocks cut for such newspapers of the day as the Nuremberg Chronicle of 1493 and for book illustrations. In Italy the art centred in book illustrations from the beginning. Lippmann, in his *Art of Wood Engraving in Italy in the Fifteenth Century,* notes this difference between the North and the South by saying, "In Germany the proper function of book illustration was instruction; in Italy, ornament." In thus stating the case he must have meant obvious ornament for there is a decorative design quality in the German work that goes far beyond "instruction."

Holbein (*q.v.*) was the next great artist to design particularly for the woodcut. Working through the woodcutter, Hans Lützelburger, the greatest master of the knife the craft has produced, he achieved what is probably as complete a synthesis between the means and the expression as is possible with the black line method. His *Dance of Death* series of blocks is one of the outstanding attainments of the medium.

In France the woodcut started in Paris with the cutting of blocks for the popular and frequently published *Books of the Hours.* Its chief masters in the 16th century were Jean Cousin and Bernard Salomon who worked around 1550. In the 17th and 18th it gradually declined. In 1766 Jean Michel Papillon wrote his famous *Treatise on Engraving* and showed in his work the minuteness of technique that was typical of the decline.

Thomas Bewick (1753–1828) did not invent the white line pictorial wood-engraving, there being evidence in his work that he was influenced by Croxall's cuts in his *Aesop* of 1722. He was, however, the first to give it popularity. The woodcut during the 18th and 19th century decline rivalled the camera as a recording instrument. By adapting itself to the mirroring of a dozen mediums it had been forced into a sphere not its own. Bewick furnished the mechanism for this decline as well as that for the revival from it. The illustration of one of his blocks in Plate II. fig. 7. shows the nature of his work. His finest productions are the illustrations to *British Quadrupeds* (1790) and *British Birds* (1797).

William Blake (1757–1827) made only a few small woodcuts. He used the white line method. Technically they were not particularly skillful. But pre-eminently they are *wood*-engravings. They emerge from blackness into light. They are plastic. They exploit the inherent quality of the medium. In doing these things they are the forerunners in character as well as technic of the significant work of today. (*See* BLAKE, WILLIAM.)

At the end of the century we find Felix Vallotton in Paris playing with solid areas of blacks and whites—one of the first to pick up the thread begun in Florence 500 years ago (*see* the early Florentine woodcut shown in Pl. II. fig. 6.) the thread that in the 20th century is to develop into the dominant means of the modern expression.

MODERN TENDENCIES

The writer's contention that the present is the most fertile period in the history of the woodcut, in actual, contemporary achievement and in future possibilities is supported by two main reasons. The revolution in the mental approach to the making of pictures, which is the contribution of the first quarter of our 20th century to art history, and which involves a change from thinking of pictures as imitations or reports of nature to a conception of them as creatively reorganized interpretations, has brought the woodcut (which has been more sensitive to the new vitality than any other print medium) back into the fold of the *grand tradition.* Next in importance to this exceedingly significant event, the woodcut has found itself technically. That is, it has, in the last thirty or forty years, ceased forced service as proxy for another medium, the line drawing, and blossomed into a self-expression based on its inherent qualities. Its usefulness, however, has passed from the multitude who now find their pictorial entertainment in the photo and the pen and ink "funnies," to the few who care to seek out and pay the higher costs of what has become an aristocratic art—aristocratic, yet the lowest priced of all original pictorial works of art. (Prints made and signed by the artist are counted originals.)

This *grand tradition* includes work that is universal rather than particular in conception, creative rather than reportorial; it is older than the woodcut medium by many centuries. Work of today is rooted in fertile soil only when it belongs in both of these classifications. From the one it gains time*less*ness; from

the other timeliness. (For articles relating to the woodcut, *see* ENGRAVING; LINE ENGRAVING; PHOTO-ENGRAVING; PRINTING; ETCHING; LITHOGRAPHY.) (R. PN.)

WOODFALL, HENRY SAMPSON (1739–1805), English printer and journalist, born in London on June 21, 1739. His father, Henry Woodfall, was the printer of the *Public Advertiser*, and the author of the ballad *Darby and Joan*, for which his son's employer, John Darby, and his wife, were the originals. From 1758–93 H. S. Woodfall controlled the *Public Advertiser* in which appeared the famous letters of "Junius." He died on Dec. 12, 1805. His younger brother, William Woodfall (1746–1803), also a journalist, established in 1789 a daily paper called the *Diary*, in which, for the first time, reports of the parliamentary debates were published on the morning after they had taken place.

WOODFORD, an urban district in the Walthamstow (S.W.) parliamentary division of Essex, England, 9 m. N.E. from Liverpool Street station, London, by a branch of the Great Eastern railway. Pop. (1901) 13,798. Its proximity to the southern outskirts of Epping Forest has brought it into favour both with residents and with holiday visitors from London. A converted mansion, Woodford Hall, forms a convalescent home. On high ground to the N. is the ecclesiastical parish (one of three) of Woodford Wells, where there is a mineral spring.

WOOD GREEN, an urban district in the Wood Green parliamentary division of Middlesex, England, suburban to London, 7 m. N. of St. Paul's cathedral, on the L.N.E. railway. Pop. (1921) 50,707. The name covers a populous residential district lying north of Hornsey and west of Tottenham.

WOOD-LOUSE, a name commonly applied to certain terrestrial Isopoda (Crustacea) (*q.v.*), found in damp places, under stones or dead leaves, or among decaying wood. They form the tribe *Oniscoidea* and are distinguished from all other Isopoda by living on land and breathing air, and by the small size of the antennules and the absence of the mandibular palp. The head bears a pair of sessile compound eyes as well as the minute antennules and the longer antennae. Each of the seven thoracic segments carries a pair of walking legs. The appendages of the abdomen (except the last pair) are flat membranous plates and serve as organs of respiration. In many cases their outer branches have small cavities opening to the outside by slit-like apertures, and giving rise internally to a system of ramifying tubules filled with air somewhat similar to the air tubes or *tracheae* of insects and other air-breathing Arthropods.

FROM KUNKEL, "ARTHROSTRACA OF CONNECTICUT"

WOOD-LOUSE OR PILL BUG (ONISCUS ASELLUS)

The female wood-louse carries her eggs, after they are extruded from the body, in a pouch or "*marsupium*" which covers the under surface of the thorax and is formed by overlapping plates attached to the bases of the first five pairs of legs. The young on leaving this pouch are like miniature adults except that they are without the last pair of legs. Some twenty-four species of wood-lice occur in the British Islands. Some, like the common slaty-blue *Porcellio scaber*, are practically cosmopolitan. (W. T. C.)

WOODPECKER, the name applied to certain birds, forming together with the wrynecks (*q.v.*) the family *Picidae*, whose nearest allies are the toucans (*q.v.*). They generally have a bright particoloured plumage; the feet have two toes behind and two in front and the tail-quills are usually stiffened to form a prop on which the bird partially supports itself when climbing the trunks of trees.

The commonest species in Britain is the green woodpecker or yaffle (from its laughing cry), *Picus viridis*. It is about the size of a jay; the plumage is green, with a red crown and yellow rump. It obtains its food, consisting mainly of grubs, from the bark and rotten wood of trees; in search of these, it mounts trees in a spiral direction and bores holes in the decaying portions with its chisel-like beak. It also feeds much on the ground, being especially fond of ants. The nest consists of a hole drilled in the trunk of a tree, continued as a horizontal passage that reaches the core, whence it runs downwards for nearly a foot to expand into a chamber in which about six white eggs are laid on a bedding of chips. The two other British species, the greater and lesser spotted woodpeckers (*Dryobates major* and *D. minor*) are similar in habits, but have a plumage of black and white. They share with the red-headed woodpecker (*Melanerpes erythrocephalus*) of America, and other species, the habit of drumming with the beak on dead branches, etc., in lieu of a love-song. Inhabiting the pine forests of the Old World is the great black woodpecker (*P. martius*), larger than any of the previous species and with a black plumage and red crest. It is replaced in North America by the pileated woodpecker or log-cock, *Ceophloeus pileatus*, which is variegated with white.

BY COURTESY OF THE NATIONAL ASSOCIATION OF AUDUBON SOCIETIES

ABOVE: MALE AND FEMALE DOWNY WOODPECKERS (DRYOBATES PUBESCENS): BELOW: HAIRY WOODPECKER (DRYOBATES VILLOSUS), BOTH NORTH AMERICAN SPECIES

The Californian woodpecker, *Melanerpes formicivorus*, displays an amount of providence beyond almost any other bird in the number of acorns it fixes tightly in holes which it makes in the bark of trees, and thus a large pine forty or fifty feet high will present the appearance of being closely studded with brass nails, the heads only being visible. This is not done to furnish food in winter, for the species migrates, and only returns in spring to the forests where its supplies are laid up. The acorns thus stored are always those which contain a maggot, and, being fitted into the sockets prepared for them cup-end foremost, the enclosed insects are unable to escape, as they otherwise would, and are thus ready for consumption by the birds on their return from their winter migration to the south.

All woodpeckers are fond of ants, but one form, *Colaptes auratus*, the golden-winged woodpecker or flicker of North America, lives largely on grasshoppers and other ground insects and in this connection exhibits several interesting modifications, the bill being less sharp. The red is, in this species, reduced to a crescent on the neck. The red-shafted flicker (*C. cafer*) is a closely related species; the two interbreed where their ranges overlap, producing a variety of segregating types. Other common North American forms are the hairy woodpecker (*Dryobates villosus*) and the smaller downy woodpecker (*D. pubescens*), both black and white forms. The North American sapsuckers (*q.v.*) are also woodpeckers. Nearly one-half of the known species of woodpeckers occur in the New World. The remainder inhabit all parts of the Old World except Madagascar and the Australian region east of Celebes and Flores.

Some other woodpeckers deserve especial notice—the *Colaptes* or *Soroplex campestris*, which inhabits the treeless plains of Paraguay and La Plata; also the South-African woodpecker *Geocolaptes olivaceus*, which lives almost entirely on the ground or rocks, and picks a hole for its nest in the bank of a stream.

WOOD PULP: *see* PAPER MATERIALS.

WOODRUFF (*Asperula odorata*), a small herb of the madder family (Rubiaceae), found widely throughout Europe and northern Asia, native to Great Britain, and sparingly naturalized in the eastern United States. It has an erect stem, about 8 in. high, bearing lance-shaped leaves mostly in whorls of 8, and small white flowers in loose clusters. The dried leaves emit a hay-like fragrance.

WOODSTOCK, a town and port of entry of Oxford county, Ontario, Canada, 80 m. S.W. of Toronto by rail, on Cedar creek, the Thames river and the Canadian National and Canadian Pacific railways. Pop. (1921) 9,935. It is one of the best agriculture sections of the province and has a large export trade in cheese, butter and farm produce. Organs, pianos and agricultural implements are manufactured.

WOODSTOCK, a town and municipal borough in Oxfordshire, England, 8 m. N.W. of Oxford and the terminus of a branch of the G.W. railway. Pop. (1921) 1,510. The River Glyme divides the town into New and Old Woodstock. The church of St. Mary Magdalene, in New Woodstock, is Norman but has additions in later styles, and a west tower built in 1785.

After the battle of Blenheim the manor of Woodstock was bestowed in perpetuity on John, duke of Marlborough. In 1723 it was destroyed and the site levelled after the erection of Blenheim house, a mansion erected by parliament for the duke of Marlborough in consideration of his military services, and especially his decisive victory at Blenheim. The sum of £500,000 was voted for the purchase of the manor and the erection of the building, erected by Sir John Vanbrugh (*q.v.*), in a heavy Italo-Corinthian style. The magnificent park contains Fair Rosamund's well, near which stood her bower. On the hill stands a column commemorating the duke.

Domesday describes Woodstock as a royal forest; it was a royal seat from early times and Aethelred is said to have held a council there, and Henry I. to have kept a menagerie in the park. Woodstock was the scene of Henry II.'s courtship of Rosamund Clifford ("Fair Rosamund"). It was a favourite royal residence until the Civil War, when the manor house was destroyed.

See Rev. E. Marshall, *Early History of Woodstock Manor* (Oxford, 1873); Adolphus Ballard, *Chronicles of Royal Borough of Woodstock; Victoria County History, Oxfordshire.*

WOOD-WORKING MACHINERY includes the various classes of tools for performing the operations on timber, from the rough log to the finished product. This group of machine-tools differs from those for metal-working in two important particulars. The speeds of cutting the material are relatively much greater, and the methods of holding or feeding it are usually quite different. These facts affect the design of the machines in numerous ways, while the saws, cutters, and knives possess much keener angles than those used on metal. Heavy pieces, such as logs, are held on a carriage or table which provides the means of movement in relation to a saw; in other cases ribbed rollers press against partly finished pieces and feed them along. There is also a good deal of direct hand feeding, with the assistance of fences or guides which keep the wood in a correct path, although much mechanically operated equipment is now in use.

Sawing Machines.—Taking the machines according to their class of operation, the saws comprise a wide range, from those dealing with big logs to the finest cutting necessary for cabinet work, and running blades of either circular, reciprocating, or band type. The first operation after tree-felling is to cross-cut the logs into suitable lengths for transport; for this purpose a stiff reciprocating blade, which cuts on the inward stroke, is driven by a steam or compressed air cylinder, the sole of the machine resting upon the ground. Or a crank-disc is driven by electric motor to reciprocate the blade, if current should be available. Tree-felling may be done by the same sort of machine differently mounted. Swing machines using a circular saw are likewise used for the cross-cutting of the smaller logs.

Several types of machines are employed for breaking down logs. A rapid-cutting machine which is much used, although it is rather wasteful of material, runs a big circular saw; past this the log is fed by a carriage on rollers, the log being held securely by a set of spiked dogs. A similar style of feed also occurs with the vertical band saws, with a blade thinner than that of the circular saw. The horizontal band-saw is a very fast-cutting and accurate machine, feeding the log by means of a carriage between two uprights up and down which the saw frame may be adjusted to cut successively the several boards or flitches from the log. The width of the saw blade reaches to a foot in the big machines, taking logs to 7 ft. diameter. Another manner of breaking down logs is with the log frame, with a feeding movement between uprights as with the horizontal band-saw; but the log is divided up by a number of reciprocating saws operated by a crank-shaft.

What are termed re-sawing machines do not deal with logs, but cut up the products from the latter, such as deals and flitches, into boards, etc. Such deal or flitch frames cut by a vertically reciprocating set of saws. For more varied cutting, a band re-saw is employed, this having the band-saw running vertically and the material fed over the table by ribbed feed rollers. A like class of feed apparatus is fitted to circular saw benches for re-sawing purposes. Saws for cross-cutting are used extensively, being of circular blade class, and with one saw, or two to cut to definite lengths. The pendulum saws are also utilized for this service, consisting of a frame pivoted from an overhead beam so that the circular saw at the bottom of the frame may be pulled by a hand motion through the wood. For general sawing the circular-saw bench is made in various styles, with a fence which guides the wood. The most complete types are the dimension saws which have a complete system of adjustments to angles and positions, with graduated scales for reading the amount that all sorts of cutting, as ripping, cross-cutting, bevelling, mitring, rebating, grooving, etc., require. Single machines carry one saw, double ones two, for ripping and cross-cutting respectively; either of these can be swung up through the table when required. By the use of a cutter-block on a saw spindle further operations beyond the capacity of a saw are practicable.

Band-sawing machines, and to a lesser degree fret-saws have to be utilized to cut straight and curved parts which cannot be dealt with by means of a circular saw. The table, through which the blade runs, may be used either in the horizontal attitude, or canted for bevel cutting. These saws need careful design in order to keep working well; the tension on the blade must be sensitive, and the latter has to run in anti-friction guides above and below the table so as to cut truly.

Planing Machines.—Those which finish sawn material on various faces vary greatly in design. The smallest are the hand-feed planers, along the surface of the table of which the operator slides the wood past the revolving cutter-block. For hand machines this has to be of the safety type, forming almost a cylinder so that the fingers cannot be drawn into the machine as with the older square cross-sectional shape. A vacuum effect is thus secured by the eccentric formation, leaving a space as marked. This both tends to draw the wood down on to the cutters and to suck away the chippings. The panel planers or thicknessing machines feed the wood along a table underneath the cutter cylinder, so that thick or thin pieces may be planed to uniform dimensions. With a second cutter-cylinder below the table each side of the wood is planed simultaneously. And with two extra vertical spindles, each carrying a short cutter-block, the edges of the timber may be treated as well, including tonguing, grooving, moulding, or rebating. Roller feed is applied to these panel machines. The most elaborate planing machines are those for flooring-boards, etc., the big ones having eight feed-rollers to propel the timber past the cutters and knives, the latter being of non-revolving class to impart a high finish after the revolving cutters have roughed off the surface. The rate of feed will sometimes exceed 400 ft. per minute. Machines for smaller dimensions of stuff are also made with four or five cutters, and either sort will do matching on the edges of the timber. The bottom cutter heads are constructed to draw out by means of a heavy slide, so that adjustments and settings may be effected and the head slid back into the working position.

Moulding machines produce shapes, planing all four sides at one

pass, and for mass production are built somewhat after the style of the large planing machines just mentioned. The vertical shaper or circular moulder has a cutter spindle standing up from a flat table, and the cutters may be of any desired profile, and will mould either straight, curved, or irregular mouldings. Fences of suitable shape guide the wood. Tenoning machines operate with cutters of appropriate shape, above and below the timber, which is fed along by a carriage. A grooving or drunken saw is often used: this is a circular saw set askew on its spindle, so that it wobbles and produces the groove. Dovetails are cut in machines of single- or multiple-spindle design. For the first, a pitching arrangement moves the wood into the successive positions for the high-speed cutter to pass through, and in the second all the dovetails are made at one feed, by the several cutters set at the correct distance apart.

Holes of round, square, or oblong shape are made in the boring and mortising machines. The first resemble drilling machines for metal in general form, but are of rather simpler construction. Mortising may be performed with a reciprocating chisel, which is pulled down by a slide and lever to penetrate the wood; but the hollow chisel is a faster-cutting tool. This is a hollow tool within which an auger revolves and removes the bulk of the stuff and as it is fed in the sharp corners at the end of the chisel square out the hole. Some machines, such as those for railway carriage and wagon work, have several boring spindles and a hollow auger spindle. Another fast-cutting machine is the chain mortiser. This has an endless steel chain the links of which are formed with chisel teeth, and it runs around a long guide bar that is fed into the wood, the teeth cutting the way before and producing the mortise.

Lathes.—Lathes produce all the numerous turned chisels, some of which are evolved with hand-controlled chisels and gouges supported on the hand-rest, others by means of a slide-rest having slides moved with handles and screws. When the contours of articles vary (*e.g.*, those of spokes, pick handles, cricket bats, or gun-stocks) a copying lathe is employed. This carries a model of the piece with one spindle and the roughly shaped wood with the other; the cutting is done by means of a revolving cutter block, and the frame holding this is moved in accordance with the copy, so that the shape of the latter becomes exactly reproduced on the wood.

Sandpapering machines finish wood of different shapes, some against a flat disc, others on an endless band. The drum machines are the largest kinds, for extensive output, and have three drums for successive action. The first has coarse paper, the second finer, and the third finer still with a soft cushion beneath to produce a high finish. A brush cleans off the dust.

Woodworking machines are extensively fitted with ball or roller bearings, to enable their high speeds to be maintained without heating and excess consumption of power. The mass of sawdust or chips, which is soon enormous with some machines, has to be taken away by a suction apparatus, as mentioned under FANS.

(F. H.)

WOOF. Another name for Weft: *see* WARP and WEFT.

WOOL. Animal fibres are usually spoken of as hair, with the exception of the coat of the sheep which is usually termed wool. Before the researches of Professor Cossar Ewart (Edinburgh) wool was looked upon as a modified form of hair. Now it is usual to look upon wool as the simpler structure and hair as a development from this structure. The difference between wool and hair is best realized by a study of the double coat of the primitive wild sheep. The under coat is fine wool—the fibre showing a twofold structure, inner or cortex and outer or cuticle. Microscopic examination of this fibre shows a highly imbricated or serrated surface. The outer coat is coarse hair—the fibre showing a threefold structure, medulla along with cortex and cuticle. The medulla is probably an air or gas-filled core of the fibre which markedly changes both the appearance and physical properties of the fibre. Certain animals are covered with wool only, others with hair only and others with both hair and wool. The sheep is possibly the only animal carrying a fleece of wool only and not every variety of sheep does this. Certain varieties of sheep are stated to carry hair only, but such animals as goats, cattle, horses, etc., are the chief hair-bearing animals. A few years ago the hair of the Angora goat (termed mohair) would have been classed as a hair but Duerdon (Grahamstown) has shown that it is the under-coat and therefore ought to be ranked as wool. That there may be gradations from wool to hair was shown by an analysis of the coat of the blackface sheep by Barker (Leeds) but further researches on this coat by Janet Blyth (Edinburgh) suggest rather modifications of the two extreme types of fibres towards a common type. The differentiation between the two types, however, is very difficult for both probably arise from the inturned epidermis; but as the sheep has two skins separated by a layer of fat it is suggested that the physiological process of bringing a fibre up from the lower skin produces hair and the process of bringing a fibre from the upper skin produces wool. This is borne out by the fact that if a small lock of wool is jerked from a fine merino sheep it brings the upper skin away with it. The camel produces two distinctive coats but perhaps the most interesting animal of this class is the "musk ox" or ovibos of the Arctic regions. This creature grows an under-coat of beautifully soft fibre, which perhaps should be regarded as wool, which it casts once a year; and an outer coat of strong hair of which presumably it distributes the casting throughout the entire year.

Wool in Britain.—Wool is one of the most important of the textile fibres. Owing to the ease with which it may be spun into thread, and the comfort derived from clothing made of wool, it would naturally be one of the first textiles used by mankind for clothing. Ancient records prove the high antiquity of wool textiles and the early importance of the sheep. The different kinds of wool and the cloth made from them in antiquity are described by Pliny and referred to by other writers. The sheep certainly was a domestic animal in Britain long before the period of the Roman occupation; and it is probable that some use was made of sheep skins and of wool. But the Romans established a wool factory whence the occupying army was supplied with clothing, and the value of the manufacture was soon recognized by the Britons, of whom Tacitus remarks, "*Inde etiam habitus nostri honor et frequens toga*" (*Agric.* c. 21). The product of the Winchester looms soon established a reputation abroad, it being remarked that "the wool of Britain is often spun so fine that it is in a manner comparable to the spider's thread." This reputation was maintained throughout the middle ages, and the fibre was in great demand in the Low Countries and other continental centres. There are many allusions to woollen manufactures in England in early times; but the native industry of the island could not rival the products of the continent.

In the time of William the Conqueror Flemish weavers settled under the protection of the queen at Carlisle, but later they were removed to Pembrokeshire. At various subsequent periods there were further immigrations of skilled Flemish weavers, who were planted at different places throughout the country. The cloth fair in the churchyard of the priory of St. Bartholomew was instituted by Henry II.; gilds of weavers were established; and the exclusive privilege of exporting woollen cloth was granted to the city of London. Edward III. made special efforts to encourage wool industries. He brought weavers, dyers and fullers from Flanders; he himself wore British cloth; but to stimulate native industry he prohibited, under pain of life and limb, the exportation of English wool. Previous to this time English wool had been in large demand on the continent, where it had a reputation exceeded only by the wool of Spain. The customs duties levied on the export of wool were an important source of the royal revenue. Edward III.'s prohibitory law was, however, found to be unworkable, and the utmost that both he and his successors were able to effect was to hamper the export trade by vexatious restrictions and to encourage much smuggling of wool. Thus while Edward III. limited the right of exporting to merchant strangers, Edward IV. decreed that no alien should export wool and that denizens should export it only to Calais. Legislation of this kind prevailed till the reign of Elizabeth, when the free exportation of English wool was permitted; and Smith, in his *Memoirs of Wool*, points out that it was during this reign that the manufacture made the most rapid progress. In 1660 the absolute prohibition of the

export of wool was again decreed, and it was not till 1825 that this law was finally repealed. The results of the prohibitory law were exceedingly detrimental; the production of wool far exceeded the consumption; the price of the raw material fell; wool-"running" or smuggling became an organized traffic; and the whole industry became disorganized. Extraordinary expedients were resorted to for stimulating the demand for woollen manufactures, among which was an act passed in the reign of Charles II. decreeing that all dead bodies should be buried in woollen shrouds—an enactment which remained in the Statute Book, if not in force, for a period of 120 years. On the opening up of the colonies, every effort was made to encourage the use of English cloth, and the manufacture was discouraged and even prohibited in Ireland.

Wool was "the flower and strength and revenue and blood of England," and till the development of the cotton trade, towards the end of the 18th century, the wool industries were, beyond comparison, the most important sources of wealth in the country. Towards the close of the 17th century the wool produced in England was estimated to be worth £2,000,000 yearly, furnishing £8,000,000 worth of manufactured goods, of which there was exported about £2,000,000 in value. In 1700 the official value of woollen goods exported was about £3,000,000, and in the third quarter of the century the exports had increased in value by about £500,000 only. In 1774 Dr. Campbell (*Political Survey of Great Britain*) estimated the number of sheep in England at 10,000,000 or 12,000,000, the value of the wool produced yearly at £3,000,000 (or about 5s. per lb.), the manufactured products at £12,000,000, and the exports at £3,000,000 to £4,000,000. He also reckoned that the industry then gave employment to 1,000,000 persons. In 1800 the native crop of wool was estimated to amount to 96,000,000 lb; and, import duty not being imposed till 1802, the quantity brought from abroad was 8,600,000 lb., 6,000,000 lb. of which came from Spain. In 1825 the importation of colonial wool became free, the duty leviable having been for several previous years as high as 6d. per lb, and in 1844 the duty was finally remitted on foreign wool also.

British Wools.—English wool, known the world over as being of a long and lustrous type was doubtless the kind so much in demand in the middle ages. That it was as long and lustrous as the typical Leicester or Lincoln of to-day is doubtful, as the new Leicester breed of sheep was only fully developed by Bakewell after the year 1747, and the latter day Lincoln is even a later development of a similar kind. As already remarked, the long and lustrous wools are the typical English, being grown in Lincolnshire, Yorkshire, Nottinghamshire, Devonshire, etc., in fact in all those districts where the pasturage is rich and specially fitted for carrying a heavy sheep. It is claimed that the lustre upon the wool is a direct result of the environment, and that to take a Lincoln sheep into Norfolk means the loss of the lustre. Attempts were made in the 18th century to develop a fine wool breed in England, George IV. importing a number of merino sheep from Spain. The discovery was soon made that it was difficult to maintain a breed of pure merinos in Great Britain, but the final outcome was by no means unsatisfactory. By crossing with the indigenous sheep a race of fairly fine woolled sheep was developed, of which the present day representative is the Southdown—a sheep which feeds naturally on the downs of Sussex, etc., forming a marked contrast to the artificially turnip-fed Lincoln, Leicester, etc., sheep. Following the short, crimpy Southdown, but rather longer, come the Hampshire and Oxford down sheep; these are followed by Suffolk, Shropshire, Kent and Romney Marsh (Demi-lustre), until at last the chain from the Southdown to the Lincoln (lustre) is completed. Of course there are several British wools not included in this chain. Scotch or black-face wool is long and rough, but well adapted for being spun into carpet yarns. Welsh wool has the peculiarity of early attaining its limit of shrinkage when washed, and hence is specially chosen for flannels. Shetland wool is of a soft nature specially suited for knitting yarns, while Cheviot wool—said to be a cross between merino sheep saved from the wreck of the Great Armada and the native Cheviot sheep—has made the reputation of the Scottish manufacturers for tweeds. North wool—wool from an animal of the Border Leicester and Cheviot breed—Wensleydale, Masham and Ripon wools are also specially noted as lustre wools.

Merino.—For centuries the finer wools used for cloth-making throughout Europe had been obtained from Spain—the home of the famous merino breed developed from races of sheep originally introduced into the peninsula by the Moors. Till early in the 19th century the superiority of Spanish merinos remained unchallenged, but the Peninsular War and its attendant evils produced a depreciation of quality concurrently with the introduction of Saxon and Silesian wools, which suddenly supplanted the product of Spain. The Spanish merino sheep had been introduced into Saxony by the elector in 1765, and by judicious crossing with the best native race developed the famous electoral breed. Merinos were carried to Hungary in 1775, and to France in 1776, and in 1786 Daubenton brought them to Rambouillet, whence a famous race developed. In 1802 the first merinos known to have left pure descendants were taken to the United States, and in 1809–1810 an importation (4,000) of merino sheep was made.

Wool in Australasia.—The introduction of the merino sheep into Australasia about the end of the 18th century and later into South America was an important move. It is probable that the marked improvement in the appearance of the first sheep taken out by the early colonists suggested the possibilities of Australia as a wool-growing country. As has been noted above, marked endeavours were being made at this time to extend the merino breed of sheep, so that it was but natural that this breed should be given the first chance. It should here be noted that the Australian fine wools were first shipped from Botany bay (near Sydney), hence the now universal term "botany" for fine wools. The colonists were not to be repressed, however, and eventually, through the endeavours of Captain MacArthur, the Rev. Samuel Marsden and others, notwithstanding the opposition of Sir Joseph Banks, the president of the Royal Society, the merino breed became established on a firm basis, and in a comparatively short time Australian wools were no longer a drug on the market. In the 19th century the possibilities of raising larger sheep on the better coastal pasturage was naturally suggested. Until about 1885 this tendency was largely repressed owing to the demand for merino as distinct from cross-bred wool. In other words wool was the dominating factor. But with the possibilities and the development of the frozen meat trade from 1880 to 1890 this condition was changed, and the tendency to breed a large sheep of an early maturing type, with a valuable carcass and mediocre wool grew apace. New Zealand was specially adapted for this development; thus New Zealand frozen mutton completely dominated New Zealand wool. In this manner it came about that cross-bred wool supplanted merino wool to a very considerable extent throughout Australasia.

The final results of these crossings are somewhat peculiar. The Lincoln crossed on to the Merino and in-bred for at least ten generations has produced the world renowned "Corriedale" sheep which on a large body carries a heavy fleece of 48's/56's quality of wool. The half-bred Down cross Merino produces an early fattening lamb with a wool between the Down and the Merino. The Romney Marsh sheep has proved a wonderful sheep for New Zealand especially from the frozen mutton trade point of view. Its wool may be a useful demi-lustre but unfortunately has been allowed to deteriorate. This deterioration, however, is now being suppressed and wools at present being tested in the University of Leeds (1928) show a return to a useful quality. Any cross between an English breed and a Merino which has been crossed towards the Merino again produce the fine "cross-bred" or "Comeback" wools for which Australia is specially noted. The Corriedale sheep crossed on to the Merino and in-bred for many generations form the Polworth sheep and wool.

A somewhat different evolution has taken place in later years with reference to the interior sheep stations. The merino sheep will thrive where a larger sheep would starve, hence its value for the stations where salt-bush and blue-bush dominate all vegetation. But the merino sheep is a "wool" sheep, not a "frozen mutton" sheep, hence all crossing here was carried out with the idea of simply developing the weight of fleece and if possible retaining the merino wool characteristics.

South American Wool.—Hardly second in importance to Australia as a wool-growing country comes South America. In most years Australia has produced the greater bulk, but until recently occasionally S. America has come out top. To-day, however, although Patagonia and Chile have shown remarkable sheep developments, South America as a whole has relatively declined as a wool-growing continent. Cattle and cereals prove the better paying products. The history of the introduction of merino sheep into S. America may be briefly summed up as follows. In 1842 Henri Solanet, a Frenchman, began to shear the comparatively few sheep round Buenos Aires. His example was soon followed by Edouardo Olivera and José Planer. The idea almost at once came to these pioneers of importing well-bred rams, and as S. America is essentially a Latin country it was but natural that the French flocks of Rambouillet should be first drawn upon. With the development of the meat trade—just as in the case of Australia and New Zealand—a larger carcass was then sought after. This led to the introduction of the Lincoln ram and the development of cross-bred flocks about the year 1885. Perhaps this cross was favoured owing to the skill of the Bradford spinners, who made excellent use of the cross-bred wool produced. Flocks of sheep were first introduced into the Falkland islands in 1867. The pasturage here being limited, the flocks have probably attained their limit, but from the Falkland islands flocks have been passed on to Punta Arenas, where there is practically unlimited pasturage. The chief centres from which wool from S. America comes to Europe are Buenos Aires, which exports chiefly long and cross-bred wools, Montevideo, which exports chiefly merino wools, and the Falkland islands and Punta Arenas, which export mostly wools of the finer Cheviot type. The industry is largely in the hands of Englishmen. In Peru the weight of fleece carried and the number of sheep are being so increased that Peru may soon be exporting over 100,000,000 lb. of wool annually in addition to its export of vicuna, alpaca, and llama markets.

South African Wool.—Prior to the introduction of the merino sheep into Australia it had been introduced into S. Africa by the Dutch. There the climate was not so helpful as was that of Australia. The newly acclimatized sheep appears to have cast its wool at about the fifth generation and to have generally deteriorated, necessitating the reintroduction of fresh blood from Europe. In this manner have been developed the Cape flocks and the considerable Cape wool trade—largely centred at Port Elizabeth, East London, Cape Town, Mossel Bay and Port Natal. The country is evidently specially adapted for the rearing of the merino type of sheep, as cross-bred Cape wool is almost unknown. In 1907 some thousands of Australian merino sheep were introduced, and this has been followed up by more recent importations. Thus to-day Cape merinos rival those of Australia.

Such remarkable advances have been made in the weights of fleeces carried by sheep of particular breeds that it is difficult to say if finality has been reached. The following list gives average weights:

Breed	Weight of average fleece	Breed	Weight of average fleece
Merino (Australian)	8 to 10 lb.	Southdown	6 lb.
Merino (South American)	4 to 6½ lb.	Lincoln	12 lb.
Corriedale	8 to 10 lb.	Shetland	4 lb.
		Cashmere	4 oz.

In 1885 the average weight of wool per sheep per year was about 5 lb., while 7 to 8 lb. is now the average weight. The weights of Australian fleeces are to-day about double as compared with 1885.

The Colour of Wool.—The prevailing colour of sheep's wool is white, but there are races with black, brown, fawn, yellow and grey shades of wool. For manufacturing purposes generally white wool is, of course, most valuable, but for the homespuns, which in earlier times absorbed the bulk of wool, natural colours were in many cases used with good effect. In domestic spinning, knitting, and weaving, natural colours are still largely taken advantage of, as in the cases of rough yarns, Shetland knitted shawls, Highland tweeds, etc.

Tables I. and II. give useful particulars of the World's sheep and wool and also illustrate recent developments in wool-growing.

The Physical Characteristics of Wool.—The most important physical characteristics of the wool fibre are the cell structure, the fibre diameter and the fibre length. Researches into the external structures of ranges of British and Merino wools reveal interesting differences which largely explain the felting qualities observable in the respective wools. It is usual to consider British wools under the headings—*mountain wools, lustre wools, demi-lustre wools* and *down wools.*

Fig. 1 illustrates typical fibres taken from the Swaledale (an improved Blackface Scotch sheep) showing in *K* the external structure of the kemp, in *I.* medullated and non-delullated coarse fibres and in *II.* the finest fibre, which in this case approaches the merino fibre in actual scale structure.

Fig. 2 illustrates typical fibres taken from the Lincoln sheep, typical of the lustre wool class; in this case in *I.* there are continuous and intermittent medullated fibres.

Fig. 3 illustrates typical fibres taken from the Romney Marsh sheep, typical of the demi-lustre class. This is a remarkably good felting wool and the very clearly defined external scale structure is probably a dominant factor with reference to this quality.

Fig. 4 illustrates fibres taken from Southdown sheep—the best of the fine British breeds—which are particularly interesting in that there are no medullated fibres, while both thick and thin fibres clearly show a merino origin. This is not a milling wool.

In fig. 5 a photo-micrograph of a typical merino fibre is shown, from which it will be gathered that the typical merino structure is of the coronal pattern in which each scale tends to encircle the shaft of the fibre and rests in the cup formed by the scale beneath it.

In fig. 6 a photo-micrograph of a New Zealand cross-bred fibre (Lincoln×merino) is given, this presenting a curious blend of the British and merino wools external fibre structures.

Wool fibres vary in diameter from more than $\frac{1}{400}$″ to less than $\frac{1}{2,000}$″. In the best bred merino wools, say a 70's quality,

shoulder staples or locks of wool will snow a useful uniformity varying only from about $\frac{1}{1,000}$″ to $\frac{1}{4,000}$″, whereas in the typical mountain wools variations from $\frac{1}{400}$″ to $\frac{1}{900}$″ are quite usual. The explanation is that the well-bred merino wool is entirely the under coat of the wild sheep, while the mountain wool appears to be composed of fibres from both the under and outer coats of the wild sheep with modified fibres coming in between the two types.

Just as the life history of a fish may be recorded in its scales so the life history of a sheep is recorded in its wool fibres. The single factor—fibre diameter—usually reveals important facts with reference to both "race" and "environment."

Wool fibres vary in length from under one inch to more than 18 inches, in fact, on several occasions when sheep have accidentally missed shearing for two or three years a wool growth, in the case of crossbreds, has been recorded to more than 40 inches. The yearly growth of wool, however, is within the limits indicated. The following are the average yearly growths of the most important breeds of sheep.

Blackface	18″ to 10″	Southdown	3 ″ to 4″
Lincoln	12″ to 18″	Clothing Merino	1½″ to 3″
Romney	6″ to 8″	Combing Merino	2½″ to 5″
Shropshire	4″ to 6″		

It should be noted that the first year's growths of wool, sheared from what are termed "hogg" or "teg" sheep, are usually rather longer than the above owing to the lambs being dropped from February to April and the shearing not taking place until the following May or June. Hogg wool also reveals itself in its pointed fibre tips.

The dominant physical characteristics of the four classes of wool referred to are:—For mountain wools, strength of fibre and in some cases a free intermixture of coarse and fine fibres; for lustre wools, that lustre which the manufacturer can develop in his lustre fabrics; for demi-lustre wools, either an approach to a lustre type or more frequently a loftiness in handle well suiting the type of wool for the coarser hosiery fabrics. For down wools, a fineness combined with loftiness which specially fits these wools for the finer hosiery styles; and for merino wools, a special fibre fineness with plasticity of handle which enables the spinner to produce the finest possible wool yarns and the manufacturer to obtain a superb "handle" in his fabrics.

The other distinguishing qualities of good wool are uniformity and strength of fibre with freedom from tender or weak portions in its length, a condition which not unfrequently arises from ill health in the sheep, or is due to violent climatic changes. In ill-bred wool there may also be found intermingled "kemps" or dead hairs—straight, coarse, dull fibres which show conspicuously among the wool, and become even more prominent in the manufactured and dyed goods, as they will not take dye.

The Chemical Characteristics of Wool.—Wool as it comes from the sheep's back is in anything but a pure form. The following analyses carried out at Leeds university (Barker and Wilson) give an idea of the problem facing the wool-scourer who, receiving wool "in the grease," is expected to turn it out clean with a moisture content of about 16% in the weight of the clean dried wool.

Type of wool	Clean wool	Water	Soil	Fat	Potash salts	Organic matter burnt off	Per cent
	%	%	%	%	%	%	%
Lincoln (washed)	73·3	13·4	5·32	3·77	2·06	1·63	99·48
Merino	45·0	9·0	13·0	24·0	4·0	6·0	101·0
Corriedale	54·0	13·0	10·0	12·0	5·9	6·0	100·9
Southdown	50·0	11·0	16·0	10·0	5·2	8·0	100·2
Burry	62·0	12·8	9·3	10·0	4·5	4·6	102·9

A careful analysis of typical wools (Speakman) usefully indicates the percentages on the weights of the clean dry wool of "wool fat" and "suint" usually present.

Type of wool	Wool fat	Suint
	%	%
Australian wools		
Geelong, 80's quality	35·3	14·2
Merino, 64's quality	41·0	17·1
Corriedale, 56's quality	45·8	23·5
African wools		
Eastern state, 70's quality	27·0	20·0
Swagershock, 64's quality	29·6	21·4
Grootfontein, 70's quality	41·4	12·0
Peruvian		
Ordinary, 56's quality	9·4	29·2
Improved, 60/64's quality	14·0	35·0
English		
Wensleydale, 46's quality	9·3	27·3

The variations here in evidence are remarkable and well illustrate the difficulties with which the wool-scourer has to contend It is usual now to recover the wool fat which is placed on the market as "lanoline," but it is not usual to attempt to recove the potash salts.

Chemical Composition.—According to Dr. Bowman, the chemical composition of the cell structure of the average wool fibre is:—

Carbon	50·8
Hydrogen	7·2
Nitrogen	18·5
Oxygen	21·2
Sulphur	2·3
	100·0

It is said to be a most complex body of which the probabl formula is $C_{42}H_{157}N_5SO_{15}$.

If wool is burnt, it largely resolves itself into ammonia gas—whence it derives its characteristic odour—and carbon "beads" o "remains," which serve to distinguish wool from cotton, which upon being burnt, does not smoulder but burns with a flash an leaves no beads. For further particulars on the organic nature o the wool-fibre *see* FIBRES.

Lamb, Hogg and Wether Wool.—The bulk of the wool o commerce comes into the market in the form of fleece wool, th product of a single year's growth, cut from the body of the livin animal. The first and finest clip, called lambs' wool, may be take from the young sheep at about the age of eight months. When th animal is not shorn till it attains the age of twelve or fourtee months the wool is known as hogg or hogget, and, like lamb wool, is fine and tapers to a point. All subsequently cut fleeces ar known as wether wool, and usually possess relatively somewha less value than the first clip. Fleece wool as it comes into th market is "in the grease," that is, unwashed, and with all the dir etc., present; or it is received as "washed" wool, the washin being done as a preliminary to the sheep-shearing; or, in som few cases, it is scoured and is consequently stated as "scoured. Skin wool is that which is obtained from sheep which have eithe died or have been killed. Typical skin wool is that which has bee removed by a sweating process or by painting with sulphide

Sheep Washing.—Where there is abundance of water an other conveniences it is the practice to wash sheep previous t shearing, and such wool comes onto the market as washed. Wher running streams exist, the sheep are penned by the side of th water, and taken one by one and held in the stream while they ar washed, one man holding and the other washing. Sheep washin appliances are now largely employed, the arrangement consistin of a pen into which the sheep are driven and subjected to a stron spray of water either hot or cold, which soaks the fleece an softens the dirt. This done, they are caused to swim along tank which narrows towards the exit, and just as they pass ou of the pen they are caught and subjected to a strong douche o pure water. They should then be kept on grass land free fron straw, sand, etc., so that the wool may be sheared free fron vegetable matter, etc. After a few days the wool of a washe sheep is sufficiently dry for shearing or clipping.

Sheep Shearing.—A skilful shearer will clip the fleece from sheep in one unbroken continuous sheet, retaining the form an relative positions of the mass almost as if the creature had bee

skinned. In this unbroken condition each fleece is rolled up by itself and tied with its own wool, which greatly facilitates the sorting or stapling which all wool undergoes for the separation of the several qualities which make up the fleece. Mechanical shears have almost revolutionized the shearing industry, a good shearer shearing from 100 to 200 sheep per day.

Wool Classing.—On the great Australian sheep stations wool classing is one of the most important operations, largely taking the place of sorting in the English wool trade. This is no doubt due to the wonderful success which has attended the efforts of the Australian sheep breeders to breed a sheep of uniform staple throughout. Thus the fleeces as taken from the sheep are skirted and trimmed on one table and then passed on to the classer, who places them in the 56's, 60's, 64's, 70's, 80's or 90's class according to their fineness, these numbers approximately indicating the worsted counts to which it is supposed they will spin. The shorter Australian wools not coming under any of these heads are classed as super-clothing, ordinary clothing, etc., being more suitable for the woollen industry.

The technique of sheep shearing, skirting, classing, packing and transporting has been brought up to a wonderful state of perfection in Australia, and the "get up" of the wool is usually much superior to the "get up" of the "home-clip."

Wool Sorting.—Sorting or stapling was formerly a distinct industry, and to some extent it is so still, though frequently the work is done on the premises of the comber or spinner. Clothing wools are separated and classed differently from combing wools, and in dealing with fleeces from different breeds, the classification of the sorter varies. In the woollen trade short-staple wool is separated into qualities, known, in descending series from the finest to the most worthless, as picklock, prime, choice, super, head, seconds, abb and breech, and the proportions in which the higher and lower qualities are present are determined by the "class" of the fleece. In the worsted trade the classification goes, also in descending series, from fine, blue, neat, brown, breech, downright, seconds, to abb for English wools. The last three are short and not commonly used in the worsted trade. The greater proportion of good English long wool will be classified as blue, neat and brown; it is only in exceptional cases that more than from 5 to 8% is "fine" on the one hand, or of lower quality than breech on the other. Generally speaking, the best portion of a fleece is from the shoulders and side of the animal. The quality decreases towards the tail end of the sheep, the "britch" being frequently long, strong and irregular. The belly wool is short, worn and dirty, as is also the front of the throat, while on the head and shins the product is short, stiff and straight, more like hair than wool and is liable to contain grey hairs. The colonial wools come "classed," and consequently are only as a rule sorted into three or four qualities. Thus a 60's fleece may be sorted into 56's, ordinary 60's, super 60's and skirtings.

The sorter works at a table or frame covered with wire netting through which dust and dirt fall as he handles the wool. Fleeces which have been hard packed in bales, especially if unwashed, go into dense hard masses, which may be heated till the softening of the yolk and the swelling of the fibres make them pliable and easily opened up. When the fleece is spread out the stapler first divides it into two equal sides; then he picks away all straws, large burrs, and tarry fragments which are visible; and then with marvellous precision and certainty he picks out his separate qualities, throwing each lot into its allotted receptacle. Sorting is very far removed from being a mere mechanical process of selecting and separating the wool from certain parts of the fleece, because in each individual fleece qualities and proportions differ, and it is only by long experience that a stapler is enabled, almost as it were by instinct, rightly to divide up his fleeces, so as to produce even qualities of raw material. Cleanliness is most essential if the wool sorter is to keep his health and not succumb to the dread disease known as "anthrax" or "wool-sorters' disease." Certain wools such as Persian, Van mohair, etc., are known to be very liable to carry the anthrax bacilli, and must be sorted under the conditions imposed by government for "dangerous wools." Fortunately wools can now be readily disinfected at the Government's station at Liverpool. Ordinary or non-dangerous wools are perfectly harmless from this point of view.

Scouring.—The washing which a fleece may have received on the live sheep is usually not sufficient for the ordinary purposes of the manufacturer. On the careful and complete manner in which scouring is effected much depends. The qualities of the fibre may be seriously injured by injudicious treatment, while, if the wool is imperfectly cleansed, it will dye unevenly, and the manufacturing operations will be more or less unsatisfactory. The water used for scouring should be soft and pure, both to save soap and still more because the insoluble lime soap formed in dissolving soap in hard water is deposited on the wool fibres and becomes so fixed that its removal is a matter of extreme difficulty. In former times stale urine was a favourite medium in which to scour wool; but that is now a thing of the past, and a specially prepared potash soap is the detergent principally relied on. Excess of uncombined alkali has to be guarded against, since uncombined caustic acts energetically on the wool fibre—especially in the presence of heat—and is indeed a solvent of it. A soap solution of too great strength leaves the wool harsh and brittle, and the same bad result arises if the soapy solution is applied too hot.

The scouring of wool has passed through many changes during the past fifty years, but to-day the principle upon which all scouring machines are based is that wool naturally opens out in water. The mechanical arrangements of the machines are such as to ensure the passage of the wool without undue lifting and "stringing"; to obviate the mixing of wool grease, sand, dirt, etc., once taken out of the wool with that wool again; to give time for the thorough action of the scouring agents, so that neither too strong a solution nor too great a heat be employed; and to allow of the ready cleansing of the machines so that there is no unnecessary waste of time. In England the recognized type of merino wool-washing machine is the fork-frame bowl. Three to five of these machines are employed. The "scour" is strongest and hottest in the first bowl (unless this is used as a "steeper") as the wool at first is protected from the caustic by the wool-fat, etc., present. The last bowl is simply a rinsing bowl. With modern "nip rollers" botany wool is sufficiently dry to be passed on directly—say by pneumatic conveyers—to the carding. This the worsted spinner does, thereby saving time and money. The woollen spinner, however, may require the wool for blending, and so may require it dry and in a fit state for oiling. He, therefore, will employ one or other of the drying processes to be immediately described. For English and cross-bred wools more agitation in the scouring bath may be desirable. If so, the eccentric fork action machine is employed, in which the agitation of the bath is satisfactorily controlled by the setting of the forks which propel the wool forward. An average wool will be in the scouring liquor about eight minutes, the temperature will vary from 120° F to 110° F, and the length of bath through which it will have passed will be from 48 to 60 ft.

It is interesting to note that the "emulsion" method of wool scouring as described above is practically universal in England. In the United States of America the "solvent" method is largely in use. The agent employed—say benzene—is recovered by volatilizing and condensing, thus being used over and over again.

Wool Drying.—The more gently and uniformly the drying can be effected the better is the result attained; over-drying of wool has to be specially guarded against. By some manufacturers the wool from the squeezing rollers is whizzed in a hydro-extractor, which drives out so much of the moisture that the further drying is easily effected. The commonest way, however, of drying is to spread the wool as uniformly as possible over a framework of wire netting, under or over which is a range of steam-heated pipes. A fan blast blows air over these hot pipes, and the heated air passes up and is forced upwards through the layer of wool which rests on the netting, or downwards, as the case may be. In either case, unless the wool is spread with great evenness, it gets unequally dried, and at points where the hot air escapes freely it may be much over-dried. A more rapid and uniform result may be obtained by the use of the mechanical wool drier, a close chamber divided into horizontal compartments, the floors of which have alternate fixed and movable bars. Under the chamber is a tubular

heating apparatus, and a fan by which a powerful current of heated air is blown up the side of the chamber, and through all the shelves or compartments successively, either following or opposing the wool in its passage through the machine. The wool is introduced by a continuous feed at one end of the chamber; the strength of the blast carries it up and deposits it on the upper shelf, and by the action of the movable bars, which are worked by cranks, it is carried forward to the opposite end, whence it drops to the next lower shelf, and so on it travels till at the extremity of the lower shelf it passes out by the delivery lattice well and equally dried. Another drying machine in extensive use is what is known as the "Jumbo dryer." This consists of a large revolving cylinder or churn which turns over the wool—as a churn turns butter—and owing to its inclination passes it from one end to the other. A hot air blast follows the wool through the machine.

Teasing.—The dried wool may be in a partially matted condition. If so, it must be opened out and the whole material brought into a uniformly free and loose condition. This is effected in the Willey, which consists of a large drum and three small cylinders mounted in an enclosed frame. The drum is armed with ranges of powerful hooked teeth or spikes, and is geared to rotate with great rapidity, making about 500 revolutions per minute. The smaller cylinders, called workers, are also provided with strong spikes; they are mounted over the drum and revolve more slowly in a direction contrary to the drum, the spikes of which just clear those of the workers. The wool is fed into the drum, which carries it round with great velocity; but, as it passes on, the locks are caught by the spikes of the workers, and in the contest for possessing the wool the matted locks are torn asunder till the whole wool is delivered in a light, free and disentangled condition. It is a debatable point as to whether willowing should precede scouring.

Burring.—For certain classes of wool, notably Buenos Aires, still another preparing operation is essential at this stage—that is, the removal of burrs or small persistently adherent seeds and other fragments of vegetable matter which remain in the wool. Two methods of effecting this—one chemical, the other mechanical —may be pursued. The chemical treatment consists in steeping the wool in a dilute solution of sulphuric acid (or other carbonizing agent), draining off the dilute acid by means of the hydro extractor, and then heat-drying in a temperature of about 250° F. The acid leaves the wool practically uninjured, but is concentrated on the more absorbent vegetable matter, and the high heat causes it to act so that the vegetable matter becomes completely carbonized. The burrs are then crushed and the wool washed in water rendered sufficiently alkaline to neutralize any free acid which may remain, and dried. The same burr-removing effect is obtained by the use of a solution of chloride of aluminium, a method said to be safer for the wool and less hurtful to the attendant workmen than is the sulphuric acid process. For mechanical removing of burrs, a machine something like the Willey in appearance is employed. The main feature of this apparatus is a large drum or swift armed with fine short spikes curved slightly in the direction in which it rotates. By a series of beaters and circular brushes the wool is carried to and fed on these short spikes, and in its rotation the burrs, owing to their weight, hang out from the swift. The swift as it travels round is met by a series of three burning rollers rotating in an opposite direction, the projecting rails of which knock the burrs off the wool. The burrs fall on a grating and are ejected, with a certain amount of wool adhering to them, by another rotating cylinder. With wools not too burry the worsted spinner largely depends upon burring rollers placed upon the first cylinder of the "carder," and possibly to one or other of the patent pulverizing processes applied further on in the card. In the latter process a complete pulverizing of the burrs is aimed at, this being effected by the introduction of specially constructed pulverizing rollers between the first doffer and the last swift of the carding engine. Wooled skins are now successfully deburred by a recently introduced machine—an Australian invention.

(A. F. B.)

Wool in the United States.—The three types of wool produced in the United States are usually classified as fine, medium and long. Fine wools come from Merino and Rambouillet sheep or crossbreds which show a preponderance of Rambouillet o Merino blood. They vary from 1 to 4 in. in length. The 192(Census showed that 42·2% of the purebred sheep were of th(fine wool breeds. The fineness, crimp, elasticity and good feltin(qualities of such wools make them suitable for a wide range o uses. They are well adapted to the making of choice woollen an(worsted yarns, from which many different fine-textured goods such as suitings, dress goods and broadcloths are manufactured

Medium wools, which are coarser than the fine wools, but no usually as coarse as the long wools, come largely from the South down, Hampshire, Shropshire, Oxford and Dorset breeds; know as Down breeds. Wool from many different kinds of crossbre(sheep similar to the Down breeds is also included as medium wool The length of medium wool varies from 2 to 5 inches. Accordin(to the 1920 Census 54·1% of purebred American sheep belonge(to medium wool breeds. This kind of wool does not usuall possess the elasticity or such well-defined crimp as the fine wools While it is used in the manufacture of woven fabrics of nearl every description, it is particularly well adapted for blankets tweeds, and flannels, as well as suitings. It also makes very choic(knitting yarns.

The long wools, or "coarse wools" come from Lincoln, Lei cester, Cotswold and Romney sheep. This wool is usually coarse than the medium wool, very lustrous, and varies from 5 to 15 in in length. The 1920 Census showed that only 3·7% of purebre(American sheep were of the long wool breeds. Long wools ar used for the most part in the manufacture of bright, lustrous yarn for linings, mantel fabrics, braids and dress goods.

Dividing the United States into its geographic divisions an(arranging these divisions in the order of their purebred sheep pro duction, they would rank as follows: Mountain, East North Cen tral, Pacific, West North Central, Middle Atlantic, West Soutl Central, South Atlantic, East South Central and Northeast. Th(Mountain States lead the country in wool production. In thi area is the largest production of fine wool, medium wool bein next in importance. The Pacific division ranks third. Fine woo is important in this region, coming from both Rambouillets, an(Merinos. Medium wool also plays an important part in th(production of this region. The two divisions just described con stitute what is commonly known as the range area of the Unite(States. The estimates of the U.S. Department of Agriculture fo the year 1928 showed 26,722,000 sheep of the total 47,171,00(for the entire United States to be in these two regions.

In the East North Central States, medium wool, from Dow breeds, prevails, although fine wools are important, especially i Ohio and Michigan. In the West North Central division, and i the Middle Atlantic States, the production of medium wool fron Down breeds also predominates, although Pennsylvania produce considerable fine wool from Merinos. In the West South Centra States, medium wools prevail with the exception of the weste half of Texas. Texas, the largest wool-producing State in th Union, grows mostly fine wool on its western range area an(supplies altogether about 10% of the total wool of the country

The South Atlantic States, and the East South Central State produce, for the most part, medium wool. There is also a con siderable amount of fine wool produced in the northern part o West Virginia, mostly from Merino sheep. In the New Englan(division, the medium wool is mostly from Shropshires, althoug other Down breeds are represented. While less wool is produce in the New England region than in any other, it was at one tim a leading wool-producing area. As a result of the developmen of the lamb-meat trade, which is associated principally with shee which produce medium wool, the production of fine and long woo has been decreasing and that of medium wool has been increasin since about 1900.

(J. I. H.)

WOOL, WAR CONTROL OF. Wool is an indispensabl article in war. No fibre has yet been discovered, the propertie of which can equal, for the clothing of armies, its hygienic an(durable qualities; whilst for munition purposes, such as fel washers, for shells, guns, submarine and aeroplane engines, tor pedoes, tanks, etc. and other equipment such as water bottl covers, wool is essential. A soldier's clothing and equipment con

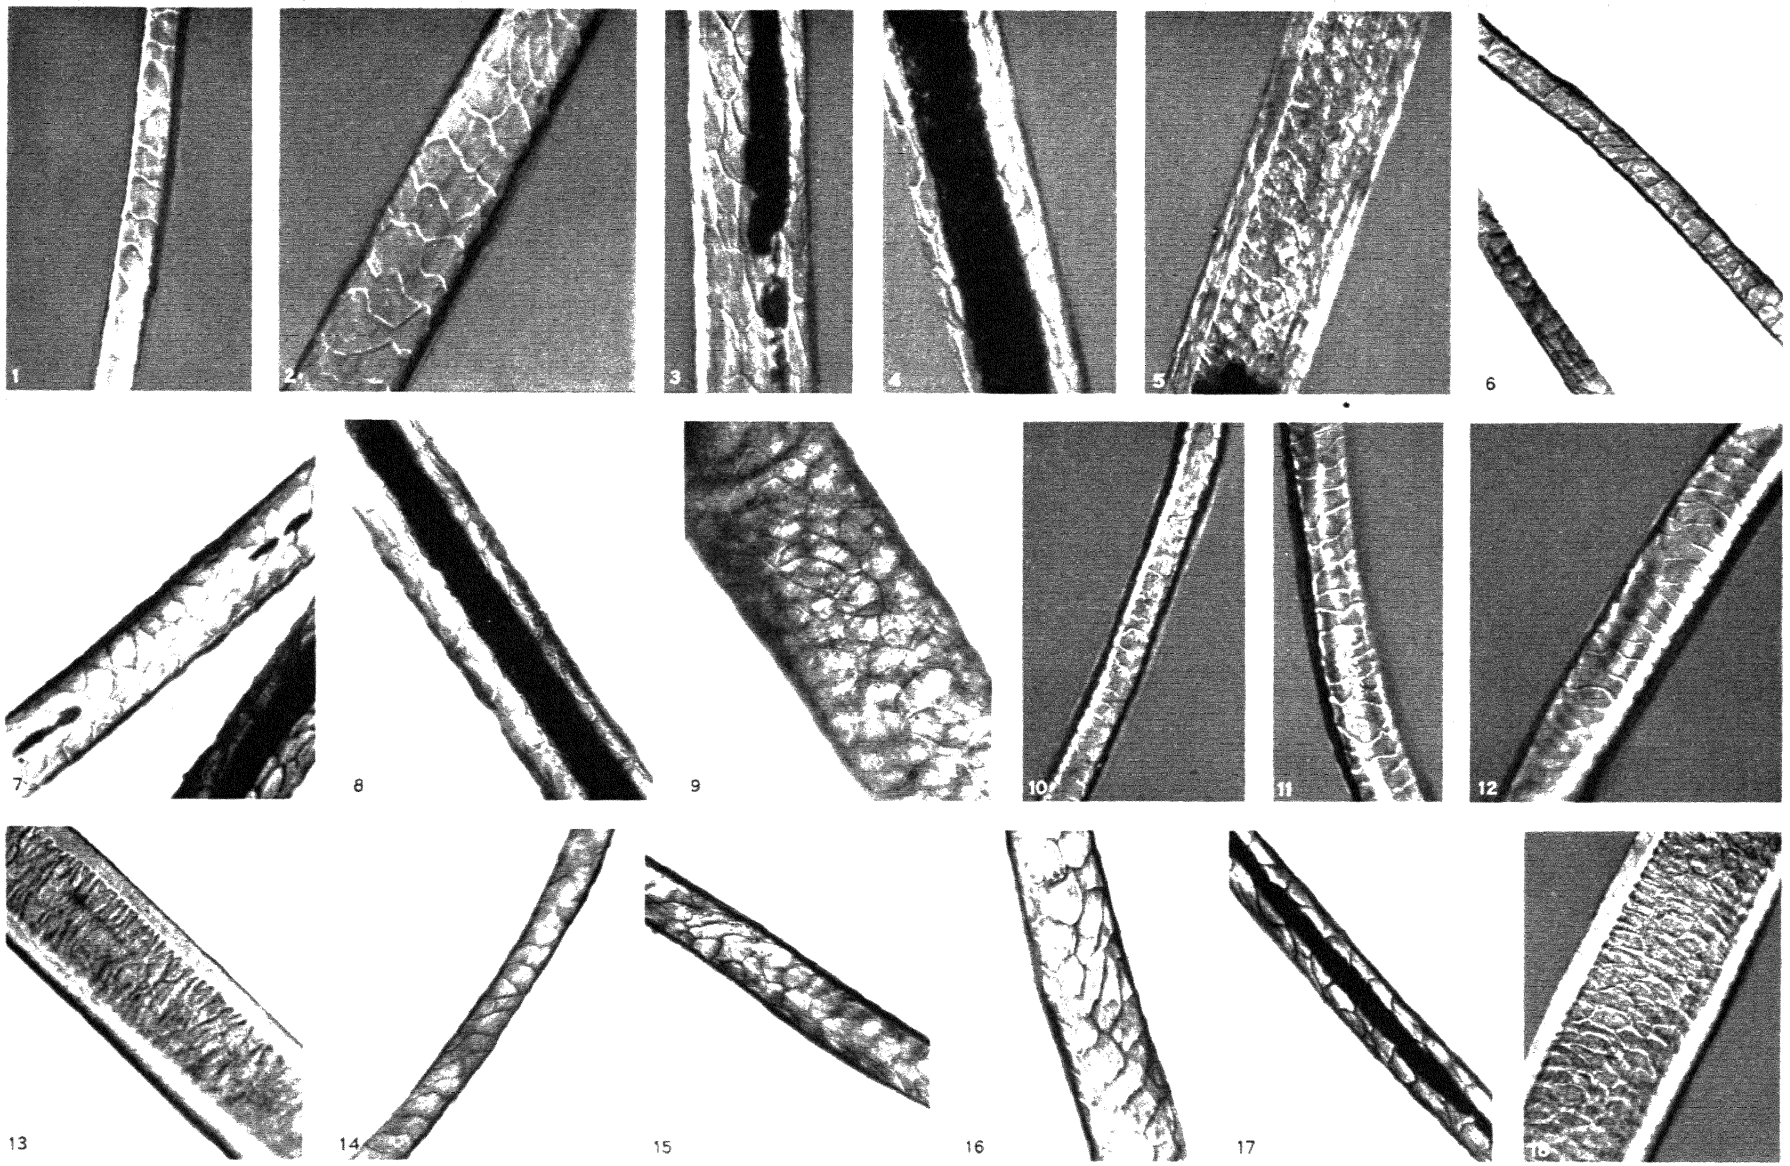
sumes on a war basis from four to ten times the average wool consumption of a civilian in times of peace.

The question of wool supplies during the World War was in part met by each country from its domestic production, and by the utilisation of old woollens in the manufacture of new goods. By this latter method and by substitution by inferior materials, the German armies, in fact, maintained their military clothing supplies throughout the war on a level of efficiency adequate for their purpose, in spite of the Allied blockade which effectually prevented supplies of overseas wool from reaching Germany and her Allies. Germany achieved this, however, at the expense of her non-combatants, who had to rely largely upon inferior substitutes for all their textile requirements.

From the point of view of the Allies the importance of conserving supplies could not be minimised. It was true that 85% of the wool production of Australia consisted of the finer merino quality not specially required for military purposes. After some discussion, however, the British Government agreed in the autumn of 1916 to purchase the whole wool production, excluding local manufacturing requirements, of Australia and New Zealand on a f.o.b. basis of 55% over average pre war prices (1913–14) with the stipulation that this price should be maintained for all military and other Government requirements both of Great Britain and of her Allies, but that in respect of civil consumption the fullest possible price should be obtained, and any net profit resulting be divided equally between the Treasuries of the imperial Government and the Governments of the commonwealth and the dominion. The purchase was repeated in practically the same terms for the 1917–18 and 1918–19 seasons.

In 1915 the French Government had requisitioned its domestic wool clip on a price basis 25% over pre war, in 1916 the British Government requisitioned the British domestic clip on a level of 35% over pre war prices. The latter was a gesture rather than a necessity. In 1917 the price paid for the British clip was raised to 50% over pre war prices and in 1918 to 60%.

Institution of Control.—Owing mainly to factors external to its own peculiar difficulties the War Office in the autumn of 1916 found itself launched on a huge wool purchase scheme and had immediately to devise ways and means of dealing with the raw wool which it now owned. In the first place, arrangements were made with the shipping authorities by which the wool was brought from Australasia by requisitioned shipping at Blue Book rates. Special storage and transport arrangements had to be improvised both in Australia and at British ports. In the previous spring an organisation had been set up by the War Office for the valuation, collection, and distribution of the British domestic clip, a relatively small matter of 120,000,000 lb. The Australian and New Zealand clips, amounting to about 1,000,000,000 lb., were valued, collected, and brought to Australasian ports by a machinery set up by the selling brokers and other trade organisations under the supervision of their Governments, which worked amazingly well within a very short time. When it is realised that whilst the average price of Australian wool was 15½d. there were almost a thousand different prices in the schedules prepared, the detailed work of valuation alone will be appreciated.



The War Office then expanded its British wool purchase executive under a wool controller to deal with the supplies of colonial wool now coming forward. The distribution of wool and tops to manufacturers at fixed prices made it possible to fix also the prices at which the finished cloth was to be delivered. In making purchases of cloth and other textiles, the War Office contracts department up to the end of 1916 endeavoured to purchase within fixed prices, but owing to rising prices of raw material this method in practice broke down. Not only was wool now issued for military but also for civilian purposes, whilst control of the raw material gave automatically the opportunity of controlling the use to which machinery should be put and ensured the supply of finished war material at fixed prices. To cope with these difficult problems a department of wool textile production was set up. The shipping and political factors involved were not known by and could not, therefore, be justly appreciated by the trade. It seemed, indeed, to a vast majority of those in the wool textile industry that an unnecessary degree of State control and interference had been instituted and this was vigorously opposed. As a method of understanding, a board of control of the wool textile industries was set up consisting of Government officials, mainly brought in from the trade, employers' and also trade union representatives. This board in practice represented a buffer between the War Office and the trade, and under its auspices problems concerning the rationing and control of civilian trade were decentralised. The responsibility, however, for meeting the increasingly growing demands not only of the British military, naval, and air forces, but of the armies of Russia, Belgium, Serbia and to a certain extent of Italy and France, and later the entire equipment in Europe of the American troops, remained with the responsible officials. In addition they were responsible for supplies of essential public services, both voluntary and Government, throughout the empire, including the Red Cross and prisoners of war organisations, post office, police and municipal requirements at home and abroad, women's organisations, as well as such services as the Indian and Egyptian Government services, together with the initiation and control of standard clothing schemes for the civil population and for the needs of demobilisation after the war.

In March 1918, when the British armies lost large reserves of stores in France, and the demands of the Allies and America were rapidly increasing, the department had to extend its production by over one million yards of material per week. It did this without apparent difficulty. A costings department was set up to investigate and fix conversion costs at each stage of production, but owing to technical complications the fixing of these rates was a most difficult business. The practical workings of a central statistical and costings staff necessarily lacked the flexibility of the normal play of individual units in competition. The system inevitably tended to fix the recognised conversion rate in excess of average efficiency, for otherwise output suffered.

Success of the Scheme.—Viewed broadly the scheme achieved its object. It produced necessary supplies at a calculable price. To produce the varied and changing demands of peace at competitive prices, the system must have broken down, but to meet a fairly standardised demand, in which finance as the governing factor was absent, the system was satisfactory, and inevitable in the circumstances of war.

The wool purchase scheme was of special benefit to Australia and New Zealand. During the first year of the purchase the imperial Government paid to the commonwealth and dominion Governments £25,000,000 and received for sales £330,000. By June 1918, it had paid out over £100,000,000 and received not much more than £50,000,000 by the end of 1919. A year after the war the imperial Government had expended many millions sterling in the purchase of wool more than it had received and at the conclusion of hostilities it was responsible for about £75,000,000 of wool accumulated in Australasian ports owing to lack of shipping to transport it. In addition, an arrangement was entered into by the surveyor-general of supply, who had been appointed in 1917 to control all War Office supply services, by which one clear season's (1919–20) wool clip after the war was purchased by the imperial Government. During the war a large part of the South African clip was also purchased, on optional terms to growers, as well as that of the Falkland islands and of Iceland (from which country wool cargoes had been running the North sea blockade). East Indian wool was marketed at fixed levels of prices under a special scheme. Numerous proposals were from time to time put forward for the purchase of the wool clips of South America but were in turn all vetoed by the Treasury owing mainly to exchange difficulties.

In all 9,895,000 bales (approximately 3,250,000,000 lb. of wool) were purchased, for which approximately £300,000,000 was paid and a net profit of £70,000,000 was divided equally between the British and colonial Governments. The aggregate sales of British wool amounted to £40,000,000 on which a profit of £5,000,000 was made. Within one year of the war the whole organisation of the department of wool textile production was liquidated, but owing to the new arrangement made with regard

BY COURTESY OF JANET BLYTH

MAGNIFIED WOOLLEN FIBRES

Top panel (1–5): typical fibres taken from Lincoln sheep. Both continuous and intermittent medullated fibres are seen

Second panel (6–9): wool fibres from the Swaledale (improved Blackface Scotch sheep) showing external structure of the kemp. Actual scale structure approaches Merino fibre

Third panel (10–13): there are no medullated fibres in this wool from a Southdown sheep, the best of the fine British breeds. Merino origin is shown by both thin and thick fibres

Bottom panel (14–18): demi-lustre class fibres taken from a Romney Marsh sheep, the wool of which makes good felting. Clearly defined external structure is probably dominant factor with reference to this quality

to the further purchase, wool control was maintained, and a wool control board set up to advise the War Office and the liquidation commission concerning the various post-war questions which arose.

Government wool control continued until 1921, when its functions were taken over by a company, called the British Australian Wool Realisation Association, referred to as B.A.W.R.A. This rearrangement was made in order to avoid the restrictions and international complications which direct Government trading involved, and, incidentally, to minimise domestic political interference. During the post-war period the policy was followed of establishing price by the release of wool at auction at calculated quantities and at reserve prices based upon estimates prepared from centralised Government and other statistics, and this for a short time appeared very successful. The basing of potential consumption figures upon such estimates proved, however, within a short time unreliable. In spite of having at its command the fullest possible information, and in addition, being in the enormously strong position of the largest holder of wool stocks, the wool control was unable to make any estimate of a useful nature of future wool consumption, or to control the market, and as a result its predictions on price did not eventuate, and sudden and severe slumps overwhelmed the world wool trade both in 1920 and 1924. Apart, however, from this post-war experiment, which endeavoured somewhat unsuccessfully to control prices, it is generally conceded that the wool control exercised during the war was justified in the circumstances and by its results. (E. F. H.)

WOOL COMBING: *see* COMBING.

WOOLF, VIRGINIA, English writer, daughter of Sir Leslie Stephen, married in 1912 Leonard Woolf. They control the Hogarth Press, by which most of her books have been published. Her first novel, *The Voyage Out* (1915), was realized to be a remarkable book, and its success was followed up with *Night and Day* (1919) and *Jacob's Room* (1922). Meanwhile, Mrs. Woolf had published several shorter experiments in a new method, which were collected in *Monday or Tuesday* (1921). In this new style are written the rest of her novels, *Mrs. Dalloway* (1925), *To the Lighthouse* (1927), and, to a lesser extent, *Orlando,* a "biography" (1928). Instead of writing novels in which the thoughts of the characters are to be deduced from what they say and do, and, except in so far as they determine action, are for the most part deemed irrelevant, or novels in which the thoughts of individuals are recorded in order to show to what sort of person they belong, Mrs. Woolf chose to write novels in which thought is so minutely revealed that words and actions (their springs being clearly understood) themselves lose much of their importance; the merit of her books lies partly in her understanding of those about whom she writes, partly in the felicity with which she uses words. These same gifts place her among the best literary critics of her time; she has published a volume of critical Essays, *The Common Reader* (1925) and a pamphlet on the novelist's art, *Mr. Bennett and Mrs. Brown* (1924).

WOOLLEN MANUFACTURE. The processes described in the article WOOL are common to English, cross-bred and botany wools, whether intended for woollen or for worsted yarns. From this point, however, differentiation starts. Wool may be manipulated with the idea of converting it into felt (*q.v.*), "woollen" fabrics or "worsted" fabrics.

Woollen and Worsted.—In a general way it may be said that *woollen* yarns are those made from short wools usually possessed of high felting qualities. These are prepared for spinning by the process of *carding,* a process which so thoroughly blends or mixes the fibres—long and short, black and white or coloured, or even of different materials—that a homogeneous fibrous mass in broad film form is obtained, which is then divided up longitudinally, as it emerges from the carder, into a number of pith-like filaments. These filaments are then extended into finer filaments and twisted to form the woollen thread upon the mule or mule-frame.

On the other hand *worsted* yarns are generally made from the long lustrous varieties of wool; the fibres are so combed as to bring them as far as possible parallel to each other; the spinning is usually effected on the frame, and the yarn is spun into a compact, smooth and level thread, which, when woven into cloth, is not necessarily milled or felted. At all points, however, woollen and worsted yarns and cloths as thus defined overlap each other, some woollens being made from longer wool than certain worsteds, and some worsteds made from short staple wool, carded as well as combed. The most fundamental distinction between the two rests in the crossing and intercrossing of the fibres in preparing woollen yarn, while for worsted yarn the fibres are treated by processes designed to bring them into a smooth parallel relationship to each other.

Woollen Yarn Manufacture.—To obtain a sliver which can be satisfactorily spun into a typical woollen thread the following operations are necessary: willowing, oiling and blending, teasing, carding (two or three operations), condensing and possibly roving. Spinning upon the woollen mule or frame completes the series of operations all of which are designed to lead up to the desired result. Of the foregoing operations the carding is perhaps the most important as it is certainly one of the most interesting. At the same time it must be fully realized that deficiencies in any one of these operations will result in bad work at every subsequent process. For example, let an unsatisfactory combination of materials be blended together and there will be trouble in both carding and spinning. The roving operation included above is not always necessary. In the old days, if a really fine thread were required, roving was absolutely necessary, as the carder could not turn off a sliver fine enough to be spun at one operation. To-day, however, with the "tape" condensers, such fine slivers can be turned off the condenser that it is easy to spin directly to the required count.

Blending and Oiling.—At the beginning of the 19th century woollen cloths were made of wool—some of them of the very finest wool obtainable. To-day woollen cloths are made from any and every kind of material, of which the following are the most important: noils (botany, cross-bred, English, alpaca and mohair), mungo, shoddy, extract, flocks, fud (short mill waste), cotton sweeping, silk waste, etc.; in fact it is said that anything which has two ends to it can be incorporated into a woollen thread and cloth. It does not follow, however, that all woollen cloth is cheap and nasty. On the contrary the west of England still produces the finest woollen fabrics of really marvellous texture and beauty, and Batley, Dewsbury, etc., produce many fabrics which are certainly cheap and yet not cheap appearing. The first essential for blending is that the materials to be blended should be fairly opened out. This is effected by passing each material, if necessary, through the willow or through the "fearnaught"—a machine coming between the willow and card—prior to beginning the "blend-stack." Sometimes it may be that a blending of different colours of wools to obtain a definite "colour mixture" is necessary, more often it will be a blending of various materials, such as noils, mungo, cotton, etc., to obtain a cheap blend which may be spun into a satisfactory warp or weft yarn. The blender proceeds as follows: first a layer of No. 1 material—say wool—is spread over the required area on the floor; it is then lightly oiled. A layer of No. 2 material—say noils—is now added to the first layer; then another layer of wool with rather more oiling; then No. 2, then No. 1 with still more oil until all the material is built up into layers in the stack. The stack is now beaten down sideways with sticks or pulled, and then the more or less mixed mass is passed through the willow and fearnaught still further to mix it prior to carding, where the true and really fine mixing takes place. After passing through the fearnaught the material is sheeted and left to "mellow," this no doubt consisting in the oil applied distributing itself throughout the material. If wool and cotton are blended together the wool must be oiled first, or the blend will not work to the greatest advantage. The oil may be best Gallipoli olive oil—which should not turn rancid—but there are many good oils—and unfortunately many bad oils—placed on the market at a reasonable rate which the really skilled judge may use to advantage. The percentage of oil varies from 2% to 12%—this remark applies both to the woollen and worsted trades—and there is no guide as to the amount required, saving and excepting experience, observation and common sense. Automatic oiling arrangements have now been applied in the woollen trade with a considerable amount of success, the sprink-

ling of the oil by means of a watering-can on the stack, made as described above, still being much in favour. The oil serves to lubricate the fibres, and to render them more plastic and consequently more workable, and to hold the fibrous mass together and thus prevent "fly" during the passage through the cards.

Carding.—Carding was originally effected by hand, two flat boards with convenient handles, covered with teeth or card cloth-

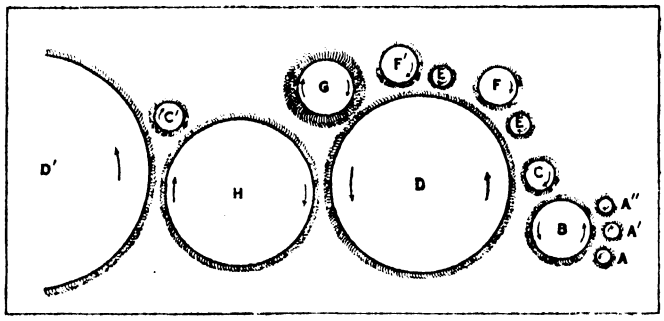


FIG. 1

ing, serving as a means of teasing out lock by lock, fibre by fibre, reversing root to tip and tip to root, so that a perfect mixing of the fibres resulted. It was but natural that, when an attempt was made to render the carding operation more mechanical, the operation should be converted into a continuous one through the adoption of rollers in place of flats. Flats combined with rollers still maintain their position in cotton carding, but in wool carding the pure roller card is employed. The factors of carding are size of rollers, speeds of rollers, inclination and shape of teeth and density of card clothing. Probably no operation in the textile industries is so little understood as carding. Thus the long wool carder would think a man an idiot who suggested the running of the teeth of the various cylinders actually into one another, while the short mungo carder regularly carries out this idea, and so on. The underlying principle of carding, however, is shown in fig. 1, in which a sectional drawing of part of a card is given. The wool is carried into the machine on a travelling lattice and delivered to the feed rollers A, A′, A″ of which A and A″ in turn are stripped by the licker-in B working at a greater speed point to smooth side. This in turn is stripped by the angle stripper C again working at a greater speed point to smooth side, which in its turn is stripped by the breast D —the "carrying-forward" and swiftest carding cylinder in the machine. The swift carries the wool forward past the stripper E—which as a matter of fact is stripped by the swift still working point to smooth side—into the slowly retreating teeth of the first worker F, which, being set a fair distance from the swift, just allows well laid-down wool to pass, but catches any projecting and uncarded staples. The worker in its turn is stripped by the stripper E, which in turn is stripped by the swift as already described. The passage of the wool forward through the machine depends upon its being carried past each worker in turn. Thus from beginning to end of a machine the workers are set closer and closer to the swift, so that the last worker only allows completely carded wool to pass it. Immediately on passing the last worker F′ the wool is brushed up on the surface of the swift by the "fancy" G—as a rule the only cylinder whose teeth actually work into the teeth of the swift and the only cylinder with a greater surface speed than the swift. The swift then throws its brushed-up coating of wool into the slowly retreating teeth of the doffer H, which carries it forward until angle stripper C′ strips the doffer, to be in its turn stripped by swift D′ and so on. The speeds of the cylinders are in the first place obviously dependent upon the principle of carding adopted, the greater speed always stripping (save in the case of the fancy). As to whether the speed shall be obtained by actual revolutions or by a larger diameter of cylinder depends upon the nature of the wool to be carded (long or short), the part which each cylinder has to play in the card, and upon the question of wear of clothing and power consumed. As a rule the strippers are all driven from a smaller circumference of the swift to obtain conveniently the necessary reduction in speed, and the slowly revolving workers are chain driven from the doffer, which indirectly receives its motion from the swift. The principles involved in the relative inclinations of teeth are very apparent, but the principles involved in the relative densities of teeth on the respective cylinders are again much involved and little understood.

A complete scribbler or first card engine consists of a breast, or small swift, and two swifts with the accompanying workers, strippers, fancies, doffers, etc. The wool is stripped from this card as a thin film by means of the doffing comb. This film is sometimes weighed on to the next machine—whether intermediate or condenser—a given weight giving a definite count of condensed sliver. Should an intermediate carder be employed, there must be an automatic feed, taking the wool, as stripped from the last doffer of the intermediate, and cross-feeding it evenly on to the feed sheet of the condenser. It is now more usual to automatically weigh into the scribbler and automatically feed the condenser or, if an intermediate is employed, both the intermediate and condenser. The condenser is a one-swifted or two-swifted card, the only difference in principle being that, whereas the sliver comes out of the scribbler or intermediate in one broad film, it is broken up into a number of small continuous slivers or films as it issues from the condenser, each one of which will ultimately be drafted or drawn out and twisted into a more or less perfect thread. These slivers—which are delicate and pith-like in substance—are wound on to light bobbins, and these bobbins are placed on the mule for the roving, or final spinning operations. There are many forms of condensing mechanisms such as the single-doffer, the double-doffer and the tape-condensers, which cannot be described here.

Mule Spinning.—The principles involved in mule spinning are comparatively simple, but the necessary machinery is very complex; indeed it is questionable if a more ingenious machine than the mule exists. The pith-like slivers received from the card must be attenuated until the correct count of yarn is obtained; they must be twisted while this attenuation or drafting is in process, otherwise they would at once break; and after being attenuated to the required fineness the requisite number of turns must be inserted. Great stress must be laid on the effects of what is termed the "drafting-twist" noted above; it is probably this simultaneous drafting and twisting which develops the most pronounced characteristics of the woollen yarn and cloth, and differentiates it entirely from the worsted yarn and cloth. The mule (*see* fig. 2) consists fundamentally of the delivery cylinders A, upon which the sliver bobbins B from the condenser are placed, which deliver the slivers as required to the front delivery rollers C (these rollers controlling perfectly the delivery of sliver for each stretch of the carriage), and the carriage EE carrying the spindles which may be

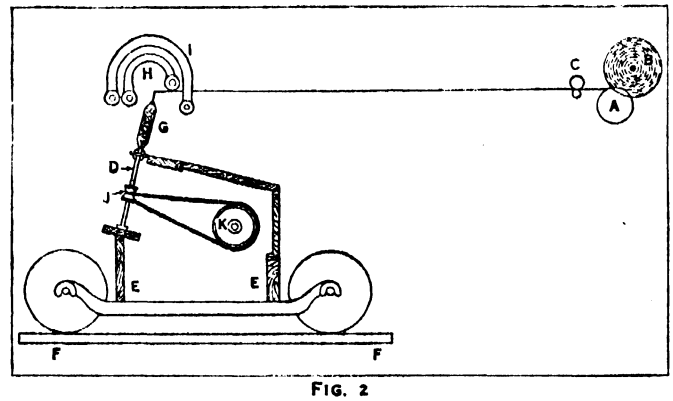

FIG. 2

run close up to the front delivery rollers and about two yards away from them to effect the "spin," which is of an intermittent character. The spindles D are turned by bands passing round a tin drum K in the carriage, but this motion, and every other motion in the mule, is controlled perfectly from the headstock. In brief, the operation of spinning is as follows: as the carriage begins to recede from the delivery rollers these rollers deliver condensed sliver at about the same rate as the carriage with its spindles moves out, the spindles putting in a little twist. When the carriage has perhaps completed half its traverse (say 36″) away

from the front rollers these suddenly stop delivering the condensed sliver, the carriage travelling more and more slowly outwards until it completes its traverse, drafting the sliver out to perhaps double the length. This drafting could not be effected but for the "drafting-twist," which, running into the thin parts of the yarn during drafting, strengthens them and thus from beginning to end equalizes the thread. Upon the completion of drafting the spindles are thrown on to "double speed" to complete the twisting of the 72" of yarn just spun as rapidly as possible, the carriage being allowed to run inwards for a few inches, to allow for the take-up due to twisting. The mule now stops dead, backs-off the turns of yarn from the top of the spindle to the bottom, the faller H wire falls into position to guide the thread on to the spindle to form the required cop G, and the counter-faller I wire rises to maintain a nice tension on the yarn. The carriage now runs in, the spindles being revolved to wind up the yarn, and, in conjunction with the guiding on of the faller wire, builds up a firm cop or spool.

Woollen mules are made with several hundred spindles and of varying pitch to suit particular requirements. Thus if the mules are to follow a set of say three machines with a tape condenser, and are required to spin fine counts, the pitch of the spindles may be much finer than ordinarily, but a greater number will be required to work up the sliver delivered by the set of machines. There are many other details which require careful consideration; the inclination of the spindles, for example, must be suited to the material to be spun.

The mule-frame to which reference has been made is a ring-spinning frame arranged to spin condensed woollen slivers continuously, thus producing about double the weight per spindle as compared with the intermittent mule. Drafting-twist is introduced in this case between two pairs of drafting rollers by a "twizzler" which, however, only inserts false twist. The true twist is inserted later by the spindle and traveller. This method of spinning necessitates more twist than that necessary in mule spinning so that "frame" woollen yarn is most suitable for warp and is usually not soft enough for weft yarn.

The yarn as delivered by the mule is "single" and will serve as warp or weft for the great bulk of woollen cloths, warp being as a rule twisted harder than weft. Sometimes for strength, sometimes for colour, however, it will be necessary to twist two or more of these single strands together. This is best effected on a twisting frame of the ring type, which consists of delivery rollers, to deliver a specified length of yarn in relationship to the turns of the spindles, and the spindles, which serve to put in twist and to wind the yarn upon the bobbin or tube, which they effect by reason of the retarding action of the traveller. Fancy twists such as knops, loops, slubs, etc., may also be produced if the frame is fitted up with two pairs of delivery rollers and two or three special but simple appliances.

For woollen and worsted weaving, *see* WORSTED MANUFACTURE.

(A. F. B.)

WOOLLEY, MARY EMMA (1863–), American educationist was born at South Norwalk (Conn.), on July 13, 1863. She was instructor at Wheaton college, Norton (Mass.), 1886–91, before going to Brown university, where she graduated in 1894. She was a teacher of biblical history in Wellesley college, 1895–98, becoming in the latter year professor and head of the department of biblical history and literature. She was appointed president of Mount Holyoke college in 1900 and became one of the most influential women educationists in the United States.

WOOLLY APPLE APHIS, an American aphid (*Eriosoma lanigera*), sometimes called the woolly root-louse of the apple. Although of American origin, this insect has become a cosmopolitan pest of the apple and pear. Making its appearance in England toward the close of the 18th century, it became known as the American blight; and either from England or from America it has been carried to many different parts of the world, probably on nursery stock. It is likely to have been an indigenous pest of Crataegus and to have established at a very early date an alternate food plant in the American elm.

In the northern part of the United States and in general throughout its whole northern range, the insect lives almost entirely upon the roots of its host plants, causing swellings and other deformations and interfering seriously with the sap flow. In the southern part of its range it lives for the most part above ground, preferably upon suckers from the trunks but also upon normal twigs and even upon leaves. In south England and most parts of Europe, the aerial form predominates. This form is concentrated upon the tender growth and is conspicuous, the colonies appearing as whitish cottony masses beneath which are the reddish insects themselves. The winter eggs are laid in crevices of the bark on elm and occasionally on apple, and hatch in the spring. They develop parthenogenetically, winged forms appearing occasionally, by means of which the insect spreads. In the United States, the fourth generation is winged and migrates from elm to apple. There are usually seven generations each summer.

At present the insect is known in nearly all the European countries, in a number of South American countries, and also in Japan, Australia and New Zealand. It has many natural enemies among the insects, just as all plant lice have, and it has one specific parasite—*Aphelinus mali*—which since 1920 has been carried from America to many countries and has been acclimatized in France, Italy, Uruguay, South Africa, Australia and New Zealand.

(L. O. H.)

WOOLMAN, JOHN (1720–1772), American Quaker preacher, was born in Northampton township, Burlington county (N.J.), Oct. 19, 1720, the son, according to himself, "of religious parents," for whom "he wrought on the plantation." Although he chronicles some small faults in his youth, the majority of his life was one of the most unaffected piety, humility, and devotion to the cause of mankind. In 1772 he sailed for London to visit Friends in the north of England, especially Yorkshire, and died in York of smallpox, Oct. 7. He spoke and wrote against slavery, refused to draw up wills transferring slaves, induced many of the Friends to set their negroes free, and during the yearly meeting in 1760 at Newport (R.I.), urged the submission to the legislature of a petition he had prepared forbidding the slave-trade. In 1763, in spite of the dangers, he "felt inward drawings" to preach to the Indians at Wehaloosing (now Wyalusing), on the Susquehanna. For the fate of the red man his heart yearned, as it did for the negro and the poor white. He was particularly concerned about the sale of rum to the Indians, and about the loss of their lands through the superior cunning and force of civilized man. Nevertheless remembering "that the people on the frontiers, among whom this evil is too common, are often poor," he was "renewedly confirmed in a belief that, if all our inhabitants lived according to sound wisdom, labouring to promote universal love and righteousness, and ceased from every inordinate desire after wealth, and from all customs which are tinctured with luxury, the way would be easy to live comfortably on honest employments," without temptation to unjust dealing.

Woolman's writings include *Some Considerations on the Keeping of Negroes* (1854; part ii., 1862); *Considerations on Pure Wisdom and Human Policy, on Labour, on Schools, on the Right Use of the Lord's Outward Gifts* (1758); *Considerations on the True Harmony of Mankind, and How it is to be Maintained* (1770); *A Word of Remembrance and Caution to the Rich* (1793); and the most important of his works, the *Journal* (1774), which was begun in his 36th year and was continued until the year of his death.

The works of John Woolman appeared in two parts in 1774 and have been frequently reprinted. The best-known edition of the *Journal* is that prepared, with an introduction, by John G. Whittier in 1871; it was translated into French and German; and it is in Everyman's Library. The most recent and scholarly edition is *The Journal and Essays of John Woolman*, edited from the original manuscripts with a biographical introduction by Amelia M. Gummere (1922). *See* also W. T. Shore, *John Woolman: His Life and Our Times* (1913).

WOOLSACK, a sack stuffed with wool and covered with red cloth upon which the lord chancellor sits in the House of Lords. Originally there were four woolsacks in the parliament chamber, upon which were seated the judges, barons of the exchequer, serjeants-at-law and masters in chancery. The uppermost woolsack now alone survives, but it is regarded as technically outside the precincts of the House.

WOOLSEY, THEODORE DWIGHT (1801–1889), American educationalist, born in New York city Oct. 31, 1801. He was the son of a New York merchant, a nephew of Timothy Dwight, president of Yale, and a descendant of Jonathan Edwards. He graduated at Yale at the head of his class in 1820: became a tutor there after studying theology and law at Princeton, in 1823–25; studied Greek at Leipzig, Berlin and Bonn in 1827–30; became professor of Greek language and literature at Yale in 1831; and was elected president of the college and entered the Congregational ministry in 1846. He resigned the presidency in 1871, and died July 1, 1889, in New Haven. During his administration the college grew rapidly, the scientific school and the school of fine arts were established, and the scholarly tone of the college was greatly improved. Much of his attention in his last years was devoted to the American commission for the revision of the authorized version of the New Testament, of which he was chairman (1871–81). He prepared excellent editions of *Alcestis* (1834), *Antigone* (1835), *Prometheus* (1837) and *Gorgias* (1843). He published several volumes of sermons and wrote for various periodicals. His *Introduction to the Study of International Law* (1860) and his *Essay on Divorce and Divorce Legislation* (1869) went through many editions. He also wrote *Political Science* (1877), and *Communism and Socialism* (1880).

See the memorial address by president Timothy Dwight (1890), and *Theodore Dwight Woolsey—A Biographical Sketch* by his son T. S. Woolsey (1912), also in the *Yale Review* (new ser., vol. 1).

WOOLSTON, THOMAS (1669–1731), English deist, born at Northampton in 1669, entered Sidney College, Cambridge, in 1685, and was made a fellow. After studying Origen, he devoted himself to the allegorical interpretation of Scripture, and advocated its use in his first book, *The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived* (1705). In 1720–1721 his open challenges to the clergy brought him into trouble. It was reported that his mind was disordered, and he lost his fellowship. From 1721 he lived in London, on an allowance of £30 a year from his brother, and other presents. His influence on the deistical controversy began with his book, *The Moderator between an Infidel and an Apostate* (1725, 3rd ed. 1729). The "infidel" was Anthony Collins (*q.v.*). Woolston denied the proof from miracles, called in question the resurrection of Christ and other miracles of the New Testament, and maintained that they must be interpreted as types of spiritual things. Two years later in a series of *Discourses,* he applied his principles to the miracles in detail. The *Discourses,* 30,000 copies of which were apparently sold, were six in number, the first appearing in 1727, the next five 1728–1729, with two *Defences* in 1729–1730. For these publications he was tried before Chief Justice Raymond in 1729 and sentenced (November 28) to pay a fine of £25 for each of the first four *Discourses,* with imprisonment till paid, and also to a year's imprisonment and to give security for his good behaviour during life. He failed to find this security, and remained in confinement until his death on Jan. 21, 1731.

See *Life* of Woolston prefixed to his *Works* in five volumes (London, 1733); *Memoirs of Life and Writings of William Whiston* (London, 1749, pp. 231–235); Appendix to *A Vindication of the Miracles of our Saviour, etc.,* by J. Ray (2nd ed., 1731); J. Cairns, *Unbelief in the Eighteenth Century* (1880); Sayous, *Les Déistes anglais* (1882); and the article DEISM, with its bibliography.

WOOLWICH, a metropolitan borough of London, England. Pop. (1921) 140,389. Area, 8,282 acres. It lies mainly north of the river Thames. The most populous part is situated between Shooter's Hill Road and the river, the site falling from an elevation of 418 ft. to the river level. To the east lie the Plumstead marshes and in the south of the borough is Eltham.

Woolwich (Wulewich) is mentioned in a grant of land by King Edward in 964 to the abbey of St. Peter at Ghent. In Domesday the manor is mentioned as consisting of 63 ac. of land. The Roman Watling street crossed Shooter's hill. Numerous Roman urns and fragments of pottery have been dug up. Early in the 16th century Woolwich rose into prominence as a dockyard and naval station. Ships were built there in the reign of Henry VII. but it was with the purchase by Henry VIII. of two parcels of land in the manor, called Boughton's Docks, that the foundation of the town's prosperity was laid, the launching of the "Harry Grâce de Dieu," of 1,000 tons burden, making an epoch in its history. Woolwich remained the chief dockyard of the English navy until the introduction of iron ship building, but the dockyard was closed in 1869. The town became the headquarters of the Royal Artillery on the establishment of a special branch of the service in 1806.

In 1664, land was acquired for storehouses and sheds for repairing ship's carriages. In 1667, batteries were erected against the invading Dutch fleet. In 1668 guns, carriages and stores were concentrated at Woolwich, and in 1695 the laboratory was moved hither from Greenwich. Before 1716 ordnance was obtained from private manufacturers and proved by the Board of Ordnance. In 1741 a school of instruction was established. It was not until 1805, however, that the establishments at Woolwich became the Royal Arsenal.

By the London Government Act 1899 Woolwich was brought into line with other London districts. Woolwich returns two members to parliament. (X.)

ROYAL MILITARY ACADEMY

The Royal Military Academy, situated on Woolwich common and familiarly known as "The Shop," dates from 1741. It was composed not only of cadets but also of young and untrained officers. Intended for the artillery and engineers, the curriculum also included a general education. The ages of the students varied from 10 to 30. Cadets were admitted on the nomination of the master-general of the ordnance without examination, but as many possessed no education whatever an entrance examination of an easy character was introduced in 1774. This system has remained in force until our own day. In the early days discipline was of a low standard, and was enforced by corporal punishment or confinement to a dark cell on bread and water diet. The number of cadets in 1782 was 30, rising to 90 in 1812. By 1870 the strength had increased to about 150. From 1900 onwards the strength has varied between 200 and 250, except during the World War, when as many as 500 cadets were in residence. Between 1905 and 1911, owing to lack of accommodation at Sandhurst, cadets destined for infantry and cavalry were trained at Woolwich.

In 1806 buildings were erected on the present site and the academy was confined to cadets. Age limits for admission were fixed a few years later at 14 to 16, and in 1820 cadets were obliged to leave at the age of 20 or after having spent five years at the academy. In 1815 the rank of under officer (selected from cadets of the senior term) was instituted. In 1859 the east and west wings, gymnasium and racquet courts were built.

The honour roll of the cadets includes Gen. Gordon (1852), the duke of Connaught (1867), Lord Kitchener (1868), and the prince Imperial (1872). At the R.M.A. cadets are trained for commissions in the Royal Artillery, Royal Engineers and Royal Corps of Signals. A few vacancies are reserved for specially selected n.c.o.'s recommended for commissions, for nominations by the New Zealand Government and for selected Egyptian, Siamese and 'Iraqi cadets. The course consists of three terms, of which there are two per year. (Feb. 1st to mid July, and from Sept. 1st to Christmas.) Cadets enter each term in batches of 75 to 85 at the age of 18 to 19.

The army entrance examination is conducted by the Civil Service Commission. With the exception of certain candidates nominated by the Army Council, candidates are required to possess a school certificate before being permitted to sit for the examination. The cadets are organized in four half companies on the lines of an infantry battalion, and cadets of the senior term act as non-commissioned officers. The staff of the academy consists of a commandant, chief instructors and company officers for each half company (four), and a number of civilian instructors. These latter are especially responsible for instruction in non-military subjects, viz., imperial and foreign affairs, mathematics, science, languages. The military part of the course includes conduct of war, strategy, tactics and organization—illustrated from military history—map reading, military law, drill, riding and physical training. At the end of the course commissions are allotted in

the three branches of the service according to existing vacancies —choice of corps being given to those high up in the order of passing out. The normal fee is £100 a term and in addition certain charges are made for uniform, books, etc. The sons of officers of H.M. forces are, subject to certain conditions, admitted at a reduced normal rate of £60 a term. A limited number of cadets are admitted at still further reduced rates on account of pecuniary need at the discretion of the Army Council. A certain number of scholarships are available for cadets on entering the academy (awarded on results of army entrance examination) and other scholarships are available for cadets during their course, and for young officers during the first five years of their service. The conditions of admission, fees and the syllabus of the army entrance examination are subject to alteration by the War Office from whom further information should be sought. (*See* also OFFICERS' TRAINING CORPS.) (J. V. D.)

WOOLWORTH, FRANK WINFIELD (1852–1919), American merchant, was born near Rodman (N.Y.), April 13, 1852. In 1879 he opened in Utica (N.Y.) his first "five cent" store, which was a failure. Later in the same year he established a "five and ten cent" store in Lancaster (Pa.), followed by another in Harrisburg. When the F. W. Woolworth Co. was incorporated in New York in Dec. 1911 he became president. In 1912 the Woolworth building in New York city was completed from the designs of Cass Gilbert. It is 760ft. high, has 57 storeys, and, excepting the Eiffel Tower in Paris, was the tallest building in the world at the time. He died at Glen Cove (L.I.), April 8, 1919, leaving an estate appraised at $27,000,000.

WOOLWORTH CO., F. W., an American chain store system, was started in Feb. 1879, in Utica, N.Y., by F. W. Woolworth (*q.v.*). Woolworth's brother, C. S. Woolworth, his cousin Seymour H. Knox and his close friends F. M. Kirby and E. P. Charlton, as well as his old mentor W. H. Moore, all started stores of their own after F. W. Woolworth.

All of these parties operated independent units until 1912 when they were merged into the present F. W. Woolworth Co. There were 598 stores in the combined organization on Jan. 1, 1912. On Dec. 31, 1928, the chain had grown to 1,724 stores, and the business had grown from $60,557,767 for the year 1912 to over $287,000,000 for the year 1928. The stores of the F. W. Woolworth Co. cover every State in the Union, also Canada and Cuba. In addition to the United States Company, the F. W. Woolworth and Co. Ltd. of England, which started in the autumn of 1910, operates 330 stores; and the F. W. Woolworth Co. of Germany, which started in 1927, operates 27 stores. The F. W. Woolworth Co. of New York holds controlling interest in both of these foreign corporations. (H. T. P.)

WOONSOCKET, a city of Rhode Island, U.S.A., on the Blackstone river. Pop. (1920) 43,496 (37% foreign-born white, of whom over half were French Canadians); 1928 local estimate 53,400. The river with its tributaries, the Mill and the Peters, provides abundant water-power. The city manufactures woollen and worsted yarns, pile fabrics, rayon, rubber articles and clothes wringers. Its output in 1925 was $83,357,763. The city's assessed valuation for 1927 was $86,339,350. Settlement began about 1666, when Richard Arnold built a saw-mill on the Blackstone. Woonsocket was separated from Cumberland and incorporated in 1867 and was chartered in 1888.

WOOSTER, a city of Ohio, U.S.A., the county seat of Wayne county; on the Lincoln highway. Population (1920) 8,204 (92% native white); 1928 local estimate over 10,000. It is the seat of the College of Wooster (Presbyterian; 1866), occupying a beautiful site of 100 ac. on a hill 1,100 ft. above sea-level; and of the Ohio agricultural experiment station, which operates 2,000 ac. of farmlands and 17,000 ac. of forests at different points in the State. The city has the largest paint-brush factory in the country and is headquarters of the oil and gas industry of the county, whose farms are nearly all under lease for drilling. Wooster was laid out in 1808, incorporated in 1817 and as a city in 1869. It was named in honour of Gen. David Wooster (1710–77).

WOOTTON BASSETT, a market town in Wiltshire, England. Pop. (1921) 2,112. It is the junction of the railway between London and the Severn tunnel with the main line of the Great Western. Wootton Bassett received its first charter from Henry VI., and returned members to parliament from 1446–1447 until the Reform Act of 1832.

WORCESTER, EARLS AND MARQUESSES OF. Urso de Abitot, constable of Worcester castle and sheriff of Worcestershire, is erroneously said to have been created earl of Worcester in 1076. Waleran de Beaumont (1104–1166), count of Meulan in France, a partisan of King Stephen in his war with the empress Matilda, was probably earl of Worcester from 1136 to 1145. He was deprived of his earldom, became a crusader and died a monk. From 1397 to 1403 the earldom was held by Sir Thomas Percy (c. 1343–1403), who in 1403 joined the other Percies in their revolt; he was taken prisoner at Shrewsbury, and subsequently beheaded, the earldom becoming extinct. The title of earl of Worcester was revived in 1421 in favour of Richard Beauchamp, Lord Abergavenny, but lapsed on his death in 1422. The next earl was John Tiptoft, or Tibetot, a noted Yorkist leader during the wars of the Roses, who was executed in 1470 (*see* below). On the death of his son, Edward, in 1485 the earldom reverted to the crown.

In February 1514 the earldom was bestowed by Henry VIII. on CHARLES SOMERSET (*c.* 1460–1520), a bastard son of Henry Beaufort, duke of Somerset. Having married Elizabeth, daughter of William Herbert, earl of Huntingdon, he was styled Baron Herbert in right of his wife, and in 1506 he was created Baron Herbert of Ragland, Chepstow and Gower. He was chamberlain of the household to Henry VIII. His son Henry, 2nd earl (*c.* 1495–1548), obtained Tintern Abbey after the dissolution of the monasteries. The title descended in direct line to Henry, the 5th earl (1577–1646), who advanced large sums of money to Charles I. at the outbreak of the Great Rebellion, and was created marquess of Worcester in 1643.

EDWARD SOMERSET, 2nd marquess of Worcester (1601–1667), is better known by the title of earl of Glamorgan, this earldom having been conferred upon him, although somewhat irregularly, by Charles I. in 1644. Under the Commonwealth he was formally banished from England and his estates were seized. At the Restoration his estates were restored, and he claimed the dukedom of Somerset promised to him by Charles I., but he did not obtain this, nor was his earldom of Glamorgan recognized.

See Henry Dircks, *Life, Times and Scientific Labours of the 2nd Marquess of Worcester* (1865); Sir J. T. Gilbert, *History of the Irish Confederation and the War in Ireland* (Dubin, 1882–1891).

His only son HENRY (1629–1700), the 3rd marquess, abandoned the Roman Catholic religion and was a member of one of Cromwell's parliaments. But he was quietly loyal to Charles II., who in 1682 created him duke of Beaufort. As the defender of Bristol, the duke took a considerable part in checking the progress of the duke of Monmouth in 1685, but in 1688 he surrendered the city to William of Orange. He inherited Badminton, still the residence of the dukes of Beaufort, and died there on the 21st of January 1700. The Worcester title was henceforth merged in that of Beaufort (*q.v.*). Henry, the 7th duke (1792–1853), was one of the greatest sportsmen of his day, and the Badminton hunt owed much to him and his successors, the 8th duke (1824–1899) and 9th duke (b. 1847).

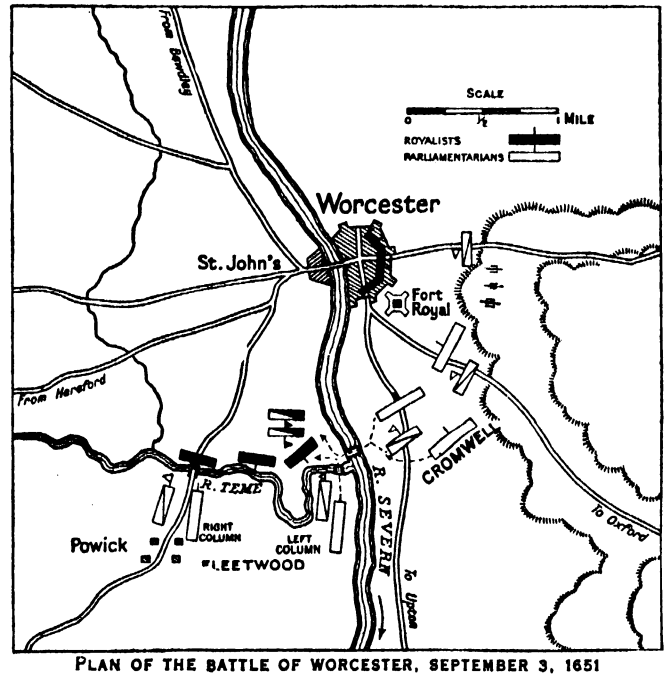
WORCESTER, WILLIAM (*c.* 1415–*c.* 1482), English chronicler, was a son of William of Worcester, a Bristol citizen, and is sometimes called William Botoner, his mother being a daughter of Thomas Botoner. He was educated at Oxford and became secretary to Sir John Fastolf. When the knight died in 1459, Worcester, although an executor, found that nothing had been bequeathed to him, and with a colleague, Sir William Yelverton, he disputed the will, obtaining some lands near Norwich and in Southwark. He died about 1482. His *Itinerarium* of England is of great value. Portions were printed by James Nasmith in 1778, and the part relating to Bristol is in James Dallaway's *Antiquities of Bristowe* (Bristol, 1834).

Worcester also wrote *Annales rerum Anglicarum*, a work of some value for the history of England under Henry VI. This was published by T. Hearne in 1728, and by Joseph Stevenson for the "Rolls" series

with his *Letters and Papers illustrative of the Wars of the English in France during the Reign of Henry VI.* (1864). Stevenson also printed here collections of papers made by Worcester respecting the wars of the English in France and Normandy. Worcester's other writings include the last *Acta domini Johannis Fastolf. See* the *Paston Letters* edited by J. Gairdner (1904); and F. A. Gasquet, *An Old English Bible and other Essays* (1897).

WORCESTER, episcopal city situated 120½ m. N.W. of London (Pop. [1921] 48,833) on a ridge parallel with the left bank of the River Severn.

The cathedral church of Our Lord and the Blessed Virgin Mary is beautifully placed close to the river. The see was founded about 679 though, owing to the opposition of the bishop of Lichfield it was not established till 780. (*See* Worcester County.) The bishop's church of St. Peter's, with its secular canons, was absorbed by Bishop Oswald into the monastery of St. Mary. The canons became monks, and in 983 Oswald finished the building of a new monastic cathedral. After the Norman Conquest the bishop of Worcester, Wulfstan, the only English prelate left in possession of his see, undertook the building of a Norman church. Of his work much remains, including (1084) one of the four apsidal crypts in England. The Norman cathedral was dedicated in 1218, and then the monks built a lady chapel and extended the building by 50 ft. In 1224 was begun the present splendid Early English choir. The nave was remodelled in the 14th century, and is principally Decorated early Perpendicular work. A Jesus chapel (an uncommon feature) is separated from the North aisle by a beautiful modern screen in the Perpendicular style. The exterior is plain, save the ornate tower, which dates from 1374, and is 196 ft. in height. The dimensions of the cathedral are—length 425 ft. (nave 170 ft., choir 180 ft.), width 145 ft. (choir 78 ft.), height of nave 68 ft. The cloisters are Perpendicular engrafted upon Norman walls. A Norman chapter house adjoins them, its Perpendicular roof supported on a central column, while on the south lies the Refectory, a fine Decorated room (1372) now the Cathedral school. There are also picturesque ruins of the Guesten hall (1320). A restoration was begun in 1857, upwards of £100,000 being spent.



Of the 11 parish churches, St. Alban's has considerable Norman remains, St. Peter's contains portions of all Gothic styles, St. Helen's has Gothic portions. The Commandery, founded in 1085, was a hospital. It was rebuilt in Tudor times, and there remains a beautiful hall, with music gallery, canopied dais, and a fine bay window, together with other parts. There are many old half-timbered houses. The guild-hall (1723) is an admirable building in the Italian style. The Festival of the Three Choirs is maintained here alternately with Gloucester and Hereford.

Public buildings include the shire-hall (1835), Corn Exchange and market-house. Fairs are held thrice annually. The cathedral school was founded in 1541; Queen Elizabeth's, in a modern building, in 1563; there are also a choir school, and municipal art, science and technical schools. In the vicinity there is a Benedictine convent, at Stanbrook hall, with a beautiful modern chapel. The company of glovers was incorporated in 1661. The market day is Saturday. Among the trades are iron goods and engineering, carriage and motor car making, rope spinning, boat building, tanning and the production of chemical manures and of cider and perry. There is a considerable traffic on the Severn.

Traces of British and Roman occupation have been discovered at Worcester (*Wigeran Ceaster, Wigornia*), but its history begins with the foundation of the episcopal see. Being the chief city on the borders of Wales, Worcester was frequently visited by the kings of England. In 1139 it was taken by the Empress Maud and retaken and burnt by Stephen in 1149. It surrendered to Simon de Montfort in 1263. In 1642, during the Great Rebellion, a handful of cavaliers was besieged here, and in spite of an attempted relief by Prince Rupert, the city was pillaged, as it was again in 1646. In 1651 Charles II. with the Scottish army was defeated here by Cromwell and Lambert.

During the reign of King Alfred, Aethelred and Aethelflead, ealdorman and lady of the Mercians, deferring to the request of the bishop, "built a burgh at Worcester." King Richard I. in 1189 granted the town to the burgesses, and Henry III. in 1227 granted a gild merchant. The first incorporation charter was granted by Philip and Mary in 1554, but James I. in 1622 made the city a separate county. By the Municipal Reform act of 1835 the government was again altered. The burgesses returned two members to parliament from 1295 to 1885, when the number was reduced to one. As early as 1203, the manufacture of cloth is mentioned and in 1590 the weavers, walkers and clothiers received an incorporation charter, but by 1789 had ceased to exist. Its place was taken by the manufacture of porcelain, introduced in 1751 by Dr. Wall, and by the increasing manufacture of gloves, a trade which is known to have been carried on in the 15th century.

Battle of Worcester, 1651.—Early in Aug. 1651 (*see* GREAT REBELLION) Charles II. crossed the Scottish border with 16,000 men, nearly all Scots, in a last attempt to regain the English throne by invasion. His first intention was to march on London, hoping that recruits would flock to his standard; on the contrary, the local militia everywhere took arms to oppose him, Cromwell's cavalry clung to his flank and heels, and Cromwell himself followed a few days' march behind. In despair Charles turned westward, still hoping for a rising in his favour, and on Aug. 22 reached Worcester, where he was brought to bay. Worcester lies on the left bank of the Severn, with a small suburb, St. John's, on the right bank, a bridge connecting the two. The city was fortified, but its walls had been demolished in 1646 and, though partially restored, presented in 1651 no formidable obstacle. Fort Royal, outside the south-eastern gate, was still of some strength, and this and the rest of the fortifications were now strengthened by Charles to the best of his limited means. The nearest bridges to Worcester were at Upton, 6 m. down stream, and Bewdley, 15 m. north. Bewdley bridge was already in the hands of the Parliamentarians, but Upton bridge the Royalists destroyed; on Aug. 28, however, it was seized by Lambert and repaired, Charles' last hope of commanding a considerable stretch of west country being thus snatched from him. None the less, his position was a strong one. About a mile below Worcester the river Teme joins

PLAN OF THE BATTLE OF WORCESTER, SEPTEMBER 3, 1651

the Severn, making a formidable obstacle to an advance up the right bank of the Severn from the south, whilst a smaller stream, running into the Teme from the north, formed some defence for the western approach to St. John's. If only the walls of the city itself on the left bank had been in their proper condition Charles might well have held out for a considerable time. The king posted the main body of his army between the Severn and the Teme, using the city and its walls as a bridge-head. Cromwell himself reached Worcester on the 28th, and found himself in command of about 30,000 men, with many thousands more, chiefly militia,

within a few days' march. He at once reconnoitred the Royalist position and, realizing that Charles could, by reason of Worcester bridge, operate upon either bank, decided that his numerical superiority entitled him to divide his army and to act simultaneously upon both. He directed Fleetwood to advance up the right bank of the Severn, force the passage of the Teme, and destroy the Scottish forces between that river and Worcester; he himself would attack Fort Royal and the city. To connect the two operations a bridge of boats was to be laid across the Severn just above its junction with the Teme, and a similar bridge across the Teme close to its junction with the Severn. A force of cavalry was sent to Bewdley to cut off the Royalists' line of retreat to the north. The preparation of the bridges took a few days, but the time was well employed by Cromwell's guns on the high ground east of the city, which pounded the fortifications mercilessly and reduced the already exhausted defenders to a state of despair. Sept. 3, the anniversary of his great victory at Dunbar, was chosen by Cromwell for the day of his attack, and its watchword, "The Lord of Hosts," repeated. Fleetwood advanced in two columns, that on the right being directed upon the junction of the Teme and Severn, where the bridges were to be laid, that on the left against Powick, just north of which a bridge crossed the Teme. Little opposition was met with till the Teme was reached, but here the Scots were found to be in great strength, whilst the road bridges over this river, both at Powick and further west, had been destroyed. The left column's attempt to cross the Teme was repulsed with some loss, but in the meantime the bridge of boats had been successfully thrown across the Severn and Cromwell himself led a brigade of horse across on to the right bank. The second bridge over the Teme was quickly laid, and Fleetwood's right column joined Cromwell's horse, which had been already reinforced by foot. For a time the Scots fought fiercely to recover their river defences, but the odds against them were too heavy and they fell slowly back towards St. John's. Fleetwood's left column now crossed near Powick and it looked as if the battle would soon be over. But Charles was soldier enough to make the one throw still left to him, and for which his dispositions had been designed. Seeing that Cromwell had transferred a considerable part of his own force to the right bank to join Fleetwood's attack, the king decided to make a sortie from his bridge-head on the left bank and strike the remainder of the Parliamentary forces still lying on that side of the river. Issuing from the walls under cover of Fort Royal, Charles' cavalry supported by such infantry as he could collect, made a furious attack upon the troops opposing them. The militia wavered, but they were stiffened by two regiments of regulars, and before long cavalry joined in the fight. For an hour or more the issue was in doubt, but Cromwell, warned of the danger, recrossed the Severn with reinforcements and gradually forced the exhausted Scotsmen back within the walls. Following close upon their heels, Cromwell's men burst into the city and, before any fresh resistance could be organized, had fallen upon the unfortunate Scotsmen and put them to the sword. Panic spread like wildfire through the city and, in spite of all the efforts of Charles and his generals, the Royalist army dissolved into a rabble of fugitives. Fleetwood blocked the line of retreat to the west but some of the cavalry, including Charles himself, escaped northwards, though most of them were cut down or captured in the relentless pursuit. Charles himself got clear away to France, but his army was completely destroyed—3,000 of his men were dead, more than 10,000 prisoners—whilst the Parliamentarians admitted a loss of but 200 men. The "Crowning Mercy" was complete.

WORCESTER, town of South Africa, near the Hex River mountains, is the centre of a fruit growing area. The annual rainfall is under 12 in., but irrigation is obtained from the Hex river. It is also intended to irrigate 8,000 ac. from the Breede river. Much wine and brandy is produced, and fresh and dried fruit is exported. Many of the South African raisins come from this district.

WORCESTER, a city of Massachusetts, U.S.A., 40 m. W. of Boston, on the Blackstone river. Population (1920) 179,754 (30% foreign-born white, representing most of the countries of Europe); 1928 estimate 197,600.

The city occupies 38·41 sq.m., at an altitude of 480 feet. On its eastern border is Lake Quinsigamond (4 m. long), spanned by a reinforced concrete bridge. Worcester is an important educational centre, the seat of Clark university (*q.v.*); Worcester academy (1832); the Worcester Polytechnic institute (1865), one of the oldest and best equipped schools of engineering in the country; the Jesuit College of the Holy Cross (founded in 1843 by the second bishop of Boston); Assumption college (1903); and a State normal school (1874). The public school system includes 72 grammar, a junior high, 4 high schools, a boys' trade school (1909) and a girls' trade school (1911). There are ten parochial schools, three of which have high-school departments. The public library (founded 1859) was one of the first in America to admit readers on Sunday. In the library and museum of the American Antiquarian Society (established 1812) are many valuable early portraits, books and pamphlets. The Art museum (founded in 1896 by Stephen Salisbury) contains, among other important collections, the Bancroft collection of Japanese art. The Worcester Natural History Society (1829) and the Worcester Historical Society (1875) both maintain museums. An annual music festival is held. There are five daily newspapers, including one in French and one in Finnish. The city has more than 100 churches, and a boys' club of 5,500 members.

Worcester is a large producer of machine tools and of wire and wire products and mill machinery. In 1925 there were 518 factories, employing an average of 31,142 wage-earners and with an output of $210,461,220. The city's trade area embraces a population of 450,000, and retail sales aggregate $90,000,000 annually. Four insurance companies, with combined assets of $100,000,000, have their home offices here. Bank resources amount to over $200,000,000, and Worcester boasts never to have had a bank failure. Bank debits in 1926 aggregated $928,925,000. The city's assessed valuation for 1927 was $339,552,850.

The first grant of land was made in 1657, and in 1668 the plantation of Quinsigamond was laid out, a committee of the general court expecting it to support from 30 to 60 families. In 1675, on the outbreak of King Philip's War, the settlement was abandoned. It was revived in 1684, and was named after the English home of several of the settlers. In 1702 it was abandoned owing to attacks by Indians. In 1713 a tavern and a mill were built, and a turnpike was constructed to Boston. Worcester became a town in 1722, and in 1780 was incorporated. Until the Revolution it remained an isolated frontier settlement and as late as 1783 its population was not over 2,000. During the Shays Rebellion it was taken by the insurgents and the courts were closed.

Utilization of waterpower and establishment of industries began about 1800, and by 1825 the town was manufacturing hats, clocks, chairs, paper, cards, carpets, corduroy, fustians, textile machinery and many other articles. In 1828 the Blackstone canal was opened from Worcester to Providence. The railroad to Boston was completed in 1835; to Norwich in 1840; to Providence in 1847; and to Springfield in 1849. In 1848 the town was incorporated as a city. Strong anti-slavery sentiment led to a serious riot in 1854, owing to an apparent attempt to enforce the Fugitive Slave Law. By 1860 the population had grown to 24,960, and there has been a steady increase ever since. Many famous men and women of America have lived for longer or shorter periods in or near Worcester, including the inventors Elias Howe, Eli Whitney, Erastus Bigelow, Russell L. Hawes, Thomas Blanchard, Samuel Crompton, Lucius James Knowles, Draper Ruggles, Joel Nourse and J. C. Mason; and Gen. Artemas Ward, Gen. Rufus Putnam, Col. Timothy Bigelow, Isaiah Thomas, Dr. William T. G. Morton, Eli Thayer, Gen. Charles Devens, George Frisbie Hoar, George Bancroft, Dorothea Lynde Dix, Clara Barton, Edward Everett Hale and John B. Gough.

WORCESTERSHIRE, a midland county of England. Area (excluding water), 455,214 acres. It covers a portion of the rich valleys of the Severn and Avon with their tributaries, the Stour and the Teme. The Avon valley, known as the vale of Evesham lies on the Lias clays, and provides an excellent soil for orchards and market-gardening. The Jurassic escarpment of the Cotswold

hills rises sharply from it in the south-east, the outlier of Bredon hill being a conspicuous spur. Salmon and lampreys are taken in the Severn; trout and grayling in the Teme and its feeders. The Malverns rise from the flat vale of Worcester and reach a height of 1,395 and 1,114 ft. in the Worcester and Hereford beacons.

The ridge is continued in the Abberley Hills to the north. The Lickey Hills (900 ft.) in which there are Silurian, Cambrian and Pre-Cambrian rocks, cross the north-east corner of the county. Their northern parts, the Clent Hills (1,028 ft.), are formed of Permian breccias. Partly within the county are the sites of two ancient forests. That of the Wyre on the northern boundary, retains some of its ancient character; but Malvern Chase is hardly recognizable. Road metal is extensively quarried in the Malvern hills (Pre-Cambrian and Cambrian) and in the Lickey hills (Cambrian); lime is obtained from the Silurian limestones; coal is mined in portions of the Forest of Wyre, and the South Staffordshire coal-fields which come within the county.

History and Early Settlement.—Worcestershire was largely wooded in early times and is consequently not rich in prehistoric remains but some stone implements have been found on the surrounding hills and some bronze implements along the Severn, pointing perhaps to river communications or perhaps to occupation of the river banks. The great earthwork on the Malvern hills of Romano-British or late pre-Roman date should be specially mentioned, and there are others at Berrow Hill above the Teme west of Worcester and at Round Hill by Spetchley.

The earliest English settlers were a tribe of the Hwiccas of Gloucestershire, who spread along the Severn and Avon valleys in the 6th century. By 679 the Hwiccan kingdom was formed into a separate diocese with its see at Worcester, and the Hwiccas had made themselves masters of nearly the whole of the modern county. From this date the town of Worcester became not only a religious centre, but the chief point of trading and military communication between England and Wales. The shire originated as an administrative area after the recovery of Mercia from the Danes. Worcester was destroyed by Hardicanute in 1041.

In no county has the monastic movement played a more important part. Foundations existed at Worcester, Evesham, Pershore and Fladbury in the 8th century; at Great Malvern in the 11th century, and in the 12th and 13th centuries at Little Malvern, Westwood, Bordesley, Whistones, Cookhill, Dudley, Halesowen and Astley. At the time of the Domesday Survey more than half Worcestershire was in the hands of the church. This prevented the rise of a local aristocracy, and Dudley castle was the sole residence of a feudal baron. Worcester Castle passed in the 12th century to the Beauchamps, who owned Elmley and Hanley castles. The possessions of William Fitz Osbern in Doddingtree hundred and the Teme valley fell to the crown in 1074 and passed to the Mortimers. Hanley Castle and Malvern Chase were granted by Henry III. to Gilbert de Clare. The early political history focusses on the city of Worcester. In the Civil War of the 17th century Worcestershire was conspicuously loyal.

The Droitwich salt-industry was very important at the time of the Domesday Survey. In the 13th and 14th centuries Bordesley monastery and the abbeys of Evesham and Pershore exported wool, and in the 16th century the Worcestershire clothing industry gave employment to 8,000; fruit-culture with the manufacture of cider and perry, nail-making and glass-making also flourished. The clothing industry declined in the 17th century, but the silk-manufacture replaced it at Kidderminster and Blockley. Coal and iron were mined at Dudley in the 13th century.

Architecture.—There are remains of the great abbeys at Evesham and Pershore, and the priory church at Malvern, besides the cathedral at Worcester. There are further monastic remains at Halesowen and at Bordesley, and there was a Benedictine priory at Astley. Good Norman work remains in the churches of Martley, Astley, Rous Lench, Bredon and Bockleton; while the Early English churches of Kempsey and Ripple are noteworthy. Half-timbered buildings add to the picturesqueness of many towns and villages; and among country houses this style is well exemplified in Birts Morton Court, Eastington Hall, Elmley Lovett Manor, and in Pirton Court. Westwood Park is a mansion of the 16th and 17th centuries; the site was formerly occupied by a Benedictine nunnery. Madresfield Court embodies remains of a fine Elizabethan moated mansion.

Agriculture.—The climate is equable and healthy, and is very favourable to the cultivation of fruit, vegetables and hops, the red marls and the rich loams being good both for market gardens and tillage. About 82% of the county is under cultivation; of this 65% is in permanent pasture. Orchards of apples, pears and plums are extensive, and there are large tracts of woodland. Wheat and oats are the principal grain crops. Beans, potatoes, peas, turnips and mangolds are important crops covering about 20,000 acres. Near Worcester there are large nurseries.

Industries.—In the north Worcester includes a portion of the Black Country. Dudley, Netherton and Brierley Hill, Stourbridge, Halesowen, Oldbury and the south and west suburbs of Birmingham, have a vast population engaged in iron-working, in chemical and glass works, and motor engineering. Worcester is famous for porcelain, Kidderminster for carpets and Redditch for needles, fish-hooks, etc. Salt is produced from brine at Droitwich and Stoke. The fire-clays and limestone of the north unite with the Coal Measures to form a basis of the industries in the Black Country. Furniture, clothing and paper-making and leather-working are also important.

Communications.—The county is served by the G.W.R. main lines connecting Worcester with Birmingham, Oxford, Gloucester, Hereford and Shrewsbury, the L.M.S.R. serves the north, and the Birmingham-Bristol line passes through the county. The Severn is an important highway; the Avon, though locked up to Evesham, is little used. Canals follow the courses of the Stour and the Salwarpe, and serve the towns of the Black Country.

Administration and Population.—The area of the ancient county is 480,560 ac., with a population in 1921 of 405,842. The area of the administrative county is 458,352 acres. The county has detached portions enclaved in Herefordshire, Staffordshire, Warwickshire and Gloucestershire. It comprises five hundreds. The county is in the Oxford circuit, and assizes are held at Worcester. It has one court of quarter-sessions, and is divided into 22 petty sessional divisions.

WORDSWORTH, CHARLES (1806–1892), Scottish bishop, son of Christopher Wordsworth, Master of Trinity, was born in London on Aug. 22, 1806, and educated at Harrow and Christ Church, Oxford. He was a brilliant classical scholar, and a famous cricketer and athlete. He was tutor at Christ Church (1834–35) and then second master at Winchester. In 1839 he brought out his *Greek Grammar,* which had a great success. In 1847, he became warden of Trinity College, Glenalmond, the new Scottish Episcopal public school and divinity college, where his views on Scottish Church questions brought him into opposition at some important points to W. E. Gladstone. In 1853 he was consecrated bishop of St. Andrews, Dunkeld and Dunblane. Wordsworth was a strong supporter of the establishment, but conciliatory towards the Free churches. He was a voluminous writer, and one of the company of revisers of the New Testament (1870–1881), among whom he displayed a conservative tendency. He died at St. Andrews on Dec. 5, 1892.

See his *Annals of my Early Life* (1891), and *Annals of My Life,* edited by W. Earl Hodgson (1893); also *The Episcopate of Charles Wordsworth,* by his nephew John, bishop of Salisbury (1899).

WORDSWORTH, CHRISTOPHER (1774–1846), youngest brother of the poet, was born on June 9, 1774, and became a fellow of Trinity College, Cambridge, in 1798. He obtained preferments through the patronage of Manners Sutton, bishop of Norwich, afterwards (1805) archbishop of Canterbury. In 1810 he published an *Ecclesiastical Biography* in 6 volumes. On the death of Bishop Mansel, in 1820, he was elected Master of Trinity, and retained that position till 1841. His proposal as vice chancellor

(1821) for a Classical Tripos, though then rejected, was adopted in 1822. He died on Feb. 2, 1846, at Buxted. In his *Who wrote Ikon Basilike?* (1824), he advocated the authorship of Charles I.; and in 1836 he published, in 4 volumes, a work of *Christian Institutes*, selected from English divines. He married in 1804 Miss Priscilla Lloyd (d. 1815), a sister of Charles Lamb's friend Charles Lloyd; and he had three sons, John W. (1805–1839), Charles (*q.v.*) and Christopher (*q.v.*); the two latter both became bishops, and John, who became a classical lecturer at Trinity College, Cambridge, was an erudite scholar.

WORDSWORTH, CHRISTOPHER (1807–1885), English bishop and man of letters, was born in London on Oct. 30, 1807, and was educated at Winchester and Trinity, Cambridge. He, like his brother Charles, was distinguished as an athlete as well as for scholarship. He was public orator at Cambridge, Headmaster of Harrow from 1836–44, and bishop of Lincoln in 1869. He died on March 20, 1885. He married in 1838 Susanna Hartley; his eldest son was John, bishop of Salisbury, and author of *Fragments of Early Latin* (1874), and his daughter Elizabeth was first principal of Lady Margaret Hall, Oxford. As a scholar he is best known for his edition of the *Greek New Testament* (1856–60), and the *Old Testament* (1864–70), with commentaries; and for his *Inscriptiones Pompeianae* (1837).

His *Life*, by J. H. Overton and Elizabeth Wordsworth, was published in 1888.

WORDSWORTH, DOROTHY (1771–1855), English writer and diarist, the third child and only daughter of John Wordsworth, of Cockermouth, and his wife, Anne Cookson-Crackanthorpe, was born on Dec. 25, 1771, and, after her mother's death in 1778, lived chiefly at Halifax with a Mrs. Threlkeld, her mother's cousin. In 1787 she went to live with her maternal grand-parents in Penrith, where she was not very happy. From 1788–93 she stayed with an uncle at Forncett, in Norfolk. She and her brother William, the poet, who was a year older than Dorothy, were early drawn to one another; in 1794 they visited the Lakes together, and in the autumn of the following year they combined their small capitals and set up house at Racedown, in Dorsetshire, where they lived a frugal but ideally happy life. In 1797 they made the acquaintance of Coleridge, and in the same year moved to Alfoxden, on the northern slope of the Quantock hills, Coleridge about the same time settling near by in the town of Nether Stowey. On Jan. 20, 1798, Dorothy Wordsworth began her invaluable *Journal*, used by successive biographers of her brother, but first printed in its quasi-entirety by Prof. W. Knight in 1897. The Wordsworths, Coleridge and Chester, left England for Germany on Sept. 14, 1798; and of this journey also Dorothy Wordsworth preserved an account, portions of which were published in 1897. On May 14, 1800, she started another *Journal* at Dove cottage, Grasmere, which she kept very fully until Dec. 31 of the same year. She resumed it on Jan. 1, 1802, for another 12 months, closing on Jan. 11, 1803. These were printed first in 1889. She composed *Recollections of a Tour in Scotland*, in 1803, with her brother and Coleridge; this was first published in 1874. Her next contribution to the family history was her *Journal of a Mountain Ramble*, in Nov. 1805, an account of a walking tour in the Lake District with her brother. In July 1820 the Wordsworths made a tour on the Continent, of which Dorothy preserved a very careful record, portions of which were given to the world in 1884, the writer having refused to publish it in 1824 on the ground that her "object was not to make a book, but to leave to her niece a neatly-penned memorial of those few interesting months of our lives." Meanwhile, without her brother, but in the company of Joanna Hutchinson, Dorothy Wordsworth had travelled over Scotland in 1822, and had composed a *Journal* of that tour. In 1829 she had a serious nervous breakdown, from which she never recovered. For the last 26 years of her life her mind and body seemed broken; she died on Jan. 25, 1855, five years after William's death in 1850.

Dorothy Wordsworth claims a distinct place in the history of English prose as one of the very earliest writers who noted, in language delicately chosen, and with no other object than to preserve their fugitive beauty, the little picturesque phenomena of homely country life amid simple scenes and quiet people.

A *Life*, by E. Lee, was published in 1886; but it is only since 1897, when Prof. Knight collected and edited her scattered mss., that Dorothy Wordsworth has taken her independent place in literary history. The *Journals of Dorothy Wordsworth*, edit. by W. Knight, were published in 1924; *see* also C. M. Maclean, *Dorothy and William Wordsworth* (Cambridge, 1927).

WORDSWORTH, WILLIAM (1770–1850), English poet, was born at Cockermouth, Cumberland, on April 7, 1770, the second son of John Wordsworth, attorney-at-law and agent to Sir James Lowther (afterwards first earl of Lonsdale). His mother was Anne, daughter of William Cookson, a Penrith mercer, and Dorothy, born Crackanthorp, "of the ancient family of that name, who from the time of Edward the Third had lived in Newbiggen Hall, Westmorland" (*Autobiographical Memoranda*). The Wordsworths were a Yorkshire family "settled at Peniston . . . probably before the Norman Conquest" (*ib.*); the first of the family to settle in the Lake District was the poet's grandfather.

Wordsworth's mother died in 1778; and in that year he was sent to the ancient grammar school of Hawkshead, boarding in the village with Anne Tyson, at the cottage still known as "Wordsworth's cottage." His father died five years later—Wordsworth speaks of him as having "never recovered his usual cheerfulness" after the loss of his wife. The family were placed under the guardianship of two uncles, Richard Wordsworth and Christopher Crackanthorp. Beyond the claims which he had against the Lowther family (amounting to well over £4,000), claims which were the subject of protracted dispute, until they were acknowledged and discharged, in 1802, by the second earl of Lonsdale, the father had left small provision for his children. Wordsworth, however, was sent in 1787 to St. John's, Cambridge, of which college his uncle, William Cookson, had been a fellow. Already he had contracted both the habit of verse and the temperament of poetry. Among his published works are included two sets of verses written as early as 1786; and "I wrote," he says, "while yet a schoolboy, a long poem running upon my own adventures and the scenery of the country in which I was brought up": a poem containing "thoughts and images" most of which were used later in the poet's "other writings." He had been sufficiently well taught at Hawkshead, at least in mathematics, to have "a full twelve months' start" of the freshmen of his year at St. John's; and to this circumstance he attributes it that he "got into rather an idle way," "reading nothing but classic authors according to my fancy, and Italian poetry" (*Autobiogr. Mem.*). His Italian master was a man who had "been well acquainted with the poet Gray." During his freshman year he composed a large part of the *Evening Walk*, finishing it in 1789. Of his Cambridge friends the chief was Robert Jones, who subsequently took orders, with whom, in 1790, Wordsworth undertook the walking tour in France and Switzerland which is commemorated in *Descriptive Sketches*. Forty years later, Jones, "fat and roundabout and rosy, and puffing and panting" up very moderate hills, "looked back to that journey as the golden and sunny spot in his life" (Dorothy Wordsworth: *Letters* ii., 497).

In Jan. 1791 Wordsworth took his B.A. degree. It is clear from Books iii.–vi. of the *Prelude* that he conceived himself to have derived from his three years residence in Cambridge little intellectual profit; and "the manners of the young men," he wrote later, "were very frantic and dissolute at that time" (*Letters*, i., 162). His guardians had destined him for the Church. But the thought of "vegetating on a paltry curacy" made no strong appeal to him (*ib.* i., 33); and it is probable that already before he had taken his degree he had experienced some unsettlement both of religious and of moral belief. He pleaded for delay; and he seems to have persuaded his guardians that the best preparation for the study of oriental languages (pressed upon him as a likely means of advancement) would be a year spent in learning French. He went to France at the end of Nov. 1791, and he remained there till the end of 1792, for the most part in Orleans and Blois. He took to France a keen sympathy with the principles of the revolution; and his faith in the revolutionary idea was deepened and intensified by the intimate friendship which he formed in Blois with Michel de Beaupuy, a captain (later general) in the republican

army. The ninth book of the *Prelude* bears witness to the profound influence exercised upon his political thinking by Beaupuy. In Orleans he formed an attachment to Marie-Anne Vallon ("Annette"), a girl of royalist family, by whom he had a daughter, Anne-Caroline (baptised Dec. 15, 1792); and by whose marriage in 1816 with Jean Baptiste Martin Baudouin he has a number of French descendants. Of "Annette" the *Prelude* tells us nothing. Yet, as first sketched, it contained the story of *Vaudracour and Julia*, of which the earlier sections, at least, were not written without some thought of her. The amatory colouring of the second paragraph of the poem is unlike the Wordsworth whom we know best; and the third paragraph attempts (we must suppose) such justification of the "Annette" episode as Wordsworth felt to be possible. He felt himself to have been betrayed by a false philosophy, by his creed of nature and freedom:

> tempted to decline
> To perilous weakness, and entrust the cause
> To nature, for a happy end of all.

During his sojourn in France he wrote the greater part of *Descriptive Sketches*. Isolated passages crudely expressed his revolutionary sympathies, his deep moral dejection; and even a mood of religious unbelief. Yet as late as May 1792, "it is at present my intention," he writes, "to take orders in the approaching winter or spring. My uncle the clergyman will furnish me with a title" (*Letters*, i., 42). "I should certainly have wished to defer the moment" (*Letters*, i., 42). The failure here, at once of religious and moral conviction, seems complete.

In Feb. 1793 Wordsworth published both *Descriptive Sketches* and *An Evening Walk*. Of both poems perhaps the principal interest resides in the conflict between style and substance: things freshly and romantically observed fight for expression within the limits of a diction which has all the faults of the worst 18th-century work. In the same month England declared war upon France —the first real shock, Wordsworth tells us, which his moral nature had received (*Prelude* x., 268 *et seq.*). At once he ranged himself on the side of his country's enemies. February 1793 was further notable in that it saw the publication of Godwin's *Political Justice*. Hitherto, Wordsworth had been content to take his philosophy from Rousseau, in ethics deifying "nature," and in politics making a gospel of "the general will." Under the influence of Godwin, he began now to deify Reason, the individual reason—collective reason being only another name for the general will, that is, for a tyranny.

The period 1793–96 is, in respect both of the external and of the internal biography of Wordsworth, still involved in considerable obscurity; an obscurity not much illumined by the rather confused account of his own development which he himself furnishes to us in Books xi.–xii. of the *Prelude*. Early in 1793 he wrote the "Letter to the Bishop of Llandaff . . . by a Republican," in which he is still the champion of the general will. The Letter attacks monarchy, the clergy and (here under Godwinian influence) the state penal code. For the bishop, a renegade liberal, Wordsworth entertains some such sentiments as, later, were felt for himself by Hazlitt and others. The Letter was not published until 1876. If its self-conscious loftiness of style and sentiment does not altogether lift it out of the commonplace, it is yet a composition which may be accounted, for the years from which it proceeded, remarkable. In the autumn of 1793, he began upon *Guilt and Sorrow*, his first considerable poem, in many parts of it distinctively "Godwinian." It was finished in 1794, and a portion of it, under the title of *The Female Vagrant* was printed in the *Lyrical Ballads* (1798); the whole saw the light (a good deal revised) in 1842. In 1795 he began, and in 1796 finished, *The Borderers: A Tragedy*, of which the gloomy perversities show him struggling out of the Godwinism in which he had been for two painful years involved. Sometime in 1795 he wrote his first truly characteristic piece, "Nay, Traveller, rest . . .", in which the victory over Godwinism is already complete.

For two years since his return from France Wordsworth had led a wandering life, making no attempt to find for himself a profession. In the early part of 1795 occurred the death of his friend Raisley Calvert, who left him a bequest of £900. He used the independence afforded to him to settle with his sister Dorothy at Racedown, Crewkerne. It was here that *The Borderers* was finished; and here (more important) *Margaret, or The Ruined Cottage* (incorporated, later, in Book i. of *The Excursion*) was begun. The poem was finished at Alfoxden, whither, in the summer of 1797, the Wordsworths moved, in order to be near Coleridge at Nether Stowey. In the *Prelude* Wordsworth traces the recovery of his moral, and poetical, health to the influence, first of his sister, and secondly of Coleridge. It was while these "three persons and one soul" were living in close conjunction in Somerset that the *Lyrical Ballads* were conceived and written.

The publication (September 1798) of the *Lyrical Ballads* constitutes the most important event in the history of English poetry after Milton. Of the genesis of the book Coleridge has given, in the first section of chap. xiv. of the *Biographia Literaria*, an account which may be summarised by saying that, while his own share in the work was directed towards illustrating (in *The Ancient Mariner*) the naturalness of the supernatural, Wordsworth's task was to point the supernatural meanings, the inner spirituality of actions and incidents the most natural conceivable. We are concerned here only with Wordsworth; and it is notable that the *Advertisement* to the *Lyrical Ballads* is concerned only with him (save for the excuses made, in its last section, for the diction of *The Ancient Mariner*). "It is the honourable characteristic of poetry"—says the opening sentence of the *Advertisement*—"that its materials are to be found in every subject which can interest the human mind." That is only to say that the natural, the ordinary, the obvious, has its poetry, its supernaturalness. It states the theme which, in Coleridge's account, it was Wordsworth's task to illustrate. But if poetry can draw its supernatural effects from natural objects and happenings, to what extent can it employ (its primary means being language) merely natural language? The *Ballads*, says the *Advertisement*, are an "experiment" to discover "how far the language of conversation . . . is adapted for the purposes of poetic pleasure." Perhaps the principal result of it was the discovery of a new blank verse—that of what Coleridge christened the "Conversation Poem." If we leave aside *The Ancient Mariner*, the best of the *Lyrical Ballads* of 1798 is that part for which blank verse is used; a blank verse neither Shakespearian nor Miltonic; domestic, but with a telling quality wanting to the domestic blank verse of Cowper; individual without eccentricity; attaining its perfection in *Tintern Abbey*. The same conversational triumph meets us in the second volume of the *Lyrical Ballads* (1800) in "There was a Boy . . .", *Michael* and *The Brothers;* and indeed, wherever in the two volumes blank verse is used, it is used to fine effect.

In the purely lyrical species Wordsworth is, in the 1798 volume, less successful. Perhaps, in this kind, only "It is the first mild day of March . . ." and "I heard a thousand blended notes . . ." have the perfect lyric quality which, two years later, he was to show in the Lucy Poems, *The Fountain, The Two April Mornings,* the *Poet's Epitaph*. Several of the lyrical experiments fail badly; e.g., *Goody Blake,* to which the *Advertisement* unhappily directed special attention. But the volumes of 1798 and 1800 contained, together, a sufficient number of lyrical successes to afford an overwhelming demonstration of the power of poetry to use natural language, even the "language of conversation." But Wordsworth had an affection for his failures; and in the preface of 1800 he threw after them many paradoxes of theory and much false history.

It is, however, neither a theory of diction nor the successful practice of a new diction which gives to the *Lyrical Ballads* the importance which they have in literary history. The greatness of the book may more truly be conceived to lie in the metaphysic of the imagination from which it proceeds (and from which, indeed, the theory of diction itself proceeds). The outlines of this metaphysic are hinted in Wordsworth's Prefaces and Notes, and in passages of the poems themselves (the *Prelude* being, in this connection, particularly valuable). The *Lyrical Ballads* owe their greatness to the power with which they revindicate for poetry the life of the senses. We are only poets in so far as we confide ourselves to the senses. We see into the life of things only when

we receive the impressions of sense in a "wise passiveness," disconnecting ourselves from the tie of reason and custom, from "the meddling intellect"—the operation of which is only one of the effects of custom. The source of truth—poetic truth—is not reason, but the eyes and ears. What is the matter with the poetry of the Age of Reason is that it had lost the art of seeing and hearing, or of performing these acts *purely*, in a fashion, that is to say, not vitiated by custom or theory. It had lost, at the same time, the gift of pure expression, using a mere customary or conventional diction. It is the supreme achievement of the *Lyrical Ballads* to have brought back the glory and the freshness of the senses. The work is done with the greater power and convincingness from the circumstance that Wordsworth had won his way back to nature and the senses through the valley of the shadow, through the rationalism of Godwin. To say that he had come back from Godwin to Rousseau would be to misconceive him. Obviously he supposes his later naturalism to escape the perils of Rousseauism. Obviously also he believes his metaphysic of the imagination—which might easily be taken for a very bare philosophic "sensationalism"—to rise above the difficulties of the ordinary sensationalist creed. A logical demonstration of his metaphysic he nowhere essays. We may be content with that practical demonstration of it which his poetry furnishes.

The six months following the publication of the *Lyrical Ballads* Wordsworth spent in Germany. In Oct. 1799 he settled in Grasmere; and in that neighbourhood, save for occasional tours in Scotland and on the Continent, the rest of his life was spent. A new edition of the *Lyrical Ballads* was called for in 1800, and this edition Wordsworth enriched by the famous preface and by a second volume of poems—among them some of his best and most original pieces. A third edition appeared in 1802 (with the appendix on Poetic Diction), and a fourth in 1805. In 1804 he married Mary Hutchinson—in 1802 he had visited "Annette," and her story had been revealed to Mary.

In the year in which the first edition of the *Lyrical Ballads* appeared, Wordsworth had already begun upon the *Prelude* (de Selincourt, p. xxxi.); and in the year which saw the fourth edition of the Ballads he finished it. In this poem, "after *Paradise Lost* the greatest long poem in the language" (A. C. Bradley), he traces his spiritual autobiography, "the Growth of a Poet's Mind," from earliest childhood, from the first intimations which came to him of poetry and immortality, down to the date at which he took the resolution of devoting himself wholly to poetry. As a document of the romantic revival the book (not published until after his death) is of the first importance; and apart from this historical interest, it constitutes a handbook of the imaginative life unique in subtlety and power. It was intended to be a preparation for "a philosophical poem, containing views of Man, Nature and Society," of which the *Excursion* was a part (the only part finished). Of the same poem another part is the impressive fragment of *The Recluse*, written in 1800 but only published some years after in 1888.

In 1807 Wordsworth published the *Poems in Two Volumes*. These show a wide extension of his poetical power. New life is given to the sonnet—used with fine effect to express lofty patriotic sentiment—and to the ode—here were printed for the first time the *Ode to Duty* and the immortal *Ode on Intimations of Immortality*. The volumes of 1800 and 1807 establish Wordsworth as one of the great inventors of poetical forms. But, form apart, these volumes, taken together with the *Prelude*, the *Recluse* fragment, *Margaret, or the Ruined Cottage* (all written before 1807), constitute a body of poetical work of which the compass and original power are such as to place him among the greatest poets. By 1807, in fact, his best work was done; not all his good work, but his best work. The death, in 1805, of his brother John Wordsworth (of whom the *Happy Warrior* is, in part, a commemoration) had affected deeply a temperament to which melancholy was native, inducing in Wordsworth a regress upon religious orthodoxy, and upon orthodoxies less venial. By the end of the first decade of the nineteenth century his thinking, in religion and in politics, loses that speculative rebel quality from which it drew so much of its early strength; and his imagination, ever a miser of its memories, and now more so, tends to hoard barren incidents and trivial perceptions, to be the material of later poetry. It requires, henceforth, some cause in which his affections are passionately engaged to educe the old power. Perhaps he is, after 1808, most like himself, not in poetry, but in the noble prose of the tract upon the *Convention of Cintra* (1809). In 1814 appeared the *Excursion*. "This will never do," said Jeffrey. Yet Keats thought it "one of the three things to rejoice at in this age." Even outside the two first books, which belong to the Somerset period, the poem has lofty and noble reaches. The general decline of power, however (especially if it be compared with the *Prelude*), is marked. In 1815 was published the first collected edition of the poet's works (with the *Essay Supplementary to the Preface*); in the same year the *White Doe of Rylstone;* in 1819 *Peter Bell* (written in 1798) and the *Wagoner;* in 1820 *The River Duddon,* and *Miscellaneous Poems*. A further decline of power is witnessed, in 1822, by the *Ecclesiastical Sketches* and the *Memorials of a Tour on the Continent*. To the last, however, it is unsafe to regard Wordsworth as negligible; at any moment the old power is apt to reassert itself. It is to the period of his decline that we owe, in the *Prelude,* the magic of the famous description of Newton's statue—

> The marble index of a mind for ever
> Voyaging through strange seas of thought alone.

Many, again, of his best sonnets come from the late period. Here and there, from the *Evening Voluntaries* (1835) the old greatness flashes out. After 1835 Wordsworth published nothing new in poetry.

"Up to 1820 the name of Wordsworth," said De Quincey, "was trampled under foot; from 1820 to 1830 it was militant; from 1830 to 1835 it has been triumphant." In 1839 Wordsworth received the honorary degree of D.C.L. from the University of Oxford: he was presented by Keble, and the ceremony showed how deep was the hold that his poetry now had on young and old alike. In 1842 he was awarded a civil list pension of £300 a year (resigning the Distributorship of Stamps which he had held since 1813, a sinecure which had brought on him many reproaches). In 1843 he was appointed poet laureate, in succession to Southey. He died on April 23, 1850; and is buried in the churchyard of Grasmere. His wife survived him by nine years. Of his five children, two had died in 1812; his daughter, Dora, wife of Edward Quillinan, had died in 1847. Two surviving sons, John and William, left children. The present literary representative is the poet's grandson, Gordon Wordsworth of Ambleside.

BIBLIOGRAPHY.—The authorised edition of the Poetical Works is that published by Moxon in 1849–50 (6 vol.); which, however, does not contain *The Prelude* (first printed in 1850) or *The Recluse* (1888, Macmillan). Of subsequent texts the principal are: W. Knight, 1882–86, 8 vols.; E. Dowden, 1892–93, 7 vols.; Nowell Smith, 1908, 3 vols.; and in one volume, J. Morley, 1888; T. Hutchinson, 1895. In 1926 E. de Selincourt published, from the original mss., Wordsworth's first version of *The Prelude* (with the "authorised" text *vis-a-vis*). The Prose Works were collected by A. B. Grosart, 1876, 3 vols. (out of print), and are accessible in W. Knight's edition, 1896, 2 vols. *The Letters of the Wordsworth Family* were printed by W. Knight in 1907 (out of print); other letters of Wordsworth are in Edith Morley's *Correspondence of Crabb Robinson with the Wordsworth Circle* (1927). Wordsworth's *Tract on the Convention of Cintra* was edited separately by A. V. Dicey in 1915; the *Guide to the Lakes* by E. de Selincourt in 1906; the *Poems and Extracts from the Works of Anne, Countess of Winchelsea* by J. R. Rees in 1905. *A Concordance to the Poems of W. W.* by Lane Cooper was published in 1911.

For the life of Wordsworth chief authorities are: *Memoirs of W. W.*, by Christopher Wordsworth, 1851 (with the poet's "Autobiographical Memoranda"); *Life of William Wordsworth* by W. Knight, 1889; *William Wordsworth, his Life, Works and Influence*, by W. Harper (containing new material 1910); *The Early Life of Wordsworth* by E. Legouis, E.T., 1897. New facts about Wordsworth are to be found in W. Harper's *Wordsworth's French Daughter*, 1921, and in E. Legouis' *Wordsworth in a New Light*, 1923. Among general interpretative studies of Wordsworth may be mentioned those of F. W. H. Myers, W. Raleigh, H. W. Garrod, O. Elton; among special studies E. Barstow, *Wordsworth's Theory of Poetic Diction*, 1917; W. Beatty, *William Wordsworth: his Doctrine and Art in their Historical Relations*, 1927. Upon bibliographical questions *Two Lake Poets: a Catalogue*, etc., by T. J. Wise (1927), should be consulted. (H. W. GA.)

WORKERS, EDUCATION OF: *see* ADULT EDUCATION.

WORKHOUSE. The workhouse (in Scotland known as the poorhouse) is a British institution in which paupers are maintained. It is administered in England and Wales by the board of guardians (the parish council in Scotland), under regulations prescribed by a central authority, the Ministry of Health or the Scottish Board of Health. Destitute persons are admitted to the workhouse by a written order of the board of guardians or the relieving officer, or in exceptional cases by the master or matron without an order. All inmates are subject to strict discipline whilst remaining in the workhouse, and, under ordinary circumstances, may not leave the institution without first giving "reasonable notice," which is usually held to mean not less than 24 hours and in some situations it may be as long as three days.

Primitive workhouses were set up here and there in the 17th century under the Poor Relief Act of 1601, which directed the overseers of every parish, amongst other things, to raise funds "for providing a convenient stock of flax, hemp, wool, thread, iron and other ware and stuff to set the poor on work." But in this early period the authorities were for the most part content with "houses of correction" for the chastisement of the vagabond.

The 18th century saw the establishment of workhouses in towns and rural parishes. The administration was either brutally hard or incredibly lax; they ranged, it has been said, from 'houses of terror" to "houses of debauchery." In 1834 the modern system was introduced. The 15,000 parishes of England and Wales were organized into a few hundred poor law "unions," each of which was required to set up a "well-regulated workhouse." Only in this institution could an able-bodied man and his family get relief, and in order to deter him from coming, the regimen was purposely made repugnant.

The Workhouse Condemned.—But in the course of the 19th century the strict principles of 1834 were generally relaxed, and in 1909 a royal commission found the state of the workhouses with few exceptions deplorable, and unanimously recommended their abolition. They were not abolished, but some improvement was effected under pressure from the central authority. In particular, a better "classification" of the inmates was enjoined. Married couples aged over 60 are now not to be separated if they wish to live together, and children between the ages of 3 and 16 may not be maintained in the workhouse. Some boards of guardians, however, have persisted in breaking this latter regulation, and in 1927 it was reported that in Somerset 15%, in Dorset 31% and in Cornwall 37% of the pauper children were in the workhouses. An effort was also made to render the workhouse less repellent to the poor by calling it "the institution," but there was no popular enthusiasm over this, and the old name continued in general use. After the World War, with the general relaxation of the restrictions on outdoor relief, the workhouse became less than ever a place for "testing" the able-bodied by disagreeable tasks of work. The inmates are chiefly aged and infirm. (*See* POOR LAWS.)

(C. M. L.)

WORKING MEN'S CLUBS have existed for workmen in England and Wales (there are few in either Scotland or Ireland) since the middle of the nineteenth century.

The majority are organized in the Working Men's Club and Institute Union, which owes its existence to the Rev. Henry Solly, a Unitarian minister, and was born at a meeting held in the rooms of the Law Amendment Society at which Lord Brougham presided, on June 14, 1862.

Many of the clubs were eleemosynary and had but a fitful existence. Scarcely one then founded is in existence to-day. It was also intended that such clubs should be teetotal, but this policy was abandoned. Apart from this change the objects of the clubs remain as in the beginning, and are as follows:

(1) That working men's clubs and institutes are calculated not only to diminish excessive use of intoxicating liquors, but also to promote self-culture and the growth of a healthy public spirit among the mass of people.

(2) That there are few social reforms of greater importance to this country than the substitution of clubs and institutes for public houses as places of resort for the recreation and business of the working classes.

Although the Union did not become entirely independent of outside support till 1890 it had, under the guidance of Hodgson Pratt, worked steadily to that end. In 1884 it became completely democratic in constitution. J. J. Dent became Secretary in 1883 and was largely responsible for the establishment of the Union on a firm and financially sound basis. In 1928 the Union included 2,530 clubs with nearly a million members. The clubs are unequally distributed over the United Kingdom. There are at least 500 workmen's clubs outside the Union. There were also in 1928 some 700 ex-Service men's clubs (remaining of a total of 1,200 in 1923). The Association of Conservative Clubs with a membership of 1,500 and the National Union of Liberal Clubs (50) include purely working class organizations.

The Union maintains four convalescent homes, accommodating about 5,000 members yearly. The net income of the Union apart from that of the homes, is (1928) approximately £17,000 annually, of which some 20 per cent is allotted to educational work.

See B. T. Hall, *Our Sixty Years* (1922).

WORKINGTON, a seaport in Cumberland, England, 34 m. S.W. of Carlisle. Pop. (1921) 26,471. It stands on the river Derwent, and the Lonsdale dock is 4½ ac. in extent, with a depth of 27 ft. at spring tide. There are large collieries (some workings extend beneath the sea), and blast furnaces, engineering works, cycle and motor works, shipbuilding yards and paper mills. Near the town is the castellated Workington Hall.

WORKMEN'S COMPENSATION. Until 1880 the only remedy which the law of Great Britain provided for a workman who had suffered physical injury in the course of his employment was a common law action in which the plaintiff had to establish that his injury was due to some personal fault in the employer, as that the employer had been guilty of personal negligence, or had knowingly employed an incompetent servant, or had committed a breach of some statutory duty. Even if the expense which had to be incurred was not an insurmountable obstacle, the cases where a workman would hope to recover damages for his injury by means of a common law action were comparatively rare. In an action for negligence formidable defences were available to the employer. Contributory negligence in the workman himself would be pleaded as a matter of course, and if it was established that the plaintiff could, by the exercise of ordinary care, have avoided the consequences of the defendant's negligence the action must fail. The doctrine of *volenti non fit injuria* might destroy the injured workman's right to damages on the ground that, knowing the risk he was running, he expressly or impliedly agreed to accept that risk. Then there was the defence of "common employment," which deprived the plaintiff of his right to damages when his injury was due to the negligence of a fellow workman. Moreover, the position of the dependants of a workman whose injuries had proved fatal was more desperate still, for the right of action was personal to the injured man and died with him. Lord Campbell's Act of 1846 created an exception to this rule in favour of a wife, husband, parent or child of the deceased, and enabled an action to be brought for the benefit of that limited class of persons in respect of the workman's death as a result of another's wrongful act or negligence. But the defences which were available in an action by the injured workman himself remained available as against the dependants of a workman whose injuries had proved fatal. So where a bricklayer was killed by the collapse of scaffolding which had been erected by men in the employment of the same employer who had not himself superintended the work, it was held that the master builder was under no liability (*Wigmore* v. *Jay* 5 Ex. 354).

Thereafter two different currents of opinion as to the manner in which the unsatisfactory state of the law should be remedied are observable. On the one hand, there was the view that any remedial measure should fit into the framework of the existing common law rules, and that all that was necessary was that those rules should be modified to remedy particular grievances. This school of thought found expression in the Employers' Liability Bill, introduced in 1893 by Asquith, who thus indicated its three vital principles: "The first is that it abolishes the doctrine of common employment; the second is that it prohibits contracts by

a workman renouncing his statutory rights; and thirdly, it simplifies the procedure by means of which the workman can seek his statutory remedy." The views of the opposing body of opinion were expressed in the amendment moved by Joseph Chamberlain when Asquith's bill was before the house of commons: "That no amendment of the law relating to employers' liability will be final or satisfactory which does not provide compensation to workmen for all injuries sustained in the ordinary course of their employment and not caused by their own acts or default." The House of Commons passed Asquith's bill, but abandoned it rather than accept an amendment of the House of Lords, the purpose of which was the preservation of the principle of contracting out, although subject to certain safeguards.

The British Workmen's Compensation Acts.—The Workmen's Compensation Act 1897 introduced a new principle into the law of the relationship between master and servant by imposing a liability on the employer to pay compensation to an injured workman, or if his injury proved fatal, to his dependants, although there had been no wrongful act or omission on the part of the employer or of anyone employed by him. Liability was imposed no less upon the employer who was blameless than upon him who had been guilty of negligence. Contracting-out was forbidden, save where an equally advantageous scheme, duly certified as such by the Registrar of Friendly Societies, was substituted for liability under the Act.

The Act of 1897 came up for review before a departmental committee appointed for the purpose in 1903. Many of the recommendations of that committee (*Report of Departmental Committee on Compensation for Injuries to Workmen,* 1904, Cmd. 2,208) were embodied in the Workmen's Compensation Act 1906, by which the Act of 1897 was repealed. In 1919 the departmental committee generally known as the Holman Gregory committee was appointed to report what alterations of the law were required "to remedy defects which experience has disclosed"; and "whether it would be desirable to establish a system of accident assurance under the control or supervision of the State." The committee reported in 1920 (*Report of Departmental Committee on Compensation for Injuries to Workmen,* 1920, Cmd. 816; *Minutes of Evidence,* Cmd. 908 and 909). Post-war conditions were not favourable to the achievement of the whole of the scheme of reform recommended by the committee, but a good deal of it was embodied in the amending Act of 1923. Finally, the consolidating Act of 1925 was passed and there the law must now be sought.

The Act of 1906 applied to the United Kingdom of Great Britain and Ireland. When the 1923 Act was passed the status of Ireland had changed. The present Act applies to England and Scotland only. It does not extend to Northern Ireland "except where otherwise expressly provided," and since the Irish Free State has dominion status it, of course, has its own legislation. Northern Ireland has passed an Act corresponding with the British Act.

From the first the remedy by way of the Workmen's Compensation Acts has, in Great Britain, been an alternative, and not an exclusive remedy. If circumstances are such that the Workmen's Compensation Act applies, the injured workman or his representatives are not barred from bringing an action at common law or under the Employers' Liability Act if the evidence necessary to support an action is forthcoming. The principle is laid down, however, that the employer is not to be liable to pay compensation twice over in respect of the same accident.

Employments to Which the Acts Apply.—The Workmen's Compensation Act of 1897 applied only to the more dangerous industries, and in effect to employers of the class best able to bear the liability. But the Workmen's Compensation Act 1900 applied the 1897 Act to "the employment of workmen in agriculture by any employer who habitually employs one or more workmen in such employment." Whereas the first Workmen's Compensation Act excluded from its scope all workmen not expressly included, the Act of 1906 included all "workmen" except the few classes expressly excluded, namely, non-manual workers whose remuneration exceeded £250 a year (the limit was raised to £350 by the 1923 Act); persons employed casually otherwise than for the purposes of the employer's trade or business; outworkers; members of the employer's family dwelling in his house; members of a police force, and persons in the army and navy. With the specific exceptions mentioned, the expression "workman" is defined to include "any person who has entered into or works under a contract of service or apprenticeship with an employer whether by way of manual labour, clerical work or otherwise." The sweep of the Act was thus widened in 1906 so as to include not only the coal miner and the engineer, but also the clerk in the counting-house, the shop assistant and the general servant.

Yet there were still workers excluded from the protection of the Act. These cases are a result of the general rule of law that, in the absence of an intention indicated in the Statute the presumption is that Parliament does not design its Acts to operate beyond the territorial limits of Great Britain. A seaman on a British ship meeting with an accident when abroad would be outside the Acts; so with the crews of British aircraft, when outside Great Britain. Again, if the legal relationship between, say, a cab proprietor and his driver is that of bailor and bailee, the relationship, the basis of which is a contract of service, which is the fundamental test for inclusion in the Acts, is absent. To bring such cases within the Workmen's Compensation Acts specific enactment has accordingly been necessary.

By Whom Compensation Is Paid.—The liability to pay compensation is imposed directly on the employer. It is not paid out of a fund to which the workman is himself a subscriber, as under national insurance. Nor does the employer's liability begin and end with the payment to a compensation fund, as in countries where there is a State scheme of workmen's compensation. Although in Great Britain insurance in respect of these risks is not compulsory, most employers do, in fact, transfer their liability to an insurance company.

What Injuries Are Within the Acts.—The law defining the liability of employers is as follows: If, in the employments to which the Act applies, "personal injury by accident arising out of and in the course of the employment is caused to a workman, his employer shall, subject as hereinafter mentioned, be liable to pay compensation." It is quite true that this form of words has given rise to an unprecedented crop of litigation. Nevertheless, a simpler and more satisfactory formula appears to be hard to find, for the formula has remained unaltered to the present day. Furthermore, the British form of words has been generally adopted in the Workmen's Compensation statutes of the British dominions and the United States, and in the Act recently passed by India the same formula appears.

On analysis it will be seen that the formula requires four conditions to be satisfied. (i) There must have been an "accident." This may include heat-stroke, murder and rupture of an aneurism by the strain of work. It does not include disease which, although traceable to the workman's employment, is gradual in its onset. (ii) The personal injury must have resulted from the accident. The incapacity or death must not be the consequence of some new intervening cause. So, if a workman dies from the effects of anaesthetics during an operation made necessary by an accident, the fact that the anaesthetic and not the accident was the immediate cause of death does not render the occurrence any the less a "personal injury by accident." Not so, however, if the fatal result was due to unskilful treatment of the injury. (iii) The accident must have arisen "in the course of" the employment. If it occurred before the employment began or after it had ended, compensation will not be payable. The beginning of employment is not the same thing as the beginning of work: the employment may begin when the workman reaches, say, a private road leading to the place of actual work: it may extend to attendance at the employers' premises for the purpose of drawing wages when not actually at work. (iv) The accident must have arisen "out of" the employment. The circumstances in which an accident may happen are infinite, and the meaning of the three words "arising out of" has to be gathered from literally hundreds of decisions in the Court of Appeal and the House of Lords. No universal test, whether an accident arose "out of" the employment, seems possible; but Lord Sumner in *L. & Y. Rly.* v. *Highley* [1917] A.C. 352 suggested a test which has been frequently ap-

plied, namely, "was it part of the injured person's employment to hazard, to suffer or to do that which caused his injury? If yea, the accident arose out of his employment. If nay, it did not."

Compensation is not necessarily payable because illness overtakes a workman while at work. For compensation to be payable for disablement or death due to disease, it must either be shown that the illness resulted from an accident, as where blood poisoning sets in as a consequence of a wound, however slight, received when at work; or the disease must be one of those to which the Workmen's Compensation Acts are specially applied, viz., anthrax, lead, phosphorus, mercury or arsenic poisoning and the miner's disease known as ankylostomiasis, together with the long list of other industrial diseases brought within the scope of the Acts by order of the home secretary in pursuance of his statutory powers.

Conditions Which Disqualify for Compensation.—In some of the dominions and the United States, it is provided that an injury which is self-inflicted, or was the result of intoxication, shall not be the subject of compensation. In Great Britain it has been left to the courts to rule out such cases, and only two disqualifications for compensation are the subject of specific enactment, namely, serious and wilful misconduct (but only in cases not resulting in death or serious and permanent disablement) and the fact that the incapacity did not extend beyond what is known as "the waiting period."

It is alleged in justification of this "waiting period" that it excludes a vast number of trivial claims, the cost of investigating and dealing with which would be disproportionate to the amount at stake. The British Act applies the simple plan by which compensation is payable after the first three days in all cases and from the date of the accident if the incapacity lasts four weeks or more. It is a condition to the granting of compensation that the accident has been brought to the knowledge of the employer as soon as possible and a claim for compensation made within six months from the occurrence of the accident, or, in fatal cases, within six months from the date of death, unless the absence of notice or failure to make the claim can be excused on one or other of the grounds indicated in the Statute, such as mistake, absence from Great Britain or "other reasonable cause."

Scale of Compensation.—In fatal cases compensation takes the form of a lump sum payment to or for the benefit of the deceased workman's dependants. Where the accident results in incapacity only, compensation is paid to the injured workman, and takes the form of a weekly payment during incapacity. The sum payable in fatal cases varies, in the first place according as the workman leaves total or partial dependants or no dependants at all and, in the second place, according as the dependants do or do not include children under the age of 15. If the deceased workman leaves any person entitled to rank as a dependant within the definition of the Act wholly dependent upon his earnings, the lump sum payable is £200 or a sum equal to the workman's earnings during the previous three years, whichever is the larger, but not exceeding £300. If the workman leaves only partial dependants, compensation is the sum which is "reasonable and proportionate to the injury" suffered by the dependants as a result of the workman's death, subject to the same maximum. If no dependants are left, only expenses of medical attendance and burial up to £15 are payable. Until 1923 no distinction was made between the case where the only dependant was, say, a young widow, and the case where a middle-aged widow and a family of small children were left to be provided for. The 1923 Act made provision for compensation additional to the above, where the workman leaves a widow or other member of his family dependant upon his earnings and in addition leaves one or more dependant children under the age of 15. This additional "children's allowance" is calculated according to the formula laid down in the Act and depends on the number of children and their respective ages. By way of illustration take the case of a workman earning 30s. a week, who leaves a widow and two children respectively seven and 14 years of age, all totally dependent upon his earnings. If the widow had been the only dependant the compensation payable would have been £234. But the "children's allowance" payable in addition is £105 6s., so that the total compensation payable amounts to £339 6s. The absolute maximum payable in a fatal case, including children's allowances, is £600. The lump sum payable in fatal cases is not paid direct to the dependants who, being generally persons unused to dealing with large sums, would possibly use it in an improvident manner, but is paid into the county court and by that court paid out to the dependants, according to their needs, in periodical instalments.

Where the workman is injured, but not killed, his weekly payment during total incapacity is a sum equal to 50% of his average weekly earnings but not exceeding 30s. So that compensation may not be wholly inadequate for the necessaries of life, provision is made by which workmen earning less than 50s. a week receive compensation in excess of 50% of earnings. Thus a workman whose earnings were 30s. a week would receive as compensation for total incapacity 20s. a week, and a workman earning only 20s. a week would get compensation amounting to as much as 75% of his weekly earnings. If the injury leaves him not totally but only partially incapacitated, so that a certain degree of working capacity exists, his compensation will be on a scale designed to give him one-half the difference between his earnings before and after the accident, special consideration being shown to workmen on the lower scales of wages.

Special provision is made for the case of minors who may meet with injury at their work when receiving only a low rate of wages, which rate, however, would normally be substantially increased when they become fully skilled workmen. Seeing that compensation is based on the wage rate during the time immediately preceding the accident, it would manifestly be unjust that compensation based on an apprentice's wages should continue without possibility of increase after the time when, but for the accident, he would be qualified for an adult workman's wages.

Compensation may be reviewed, and diminished or increased, according as the workman's condition gets better or worse. Most commonly such a review takes place when the workman, hitherto totally incapacitated, recovers part but not the whole of his earning capacity.

The authors of the original Act expected that disputed cases would in general be settled by private arbitration without resort to the courts. In fact, however, workmen's compensation cases are, with very few exceptions, dealt with by the county courts.

Systems Adopted in the Dominions and U.S.A.—In Great Britain, the employer is allowed to insure against his liability, or not, according to his discretion. But in certain of the States of the United States of America, and in a majority of the Canadian provinces, and in Queensland, the earlier Acts on the British model have been changed and the State, through the agency of a public department, levies upon employers compulsory contributions and itself assumes the liability to pay compensation. It is to the State fund and not to the individual employer that the injured workman or his dependants must look for compensation. The system, including the determination of disputes, is in reality a system of State insurance.

An intermediate position is occupied by the Australian States (with the exception of Queensland) and is common in the United States of America. There State intervention in workmen's compensation matters is directed to the compulsory insurance of workmen's compensation risk coupled, in the case of Victoria and New South Wales and sometimes in the United States, with the setting up of a State accident insurance office with which, however, private insurance enterprise is allowed to compete. In New Zealand, without the incentive of compulsory insurance, the accident branch of the Government insurance department provides an alternative to private insurance companies.

The German System.—In Germany, compensation for industrial accidents is one part of a code of social insurance of which sickness insurance, and invalidity, old age pensions, and widows' and orphans' pensions insurance are other branches. In Great Britain the latter forms of social insurance are contained in separate statutes and are administered by a distinct department.

The existing German law relating to accident insurance is contained in Part iii. of the Social Insurance Code of 1911 as revised in 1924, but its origin goes back to the period 1883 to 1889

when, by the triple scheme of social insurance then established in Germany, it became compulsory not only to insure, but to be a member of an association with liability to support a particular fund. Germany was indeed the first country to admit this liability.

Germany imposes the liability not on individual employers but on groups of employers organized in mutual trade associations. The industries broadly include the manufacturing and mining industries, the building trades, commercial undertakings and transport. Agriculture and navigation by sea constitute separate parts of the code. The financial liabilities of each association are determined annually and the levy on members necessary to cover compensation, reserves and administration expenses is based on the wage roll, modified by the risk as manifested by the accident rates for the particular industry or occupation. Compensation is paid through the post office. The workers contribute in some degree in that in respect of accidents causing temporary incapacity for work for a period not longer than 13 weeks, the case is dealt with by the sickness insurance organization and benefit paid by the sickness insurance fund to which employers and employed contribute in proportions of one-third and two-thirds. Only from the 14th week does the accident insurance organization take over the case.

Compensation for industrial accidents provides an incentive to employers to avoid conditions likely to result in accidents and illness. The German code requires the employers' accident associations to issue regulations concerning the arrangements for the prevention of accidents and the rules of conduct to be observed by the workers. (C. M. KN.)

The United States.—Workmen's compensation was undertaken as an American experiment long after it had been accepted in European countries. The first legislation on the subject, a co-operative insurance law in Maryland in 1902, was declared unconstitutional in 1904. Congress in 1908 enacted a compensation law applicable to some Federal employees which was greatly amplified in 1916. In 1910 Montana inaugurated a State co-operative insurance fund for miners, but the plan collapsed before charges of unconstitutionality. (*Cunningham* v. *North-western Improvement Co.* 44 Mont. 180, 1911.)

Commission Period.—Thorough-going study of workmen's compensation begins with what may be called the commission period. Between 1909 and 1913 over 26 commissions were appointed by various States. They frequently submitted proposed drafts for legislation, and reports with extensive statistical data. Several of the reports discussed at length the question of constitutionality. Among the most capable and thorough were the reports of the New York commission, and of the Employers' Liability and Workmen's Compensation Commission of the United States, appointed by joint resolution of Congress, June 25, 1910. With almost complete unanimity the commissions rejected the idea of employers' liability acts and urged the enactment of some form of compensation legislation. But the forms varied greatly and in the 43 States and three Territories in which workmen's compensation is in force, the legislation is anything but uniform. The National Conference of Commissioners on Uniform State Laws produced a model law which was adopted in 1914 after a committee had worked on the draft for four years. No State has taken the suggested draft in its entirety; only Hawaii, Idaho and Vermont have adopted parts, and these with modifications.

Legislative Enactments.—Legislation followed close upon the reports of the commissions. The first law of general application was passed in New York in 1910, providing for compulsory compensation in certain enumerated hazardous occupations, and elective compensation in most other occupations. The New York court of appeals declared the law unconstitutional in 1911 (*Ives* v. *South Buffalo R. Co.* 201 N.Y. 271). Thereupon the State Constitution was amended in order to permit the enactment of another compulsory insurance law in 1914. By 1913 24 States had enacted workmen's compensation laws under the impetus of the investigations, and thereafter the movement spread steadily.

Sociological legislation in the United States has had generally to survive the onslaught of constitutional lawyers, and the workmen's compensation legislation furnishes no exception. The phraseology of the 14th amendment and of similar provisions of State Constitutions had to be laid beside the new legislative efforts to determine whether they were subversive of the guarantees of American fundamental law. The test was not long delayed. It was, furthermore, a searching test which resulted in giving a clean bill of health to practically every important feature of workmen's compensation legislation, in its varying forms.

Supreme Court Decisions.—Within four years, the U.S. supreme court handed down five opinions sustaining the legislation in New York, Iowa, Washington, Texas and Arizona. These cases in order are: *New York Central R.R. Co.* v. *White,* 243 U.S. 188 (1916); *Hawkins* v. *Bleakly, Auditor of the State of Iowa,* 243 U.S. 210 (1916); *Mountain Timber Company* v. *State of Washington,* 243 U.S. 219 (1916); *Middleton* v. *Texas Power and Light Co.* 249 U.S. 152 (1918) and *Arizona Employers Liability Cases,* 250 U.S. 400 (1918). By progressively emphatic holdings, these cases swept away the principal constitutional objections. The opinion of the majority, in each case written by Mr. Justice Pitney, was forthright and unequivocal. The White case, being the first, definitely silenced any objection to legislative action depriving the employer of the defences of the fellow servant rule, contributory negligence and the doctrine of the assumption of risk,—those common law defences which had thrown the whole burden of industrial accident upon the shoulders of the employees. "No person has a vested interest in any rule of law entitling him to insist that it shall remain unchanged for his benefit" (243 U.S. at 198). In the *Arizona Employers' Liability Cases* Mr. Justice Pitney summarizes the four preceding cases: (p. 419–20):—

> These decisions have established the propositions that the rules of law concerning the employer's responsibility for personal injury or death of an employee arising in the course of the employment are not beyond alteration by legislation in the public interest; that no person has a vested right entitling him to have these, any more than other, rules of law unchanged for his benefit; and that, if we exclude arbitrary and unreasonable changes, liability may be imposed upon the employer without fault, and the rules respecting his responsibility to one employee for the negligence of another and respecting contributory negligence and assumption of risk are subject to legislative change.

Thus the action of the legislatures is upheld and their exercise of the police power in this regard fully sanctioned. The Arizona case also points out the real kernel of workmen's compensation theory, *i.e.,* that the cost, borne as it always is and should be in the first instance by the employer is, in reality, borne by the industry and the public, since the employer can charge it "as part of the cost of the product of the industry." The White case and the Arizona cases are at extreme poles. The former held constitutional a compulsory insurance law applicable to hazardous employments, which abrogated the common law defences but which likewise forced the employee to accept the benefits of the compensation law without resort to the courts. The Arizona case abrogated the common law defence of the fellow servant rule and directed that questions of contributory negligence and assumption of risk be left to the jury, while giving the employee the right either to sue at law under these circumstances and get what a jury would give him, take advantage of the employers' liability act, or the compulsory compensation law as he chose.

Compulsory Insurance Feature.—In both cases the State compulsory insurance compensation law was upheld. But while the opinion in the first case was concurred in by the entire court, in the Arizona cases four judges dissented. Mr. Justice Pitney, it may be observed, in the majority opinion, swept away any doubts which qualified statements in the White case had engendered, in no uncertain terms. These cases establish the fundamental constitutional soundness of workmen's compensation legislation and, while constitutional complaints have been made since, they relate to less vital matters. In one important particular the State legislation has encountered a difficulty. The case of *Southern Pacific Co.* v. *Jensen,* 244 U.S. 205 (1916) holds that State workmen's compensation laws cannot apply to maritime workers, as maritime matters are under the jurisdiction of Congress. The result of this case was congressional action in the form of the Longshoremen's and Harbour Workers' Compensation Act of 1927, modelled upon the New York statute and administered by Federal agencies

with the co-operation of State authorities.

Compensation Payments.—All the laws passed are compensation laws, but many in addition to establishing the right to compensation include insurance features. Of prime importance is security for the compensation payments. The methods generally used are either self-insurance; *i.e.*, satisfactory evidence given by the employer to the State authority of solvency, sometimes by giving a bond or insurance in some approved company or in a State insurance fund. There is wide variety as to the employments covered, which may be broadly classified as hazardous, extra-hazardous and non-hazardous. Sometimes the compensation law is elective, sometimes compulsory, but usually, where elective, the alternative is the abrogation of the common law defences. Ordinarily an employee may not retain his common law rights and his rights under the statute at the same time.

The States differ greatly in the waiting period required and in the amount of compensation paid. Herein lies a source of constant study, in order that the payments shall approximate in some rational way the loss suffered by the employee. It involves a nice adjustment of medical and economic knowledge. To this problem one finds the International Association of Industrial Accident Boards and Commissions directing its attention, this body being a clearing house and an instrument of progress. The injuries included, again, afford opportunity for variation. Occupational diseases were included in none of the original acts but are now recognized in some by amendment.

The effective handling of disputes about compensation payments is of great importance and receives attention in most statutes. The machinery in different jurisdictions for such adjustment varies. But its employment represents a striking move in the direction of administrative as opposed to judicial justice. The inability of the courts to function swiftly and inexpensively has made administrative machinery imperative. Although this machinery does not always function efficiently and although there is a great deal of room for improvement, the State boards and commissions do make available to injured workmen the relief which the courts could not effectively give. WORKS' COUNCILS: *see* INDUSTRIAL RELATIONS.

WORKSHOP LAW: *see* LABOUR LAW; HOURS OF LABOUR.

WORKSOP, a town, in Nottinghamshire, England, on the Chesterfield Canal. Pop. (1921) 23,206. To the south lies the Dukeries (*q.v.*). The church of St. Mary and St. Cuthbert belonged to an old priory. At the Reformation only the west portion was spared, and it was restored with Perpendicular additions. Behind it are the ruins of the Lady chapel, with fine Early English work. The priory gatehouse (14th century) remains. The town hall and free library are the principal public buildings.

WORLD COURT: *see* PERMANENT COURT OF INTERNATIONAL JUSTICE.

WORLD SOUL, in the history of philosophy, denotes the conception that there is in the world a universal spirit or soul which is related to the material world in a way that is similar or analogous to the relation of the human soul to the body. This view was taught by various Greek philosophers, notably by Plato and the Stoics. In modern times Schelling held a similar conception, and attributed to the world-soul the function of acting as an organizing principle of the material world, which is thereby made into a coherent system. *See* PLATO, STOICS, SCHELLING.

WORLD WAR. The aim of this article is to trace the main strategic currents of the World War, as also the conditions and ideas which guided them. The causes of the war are not within its scope. (For the political and diplomatic history of the struggle *see* the article EUROPE.) A process of 50 years had gone to make Europe inflammable, and a few days were enough to detonate it. To study the causes of the conflict on the German side we should have to trace the influence of Prussia on the creation of the Reich, the political conceptions of Bismarck, the German philosophical tendencies, her economic situation—a medley of factors which transmuted Germany's natural desire for commercial outlets, unhappily difficult to obtain, into a vision of world-power. We should have to analyse that heterogeneous relic of the middle ages known as Austria-Hungary, appreciate her complex racial problems, the artificiality of her governing institutions, the superficial ambitions which overlay a haunting fear of internal disruption and frantically sought to postpone the inevitable end.

On the other side we should have to examine the strange mixture of ambition and idealism which swayed Russian policy; we should have to understand the constant and justifiable fear of fresh aggression which France had suffered since 1870, and follow the regrowth of confidence which fortified her to resist further threats; finally, we should have to trace Britain's gradual movement from a policy of isolation into membership of the European system and her slow awakening to the reality of German ambitions. Beside these fundamental causes the international "incidents" that took place between 1899 and 1914 are but symptoms.

I. INTRODUCTION

The Armed Forces.—The World War may be briefly epitomized as a progress from convention through chaos to co-operation. The nations entered upon the conflict with the conventional outlook and system of the 18th century merely modified by the events of the 19th century. Politically, they conceived of it as a struggle between rival coalitions based on the traditional system of diplomatic alliances, and militarily as between professional armies—swollen, it is true, owing to the continental system of conscription, yet essentially fought out by soldiers while the mass of the people watched, from seats in the amphitheatre, the efforts of their champions. The Germans alone had a glimpse of the truth, but—one or two prophetic minds apart—the "Nation in Arms" theory evolved by them during the 19th century visualized the nation rather as a reservoir to pour its reinforcements into the army than as a mighty river in which are merged many tributary forces, of which the army is but one. Their conception was the "Nation in Arms," hardly the "Nation at War." Even to-day this fundamental truth has yet to be grasped in its entirety and its full implications understood. Progressively throughout the years 1914–18 the warring nations enlisted the research of the scientist, the inventive powers and technical skill of the engineer, the manual labour of industry and the pen of the propagandist. For long this fusion of many forces tended to a chaotic maelstrom of forces; the old order had broken down, the new had not yet evolved. Only gradually did a working co-operation emerge, and it is a moot point whether even in the last phase co-operation of forces had attained to the higher level of co-ordination—direction by unity of diversity.

The German army of 1914 was born in the Napoleonic wars, nursed in infancy by Gneisenau and Scharnhorst, and trained in adolescence by the elder Moltke and Roon. It reached maturity in the war of 1870, where it emerged triumphantly from a test against the long-service army of France. Every physically able citizen was liable to service, and the State took the number it desired, trained them to arms for a short period of full-time service, and then returned them to civil life. The feature, as also the object, of this system was the production of a huge reserve by which to expand the active army in war. A man served two or three years full-time, according to his branch of the service, followed by five or four years in the regular reserves. He then went into the Landwehr for 12 years, and finally passed into the Landsturm from 39 till 45. Further, an Ersatz reserve was formed of those who were not called on for service with the colours.

In this organization and the thoroughness of the training lay the secret of the first great surprise of the war, one which almost proved decisive. For instead of regarding their reservists as troops of doubtful quality, fit only for an auxiliary rôle or garrison duty, the Germans during mobilization were able to duplicate every first line army corps with a reserve corps—and had the courage, justified by events, to use them in the opening clash. This surprise upset the French calculations, as it dislocated their plan.

The Germans have been reproached for many miscalculations; less than justice has been done to the correctness of many of their intuitions. They alone realized what is to-day an axiom—that, given a highly trained cadre of leaders, a military machine

can be rapidly manufactured from the levies of the led, like molten liquid poured into a mould. The German mould was a long-service body of officers and n.c.o.s who in their standard of technical knowledge and skill had no equal in the world. But if the machine was manufactured by training, it gained its solidity from another process. The psychological element plays an even greater part in a "national" than in a professional army. Esprit de corps is not enough; the stimulus of a great moral impulse to action is necessary, a deep-rooted belief in the policy for which citizens are called on to fight. The leaders of Germany had worked for generations to inspire their people with a patriotic conviction of the grandeur of their country's destiny. And if their opponents went forth to battle in 1914 with as intense a belief in their country's cause, this flaming patriotism had not the time to consolidate such a disciplined combination as years of steady heat had produced in Germany. The German people had an intimacy with and a pride in their army, notwithstanding its severity of discipline, that was unknown elsewhere.

This unique instrument was handled by a general staff which, by rigour of selection and training, was unmatched for professional knowledge and skill, if subject to the mental "grooves" which characterize all professions. Executive skill is the fruit of practice; and constant practice, or repetition, tends inevitably to deaden originality and elasticity of mind. In a professional body, also, promotion by seniority is a rule difficult to avoid. The Germans, it is true, tended towards a system of staff control, which in practice frequently left the real power in the hands of youthful general staff officers. As war memoirs and documents reveal, the chiefs of staff of the various armies and corps often took momentous decisions with hardly a pretence of consulting their commanders. But such a system had grave objections, for such a happy combination as that of a Hindenburg and Ludendorff is rarely found, and from it came the grit in the wheels which not infrequently marred the otherwise well-oiled working of the German war-machine.

Tactically, the Germans began with two important material advantages. They alone had gauged the potentialities of the heavy howitzer, and had provided adequate numbers of this weapon. And if no army had fully realized that machine-guns were "concentrated essence of infantry," nor fully developed this preponderant source of fire-power, the Germans had studied it more than other armies, and by their method of grouping the machine-guns under regimental control, instead of distributing them among battalions, were able to exploit its inherent battlefield-dominating power sooner than other armies. Strategically, also, the Germans had brought the study and development of railway communications to a higher pitch than any of their rivals.

The Austro-Hungarian army, if patterned on the German model, was a vastly inferior instrument. Not only had it a tradition of defeat rather than of victory, but its racial mixture prevented the moral homogeneity that distinguished its ally. This being so, the replacement of the old professional army by one based on universal service lowered rather than raised its standard of effectiveness. The troops within the borders of the empire were often racially akin to those beyond, and this compelled her to a politically instead of a militarily based distribution of forces, so that kinsmen should not fight each other. And her human handicap was increased by a geographical one—the vast extent of frontier to be defended. Nor were her leaders, with rare exceptions, the professional equals of the Germans, and if common action was better than with the Entente Powers, Austria did not accept German direction gladly.

Yet despite all its evident weaknesses this loosely knit conglomeration of races withstood the shock and strain of war for four years, in a way that surprised and dismayed her opponents. The explanation is that this complex racial fabric was woven on a stout Germanic and Magyar framework.

From the Central we turn to the Entente Powers. France possessed but 60% of the potential man-power of Germany, and this debit balance had forced her to call on the services of practically every able-bodied male. A man was called up at 20, did three years' full-time service, then 11 in the reserve and finally two periods of seven years each in the Territorial Army and Territorial Reserve. This system gave France an initial war strength of some 4,000,000 men, equal to her German rival, but, in contrast, she placed little reliance on the fighting values of reservists. The French command counted only on the semi-professional troops of the first line, about 1,500,000 men, for the short and decisive campaign which they expected and prepared for. Moreover, they assumed a similar attitude on the part of their enemy—with dire result. But this initial surprise apart, a more profound handicap was the lesser capacity of France for expansion, in case of a long war, due to her smaller population—under 40,000,000 compared with Germany's 65 millions. Col. Mangin, later to become famous, had advocated tapping the resources in Africa, the raising of a huge native army, but the Government had considered the dangers to outweigh the advantages of such a policy.

The French general staff, if less technically perfect than that of Germany, had produced some of the ablest military thinkers in Europe, and its level of intelligence could well bear comparison. Unfortunately, in recent years a sharp division of thought had arisen, which did not make for combined action. Worse still the new French philosophy of war in its abstraction with the moral element had become more and more separated from the inseparable material factors. Abundance of will cannot compensate a definite inferiority of weapons, and the second factor, once realised, inevitably reacts on the first. In *matériel*, the French had one great asset in their quick-firing 75 mm. field gun, the best in the world, but its very value had led them to undue confidence in a war of movement and a consequent neglect of equipment and training for the type of warfare which came to pass.

Russia's assets were in the physical sphere, her defects in the mental or moral. If her initial war strength was no greater than that of Germany, her man-power resources were immense and the courage and endurance of her troops were famous. But corruption and incompetence permeated her leadership, her rank and file lacked the intelligence and initiative for scientific warfare—they formed an instrument of great solidity but little flexibility—and her manufacturing resources for equipment and munitions were far below those of the great industrial Powers. This handicap was made worse by her geographical situation, cut off from her allies by ice- or enemy-bound seas, and with immense land frontiers. Another radical defect was the poverty of her rail communications, the more essential as she relied for success on bringing into play the weight of her numbers. In the moral sphere Russia's condition was less clear. Her internal troubles were notorious and must be a brake on her efforts unless the cause was such as to prove a crusade-like appeal to her primitive and incoherent masses.

Between the military systems of Germany, Austria, France and Russia there was a close relation, differences of detail rather than of fundamental, and this similarity threw into greater contrast the system of the other great European Power—Britain. Throughout modern times she had been essentially a sea-power, intervening on land through a traditional policy of diplomatic and financial support to Allies, whose military efforts she reinforced with a leaven from her own professional army. This regular army was primarily maintained for the protection and control of the overseas dependencies—India in particular—and had always been kept down to the minimum strength for this purpose. The reason for the curious contrast between Britain's determination to maintain a supreme navy and her consistent neglect, indeed starvation of the army, lay partly in her insular position, which caused her to regard the sea as her essential life-line and main defence, and partly in a constitutional distrust of the army, an illogical prejudice, which had its almost forgotten source in the military government of Cromwell. Small as to size, it enjoyed a practical and varied experience of war without parallel among the Continental armies. Compared with them, its professional handicap was that the leaders, however skilled in handling small columns in colonial expeditions, had never directed large formations in *la grande guerre*.

Further, the foundations of a general staff had only been laid since the bitter lessons of the South African War, and the interval

was too short, the distractions too great, for this to have been developed to the level of Germany and France. For the progress in organization in the years before 1914, the British army owed much to Lord Haldane, and to him also was due the creation of a second line of part-trained citizens—the Territorial Force. Lord Roberts had pleaded for compulsory military training, but the voluntary principle was too deeply embedded in the national mind for this course to be adopted, and Haldane wisely sought to develop Britain's military effectiveness within the bounds set by traditional policy. As a result, 1914 found England with an expeditionary force of some 160,000 men, the most highly trained striking force of any country—a rapier among scythes, and to maintain this at strength the old militia had been turned into a special reserve for drafting. Behind this first line stood the Territorial Force, which if only enlisted for home defence had a permanent fighting organization unlike the amorphous volunteer force which it superseded. The British army had no special outstanding asset in war armament, but it had developed a standard of rifle-shooting unique among the world's armies.

The reforms by which the army was brought into line with Continental models had one defect, which was accentuated by the close relations established between the British and French general staffs since the Entente. It induced a "Continental" habit of thought among the general staff, and predisposed them to the rôle, for which their slender strength was unsuited, of fighting alongside an Allied army. This obscured the British army's traditional employment in amphibious operations through which the mobility given by command of the sea was exploited. A small but highly trained force striking "out of the blue" at a vital spot could produce a strategical effect out of all proportion to its slight numbers.

The last argument brings us to a comparison of the naval situation, which turned on the balance between the fleets of Britain and Germany. Britain's sea supremacy, for long unquestioned, had in recent years been challenged by a Germany which had deduced that a powerful fleet was the key to that colonial empire which she desired as an outlet for her commerce and increasing population. To the spur of naval competition the British people eventually responded, determined at any cost to maintain their "two-power" standard. If this reaction was instinctive rather than reasoned, its subconscious wisdom had a better foundation than the catchwords with which it was justified, or even than the need of defence against invasion. The industrial development of the British Isles had left them dependent on overseas supplies for food, and on the secure flow of seaborne imports and exports for industrial existence. For the navy itself this competition was a refining agency, leading to a concentration on essentials. Gunnery was developed and less value attached to polished brasswork; warship design and armament were transformed—the "Dreadnought" ushering in a new era, of the all big-gun battleship. By 1914 Britain had 29 such capital ships and 13 building, to the 18 built and nine building, of Germany. Further, Britain's naval strength had been soundly distributed, the main concentration being in the North sea.

More open to criticism, in view of the forecasts of several naval authorities, was her comparative neglect of the potential menace of the submarine. Here German opinion was shown rather by the number building than those already in commission. It is to Germany's credit that though lacking a sea tradition, her fleet an artificial rather than a natural product, the technical skill of the German navy made it a formidable rival to the British ship for ship, and perhaps its superior in scientific gunnery.

But in the first stage of the struggle the balance of the naval forces would affect the issue far less than the balance on land. For a fleet suffers one inherent limitation—it is tied to the sea, and hence cannot strike direct at the hostile nation. The fundamental purpose of a navy is therefore to protect a nation's sea communications and sever those of the enemy, and, although victory in battle may be a necessary prelude, blockade is the ultimate purpose. And as blockade is a weapon slow to take effect, its influence could only be decisive if the armies failed to secure the speedy decision on land, upon which all counted.

The Economic Forces.—In this idea of a short war lay also the reason for the comparative disregard of economic forces. Few believed that a modern nation could endure for many months the strain of a large-scale conflict. The supply of food, of munitions and their manufacture, of funds, were problems only studied on brief estimates. Of belligerents, all could feed themselves save Britain and Germany, and Germany's deficit of home-grown supplies could only be serious in the event of a struggle of years. But Britain would starve in three months if her outside supplies were cut off.

In munitions and other war material Britain's industrial power was greatest of all, though conversion to war production was a necessary preliminary, and all, again, depended on the security of her sea communication. France was weak, and Russia weaker still, but the former, unlike the latter, could count on outside supplies so long as Britain held the seas. As Britain was the industrial pivot of the one alliance, so was Germany of the other. A great manufacturing nation, she had also a wealth of raw material, especially since the annexation of the Lorraine iron-fields after the 1870 war. But the stoppage of outside supplies must be a handicap in a long war, increasing with its duration, and serious from the outset in such tropical products as rubber. Moreover, Germany's main coal and iron fields lay dangerously close to her frontier, in Silesia on the east and in Westphalia and Lorraine on the west. Thus for the Central Alliance a quick decision and an offensive war were more vital than for the Entente.

Similarly, the financial resources were calculated on a short war basis, and all the Continental Powers relied mainly on large gold reserves accumulated specially for war purposes. Britain alone had no such war chest, but she was to prove that the strength of her banking system and the wealth distributed among a great commercial people furnished the "sinews of war," in a way that few pre-war economists had realized.

The Psychological Forces.—If the economic forces were neglected in the war calculations of the Powers, the psychological forces were an unexplored region, except in their purely military aspect. And even here little study had been devoted to the moral element compared with the physical element. Ardant du Picq, a soldier-philosopher who fell in the 1870 war, had stripped battle of its aura of heroic fictions, portraying the reaction of normal men in the presence of danger. Several German critics had described from experience the reality of battle *moral* as shown in 1870, and had deduced how tactics should be based on the ever-present and balancing elements of fear and courage. At the close of the century a French military thinker, Col. Foch, had demonstrated how great was the influence of the moral element in the higher sphere of command. But only the fringe of the subject had been penetrated. Its civil aspects were untouched, and in the opening weeks of the conflict the general misunderstanding of national psychology was to be shown in the undue muzzling of the Press, followed by the equally stupid practice of issuing communiqués which so veiled the truth that public opinion became distrustful of all official news and rumour was loosed on its infinitely more damaging course. The true value of wisely calculated publicity and the true application of the propaganda weapon was only to be learnt after many blunders.

The Rival Plans.—In this survey the German plan justly takes priority, for not only was it the mainspring which set in motion the hands of the war clock in 1914, but it may even be said to have governed the course of the war thereafter. It is true that outwardly this course from the autumn of 1914 onwards seemed to be of the nature of a stupendous "siege" of the Central Powers, an idea which is incompatible with the terms we have used. But the conception of the Germanic alliance as a besieged party, although true of the economic sphere, suggests a passivity which their strategy contradicts. Although the initial German plan miscarried, even in its failure it dictated the general trend of operations thereafter. Tactically, most of the fighting resembled siege operations, but the actual strategy on land for long erred rather by its disregard of these tactical conditions than by its conformity with them.

The Germans were faced with the problem that the combined

forces of themselves and Austria were decidedly inferior to those of France and Russia. To offset this adverse balance, however, they had a central position and the anticipation that Russia's mobilization would be too slow to allow her to exert serious pressure in the opening weeks. While this assumption might suggest a decisive blow at Russia before she was ready, it was equally probable that she would concentrate her main forces too far back for such a German blow to reach—and the experience of Napoleon was not an example to encourage an advance deep into the interior of Russia, with its vast distances and poor communications. The plan adopted by Germany was, therefore, a rapid offensive against France while holding the Russian advanced forces at bay, and later, when France was crushed, to deal with the Russian army.

But this plan, in turn, was complicated by the great natural and artificial barriers which the French frontier offered to an invader. It was narrow, only some 150 m. across, and so afforded little room for manoeuvre or even to deploy the masses that Germany planned to launch against her foe. At the south-eastern end it abutted on Switzerland, and after a short stretch of flat country known as the Gap of Belfort the frontier ran for 70 m. along the Vosges mountains. Thence the line was prolonged by an almost continuous fortress system, based on Epinal, Toul, Verdun and just beyond the last-named lay not only the frontiers of Luxembourg and Belgium but the difficult Ardennes country. Apart from the strongly defended avenues of advance by Belfort and Verdun, the only feasible gap in this barrier was the Trouée de Charmes between Epinal and Toul, left open originally as a strategic trap in which the Germans could be first caught and then crushed by a French counter-stroke.

Faced with such a mental and physical blank wall, the logical military course was to go round it—by a wide manoeuvre through Belgium. Graf von Schlieffen, chief of the German general staff from 1891 to 1906 conceived and developed from 1895 onwards the plan, by which the French armies were to be enveloped and a rapid decision gained, and as finally formulated it came into force in 1905. To attain its object Schlieffen's plan concentrated the mass of the German forces on the right wing for this gigantic wheel and designedly took risks by reducing the left wing, facing the French frontier, to the slenderest possible size. The swinging mass, pivoting on the fortified area Metz-Thionville, was to consist of 53 divisions, backed up as rapidly as possible by Landwehr and Ersatz formations, while the secondary army on the left wing comprised only nine divisions. Its very weakness promised to aid the main blow in a further way, for if a French offensive pressed them back towards the Rhine, the attack through Belgium on the French flank would be all the more difficult to parry. It would be like a revolving-door—if a man pressed heavily on one side the other side would swing round and strike him in the back. The German enveloping mass was to sweep round through Belgium and northern France and, continuing to traverse a vast arc, would wheel gradually east. With its extreme right passing south of Paris and crossing the Seine near Rouen it would then press the French back towards the Moselle, where they would be hammered in rear on the anvil formed by the Lorraine fortresses and the Swiss frontier.

Schlieffen's plan allowed ten divisions to hold the Russians in check while the French were being crushed. It is a testimony to the vision of this remarkable man that he counted on the intervention of Britain, and allowed for an expeditionary force of 100,000 "operating in conjunction with the French." To him also was due the scheme for using the Landwehr and Ersatz troops in active operations and fusing the resources of the nation into the army. His dying words are reported to have been, "It must come to a fight. Only make the right wing strong."

Unhappily for Germany, if happily for the world, the younger Moltke, who succeeded him, lacked his moral courage and clear grasp of the principle of concentration. Moltke retained Schlieffen's plan, but he whittled away the essential idea. Of the nine new divisions which became available between 1905 and 1914 Moltke allotted eight to the left wing and only one to the right. True, he added another from the Russian front, but this trivial increase was purchased at a heavy price, for the Russian army of 1914 was a far more formidable menace than when Schlieffen's plan came into force. In the outcome two army corps were taken from the French theatre at the crisis of the August campaign, in order to reinforce the Eastern front.

If the fault of the final German plan was a lack of courage, that of the French plan was due to an excess. In their case, also, a miasma of confused thought seemed to creep over the leadership in the years just before the war. Since the disasters of 1870 the French command had planned an initial defensive, based on the frontier fortresses, followed by a decisive counter-stroke. To this end the great fortress system had been created, and gaps like the Trouée de Charmes left to "canalize" the invasion ready for the counter. But in the decade before 1914 a new school of thought had arisen, who argued that the offensive was more in tune with French character and tradition, that the possession of the "75"—a field gun unique in mobility and rapidity of fire—made it tactically possible, and that the alliance with Russia and Britain made it strategically possible. Forgetful of the lessons of 1870 they imagined that *élan* was proof against bullets. Napoleon's much quoted saying that "the moral is to the physical as three to one" has much to answer for; it has led soldiers to think that a division exists between the two, whereas each is dependent on the other. Weapons without courage are ineffective, but so also are the bravest troops without efficient weapons to protect them and their *moral*.

The outcome was disastrous. The new school found in Gen. Joffre, appointed chief of the general staff in 1912, a lever for their designs. Under the cloak of his authority, the advocates of the *offensive à outrance* gained control of the French military machine, and, throwing aside the old doctrine, formulated the now famous, or notorious, Plan XVII. It was based on a negation of historical experience—indeed, of common sense—and on a double miscalculation—of force and place, the latter more serious than the former. Accepting the possibility that the Government might employ their reserve formations at the outset, the strength of the Germany army in the West was estimated at a possible maximum of 68 infantry divisions. The Germans actually deployed the equivalent of 83½, counting Landwehr and Ersatz divisions. But French opinion was and continued to be doubtful of this contingency, and during the crucial days when the rival armies were concentrating and moving forward the French Intelligence counted only the active divisions in its estimates of the enemy strength—a miscalculation by half! If the plan had been framed on a miscalculation less extreme, this recognition does not condone but rather increases its fundamental falsity, for history affords no vestige of justification for a plan by which a frontal offensive was to be launched with mere equality of force against an enemy who would have the support of his fortified frontier zone, while the attackers forswore any advantage from their own.

The second miscalculation, of place, was that although the possibility of a German move through Belgium was recognized, the wideness of its sweep was utterly misjudged. The Germans were expected complaisantly to take the difficult route through the Ardennes in order that the French might conveniently smite their communications! Based on the idea of an immediate and general offensive, the plan ordained a thrust by the 1st and 2nd Armies towards the Saar into Lorraine. On their left were the 3rd Army opposite Metz and the 5th Army facing the Ardennes, which were either to take up the offensive between Metz and Thionville, or, if the Germans came through Luxembourg and Belgium, to strike north at their flank. The 4th Army was held in strategic reserve near the centre and two groups of reserve divisions were disposed in rear of either flank—relegation to such a passive rôle expressing French opinion on the capacity of reserve formations.

Britain's share in this plan was settled less by calculation than by the "Europeanization" of her military organization during the previous decade. This Continental influence drew her insensibly into a tacit acceptance of the rôle of acting as an appendix to the French left wing, and away from her historic exploitation of the

mobility given by sea-power. At the council of war on the outbreak, Lord Roberts, summoned from retirement, advocated the dispatch of the expeditionary force to Belgium—where it would have stiffened the Belgian resistance and threatened the flank of the wheeling German mass. But his was a voice crying in the wilderness, and in any case the British general staff, through Gen. Wilson, had virtually pledged themselves to act in direct co-operation with the French. When the general staffs of the two countries conducted their informal negotiations between 1905 and 1914 they little realized that they were paving the way for a reversal of England's centuries-old policy, for a war effort such as no Englishman had ever conceived.

On the Eastern front, the plans of campaign were more fluid, less elaborately worked out and formulated—although they were to be as kaleidoscopic in their changes of fortune as in the Western theatre. The calculable condition was geographical; the main incalculable, Russia's rate of concentration. Russian Poland was a vast tongue of country projecting from Russia proper, and flanked on three sides by German or Austrian territory. On its northern flank lay East Prussia with the Baltic sea beyond. On its southern flank lay the Austrian province of Galicia with the Carpathian mountains beyond, guarding the approaches to the plain of Hungary. On the west lay Silesia. As the Germanic border provinces were provided with a network of strategic railways whilst Poland, as well as Russia itself, had only a sparse system of communications, the Germanic alliance had a vital advantage, in power of concentration, for countering a Russian advance. But if they took the offensive, the further they progressed into Poland or Russia proper the more would they lose this advantage. Hence their most profitable strategy was to lure the Russians on into position for a counter-stroke rather than to inaugurate an offensive themselves. The one drawback was that such a Punic strategy gave the Russians time to concentrate and set in motion their cumbrous and rusty machine.

From this arose an initial cleavage between German and Austrian opinion. Both agreed that the problem was to hold the Russians in check during the six weeks before the Germans, it was hoped, having crushed France, could switch their forces eastwards to join the Austrians in a decisive blow against the Russians. The difference of opinion was on the method. The Germans, intent on a decision against France, wished to leave a minimum force in the East, and only a political dislike of exposing national territory to invasion prevented them evacuating East Prussia and standing on the Vistula line. But the Austrians, under the influence of Conrad von Hötzendorf, chief of their general staff, were anxious to throw the Russian machine out of gear by an immediate offensive, and as this promised to keep the Russians fully occupied while the campaign in France was being decided Moltke fell in with this strategy. Conrad's plan was that of an offensive north-eastwards into Poland by two armies, protected by two more on their right, further east. Complementary to it, as originally designed, the Germans in East Prussia were to strike south-east, the two forces converging to cut off the Russian advanced forces in the Polish "tongue." But Conrad failed to induce Moltke to provide sufficient German troops for this offensive thrust.

On the opposing side, also, the desires of one ally vitally affected the strategy of the other. The Russian command, both for military and for racial motives, wished to concentrate first against Austria, while the latter was unsupported, and leave Germany alone until later, when the full strength of the Russian army would be mobilized. But the French, anxious to relieve the German pressure against themselves, urged the Russians to deliver a simultaneous attack against Germany, and got the Russians to consent to an extra offensive for which they were neither ready, in numbers, nor organized. On the south-western front two pairs of two armies each were to converge on the Austrian forces in Galicia; on the north-western front two armies were to converge on the German forces in East Prussia. Russia, whose proverbial slowness and crude organization dictated a cautious strategy, was about to break with tradition and launch out on a gamble that only an army of high mobility and organization could have hoped to bring off.

II. THE CLASH IN THE WEST

The Detonation.—On June 28, 1914, the murder of the Austrian Archduke Francis Ferdinand at Sarajevo set light to a powder trail which within a brief span exploded the European magazine in a series of detonations. Exactly one month later Austria-Hungary declared war against Serbia, whose appeal to her ally and protector led Russia to order a partial mobilization on her southern front. The same day, July 29, an Imperial council at Potsdam decided on war against Russia, and, as a corollary, against France, although hoping to bargain for Britain's neutrality. While the chancelleries of Europe argued at cross-purposes, the military tide swept them off their feet. On July 31 Russia ordered a general mobilization and Germany, taking equivalent steps, sent a 12 hours' ultimatum. Austria, seeking belatedly to temporize, was dragged in the train of her more determined ally. By noon on Aug. 1 a state of war existed between Russia and Germany and next day German troops entered French territory. At 7 P.M. came Germany's ultimatum to Belgium, demanding an unopposed passage. On Aug. 3 Germany's formal declaration of war on France followed, and on Aug. 4 her troops crossed the Belgian frontier, for the sanctity of which England stood guarantor. At midnight, in reply, England also entered the war—while the Belgian populace, rising to resist the German invaders, sounded the death-knell of gladiatorial wars and inaugurated the new warfare of peoples. And coincidently, by Italy's declaration of her neutrality, her refusal to fulfil the alliance with her hereditary enemy—Austria—the artificiality of the political alliance system broke down before the new wave of national feeling which was to characterize the World War.

Invasion of Belgium.—The German advance into France was designed as a methodical sweep, so that unexpected checks should not upset its time-table. Confronted with the fact that the Belgians would resist, a detachment was formed under Gen. von Emmich to clear a passage through the Belgian plain north of the Ardennes, ready for the ordered advance of the main armies concentrating behind the German frontier. The ring fortress of Liége (*q.v.*) commanded this channel of advance, but, after an initial check, a German brigade penetrated between the forts and occupied the town. The interest of this feat is that it was due to the initiative of an attached staff officer, Ludendorff, whose name ere long was to be world-famous. The forts themselves offered a stubborn resistance and forced the Germans to await the arrival of their heavy howitzers, whose destructive power was to be the first tactical surprise of the World War.

The very success of the Belgians' early resistance cloaked the weight of the main German columns and misled the Allies' intelligence. The Belgian field army lay behind the Gette covering Brussels, and even before the Liége forts fell the advanced guards of the German 1st and 2nd Armies were pressing against this line. The Belgians, deprived of support owing to the mistaken French plan and British conformity with it, decided to preserve their army by falling back on the entrenched camp of Antwerp—where its location would at least make it a latent menace to the German communications. The Germans, their passage now clear, entered Brussels on Aug. 20, and on the same day appeared before Namur, the last fortress barring the Meuse route into France. It must be noted that despite the Belgian resistance the German advance was slightly ahead of its time-table.

French Offensive in Lorraine.—Meanwhile, away on the other flank, the French offensive had opened on Aug. 8 with the advance of a force under Gen. Pau into upper Alsace, a move intended partly as a military distraction and partly for its political effect. Soon brought to a halt, it was renewed on the 19th, only to meet with a fresh check. Thereafter the pressure of disasters elsewhere compelled the abandonment of the enterprise and the dissolution of the force—its units being dispatched westward as reinforcements. Meantime the main thrust into Lorraine by the French 1st (Dubail) and 2nd (de Castelnau) Armies, totalling 19 divisions, had begun on Aug. 14 and, been shattered in the battle of Morhange-Sarrebourg, Aug. 20 (*see* FRONTIERS, BATTLES OF THE) where the French discovered that the material could subdue the *moral*, and that in their enthusiasm for the offensive

they had blinded themselves to the defensive power of modern weapons, a condition which was to throw out of balance the whole mechanism of orthodox warfare. Yet it is but fair to add that this abortive French offensive had an indirect effect on the German plan, although this would hardly have been so if a Schlieffen or a Ludendorff had been in charge at German headquarters instead of the vacillating opportunist Moltke. The fact that Moltke had almost doubled the strength of his left, compared with Schlieffen's plan meant that it was unnecessarily strong for a yielding and "enticing" defensive such as Schlieffen had conceived, while lacking the superiority necessary for a crushing counter-offensive. But when the French attack in Lorraine developed and Moltke appreciated that the French were leaving their fortified barrier behind he was tempted momentarily to postpone the right wing sweep and instead seek a decision in Lorraine. This impulse led him to divert thither the six newly formed Ersatz divisions that should have been used to increase the weight of his right wing.

He had hardly conceived this new plan before he abandoned it and, on Aug. 16, reverted to Schlieffen's "swing-door" design. But the princely commanders in Lorraine were loath to forfeit this opportunity of personal glory. The Crown Prince Rupprecht of Bavaria, instead of continuing to fall back and draw the French on, halted his 6th Army on the 17th, ready to accept battle. Finding the French attack slow to develop, he planned to anticipate by one of his own. He struck on Aug. 20 in conjunction with the 7th Army on his left, but although the French were taken by surprise and rolled back from the line Morhange-Sarrebourg, the German counter-stroke had not the superiority of strength (the two armies now totalled 25 divisions) or of strategic position to make it decisive. Thus its strategic result was merely to throw back the French onto a fortified barrier which both restored and augmented their power of resistance. Thus they were enabled to despatch troops to reinforce their western flank—a redistribution of strength which was to have far-reaching results in the decisive battle, on the Marne.

With similar disregard of superior authority, the German Crown Prince, commanding the pivotal 5th Army between Metz and Thionville, attacked when he had been ordered to stand on the defensive. The lack of what Col. Foch had termed "intellectual discipline" was to be a grave factor in Germany's failure, and for this the ambitions of "court" generals were to be largely responsible.

The North-West Frontier.—While this "see-saw" campaign in Lorraine was taking place, more decisive events were occurring to the north-west. The attack on Liége awakened Joffre to the reality of a German advance through Belgium, but not to the wideness of sweep. And the sturdy resistance of Liége confirmed him in the opinion that the German right would pass south of it, between the Meuse and the Ardennes. Plan XVII. had visualized such a move, and prepared a counter. Grasping once more at phantoms, the French command embraced this idea so fervently that they transformed the counter into an imaginary *coup de grâce*. Their 3rd Army (Ruffey) and the reserve 4th Army (de Langle de Cary) were to strike north-east through the Ardennes against the rear flank of the Germans advancing through Belgium. The left wing (5th) Army, under Lanrezac, was moved further to the north-west into the angle formed by the Sambre and Meuse between Givet and Charleroi. With the British expeditionary force coming up on its left, it was to deal with the enemy's forces north of the Meuse and to converge on the supposed German main forces in conjunction with the attack through the Ardennes. Here was a pretty picture—of the Allied pincers closing on the unconscious Germans! Curiously, the Germans had the same idea of a pincer-like manoeuvre, with rôles reversed, and with better reason.

The fundamental flaw in the French plan was that the Germans had deployed twice as many troops as the French Intelligence estimated, and for a vaster enveloping movement. The French 3rd and 4th Armies (23 divisions) pushing blindly into the Ardennes against a German centre supposedly denuded of troops, blundered against the German 4th and 5th Armies (20 divisions) and were heavily thrown back in encounter-battles around Virton-Neufchateau. Fortunately the Germans were also too vague as to the situation to exploit their opportunity.

But to the north-west the French 5th Army (13 divisions) and the British (four divisions) had, under Joffre's orders, put their head almost into the German noose. The German masses of the 1st and 2nd Armies were closing on them from the north, and the 3rd Army from the east—a total of 30 divisions. Lanrezac alone had an inkling of the hidden menace. All along he had suspected the wideness of the German manoeuvre, and it was through his insistence that his army had been permitted to move so far north-west. It was due to his caution in hesitating to advance across the Sambre, to the arrival of the British on his left unknown to the German Intelligence, and to the premature attack of the German 2nd Army, that the Allied forces fell back in time and escaped from the trap.

Retreat to the Marne.—The British, after concentrating near Maubeuge, had moved up to Mons on Aug. 22, ready to advance further into Belgium as part of the offensive of the Allied left wing. On arrival, however, Sir John French heard that Lanrezac had been attacked on the 21st and deprived of the crossings of the Sambre. Although thus placed in an exposed forward position, he agreed to stand at Mons to cover Lanrezac's left. But next day Lanrezac had word of the fall of Namur and of the appearance of the German 3rd Army (Hausen) on his exposed right flank near Dinant, on the Meuse. In consequence, he gave orders for a retreat that night. The British, after resisting the attacks of six German divisions during the day, fell back on the 24th in conformity with their allies. Not a moment too soon in view of the fact that the rest of the German 1st Army was marching still further westward to envelop their open left flank.

At last Joffre realized the truth and the utter collapse of Plan XVII. Resolution was his greatest asset, and with imperturbable coolness he formed a new plan out of the wreckage. He decided to swing back his centre and left, with Verdun as the pivot, while drawing troops from the right and forming a fresh 6th Army on his left to enable the retiring armies to return to the offensive.

The German Breakdown.—His optimism might have been again misplaced but for German mistakes. The first was Moltke's folly in detaching seven divisions to invest Maubeuge and Givet and watch Antwerp, instead of using Landwehr and Ersatz troops as Schlieffen had intended. More ominous still was his decision on Aug. 25 to send four divisions to check the Russian advance in East Prussia. All these were taken from the right wing, and the excuse afterwards given for this violation of the principle of concentration was that the German command thought that the decisive victory had already been won! Further, the German command lost touch with the advancing armies and the movements of these became disjointed. The British stand at Le Cateau and Lanrezac's riposte at Guise (*see* FRONTIER, BATTLES OF THE: *Le Cateau; Guise*) were also factors in checking the German enveloping wing, and each had still greater indirect effects. For Le Cateau apparently convinced the German 1st Army commander, Kluck, that the British army could be wiped from the slate, and Guise led Bülow (2nd Army) to call on the 1st Army for support, whereupon Kluck wheeled inwards, thinking to roll up the French left. The idea of a Sedan was an obsession with the Germans, and led them to pluck the fruit before it was ripe. This premature wheel before Paris had been reached was an abandonment of the Schlieffen plan, and exposed the German right to a counter-envelopment. One further factor must be mentioned, perhaps the most significant of all: the Germans had advanced so rapidly, out-running their time-table, that their supplies failed to keep pace. Thus, in sum, so much grit had worked into the German machine that a slight jar would suffice to cause its breakdown. This was delivered in the battle of the Marne (*q.v.*).

III. THE CRISIS OF THE MARNE

The Abandoned Plan.—Let us trace the sequence of events. The first, highly coloured, reports from the army commands in the battles of the Frontiers had given the German supreme command the impression of a decisive victory. Then the compara-

tively small totals of prisoners raised doubts in Moltke's mind and led him to a more sober estimate of the situation. The new pessimism of Moltke combined with the renewed optimism of his army commanders to produce a fresh change of plan, which contained the seeds of disaster. When, on Aug. 26, the British left wing fell back southwards badly mauled from Le Cateau, Kluck had turned south-westwards again. If this direction was partly due to a misconception of the line of retreat taken by the British, it was also in accordance with his original rôle of a wide circling sweep. And by carrying him into the Amiens-Peronne area, where the first elements of the newly formed French 6th Army were just detraining after their "switch" from Alsace, it had the effect of dislocating Joffre's design for an early return to the offensive—compelling the 6th Army to fall back hurriedly towards the shelter of the Paris defences.

But Kluck had hardly swung out to the south-west before he was induced to swing in again. For, in order to ease the pressure on the British, Joffre had ordered Lanrezac to halt and strike back against the pursuing Germans, and Bülow, shaken by the threat, called on Kluck for aid. Lanrezac's attack, on Aug. 29, was stopped before Bülow needed this, but he asked Kluck to wheel in nevertheless, in order to cut off Lanrezac's retreat. Before acceding Kluck referred to Moltke. The request came at a moment when Moltke was becoming perturbed in general over the way the French were slipping away from his embrace and, in particular, over a gap which had opened between his 2nd and 3rd Armies through the latter having already turned south, from south-west, to help the 4th Army, its neighbour on the other flank. Hence Moltke approved Kluck's change of direction—which meant the inevitable abandonment of the original wide sweep round the far side of Paris. Now the flank of the wheeling German line would pass the near side of Paris and across the face of the Paris defences. By this contraction of his frontage for the sake of security Moltke sacrificed the wider prospects inherent in the wide sweep of the Schlieffen plan. And, as it proved, instead of contracting the risk he contracted a fatal counterstroke.

The decision to abandon the original plan was definitely taken on Sept. 4, and in place of it Moltke substituted a narrower envelopment, of the French centre and right. The 4th and 5th Armies were to press south-east while the 6th and 7th Armies, striking south-westwards, sought to break through the fortified barrier between Toul and Epinal, the "jaws" thus closing inwards on either side of Verdun. Meantime the 1st and 2nd Armies were to turn outwards and, facing west, hold off any counter move which the French attempted from the neighbourhood of Paris.

The Allied Counter.—But such a counter move had begun before the new plan could take effect.

The opportunity was perceived, not by Joffre, who had ordered a continuance of the retreat, but by Galliéni, the military governor of Paris. On Sept. 3 Galliéni realized the meaning of Kluck's wheel inwards, directed Maunoury's 6th Army to be ready to strike at the exposed German right flank, and next day with some difficulty won Joffre's sanction. Once convinced, Joffre acted with decision. The whole left wing was ordered to turn about and return to a general offensive, beginning on Sept. 6. Maunoury was already off the mark on the 5th and as his pressure developed on the Germans' sensitive flank, Kluck was constrained to draw off first one part and then the remaining part of his army to support his threatened flank guard. Thereby a 30 m. gap was created between the 1st and 2nd German Armies, a gap covered only by a screen of cavalry. Kluck was emboldened to take the risk because of the rapid retreat of the British opposite, or rather with their backs, to this gaping sector. Even on the 5th, when the French on either flank were turning about, the British continued a further day's march to the south. But in this "disappearance" lay the unintentional cause of victory. For, when the British retraced their steps, it was the report of their columns advancing into the gap which, on Sept. 9, led Bülow to order the retreat of his 2nd Army. The temporary advantage which the 1st Army, already isolated by its own act, had gained over Maunoury was thereby nullified, and it fell back the same day. By the 11th the retreat had extended, independently or under orders from Moltke, to all the German armies. The attempt at a partial envelopment, pivotting on Verdun, had already failed, the jaw formed by the 6th and 7th Armies merely breaking its teeth on the defences of the French eastern frontier. The attack by Rupprecht's 6th Army on the Grand Couronné, covering Nancy, was a particularly costly failure. It is difficult to see how the German command could have reasonably pinned their faith on achieving as an improvised expedient the very task which in cool calculation before the war had appeared so hopeless as to lead them to take the momentous decision to advance through Belgium as the only feasible alternative.

Thus, in sum, the battle of the Marne was decided by a jar and a crack. The jar administered by Maunoury's attack on the German right flank causing a crack in a weak joint of the German line, and this physical crack in turn producing a moral crack in the German command.

The Pursuit Fails.—The result was a strategic but not a tactical defeat and the German right wing was able to re-knit and stand firmly on the line of the Aisne. That the Allies were not able to draw greater advantage from their victory was due in part to the comparative weakness of Maunoury's flank attack and in part to the failure of the British and the French 5th Army (now under Franchet d'Espérey) to drive rapidly through the gap while it was open. Their direction of advance was across a region intersected by frequent rivers, and this handicap was intensified by a want of impulsion on the part of their chiefs. It seems, too, that greater results might have come if more effort had been made as Galliéni urged, to strike at the German rear flank instead of the front, and to direct reinforcements to the north-west of Paris for this purpose. This view is strengthened by the sensitiveness shown by the German command to reports of landings on the Belgian coast, which might threaten their communications. The alarm caused by these reports had even led the German command to contemplate a withdrawal of their right wing before the battle of the Marne was launched. When the moral effect of these phantom forces is weighed with the material effect—the detention of German forces in Belgium—caused by fears of a Belgian sortie from Antwerp, the balance of judgment would seem to turn heavily in favour of the strategy which Lord Roberts had advocated in vain. By it the British expeditionary force might have had not merely an indirect but a direct influence on the struggle, and might have made the issue not merely negatively but positively decisive.

But, considering the battle of the Marne as it shaped, the fact that 27 Allied divisions were pitted against 13 German divisions on the decisive flank is evidence, first, of how completely Moltke had lapsed from Schlieffen's intention; second, of how well Joffre had re-concentrated his forces under severe pressure; third, of how such a large balance afforded scope for a wider envelopment than was actually attempted. The frontal pursuit was checked on the Aisne before Joffre, on Sept. 17, seeing that Maunoury's attempts to overlap the German flank were ineffectual, decided to form a fresh army under de Castelnau for a manoeuvre *round and behind* the German flank. By then the German armies had recovered cohesion and the German command was expecting and ready to meet such a manoeuvre, now the obvious course.

IV. THE SECOND CRISIS—STALEMATE

Centre of Gravity Shifts.—On the Aisne was re-emphasized the preponderant power of defence over attack, primitive as were the trench lines compared with those of later years. Then followed, as the only alternative, the successive attempts of either side to overlap and envelop the other's western flank, a phase known somewhat inaccurately as the "race to the sea." This common design brought out what was to be a new and dominating strategical feature—the lateral switching of reserves by railway from one part of the front to another. Before it could reach its logical and lateral conclusion, a new factor intervened. Antwerp, with the Belgian field army, was still a thorn in the German side, and Falkenhayn, who had succeeded Moltke, determined to reduce it while a German cavalry force swept across to the Belgian coast as an extension of the enveloping wing in France.

Belgian Operations.—We must pause here to pick up the thread of operations in Belgium from the moment when the Belgian field army fell back to Antwerp, divergently from the main line of operations. On Aug. 24 the Belgians began a sortie against the rear of the German right wing to ease the pressure on the British and French left wing, then engaged in the opening battle at Mons and along the Sambre. The sortie was broken off on the 26th when news came of the Franco-British retreat into France, but the pressure of the Belgian army (six divisions) led the Germans to detach four reserve divisions, besides three Landwehr brigades, to hold it in check. On Sept. 7 the Belgian command learnt that the Germans were despatching part of this force to the front in France; in consequence King Albert launched a fresh sortie on Sept. 9—the crucial day of the battle on the Marne. The action was taken, unsolicited by Joffre, who seems to have shown curiously little interest in possibilities outside his immediate battle zone. The sortie led the Germans to cancel the despatch of one division and to delay that of two others to France, but the Belgians were soon thrown back. Nevertheless the news of its seems to have had a distinct moral effect on the German command, coinciding as it did with the initiation of the retreat of their 1st and 2nd Armies from the Marne. And the unpleasant reminder that Antwerp lay menacingly close to their communications induced the Germans to undertake, preliminary to any fresh attempt at a decisive battle, the reduction of the fortress and the seizure of potential English landing places along the Belgian coast.

A Strategic Key.—The menace to Britain, if the Channel ports fell into German hands, was obvious. It is a strange reflection that the British command should have neglected to guard against the danger hitherto, although the first lord of the Admiralty, Winston Churchill, had urged the necessity even before the battle of the Marne. When the German guns began the bombardment of Antwerp on Sept. 28 England awakened, and gave belated recognition to Churchill's strategic insight. He was allowed to send a brigade of marines and two newly-formed brigades of naval volunteers to reinforce the defenders, while a regular division and cavalry division, under Rawlinson, were landed at Ostend and Zeebrugge for an overland move to raise the siege. Eleven Territorial divisions were available in England, but, in contrast to the German attitude, Kitchener considered them still unfitted for an active rôle. The meagre reinforcement delayed, but could not prevent, the capitulation of Antwerp, Oct. 10, and Rawlinson's relieving force was too late to do more than cover the escape of the Belgian field army down the Flanders coast.

Yet, viewed in the perspective of history, this first and last effort in the West to make use of Britain's amphibious power applied a brake to the German advance down the coast which just stopped their second attempt to gain a decision in the West. It gained time for the arrival of the main British force, transferred from the Aisne to the new left of the Allied line, and if their heroic defence at Ypres, aided by the French and Belgians along the Yser to the sea, was the human barrier to the Germans, it succeeded by so narrow a margin that the Antwerp expedition must be adjudged the saving factor.

Second German Bid for Victory.—In the French theatre of operations, the month following the battle of the Marne was marked by an extremely obvious series of attempts by each side to turn the opponent's western flank. On the German side this pursuit of an opening was soon replaced by a subtler plan, but the French persevered with a straight forward obstinacy curiously akin to that of their original plan. By Sept. 24, de Castelnau's outflanking attempt had come to a stop on the Somme. Next a newly formed 10th Army under de Maudhuy tried a little further north, beginning on Oct. 2, but instead of being able to pass round the German flank soon found itself struggling desperately to hold Arras. The British expeditionary force was then in course of transfer northwards from the Aisne, in order to shorten its communications with England, and Joffre determined to use it as part of a third effort to turn the German flank. To co-ordinate this new manoeuvre he appointed Gen. Foch as his deputy in the north. Foch sought to induce the Belgians to form the left of this wheeling mass, but King Albert, with more caution, or more realism, declined to abandon the coastal district for an advance inland that he considered rash. It was. For on Oct. 14, four days after the fall of Antwerp, Falkenhayn planned a strategic trap for the next Allied outflanking manoeuvre which he foresaw would follow. One army, composed of troops transferred from Lorraine, was to hold the expected Allied offensive while another, composed of troops released by the fall of Antwerp and of four newly-raised corps, was to sweep down the Belgian coast and crush in the flank of the attacking Allies. He even held back the troops pursuing the Belgians in order not to alarm the Allied command prematurely.

Meanwhile, the new Allied advance was developing piecemeal, as corps detrained from the south and swung eastwards to form a progressively extended "scythe." The British expeditionary force, now three corps strong, deployed in turn between La Bassée and Ypres, where it effected a junction with Rawlinson's force. Beyond it the embryo of a new French 8th Army was taking shape, and the Belgians continued the line along the Yser to the sea. Although the British right and centre had already been held up, Sir John French, discounting even the underestimate of the German strength furnished by his Intelligence, ordered his left to begin the offensive from Ypres towards Menin. The effort was still-born, for it coincided with the opening of the German offensive, on Oct. 20, but for a day or two Sir John French persisted in the belief that he was attacking while his troops were barely holding their ground. With Foch the delusion persisted still longer, and this failure to grasp the situation was partly responsible for the fact that Ypres was essentially, like Inkerman, a "soldiers' battle." Already, since the 18th, the Belgians on the Yser had suffered growing pressure which threatened a disaster that was ultimately saved by the end of the month through the opening of the sluices and the flooding of the coastal area. At Ypres the crisis came later and was repeated, Oct. 31 and Nov. 11 marking the turning points of the struggle. That the Allied line, though battered and terribly strained, was in the end unbroken was due to the dogged resistance of the British and the timely arrival of French reinforcements. (*See* YPRES, BATTLE OF, 1914.)

This defence of Ypres is in a dual sense the supreme memorial to the British regular army, for here they showed the inestimable value of the disciplined morale and unique standard of musketry which were the fruit of long training, and here was their tombstone. "From failing hands they threw the torch" to the new national armies rising in England to the call of patriotism. With the Continental Powers the merging of conventional armies into national armies was a hardly perceptible process, because of their system of universal service. But with Britain it was clearly stamped as revolution, not evolution. While the little professional army sacrificed itself as the advanced guard of the nation, the truth of the new warfare of peoples was beginning to come home to the civilian population. Lord Kitchener, a national symbol because of his imperial achievements, had been summoned to the post of war minister, and with a supreme flash of vision had grasped, in contrast to Governments and general staffs alike, the probable duration of the struggle. The people of Britain responded to his call to arms, and like an ever-rising flood the "New Armies" came into being. By the end of the year nearly 1,000,000 men had enlisted, and the British empire had altogether some 2,000,000 under arms. Perhaps Kitchener was wrong in not basing this expansion, from a professional to a national scale, on the existing Territorial foundation. It must be remembered, however, that the Territorial Force was enlisted for home defence and that initially its members' acceptance of a wider role was voluntary. Perhaps, also, he was tardy in recognizing their military value.

The duplication of forces and of organization was undoubtedly a source of delay and waste of effort. Kitchener has also been reproached for his reluctance to replace the voluntary system by conscription, but this criticism overlooks how deeply rooted was the voluntary system in British institutions, and the slowness with which lasting changes can be effected in them. If Kitchener's method was characteristic of the man, it was characteristic of England. If it was unmethodical, it was calculated to impress

most vividly on the British people the gulf between their "gladiatorial" wars of the past and the national war to which they were committed.

While a psychological landmark, the battle of Ypres is also a military landmark. For, with the repulse of the German attempt to break through, the trench barrier was consolidated from the Swiss frontier to the sea. The power of modern defence had triumphed over attack, and stalemate ensued. The military history of the Franco-British alliance during the next four years is a story of the attempts to upset this deadlock, either by forcing the barrier or by finding a way round.

On the Eastern front, however, the greater distances and the greater differences between the equipment of the armies ensured a fluidity which was lacking in the West. Trench lines might form, but they were no more than a hard crust covering a liquid expanse. To break the crust was not difficult, and once broken, mobile operations of the old style became possible. This freedom of action was denied to the Western Powers, but Germany, because of her central position, had an alternative choice, and from Nov. 1914 onwards her command adopted a defensive in France while seeking to cripple the power of Russia.

V. THE RUSSIAN FRONT

Invasion of East Prussia.—In the East the opening encounters had been marked by rapid changes of fortune rather than by any decisive advantage. The Austrian command, emulating their allies in violating the principle of concentration, detached part of their strength in an abortive attempt to crush Serbia. (*See* SERBIAN CAMPAIGNS.) And their plan for an initial offensive to cut off the Polish "tongue" was further crippled by the fact that the German part of the pincers did not operate. It was, indeed, being menaced by a Russian pair of pincers instead, for the Russian commander-in-chief, the Grand Duke Nicholas, had urged his 1st and 2nd Armies to invade East Prussia without waiting to complete their concentration, in order to ease the pressure on his French allies. As the Russians had more than a two-to-one superiority, a combined attack had every chance of crushing the Germans between the two armies. On Aug. 17, Rennenkampf's 1st Army (six and a half divisions and five cavalry divisions) crossed the East Prussian frontier, and on Aug. 19–20 met and threw back the bulk (seven divisions and one cavalry division) of Prittwitz's 3rd Army at Gumbinnen. On Aug. 21 Prittwitz heard that the Russian 2nd Army (ten divisions and three cavalry divisions) under Samsonov had crossed the southern frontier of East Prussia in his rear, which was guarded by only three divisions. In panic Prittwitz momentarily spoke of falling back behind the Vistula, whereupon Moltke superseded him by a retired general, Hindenburg, to whom was appointed as chief of staff, Ludendorff, the hero of the Liège attack.

Developing a plan which, with the necessary movements, had been already initiated by Col. Hoffmann of the 8th Army staff, Ludendorff concentrated some six divisions against Samsonov's left wing. This force, inferior in strength to the Russians, could not have been decisive, but Ludendorff, finding that Rennenkampf was still near Gumbinnen, took the calculated risk of withdrawing the rest of the German troops, except the cavalry screen, from that front and rushing them back against Samsonov's right wing. This daring move was aided by the absence of communication between the two Russian commanders and the ease with which the Germans deciphered Samsonov's wireless orders to his corps. Under the converging blows Samsonov's flanks were crushed and his centre surrounded. The outcome of this military masterpiece, afterwards christened the battle of Tannenberg (*q.v.*), was the destruction of almost the whole of Samsonov's army. Then receiving two fresh army corps from the French front, the German commander turned on the slowly advancing Rennenkampf, whose lack of energy was partly due to his losses at Gumbinnen and subsequent lack of information, and drove him out of East Prussia. (*See* MASURIAN LAKES.) As a result of these battles Russia had lost a quarter of a million men and, what she could afford still less, much war material. But the invasion of East Prussia had at least, by causing the despatch of two corps from the West, helped to make possible the French "come-back" on the Marne.

Galician Battles.—Away on the southern front, moreover, the scales had tilted against the Central Powers. The offensive of the Austrian 1st and 4th Armies into Poland had at first made progress, but this was nullified by the onslaught of the Russian 3rd and 8th Armies upon the weaker 2nd and 3rd Armies which were guarding the Austrian right flank. These armies were heavily defeated (Aug. 26–30), and driven back through Lemberg. The advance of the Russian left wing thus threatened the rear of the victorious Austrian left wing. Conrad tried to swing part of his left round, in turn, against the Russian flank, but this blow was parried and then, caught with his forces disorganized by the renewed advance of the Russian right wing, he was forced on Sept. 11 to extricate himself by a general retreat, falling back almost to Cracow by the end of September. (*See* LEMBERG, BATTLES OF.) Austria's plight compelled the Germans to send aid, and the bulk of the force in East Prussia was formed into a new 9th Army and switched south to the south-west corner of Poland, whence it advanced on Warsaw in combination with a renewed Austrian offensive. (*See* VISTULA-SAN, BATTLES OF.) But the Russians were now approaching the full tide of their mobilized strength; regrouping their forces and counter-attacking, they drove back the advance and followed it up by a powerful effort to invade Silesia.

The Grand Duke Nicholas formed a huge phalanx of seven armies—three in the van and two protecting either flank. A further army, the 10th, had invaded the eastern corner of East Prussia and was engaging the weak German forces there. Allied hopes rose high as the much-heralded Russian "steam-roller" began its ponderous advance. To counter it the German eastern front was placed under Hindenburg and Ludendorff, who devised yet another master-stroke, based on the system of lateral railways inside the German frontier. The 9th Army, retreating before the advancing Russians, slowed them down by a systematic destruction of the scanty communications in Poland. On reaching its own frontier, unpressed, it was first switched northward to the Posen-Thorn area, and then thrust south-east on Nov. 11, with its left flank on the Vistula, against the joint between the two armies guarding the Russian right flank. The wedge, driven in by Ludendorff's mallet, sundered the two armies, forced the 1st back on Warsaw and almost effected another Tannenberg against the 2nd, which was nearly surrounded at Lodz (*q.v.*), when the 5th Army from the van turned back to its rescue. As a result, part of the German enveloping force almost suffered the fate planned for the Russians, but managed to cut its way through to the main body. If the Germans were baulked of decisive tactical success, this manoeuvre had been a classic example of how a relatively small force, by using its mobility to strike at a vital point, can paralyse the advance of an enemy several times its strength. The Russian "steam-roller" was thrown out of gear, and never again did it threaten German soil.

Within a week, four new German army corps arrived from the Western front, where the Ypres attack had now ended in failure, and although too late to clinch the missed chance of a decisive victory, Ludendorff was able to use them in pressing the Russians back by Dec. 15 to the Bzura-Ravka river line in front of Warsaw. This set-back and the drying up of his munition supplies decided the Grand Duke Nicholas to break off the see-saw fighting still in progress near Cracow and fall back on winter trench lines along the Nida and Dunajec rivers, leaving the end of the Polish "tongue" in the hands of the enemy. Thus, on the East as on the West, the trench stalemate had settled in, but the crust was less firm and the Russians had drained their stock of munitions to an extent that their poorly industrialized country could not make good.

The Beginning of Air Attack.—The same period witnessed the dawn of another new form of war which helped to drive home the new reality that the war of armies had become the war of peoples. From Jan. 1915, Zeppelin raids began on the English coast and reached their peak in the following winter, to be succeeded by aeroplane raids. The difficulty of distinguishing from the air between military and civil objectives, smoothed the path for a development which, beginning with excuses, ended in a frank

avowal that in a war for existence the will of the enemy nation, not merely the bodies of their soldiers, is the inevitable target.

The Psychological Situation.—The first psychological symptom of the World War, as it seemed to many, was an immeasurable sigh of relief. Had the peoples of Europe sat on the safety-valve too long? The war-weary mind of to-day cannot reconstruct the tension and anxiety, the strain and stress of hope and fear of the long years of the peace that was no peace and yet was not war. It may be read as a revolt of the spirit against the monotony and triviality of the everyday round, the completion of a psychological cycle when the memories of past war have faded, and paved the way for the emergence and revival of the primal "hunting" instinct in man.

This first phase of enthusiasm was succeeded by one of passion, the natural ferocity of war accentuated by a form of mob spirit which is developed by a "nation in arms." The British army was relatively immune because of its professional character, whereas in the German army, the most essentially "citizen," it gained scope because of the cold-blooded logic of the general staff theory of war. With the coming of autumn 1914, a third phase became manifest, more particularly among the combatants. This was a momentary growth of a spirit of tolerance, symbolized by the fraternization which took place on Christmas Day, but this in turn was to wane as the strain of the war became felt and the reality of the struggle for existence came home to the warring sides.

VI. THE EVENTS OF 1915

The Deadlock on Land.—Well before the end of 1914, the reality of the deadlock on the Western front was clear to the Governments and general staffs of the warring countries, and each was seeking a solution. The reaction varied in form and in nature according to the mental power and predisposition of the different authorities. With the Central Powers the opinion of Falkenhayn was the decisive factor, and the impression derived not merely from his critics but from his own account is that neither the opinion nor the direction was really clear as to its object. He was too obsessed with the principle of security at the expense of the principle of concentration, and in his failure to fulfil the second he undermined the foundations of the first.

On his appointment after the Marne reverse, he still adhered to the Schlieffen plan of seeking a decision in the West, but he did not follow the Schlieffen method of weakening his left wing in order to mass on the vital right wing. The October–November attack round Ypres was made largely with raw formations, while war-experienced troops lay almost idle between the Aisne and the Vosges. Col. Gröner, chief of the field railways, even went so far as to submit a detailed plan to Falkenhayn for transferring six army corps to the right wing, but it was rejected. When we remember how close to breaking point was the Allied line at Ypres, it can only be said that for a second time the German supreme command saved the Allies. At this juncture, too, Ludendorff was pleading for reinforcements to make his wedge-blow at the Russian flank near Lodz decisive, but Falkenhayn missed the chance by delaying until the Ypres failure had passed from assurance to fact.

Convinced at last of the strength of the Allied trench-barrier, Falkenhayn took the momentous decision to stand on the defensive in the West. But his object in so doing seems to have been vague. His feeling that the war must ultimately be decided in France led him to distrust the value, as he doubted the possibility, of a decision against Russia. Hence while he realized that the Eastern front was the only practicable theatre for operations in the near future, he withheld the necessary reinforcements until forced to do so by the threatening situation of the Austro-Hungarian front. And even then he doled out reserves reluctantly and meagrely, enough to secure success but never in the quantity and the time for decisive victory.

It is to his credit, however, that he realized a long war was now inevitable, and that he set to work to develop Germany's resources for such a warfare of attrition. The technique of field entrenchment was carried to a higher pitch than with any other country, the military railways were expanded for the lateral movement of reserves, the supply of munitions and of the raw material for their manufacture was tackled so energetically and comprehensively, that an ample flow was ensured from the spring of 1915 onwards—a time when the British were only awakening to the problem. Here were laid the foundations of that economic organization and utilization of resources which was to be the secret of Germany's resisting power to the pressure of the British blockade. For the scientific grasp of the economic sphere in war Germany owed much to Dr. Walter Rathenau, a brilliant captain of industry. She was also a pioneer in the psychological sphere, for as early as the autumn of 1914, she launched a vast scheme of propaganda in Asia, to undermine British prestige and the loyalty of Britain's Mohammedan subjects. The defect of her propaganda, its crudeness, was less apparent when directed to primitive people than when applied to the civilized peoples of Europe and America.

The same period witnessed also the one great success for German diplomacy, the entry of Turkey into the war, although this was fundamentally due to a combination of pre-war causes with military events. Since 1909 the country had been under the control of the Young Turk party, to whom traditions, including that of friendship with Britain, were abhorrent. Germany, filled with her own dream of a Germanic Middle East—of which the Baghdad railway was the symbol, had skilfully exploited the opportunity to gain a dominating influence over the new rulers of Turkey. Their leader, Enver Pasha, had been military attaché in Berlin, German instructors permeated the Turkish army, and a definite understanding existed between Germany and the Young Turk leaders as to common military action—urged by the common bond of necessary safeguard against danger from Russia. The arrival of the "Goeben" and "Breslau" reinforced the moral pressure of Wangenheim, the German ambassador, and eventually on Oct. 29 the Turks committed definite acts of war, at Odessa against Russia, and in Sinai against Britain.

Falkenhayn has shown "the decisive importance of Turkey joining in the struggle"—first as a barrier across the channel of munition supply to Russia, and secondly as a distraction to the military strength of Britain and Russia. Under German dictation, Turkey struck as early as mid-December against the Russians in the Caucasus (*q.v.*), but Enver's over-ambitious plan ended in disaster at the battle of Sarikamish. Turkey was no more fortunate in her next venture; to cut Britain's Suez canal artery with the East. The Sinai desert was a check on an invasion in strength, and the two small detachments which got across were easily repulsed, at Ismailia and El Kantara, although allowed to make good their retreat. But if both these offensives were tactical failures, they were of great strategic value to Germany by pinning down large Russian and British forces.

As an offset to Turkey joining the Central Powers, Italy definitely threw over the artificial ties of the old Triple Alliance and joined the Entente. On May 24 she declared war on Austria—her hereditary enemy—although avoiding an open breach with Germany. If her main object was to seize the chance of redeeming her kinsmen in Trieste and the Trentino from Austrian rule, there was also a spiritual desire to reassert her historic traditions. Militarily, however, her aid could not have an early or great effect on the situation, for her army was unready to deliver a prompt blow, and the Austrian frontier was a mountainous obstacle of great natural strength.

Franco-British Plans.—On the Entente side the reality of the trench deadlock produced different and diverse reactions. If the desire to hold on to her territorial gains swayed German strategy, the desire to recover her lost territory dominated French strategy. It is true that their mental and material concentration on the Western front, where lay the main armed force of the enemy, was justified by military tenets, but without any key to unlock the barrier they were merely knocking themselves to pieces. Winter attacks in Artois, on the Aisne, in Champagne and the Woevre afforded costly proof, and against the Germans' skill in trench-fighting Joffre's "nibbling" was usually attrition on the wrong side of the balance sheet. As for any new key, the French were singularly lacking in fertility of idea.

Britain's trouble was rather an excess of fertility, or rather an

absence of concentration in choosing and bringing to fruition these mental seeds. Yet in great measure this failing was due to the obscurantism of professional opinion, whose attitude was that of blank opposition rather than expert guidance.

British-inspired solutions to the deadlock crystallized into two main groups, one tactical, the other strategical. The first was to unlock the trench barrier by producing a machine invulnerable to machine-guns and capable of crossing trenches, which would restore the tactical balance upset by the new preponderance of defensive over offensive power. The idea of such a machine was conceived by Col. Swinton in October 1914, was nourished and tended in infancy by Winston Churchill, then first lord of the Admiralty, and ultimately, after months of experiment hampered by official opposition, came to maturity in the tank of 1916.

The strategical solution was to go round the trench barrier. Its advocates—who became known as the "Eastern" in contrast to the "Western" school—argued that the enemy alliance should be viewed as a whole, and that modern developments had so changed conceptions of distance and powers of mobility, that a blow in some other theatre of war would correspond to the historic attack on an enemy's strategic flank. Further, such an operation would be in accordance with the traditional amphibious strategy of Britain, and would enable it to exploit the advantage of sea-power which had hitherto been neglected. In October 1914, Lord Fisher, recalled to the office of first sea lord, had urged a plan for a landing on the German coast. In Jan. 1915, Lord Kitchener advocated another, for severing Turkey's main line of eastward communication by a landing in the Gulf of Alexandretta. The post-war comments of Hindenburg and Enver show how this would have paralysed Turkey. It could not, however, have exercised a wider influence, and it was anticipated by another project —partly the result of Churchill's strategic insight and partly due to the pressure of circumstances.

This was the Dardanelles expedition, about which controversy has raged so hotly that the term just applied to Churchill may be disputed by some critics. This is answered by the verdict of Falkenhayn himself: "If the straits between the Mediterranean and the Black sea were not permanently closed to Entente traffic, all hopes of a successful course of the war would be very considerably diminished. Russia would have been freed from her significant isolation . . . which offered a safer guarantee than military successes . . . that sooner or later a crippling of the forces of this Titan must take place . . . automatically." The fault was not in the conception, but in the execution. Had the British used at the outset even a fair proportion of the forces they ultimately expended in driblets, it is clear from Turkish accounts that victory would have crowned their undertaking.

The cause of this piecemeal application of force and dissipation of opportunity lay in the opposition of Joffre and the French general staff, supported by Sir John French. Despite the evidence of the sequel to the Marne, of the German failure at Ypres, and subsequently of his own still more ineffectual attacks in December, Joffre was still confident of his power to achieve an early and decisive victory in France. His plan was that of converging blows from Artois and Champagne upon the great salient formed by the entrenched German front, to be followed by an offensive in Lorraine against the rear of the enemy armies. The idea was similar to that of Foch in 1918 but the vital difference lay in the conditions existing and the methods employed. A study of the documents conveys the impression that there has rarely been such a trinity of optimists in whom faith was divorced from reason as Joffre, Foch, his deputy in Flanders, and French —albeit the latter's outlook oscillated violently. In contrast the British Government considered that the trench-front in France was impregnable to frontal attacks, had strong objection to wasting the man-power of the new armies in a vain effort, and at the same time felt increasing concern over the danger of a Russian collapse. These views were common alike to Churchill, Lloyd George and Lord Kitchener, who on Jan. 2, 1915, wrote to Sir John French: "The German lines in France may be looked upon as a fortress that cannot be carried by assault and also that cannot be completely invested, with the result that the lines may be held by an investing force while operations proceed elsewhere."

Lloyd George advocated the transfer of the bulk of the British forces to the Balkans both to succour Serbia and to develop an attack on the rear of the hostile alliance. This view was shared by a section of French opinion and, in particular, by Galliéni, who proposed a landing at Salonika as a starting point for a march on Constantinople with an army strong enough to encourage Greece and Bulgaria to combine with the Entente. The capture of Constantinople was to be followed by an advance up the Danube into Austria-Hungary in conjunction with the Rumanians. But the commanders on the Western front, obsessed with the dream of an early break-through, argued vehemently against any alternative strategy, stressing the difficulties of transport and supply and insisting on the ease with which Germany could switch troops to meet the threat. If there was force in their contention, it tended to ignore the experience of military history that "the longest way round is often the shortest way there," and that the acceptance of topographical difficulties has constantly proved preferable to that of a direct attack on an opponent firmly posted and prepared to meet it.

The weight of military opinion bore down counter-proposals and the Balkan projects were relinquished in favour of a concentration of effort on the Western front. But misgivings were not silenced and at this juncture a situation arose which revived the near Eastern scheme in a new if attenuated form.

The Dardanelles Expedition.—On Jan. 2, 1915, Kitchener received an appeal from the Grand Duke Nicholas for a diversion which would relieve the Turkish pressure on Russia's army in the Caucasus. Kitchener felt unable to provide troops and suggested a naval demonstration against the Dardanelles, which Churchill, appreciating the wider strategic and economic issues, proposed to convert into an attempt to force the passage. His naval advisers, if not enthusiastic, did not oppose the proposal and in response to a telegram the admiral on the spot, Carden, submitted a plan for a methodical reduction of the forts and clearance of the mine-fields. Fisher, while clinging to his own North sea project, strongly advocated a combined naval and military expedition. On Jan. 13, the War Council decided for a naval expedition to "take the Gallipoli peninsula, with Constantinople as its objective." A naval force, mainly of obsolete vessels was got together with French aid, and after preliminary bombardment, entered the straits on March 18. Drift mines, however, caused the sinking of several ships, and the attempt was abandoned.

It is a moot point whether a prompt renewal of the advances would not have succeeded, for the Turkish ammunition was exhausted, and in such conditions the mine obstacle might have been overcome. But the new naval commander, Admiral de Robeck decided against it, unless military aid was forthcoming. Already, a month before, the War Council had determined on a joint attack, and began the despatch of a military force under Sir Ian Hamilton. (*See* DARDANELLES CAMPAIGN.) But as the authorities had drifted into the new scheme, so were they tardy in releasing the necessary troops, and even when sent in inadequate numbers, several more weeks' delay had to be incurred—at Alexandria—in order to redistribute the force in its transports suitably for tactical action. Worst of all, this fumbling policy had thrown away the chance of surprise, which was vital for a landing on an almost impregnable shore. When the preliminary bombardment took place in February only two Turkish divisions were at the straits; this was increased to four by the date of the naval attack, to six when Hamilton was at last able to attempt his landing. For this he had only four British divisions and one French division—actually inferior in strength to the enemy in a situation where the inherent preponderance of defensive over offensive power was multiplied by the natural difficulties of the terrain. His weakness of numbers and his mission of aiding the passage of the fleet compelled him to choose a landing on the Gallipoli peninsula in preference to one on the mainland or on the Asiatic shore; and the rocky coastline limited his possible landing places.

On April 25, he made his spring, at the southern tip of the

peninsula near Cape Hellas and—with Australian and New Zealand troops—near Gaba Tepe, some 15 m. up the Aegean coast; the French, as a diversion, made a temporary landing at Kum Kale on the Asiatic shore. The troops effected the impossible and made good their lodgment on beaches strewn with barbed wire and swept by machine-guns. But the momentary asset of tactical surprise had passed, the difficulties of supply were immense, while the Turks held the commanding heights and were able to bring up their reserves. The invaders managed to hold on to their two precarious footholds, but they could not expand them appreciably, and the stagnation of trench warfare set in. They could not go on, and national prestige forbade them to go back.

Ultimately, in July, the British Government decided to send a further five divisions to reinforce the seven by now on the peninsula. By the time they arrived the Turkish strength in the region had also risen to 15 divisions. Hamilton decided on a double stroke—a reinforced blow from Gaba Tepe and a new landing at Suvla bay a few miles north—to sever the middle of the peninsula and secure the heights commanding the Narrows. He deceived the Turkish command and achieved surprise (Aug. 6), but the first blow failed and the second lost a splendid chance by the inexperience of the troops and still more the inertia and fumbling of the local commanders. For over 36 hours, before reserves arrived, only one and a half Turkish battalions barred the path. Energetic new commanders, for whom Hamilton had previously asked, were sent out when the opportunity had passed. The British were once more condemned to hang on to tenuous footholds, and with the autumn rains setting in their trials were increased. The Government had lost faith and were anxious to withdraw, but fear of the moral effect delayed their decision. Hamilton was asked for his opinion, however, and when he pronounced in favour of continuing—in which course he still had confidence—he was replaced by Sir Charles Monro, who immediately declared for evacuation. Kitchener was then set out to investigate, and on his verdict a withdrawal was sanctioned and carried out from Suvla and Anzac on the night of Dec. 18–19 and from Hellas on that of Jan. 8–9. If the bloodless evacuation was an example of masterly organization and co-operation it was also a proof of the greater ease of such operations in modern warfare. Thus the curtain rang down on a sound and far-sighted conception marred by a chain of errors in execution almost unrivalled even in British history.

The Menace to Russia.—While the British were striving to unlock the back door to Russia, the Germanic Powers were hammering their Russian allies, whose resistance was collapsing in large measure from a lack of munitions which could only be made good by foreign supplies through that locked entrance, the Dardanelles. On the Eastern front, the campaign of 1914 had shown that a German force could count on defeating any larger Russian force, but that when Russians and Austrians met on an equality victory rested with the Russians. Falkenhayn was forced, reluctantly, to despatch German reinforcements as a stiffening to the Austrians, and thus was dragged into an offensive in the East rather than adopting it as a clearly defined plan. Ludendorff, in contrast, had his eyes firmly fixed on the ultimate object, and from now on advocated unceasingly a whole-hearted effort to break Russia. Ludendorff's was a strategy of decision, Falkenhayn's a strategy of attrition.

In the conflict of wills between these two men lies the clue to the resultant strategy of Germany—highly effective, yet not decisive. On the other side the fresh Russian plan embodied the lessons of experience and was soundly conceived, but the means were lacking and the instrument defective. The Grand Duke Nicholas aimed to secure both his flanks solidly before attempting a fresh blow towards Silesia. From January until April, under bitter winter conditions, the Russian forces on the southern flank of the Polish salient strove to gain possession of the Carpathians and the gateways into the Hungarian plain. But the Austrians, with a German infusion, parried their efforts, and the loss was disproportionate to the small gains. The long-besieged fortress of Przemysl (*q.v.*), however, at last fell into their hands on March 22. In northern Poland the Russians were preparing to strike upwards at East Prussia, when they were forestalled by a fresh Ludendorff stroke eastwards towards the frontier of Russia proper. The blow was launched on Feb. 7, over snow-buried roads and frozen swamps, and was distinguished by the envelopment of four Russian divisions in the Augustovo forests. (*See* MASURIAN LAKES.) Moreover, it extracted the sting from the Russian attack further west.

These moves were, however, merely a "curtain-raiser" to the real drama of 1915. But before turning to this it is necessary to glance at events on the Western front, the importance of which is partly as a signpost to the future and partly because of their reaction on the Eastern front.

The Western Front.—While a way round the trench barrier was being sought in Gallipoli and experiments with a novel key were being carried out in England, the Allied commands in France were trying more orthodox solutions. The most significant was the British attack at Neuve Chapelle (*q.v.*) on March 10. Save as a pure experiment the attempt stood self-condemned. For it was an isolated attempt on a small front with inadequate resources. The arrival in France of several new regular divisions made up from foreign garrisons, of the Indian Corps, and the 1st Canadian Division had brought the British strength up to 13 divisions and 5 cavalry divisions, besides a number of selected territorial battalions. This increase enabled French to divide his forces into two armies and gradually to extend his share of the front. But Joffre was insistent that he should relieve the French of the Ypres salient, which they had taken over in November, and made the intended French attack contingent on this relief. Sir John French considered that he had not sufficient troops for both purposes, and so decided to carry out the attack single-handed. An additional motive was his resentment of the constant French criticisms that the British were not "pulling their weight."

In design, however, the attack, entrusted to Haig's 1st Army, was both original and well thought out. After an intense bombardment of 35 minutes duration on a 2,000 yd. frontage, the artillery lengthened their range and dropped a curtain of fire to prevent the reinforcement of the enemy's battered trenches, which were rapidly overrun by the infantry.

Complete surprise was attained and most of the first positions captured, but when in the second phase, the frontage was extended, the artillery support was inadequate. Further, owing to scanty information and to the two corps commanders waiting upon each other a long pause occurred which gave the Germans five clear hours to organize fresh resistance. Then, too late and mistakenly, the attack was ordered to be pushed "regardless of loss." And loss proved the only result. An underlying factor was that the narrowness of the attack sector made the breach more easy for the defenders to close, although this defect was unavoidable owing to the general shortage of munitions. The British had been slower than the Germans to awaken to the scale of ammunition supply required for this new warfare, and, even so, deliveries fell far behind contract, owing largely to the handicap imposed by trade union rules on the dilution of skilled labour. These could only be modified after long negotiation and the shortage of shells became so obvious in the spring of 1915 as to lead to a public outcry which culminated in the establishment of a Ministry of Munitions, under Lloyd George, to co-ordinate and develop both manufacture and the supply of raw materials. Apart from shells, the crudeness and inferiority of all the British trench-warfare weapons compared with those of the Germans, made such a radical organization overdue, and its urgency was emphasized by the near approach of the time when Britain's new armies would take over the field. If the task was undertaken late, it was carried out with energy and thoroughness, and by 1916 the flow of munitions reached a volume, still expanding, which finally removed any material handicap on the strategy of the British leaders.

The tactical sequel of Neuve Chapelle was less fortunate. It was clear that the small-scale experiment had only missed success by a narrow margin and that there was scope for its development. But the Entente commands missed the true lesson, which was the surprise attainable by a short bombardment that com-

ensated its brevity by its intensity. And only partially did they ppreciate that the sector attacked must be sufficiently wide to revent the defender's artillery commanding, or his reserves closng the breach. Instead, they drew the superficial deduction that here volume of shell-fire was the key to success. Not until 1917 lid they revert to the Neuve Chapelle method. It was left to he Germans to profit by the experience against the Russians in May.

But before that came, the Western front was destined to inrease the tally of military blunders. In the first, it was the Germans' turn to find and misuse a new key to the trench deadlock. This was the introduction of gas, and, unlike the British introuction of tanks later, the chance, once forfeited, did not return, wing to the relative ease of providing an antidote. In a local ttack in Poland on Jan. 31, the Germans had tried the use of as-shells, but the experiment had been a failure owing to the ullifying effect of the intense cold. At the next attempt it was ischarged from cylinders owing to the failure of the authorities o provide the inventor, Haber, with adequate facilities for the anufacture of shells. Further, the initial disappointment led he German command to place little trust in its value. In conseuence, when discharged against the French trenches at Ypres n April 22, there were no reserves at hand to pour through the ide breach it created. (*See* YPRES, BATTLES OF, 1915.) A range green vapour, a surging mass of agonized fugitives, a 4 m. ap without a living defender—such was the sequence of events. ut the heroic resistance of the Canadians on the flank of the reach and the prompt arrival of English and Indian reinforcements saved the situation in the absence of German reserves.

The chlorine gas originally used was undeniably cruel, but no orse than the frequent effect of shell or bayonet, and when it as succeeded by improved forms of gas both experience and atistics proved it the least inhumane of modern weapons. But was novel and therefore labelled an atrocity by a world which ondones abuses but detests innovations. Thus Germany incurred he moral odium which inevitably accompanies the use of a novel eapon without any compensating advantage. (*See* CHEMICAL ARFARE.)

On the Entente side, wisdom would have counselled a period f waiting until their munition supply had grown and the new ritish armies were ready, but the desire to regain lost territory nd the duty of relieving the pressure on Russia, combined with l-founded optimism to spur Joffre to premature offensives. The erman losses were exaggerated, their skill and power in defence nderrated, and a series of diffused and unconnected attacks were ade. The chief was by the French between Lens and Arras, nder Foch's direction, and the earlier experience of failure to ake an effective breach in the trench barrier was repeated. he attack was launched on May 9 by d'Urbal's army on a fourile frontage. It was quickly checked with murderous losses cept on the front of Pétain's corps which, thanks to meticulous reparation, broke through to a depth of three miles. But the enetration was too narrow, reserves were late and inadequate nd the gap closed. Foch, however, persevered with vain attacks hich gained a few acres of ground at excessive loss. Meantime aig's 1st Army had attacked towards Aubers Ridge simultaneusly with the larger French attempt. The plan was to penetrate two points north and south of Neuve Chapelle, 4 m. apart, the otal frontage of the two being 2½ m., and then to converge in ploiting the double penetration. But the Germans, profiting lso from the experimental value of Neuve Chapelle, had deeloped their defences. Thus the attack died away quickly from surfeit of German machine-guns and an insufficiency of British ells. Under pressure from Joffre the attack was renewed on lay 15 on the Festubert sector south of Neuve Chapelle, and ontinued by small bites until May 27. The larger French offenve between Lens and Arras was not abandoned until June 18, hen the French had lost 102,000 men—rather more than double he defender's loss.

The effect of these attacks was, moreover, to convince even the ubious Falkenhayn of the strength of his Western line and of he remoteness of any real menace from the Franco-British forces. His offensive on the Eastern front had already opened. Tactically unlimited, its strategic object was at first only the limited one of relieving the pressure on the Austrian front and, concurrently, reducing Russia's offensive power. Conrad proposed and Falkenhayn accepted a plan which aimed at a rupture of the Russian centre as the best means to this end, and in which the Dunajec sector between the upper Vistula and the Carpathians was selected as offering the fewest obstacles to an advance and best protection to the flanks of a penetration. The break-through was entrusted to Mackensen, whose force comprised the newly formed German 11th Army—strengthened by divisions from the West, and the 4th Austro-Hungarian Army. The Ypres gas attack and a large cavalry raid from East Prussia were initiated to cloak the concentration on the Dunajec river of 14 divisions and 1,500 guns against a front held by only six Russian divisions and lacking rear lines of trenches.

The Dunajec Break-through.—On May 2, after an intense bombardment had flattened the Russian trenches, the attack was launched and swept through with little opposition. The surprise was complete, the exploitation rapid, and despite a gallant stand on the Wisloka river, the whole line along the Carpathians was rolled up, until on May 14 the advance reached the San, 80 m. from its starting point. Defeat almost turned into disaster when this was forced at Jaroslav, but the impetus of the advance had momentarily spent itself and reserves were lacking. A new factor was introduced by Italy's declaration of war against Austria, but Falkenhayn persuaded the Austrian command, with some difficulty, not to move troops from the Russian front, and to maintain a strict defensive on their Italian frontier, which was secured by the mountain barrier. He realized that he had committed himself too far in Galicia to draw back, and that only by bringing more troops from France could he hope to fulfil his object of transferring troops back there, as this could only be possible when Russia's offensive power was crippled and her menace to Austria removed. Strengthened by these reinforcements, Mackensen attacked again in co-operation with the Austrians, retook Przemysl on June 3 and captured Lemberg on June 22, cutting the Russian front into two separated portions.

But the Russians, from their vast man-power resources had almost made good the loss of 400,000 prisoners, and Falkenhayn's anxiety about the stability of his Austrian allies decided him to continue the offensive, although still with limited objects and with one eye on the situation in France. He changed its direction, however, from eastwards to northwards, between the Bug and Vistula, where lay the main Russian forces. In conjunction, Hindenburg was ordered to strike south-east from East Prussia, across the Narew (*q.v.*) and towards the Bug. Ludendorff disliked the plan as being too much of a frontal attack; the Russians might be squeezed by the closing in of the two wings but their retreat would not be cut off. He urged once more his spring scheme for a wide enveloping manoeuvre through Kovno on Vilna and Minsk, but Falkenhayn rejected it, fearing that it would mean more troops and a deeper commitment. The result justified Ludendorff's expectation—the Grand Duke extricated his troops from the Warsaw salient before the German shears could close on him. Falkenhayn, on the other hand considered that Ludendorff had not put his full weight into the attack. (*See* further BREST-LITOVSK, BATTLES OF.)

Nevertheless, 750,000 prisoners had been taken by the middle of August, Poland had been occupied, and Falkenhayn decided to break off large scale operations on the Eastern front. Bulgaria's entry into the war was now arranged and he wished to support the combined attack of Austria and Bulgaria against Serbia, as well as to transfer troops back to meet the French offensive expected in September. Mackensen was sent to the Serbian front and Ludendorff was given a belated permission to carry out his Vilna scheme, with such resources as he had, but as an independent operation.

It began on Sept. 9, Below's Army of the Niemen and Eichhorn's 10th Army forming two great horns which gored their way into the Russian front, the one east towards Dvinsk and the other south-east towards Vilna. The Russians were driven

back in divergent directions and the Germany cavalry advancing between the horns far overlapped Vilna and drew near the Minsk railway. But the German strength was slender, the Russians free to concentrate against this isolated menace, and in face of the stiffening resistance Ludendorff took the wise course of suspending operations. The crux of the situation was that the Russian armies had been allowed to draw back almost out of the net before the long delayed Vilna manoeuvre was attempted; the degree of success attained with such weak forces was confirmation of its practicability and of Ludendorff's claim that a powerful blow delivered while the Russians were deeply enmeshed in the Polish salient might have annihilated the armed force of Russia. She had been badly lamed, but not destroyed, and although never again a direct menace to Germany, she was able to delay the full concentration of German strength in the West for two years, until 1918. Falkenhayn's cautious strategy was to prove the most hazardous in the long run, and indeed to pave the way for Germany's bankruptcy.

Thus, at the end of September, the Russian retreat, after a nerve-racking series of escapes from the salients which the Germans systematically created and then sought to cut off, came to a definite halt on a straightened line, stretching from Riga on the Baltic to Czernowitz on the Rumanian frontier. But the Russian armies had gained this respite at a ruinous price, and their Western allies had effected little in repayment of Russia's sacrifice on their behalf in 1914.

Allied Offensive in the West.—For the Franco-British relief offensive of Sept. 25 had been no more fruitful than its predecessors. The main blow was launched by the French in Champagne (*q.v.*), in conjunction with a Franco-British attack in Artois, on either side of Lens. One fault was that the sectors were too far apart to have a reaction on each other, but a worse was that the command tried to reconcile two irreconcilable factors—they aimed at a break-through but preceded it with a prolonged bombardment which gave away any chance of surprise. Joffre's plan was that the break-through in these two sectors was to be followed by a general offensive on the whole Franco-British front which would "compel the Germans to retreat beyond the Meuse and possibly end the war." The unquenchable optimist! The British attack at Loos (*q.v.*) was undertaken against the opinion of Haig, whose 1st Army had to carry it out. The British resources in artillery were still much less than those of the French, and Haig, after personal reconnaissance, reported that the sector was unsuitable for an attack. But Joffre, with the enchantment that distance lends, declared that it was "particularly favourable ground." Sir John French vacillated as usual, but finally ordered the attempt under pressure from Kitchener. The latter, in this reversal of his own previous attitude was apparently influenced by the grave situation in Russia, as well, perhaps, by his reaction from the disappointment at the Dardanelles. But as he had long since declared his view that the Western front was impassable, it is difficult to see how he could feel that a hopeless offensive there could bring fresh hope to the Russians. Both in Champagne and Artois the attacks penetrated the forward German positions without difficulty, but the delay in bringing reserves forward allowed the German reserves to close the gaps, a task simplified by the narrowness of the attack frontage. The slight gains of ground in no way compensated for the heavy price paid for them—the Allied loss was approximately 242,000 against 141,000 Germans. And if the Allied commands had gained more experience so had the Germans, in the art of defence. The British share in this offensive is, however, notable as marking the appearance in strength of the New Armies; at Loos they were "blooded" and if inexperience detracted from their effectiveness, their courage and driving force were an omen of Britain's power to improvise a national effort comparable with the long-created military machines of the Continent.

The direction of this effort inspired less confidence, and Sir John French gave place to Sir Douglas Haig as commander-in-chief, just as already in September the Russian command had been transferred from the Grand Duke Nicholas, nominally to the Tsar, as a moral symbol, but actually to a new commander-in-chief, Gen. Alexeiev, the newly appointed chief of staff.

The Italian Front, 1915.—Italy's military contribution to the Allied cause was handicapped not only by her unreadiness but by the awkward strategic position of her frontier, difficult for initiating an offensive and hardly more favourable for a secure defensive. The Italian frontier province of Venezia formed a salient pointing to Austria and flanked on the north by the Austrian Trentino, on the south by the Adriatic. Bordering on the Adriatic was a stretch of relatively low ground on the Isonzo front but the frontier then followed the Julian and Carnic Alps in a wide sweep round to the north-west. Any advance eastwards inevitably suffered the potential menace of an Austrian descent from the Trentino upon its rear.

Nevertheless, the eastern front, though difficult enough, seemed to offer more prospect of success, besides threatening a vital part of Austria, than an advance northward into the Alps. When Italy was preparing to enter the war Gen. Cadorna, who assumed command, drew up his plan on this basis of an offensive eastwards and a defensive attitude in the north. The overhanging menace of the Trentino was mitigated by the expectation of simultaneous pressure upon Austria from Russia and Serbia. But on the eve of Italy's declaration of war this hope faded, the Russian armies falling back under Mackensen's blows, while the Serbs, despite requests from the Allies, failed to make even a demonstration. This enabled the Austrians to despatch five divisions to the Isonzo from the Serbian front, these being relieved by three newly formed German divisions. Even so there were only some eight divisions in all available to oppose the Italians, who had a numerical superiority of more than three to one.

In order to secure good covering positions on the north a limited advance was made into the Trentino, with success, but another into the north-east corner of the frontier salient—towards Tarvis in the Carnic Alps—was forestalled. This local failure was to have unfortunate results later for it left the Austrians with a good strategic sally port into the Tagliamento valley. Meantime the main Italian advance, by the 2nd and 3rd Armies, had begun at the end of May, but out of their total of 14 divisions only seven were ready. Bad weather increased the handicap, the Isonzo coming down in flood, and the initial advance soon came to a standstill. The Isonzo front crystallized, like the others, into trench warfare. The Italian mobilization, however, was now complete and Cadorna mounted a deliberate attack, which opened on June 23. This first battle of the Isonzo continued until July 7 with little gain to show. A fresh series of efforts after a ten days' pause were hardly more effective, and the front then relapsed into the spasmodic bickering characteristic of trench warfare, while Cadorna made preparations for a new and larger effort in the autumn. When it was launched in October he had a two to one superiority in numbers but was weak in artillery. This defect coupled with the superior experience of the defender rendered the new offensive as barren as its predecessors. It was sustained perhaps too obstinately and when finally broken off on Dec. 5, the Italian loss in the six months' campaign totalled some 280,000 —nearly twice that of the defenders, who had shown on this front a fierce resolution which was often lacking when they faced the Russians.

The Conquest of Serbia, Oct., 1915.—While stalemate, although with marked changes beneath the surface, had once more settled in on both the Eastern and Western fronts, the latter months of 1915 witnessed fluid operations elsewhere which were to have an uncalculated influence on the war.

Austria had proved capable of holding the Italians on the Isonzo, and once the Russian danger began to fade under the pressure of the summer offensive, her command was anxious to deal with Serbia conclusively. Austria's attempted invasions in August and September 1914, and again in November, had been brusquely repulsed by Serbian counter-strokes, and it was not pleasant for a great Power, especially one with so many Slav subjects, to swallow such military rebuffs. Her impatience coincided with Falkenhayn's desire to gain direct railway communication with Turkey, hard pressed at the Dardanelles. Throughout the summer the rival coalitions had been bidding for Bulgaria's

support, and in this bargaining the Entente suffered the moral handicap of military failure and the material handicap caused by Serbia's unwillingness to give up any part of Macedonia—of which she had despoiled Bulgaria in 1913. As Austria had no objection to offering territory that belonged to her enemy, Bulgaria accepted her bid. This accession of strength enhanced the chance of a decision against Serbia and in August Falkenhayn decided to reinforce Kövess's Austrian 3rd Army with Gallwitz's German 11th Army from the Russian front. In addition two Bulgarian armies were available. Mackensen was sent to direct the operations. To meet this new threat Serbia, apart from her own relatively small forces, had only a treaty guarantee of Greek aid and promises from the Entente Powers. The first disappeared with the fall of Venizelos, the pro-Ally Greek premier, and the second, as usual, was too late.

On Oct. 6, 1915 (*see* further, SERBIAN CAMPAIGNS) the Austro-German armies attacked southwards across the Danube, with a flanking movement across the Drina on the right. The sturdy resistance of the Serbs in delaying actions, and the natural difficulty of the mountainous country, checked the advance, but before Franco-British reinforcements could arrive, the Bulgarian armies struck westwards into southern Serbia, across the rear of the main Serbian armies. This drove a deep wedge between the Serbs and their allies, moving up from Salonika, and automatically loosened the props of the resistance in the north. With their line bent at both ends until it resembled a vast bow, threatened with a double envelopment, and with their retreat to the south cut off, the Serbian armies decided to retire west through the Albanian mountains. Those who survived the hardships of this mid-winter retreat were conveyed to the island of Corfu, and after being re-equipped and reorganized, joined the Entente force at Salonika in the spring of 1916. The conquest of Serbia, though not, as it proved, of Serbian military power, relieved Austria of danger on her southern frontier, and gave Germany free communication and control over a huge central belt from the North sea to the Tigris. For the Entente this campaign dug a military sump-pit which for three years was to drain their military resources, there to lie idle and ineffective. Yet ultimately that sump-pit was to overflow and wash away one of the props of the Central Alliance.

The Salonika Expedition.—When at the beginning of October the Entente Governments had awakened to Serbia's danger, British and French divisions had been despatched hurriedly from Gallipoli to Salonika, which was the only channel of aid to Serbia —by the railway to Uskub. The advanced guard of this relieving force—which was under the command of Gen. Sarrail—pressed up the Vardar and over the Serbian frontier, only to find that the Bulgarian wedge had cut it off from the Serbians, and it was forced to fall back on Salonika, pursued by the Bulgarians. On military grounds an evacuation of Salonika was indicated, but political reasons induced the Allies to remain. The Dardanelles failure had already diminished their prestige, and by convincing the Balkan States of German invincibility had induced Bulgaria to enter the war and Greece to break her treaty with Serbia. To evacuate Salonika would be a further loss of prestige, whereas by holding on the Allies could check German influence over Greece, and maintain a base of operations from which to aid Rumania, if, as expected, she entered the war on their side. To this end the Salonika force was augmented with fresh British and French divisions, as well as contingents from Italy and Russia, and there also the rebuilt Serbian army was brought. But apart from the capture of Monastir in Nov. 1916, and an abortive attack in April 1917, the Entente force made no serious offensive until the autumn of 1918. Its innocuousness was partly due to the natural difficulties of the country—the chain of mountain ridges which guarded the approach to the Balkans, partly to the feeling of the Allied Governments that it was a bad debt, and partly to the personality of Sarrail, whose conduct and reputation for political intrigues failed to command the confidence and co-operation essential if such a mixed force was to "pull its weight." On their side the Germans were content to leave it in passivity, under guard of the Bulgarians, while they steadily withdrew their own forces for use elsewhere. With gentle sarcasm they termed Salonika their "largest internment camp," and with half a million Allied troops locked up there the jibe had some justification—until 1918. (*See* further SALONIKA CAMPAIGN.)

The Mesopotamia Expedition to the Fall of Kut.—Nor was Salonika the only "drain" opened in 1915. Mesopotamia was the site of a fresh diversion of force from the centre of military gravity, and one which could only be excused on purely political grounds. It was not, like Salonika and the Dardanelles, begun to relieve a hard-pressed ally, nor had it the justification of the Dardanelles expedition of being directed at the vital point of one of the enemy States. The occupation of Mesopotamia might raise British prestige, and it might annoy Turkey, but it could not endanger her power of resistance. Although its origin was sound, its development was another example of "drift," due to the inherent faultiness of Britain's machinery for the conduct of war. (*See* further MESOPOTAMIA OPERATIONS.)

The oilfields near the Persian gulf were of essential importance for Britain's oil supply, and thus when war with Turkey was imminent, a small Indian force, of one division, was despatched to safeguard them. To fulfil this mission effectively it was necessary to occupy the Basra vilayet at the head of the Persian gulf, in order to command the possible lines of approach.

On Nov. 21, 1914, Basra was captured, but the rising stream of Turkish reinforcements compelled the Indian Government to add a second division. The Turkish attacks in the spring of 1915 were repulsed, and the British commander, Gen. Nixon, judged it wise to expand his footing, for greater security. Townshend's division was pushed up the Tigris to Amara, gaining a brilliant little victory, and the other division up the Euphrates to Nasiriya. Southern Mesopotamia was a vast alluvial plain, roadless and railless, in which these two great rivers formed the only channels of communication. Thus a hold on Amara and Nasiriya covered the oilfields; but Nixon and the Indian Government, inspired by these successes, decided to push forward to Kut-al-Amara, a move which was 180 m. further into the interior but had a partial military justification in the fact that at Kut the Shatt-el-Hai, issuing from the Tigris, formed a link with the Euphrates by which Turkish reserves might be transferred from one river line to the other.

Townshend was sent forward in August, defeated the Turks near Kut, and his cavalry carried the pursuit to Aziziya, half way to Baghdad. Enthusiasm spread to the home Government, anxious for a moral counterpoise to their other failures, and Nixon received permission for Townshend to press on to Baghdad. But after an indecisive battle at Ctesiphon, the growing superiority of the Turkish strength compelled Townshend to retreat to Kut. Here, isolated far from help, he was urged to remain, as several fresh divisions were being sent to Mesopotamia. Kut was invested by the Turks on Dec. 8, 1915, and the relieving forces battered in vain against the Turkish lines covering the approach on either bank of the Tigris. The conditions were bad, the communications worse, the generalship faulty, and at last on April 29, 1916, Kut was forced to surrender. However unsound the strategy which despatched Townshend on this adventure, it is just to emphasize that the actual achievements of his small force in face of superior numbers, with inadequate equipment and primitive communications, and utterly isolated in the heart of an enemy country, wrote a glorious page of British history. When these handicaps are compared with the four to one superiority in number, and highly organized supply system of the force which ultimately took Baghdad, the comparison explains the awe in which Townshend and his men were held by the Turks.

The Home Front 1915.—Perhaps one of the most significant landmarks of the transition of the struggle from a "military" to a "national" war was the formation of a National Ministry in Britain which occurred in May 1915. For the prototype of Parliaments to abandon the deep-rooted party system and pool the direction of the war was proof of the psychological upheaval of traditions. The Liberal prime minister, Asquith, remained, but the real lead began to pass insensibly into other hands, notably those of Lloyd George. Churchill, whose vision had saved the

menace to the Channel ports and made possible the future key to the deadlock, was shelved, as already had been Haldane, the creator of the expeditionary force.

Political changes were general in all countries, and were symptomatic of a readjustment of popular outlook. The early fervour had disappeared and been replaced by a dogged determination which, if natural to the British, was in strange contradiction to popular, if superficial, conceptions of the French temperament.

Economically, the strain had yet to be felt severely by any country. Finance had shown an unexpected power of accommodation, and neither the blockade nor the submarine campaign had seriously affected the food supply. If Germany was beginning to suffer some shortage, her people had more tangible omens of success to fortify their resolution than had their enemies.

VII. FROM VERDUN TO THE ENTRY OF AMERICA

Verdun, 1916.—In 1914 the centre of gravity of the World War had been on the Western front, in 1915 it shifted to the Eastern front, and in 1916 once more moved back to France. Although the Entente had dissipated some of their strength in Salonika and Mesopotamia, the rising tide of England's new armies and of her munition supplies promised the power for an effort far larger in scale than before to break the trench deadlock. Measures had also been taken to keep these new divisions up to strength. By the end of 1915 the British force in France had risen to 36 divisions through the entry into the field of "Kitchener's Army," as well as of the territorial divisions. Although the principle of voluntary enlistment had not yet been abandoned, the method was systematized and based on a national register. This scheme, launched in Oct. 1915, under the aegis of Lord Derby, aimed to reconcile the demands of the army with the needs of industry, calling up men by groups as they were wanted, and taking single men first. But the response among the latter was not adequate to preserve this graduated principle and in Jan. 1916, by the Military Service Act, the voluntary system—system is hardly the correct term—was replaced by conscription.

At the close of 1915 the first serious effort to obtain unity of action between the Allies was made, and a conference of the leaders of the French, British, Belgian and Italian armies, with representatives present from the Russian and Japanese, was held at Joffre's headquarters in December. As a result they adopted the principle of a simultaneous general offensive in 1916 by France, Britain, Russia and Italy. In view of the rawness of the British troops, it was recognized that time must be allowed for training, and that the offensive could not begin before the summer of 1916, although it was hoped to carry out preliminary attacks to wear down the enemy's strength.

But German action was to dislocate this scheme, and only the British share came fully into operation, and not even that into full effect. Falkenhayn was about to fulfil his long-cherished plan for a Western offensive, but with characteristic limitations. Always a believer in the strategy of attrition, he now carried this ruling idea into tactics, and produced the new form of attack by methodical stages, each with a limited objective. In a memorandum to the German emperor at Christmas 1915 he argued that England was the staple of the enemy alliance. "The history of the English wars against the Netherlands, Spain, France and Napoleon is being repeated. Germany can expect no mercy from this enemy, so long as he still retains the slightest hope of achieving his object." Save by submarine warfare, however, England and her army were out of reach, for their sector of the front did not lend itself to offensive operations. "In view of our feelings for our arch-enemy in the war that is certainly distressing, but it can be endured if we realize that for England the campaign on the Continent . . . is at bottom a side-show. Her real weapons here are the French, Russian and Italian armies." He regarded Russia as already paralysed, and Italy's military achievements as unlikely to affect the situation. "Only France remains. France has almost arrived at the end of her military effort. If her people can be made to understand clearly that in a military sense they have nothing more to hope for, breaking-point would be reached, and England's best sword knocked out of her hand." He added that a break-through in mass was unnecessary, and that instead the Germans should aim to bleed France to death by choosing a point of attack "for the retention of which the French command would be compelled to throw in every man they have." Such objectives were either Belfort or Verdun, and Verdun was chosen, because it was a menace to the main German communications, because it offered a salient and so cramped the defender, and because of the moral effect if so renowned a place was lost to France.

The keynote of the tactical plan was a continuous series of limited advances which by their menace should draw the French reserves into the mincing-machine of the German artillery. And each of these advances was itself to be secured from loss by an intense artillery bombardment, brief for surprise and making up for its short duration by the number of batteries and their rapidity of fire. By this means the objective would be taken and consolidated before the enemy could move up his reserves for counter-attack. Although the French Intelligence branch at general headquarters gave early warning of the German preparations, the Operations branch were so full of their own offensive schemes that the warning fell on deaf ears. Further, the easy fall of the Belgian and Russian fortresses had led to a commonly held view that fortresses were obsolete, and Joffre, persuading the French Government to "declass" Verdun as a fortress, had denuded it of guns and troops. The forts were only used as shelters and the trench lines which took their place were inadequate and in poor repair. Yet in the outcome eight months' bombardment was to leave the forts almost undamaged!

At 7.15 A.M. on Feb. 21, the German bombardment began, on a front of 15 m., and progressively trenches and wire were flattened out or upheaved in a chaos of tumbled earth, giving to the countryside a weird resemblance to the surface of the moon. At 4.45 P.M. the German infantry advanced, although the first day only on a 2½ m. front. From then until Feb. 24 the defenders' line east of the Meuse was crumbled away as by the erosion of the tide.

"Operations" still argued that it was only a feint, but Joffre decided to send de Castelnau to discover the true situation and with full powers to act. De Castelnau swung back the right flank but ordered the line of the forts to be held at all costs and entrusted the defence to Pétain, for whose use a reserve army was assembled. Pétain's first problem was not so much defence as supply—the German heavy guns had closed all avenues into the salient except one light railway and the Bar-le-Duc road. While gangs of territorial troops worked night and day to keep this in repair and widen it, Pétain organized the front into sectors and threw in repeated counter-attacks, which, helped by the narrowness of the front, at least slowed down the advance. Falkenhayn sought, somewhat late, to widen the front, and on March 6 the Germans extended the attack to the west bank of the Meuse. But the defence was now stiffening, the numbers balanced, and the immediate thrust to Verdun was checked.

A slight lull followed, and during it the Allies of France made efforts to relieve the pressure on her. The British took over the Arras front from the French 10th Army, their front becoming now continuous from the Yser to the Somme, the Italians made their fifth attack, though in vain, on the Isonzo front, and the Russians hurled untrained masses on the German front at Lake Narocz, near Vilna, once more striking prematurely and gallantly sacrificing themselves to help their Allies. The slight gains were soon lost through a counter-stroke. These efforts did not prevent Falkenhayn pursuing his attrition offensive at Verdun. (*See* further VERDUN, BATTLES OF.) The advances were slight but they were cumulative in effect, and the balance of loss turned definitely against the defenders. On June 7 Fort Vaux fell, and the German tide crept ever closer to Verdun, seeming to the anxious watchers to resemble the forces of nature rather than of men. And in the Asiago (*q.v.*) region, Conrad had launched his offensive against Italy's Trentino flank.

Brusilov's Offensive.—Again Russia came to the rescue. In the spring of 1916 she had 130 divisions, but was woefully short

of equipment, facing 46 German and 40 Austrian divisions. The preparation and reorganization for her intended share in the year's Allied offensive were cut short by the emergency at Verdun and in relief of her French allies she had launched a costly and obstinately prolonged attack at Lake Narocz in March. When it was at last broken off, the preparations for the main offensive were resumed. This was to begin in July, coincidently with the Somme offensive and Brusilov, commanding the south-western front, was ordered to prepare such attacks as he could stage from his own resources as a distraction of the enemy's attention from the main offensive. But the distraction was released prematurely, on June 4, in response to Italy's appeal to Russia to prevent the Austrians reinforcing their Trentino attack. Without warning, because without any special concentration of troops, Brusilov's troops advanced against the Austrian 4th Army near Luck (*q.v.*) and the Austrian 7th Army in the Bukovina, whose resistance collapsed at the first shock. In three days Brusilov took 200,000 prisoners. This last vital effort of the Russian army in the war had important consequences. It stopped the Austrian attack on Italy, already impaired by an Italian riposte. It compelled Falkenhayn to withdraw troops from the Western front, and so abandon his plan for a counter-stroke against the British offensive preparing on the Somme, as well as the hope of nourishing his Verdun attrition process. It led Rumania to take her fateful decision to enter the war on the Entente side, and caused the supersession of Falkenhayn in the supreme command and his replacement by Hindenburg—with Ludendorff, officially styled First Quartermaster-General, as the directing brain.

Although Rumania's entry was the ostensible reason, the underlying one was the fact that Falkenhayn's "limited" strategy in 1915 had made possible the Russian recovery which stultified the strategy of 1916. Falkenhayn was history's latest example of the folly of half-measures, the ablest and most scientific general —"penny wise, pound foolish"—who ever ruined his country by a refusal to take calculated risks. In 1916 he had turned back westwards to pursue his long cherished goal, and his strategy had faithfully fulfilled the canons of military orthodoxy by taking for its objective the enemy's strongest army and the strongest point of that army's position. It certainly achieved the object of compelling the French to pour their reserves into the Verdun "blood-bath," but did not effect any decisive strategic result. Falkenhayn had rejected Conrad's proposal for a concentration against Italy such as had previously overthrown Serbia. Conrad's reasons had been that such a blow against the "hereditary enemy" would act as a tonic to the Austro-Hungarian forces and that the theatre of war lent itself to decisive results by a thrust southwards from the Trentino against the rear of the Italian armies engaged on the Isonzo. The success attained by the relatively light blow of 1917—Caporetto—lends historical support to his contention. But Falkenhayn was dubious both of the feasibility and value of the plan and was unwilling even to lend the nine German divisions which Conrad asked for to relieve Austrian divisions in Galicia. In default of this aid Conrad persisted in attempting his design single-handed, taking some of his best divisions from Galicia, and thereby exposing their front to Brusilov's advance without obtaining adequate force to achieve his Italian front plan. Falkenhayn's smouldering resentment at this disregard of his views was fanned into flame by the Galician disaster, and he intervened in Vienna to procure the deposition of Conrad. His own fall followed hard on Conrad's heels.

Brusilov's offensive continued for three months with fair success, but reserves were not at hand for immediate exploitation, and before they could be moved down from the north the Germans were patching up the holes. His later efforts were never so dangerous, but they absorbed all the available Russian reserves, and their ultimate loss of 1,000,000 casualties completed the virtual ruin of Russia's military power.

The Somme.—Great as was the influence of Brusilov's offensive on German strategy, its effect on the Verdun situation was less immediate, and on June 23 the Germans almost reached the Belleville height, the last outwork of Verdun. Pétain made all ready for an evacuation of the east bank of the Meuse, though to his troops he showed no sign of anxiety, and ever repeated the now immortal phrase, "On les aura!"

But on July 1, the long-planned offensive on the Somme (*q.v.*) began, and from that day on the Germans at Verdun received no new divisions, and their advance died away from pure inanition. Nevertheless, although the Germans at Verdun had fallen short of their object, moral and material, they had so drained the French army that it could play but a slender part in the Allied plan for 1916. The British had now to take up the main burden of the struggle, and the consequence was to limit both the scope and effect of the Entente strategy.

On July 1, after a week's prolonged bombardment, the British 4th Army (recently created and placed under Rawlinson) attacked with 15 divisions on a front of 15 m. north of the Somme, and the French with five divisions on a front of 8 m., mainly south of the river, where the German defence system was less highly developed. The unconcealed preparations and the long bombardment had given away any chance of surprise, and in face of the German resistance, weak in numbers but strong in organization, the attack failed along most of the British front. Owing to the dense and rigid wave formations that were adopted the losses were appallingly heavy. Only on the south of the British front, near Fricourt and Montauban, did the attack gain a real footing in the German defences. The French, with slighter opposition, and being less expected, made a deeper advance.

This setback negatived the original idea of a fairly rapid penetration to Bapaume and Cambrai, and Haig adopted the attrition method of limited advances aimed to wear down the German strength. Rejecting Joffre's desire that he should again throw his troops frontally on the Thiepval defences, the attack was resumed on the southern British flank alone, and on July 14 the capture of the Germans' second position offered the chance of exploitation, which was not taken. From now onward a methodical but costly advance continued, and although little ground was gained the German resistance was seriously strained when the early onset of winter rains suspended operations in November. The effect, however, can be exaggerated, for it did not prevent the Germans withdrawing troops for the attack on Rumania. But in one respect the Somme shed a significant light on the future, for on Sept. 15 the first tanks (*q.v.*) appeared. Their early employment before large numbers were ready was a mistake; losing the chance of a great strategic surprise, and owing also to tactical mishandling and minor technical defects they only had a limited success. Although the higher military authorities lost faith in them, and some urged their abandonment, more discerning eyes realized that here was a key which, when properly used, would unlock the trench barrier. The Somme offensive had a further indirect effect, for its relief to the Verdun pressure enabled the French to prepare counter-strokes, carried out by Mangin's corps on Oct. 24 and Dec. 15, which regained most of the lost ground with small casualties. These economic successes were due to a revival of surprise, to a more elastic use of the limited objective method, and to a high concentration of artillery, with a minimum of infantry, to occupy the defences crushed by the guns.

The Conquest of Rumania.—Rumania, sympathetic to the Entente cause, had been waiting a favourable opportunity to enter the war on their side, and Brusilov's success encouraged her to take the plunge. Her command hoped that this success, combined with the Allied pressure on the Somme and at Salonika, would draw off the German reserves. She might have fared better and contributed more if she had taken the decision earlier, when Serbia was still an active force and Russia a real one. The two years of preparation had doubled the numbers of the Rumanian army, but in reality reduced its relative efficiency, for while other armies had developed with experience, Rumania's isolation and the incapacity of her military leadership had prevented the transformation of her army from a militia of "bayonet men" into a modern force. Her 10 active divisions had only a low proportion of machine-guns, 5 of the 13 newly formed divisions had none at all, the artillery was inadequate and the air force negligible. She had only six weeks' supply of ammunition at the start and her allies failed to fulfil their guarantees of supply. Moreover, her

strategical situation was another source of weakness—her territory forming an "L" reversed with the bottom section, Wallachia, sandwiched between Transylvania and Bulgaria, while the length of the frontier was out of all proportion to the depth of the country, with a shortage of lateral railways and the capital within 30 m. of the Bulgarian frontier. Further, she had in the Dobruja, on the other side of the Danube, a "back-yard" strip which offered an easy way of access.

These handicaps were accentuated by the divergent counsels of the Allies. While the British General Staff favoured a southward advance against Bulgaria which might have crushed the latter between the Rumanians and the Salonika army, the Russians urged a westward advance which would, in theory, be in closer co-operation with their own Bukovina advance. The political and moral advantages of a move into Transylvania led the Rumanians to adopt the second course. This has been much criticized, but without sufficient appreciation of the fact that the advance into Transylvania placed the Austro-German command in an awkward predicament, which might easily have been disastrous if the invasion had not been so sluggish. At the outset she had 23 divisions against 7 opposing her, but within a week the enemy would be, and were, able to raise this figure to 15.

The Rumanian advance began, on Aug. 27, with three main columns each of about 4 divisions, moving north-west through the Carpathian passes, the general conception being to pivot on the left and wheel the right up into line facing west when the Hungarian plain was reached. To guard the Danube three divisions were left and three more in the Dobruja, whither the Russians had promised to send two—Rumania's original stipulation had been that a force of 150,000 Russians should be sent.

The slow and cautious advance of the Rumanian columns, hampered by the poverty and destruction of communications, but not by resistance, withheld danger from the five weak Austrian divisions which covered the frontier and enabled their reinforcement by five German and two Austrian divisions. In fulfilment of the other half of the plan, made by Falkenhayn before his fall, four Bulgarian divisions with Austro-German technical troops were to be placed under Mackensen for the invasion of the Dobruja.

While the Rumanian columns were creeping westward into Transylvania, Mackensen stormed the Turtucaia bridgehead on Sept. 5, destroying the three Rumanian divisions which covered the Danube front, and then, with his flank secure, pressed eastwards into the Dobruja. This automatically drew away reserves from, and thereby halted the Rumanian offensive in Transylvania, while Falkenhayn had arrived to take charge. Finding that the Rumanian columns, now at a standstill were dispersed over a 200-mile front, Falkenhayn concentrated against the southern column which had crossed the Rother Turm Pass, while using smaller forces to hold off the others. Having thrown this column back through the mountains by a convergent manoeuvre in which the Alpine Corps made a 50-mile march in three days, Falkenhayn then profited by the despatch of the Rumanian reserves against Mackensen to concentrate his forces against the Rumanian centre column at Brasov (Kronstadt). By Oct. 9 he had driven this back in turn but he missed his greater goal of encircling it, which would have opened for him a clear passage into Rumania. The mischance jeopardised the whole German plan and almost saved Rumania, for with all the passes still in their hands, her troops sturdily repulsed all efforts to press through on their heels. A prompt attempt by Falkenhayn to swing further south and force a way by the Vulcan and Szurduk passes was foiled and the beginning of the winter snows was on the point of blocking operations when a concentrated last-hour effort at the same point, Nov. 11–17, broke through. It was the signal for the next move in the German plan. Mackensen had switched his main forces westwards, and on Nov. 23 crossed the Danube close to Bucharest, on which both armies now converged. It fell on Dec. 6, and, despite belated Russian aid, the Rumanian forces were driven north into the upper section of the Rumanian "L." The brilliantly co-ordinated German strategy had crippled their new foe, gained possession of the bulk of Rumania, with its oil and wheat, and gave the Russians another 300 m. of front to hold. Sarrail, at Salonika, had not succeeded in detaining the Bulgarian reserves.

The Capture of Baghdad.—The only territorial success that the Entente could show for their year's campaign was away in Mesopotamia—the capture of Baghdad, and this moral token was seized on with an enthusiasm which, militarily, it hardly warranted. The bitter experience of the past had damped the ardour of the British Government, and Sir William Robertson, the new Chief of the Imperial General Staff, was opposed to any further commitments which drained the strength available for the Western front. But Maude, the new commander on the spot, by subtle, if unconscious, steps succeeded in changing this defensive policy into one of a fresh offensive. After thorough reorganization of the Mesopotamian force and its communications, he began on Dec. 12, 1916, a progressive right wheel and extension of his front on the west bank of the Tigris above and below Kut. These methodical trench-warfare operations had placed him ready for a spring across the Tigris at the Turks' line of retreat, which was thus parallel to his front. But despite his four-to-one superiority of force, the failure of his right to pin down the enemy and of his cavalry to cut off their retreat prevented a decisive success. But it led to permission for an advance on Baghdad, and he entered the Mesopotamian capital on March 11, 1917. A series of skilfully conducted operations then drove the Turks into divergent lines of retreat and secured the British hold on the province.

The Advance on Palestine.—Ever since the abortive Turkish attempt to invade Egypt early in 1915, the British had kept large forces there, even when the Dardanelles expedition was crying out for troops. When Gallipoli was evacuated, the release of the Turkish forces threatened a fresh move on Egypt. To anticipate this by gaining command of the Sinai desert, Sir Archibald Murray advanced in the spring of 1916, defeating the Turkish forces, freshly arrived, at Romani, Magdhaba and Rafa. The rate of advance was governed by the time taken in extending a railway and pipe-line (for water) across the desert. This new "Exodus" inspired the British Government to carry out an invasion of Palestine, at as cheap a cost in troops as possible. The towns of Gaza, on the coast, and Beersheba, 25 m. inland, guarded the approach to Palestine. Murray attacked Gaza on March 26, but the attempt fell short when on the brink of success. By nightfall Gaza was practically surrounded but the victorious position was given up bit by bit, not under enemy pressure but on the orders of the executive British commanders, through faulty information, misunderstandings and over-anxiety. Nor did the harm end there for Murray reported the action to the Government in terms of a victory, and without hint of the subsequent withdrawal, so that he was encouraged to attempt, without adequate reconnaissance or fire support, a further attack on April 17–19 which proved a costlier failure against defences now strengthened. (*See* further PALESTINE CAMPAIGNS.)

The Capture of Gorizia.—The Austrian offensive in the Trentino had interrupted Cadorna's plans for a renewed effort on the Isonzo, but when the former was halted, Cadorna switched his reserves back to the Isonzo. In preparation for this offensive the whole sector from Monte Sabotino to the sea was entrusted to the Duke of Aosta's 3rd Army, under which 16 divisions were concentrated, against six Austrian divisions. Following a preliminary feint near the sea on Aug. 4, the attack opened well two days later. North of Gorizia Capello's corps swept over the long impregnable Monte Sabotino, which guarded the approach to the river, and, crossing the river on the night of Aug. 8, occupied the town. This compelled an Austrian retreat on the Carso sector to the south, but attempts to exploit the success eastward failed against fresh positions of resistance. Three more efforts were made in the autumn and if they imposed a wearing strain on the Austrians they caused greater loss to the attackers. During the year Italians had suffered some 483,000 casualties and inflicted 260,000.

The War at Sea, 1915–16.—Germany's first submarine campaign—associated by Allied opinion with the name of Admiral von Tirpitz, the exponent of ruthlessness—had been a signal failure, both in its meagre results and the disproportionate ethical

damage it did to Germany's cause. A series of Notes exchanged between the American and German Governments, culminated in April 1916 in a virtual ultimatum from President Wilson, and Germany abandoned her unrestricted campaign.* The deprivation of this weapon spurred the German navy to its first, and last, attempt to carry out the initial plan on which it had begun the war. On May 30, 1916, the British Grand Fleet left its bases on one of its periodical sweeps through the North sea, but with reason to expect a possible encounter. On May 31, early in the morning, the German High Sea Fleet also put to sea, in the hope of destroying some isolated portion of the British fleet.

For such an encounter the British admiral, Jellicoe, had formulated an outline plan in the early months of the war. Its basis was the cardinal necessity of maintaining the unimpaired supremacy of the Grand Fleet, which he viewed as an instrument not merely of battle but of grand strategy, the pivot of the Allies' action in all spheres, economic, moral and military. Hence while desirous of bringing the German fleet to battle under his own conditions he was determined not to be lured into mine and submarine infested waters.

Early in the afternoon of May 31, Beatty, with his battle-cruisers and a squadron of battleships, after a sweep to the south was turning north to rejoin Jellicoe, when he sighted the German battle-cruisers, five in number. In the initial engagement two of Beatty's six battlecruisers were hit in vital parts and sunk; when thus weakened he came upon the main German fleet under Admiral Scheer. He turned north to lure them into reach of Jellicoe, 50 m. distant, who raced to support him. To describe the intricate and much debated manoeuvres which followed is neither possible nor would it be just within the limits of this article, a strategical and not a tactical survey. Mist and failing light put an end to an indecisive action, which, however, left the British fleet between the German and its bases. During the night Scheer broke through the destroyer guard, and, although sighted, was not reported. Then he slipped safely through a net which Jellicoe dared not draw too close in view of his guiding principle and the danger of torpedo attack.

But if the battle of Jutland (*q.v.*) could be counted a tactical advantage to the Germans, it had no effect on their strategic position. Britain's command of the sea was intact, and the grip on the blockade on Germany unrelaxed. Once more she fell back on submarine warfare, and the first development was an extension of range. In July one of her new large submarine-cruisers appeared off the American coast and sank several neutral ships. In British and Mediterranean waters the pressure began seriously to affect the sea-borne trade and food supplies of the Entente. Various remedies were tried—the most effective being a system of sailing in convoys—but the only truly adequate measure, that of penning the Germans in their bases by close-in minefields, was debarred by Britain's failure to obtain a decisive battle success. But if Britain was feeling the strain of economic pressure, so also was Germany, and her leaders feared that the race between decisive success on land and economic collapse would end against her. The naval authorities declared that a renewal of the "unlimited" submarine campaign, which with her increased numbers could now be far more intense, would bring the Entente to their knees. Accepting this opinion, Ludendorff consented to a step which he had hitherto opposed, and on Feb. 1, 1917, it was inaugurated—with the full realization that it involved the weight of America being thrown into the scales against them.

VIII. THE PENULTIMATE YEAR

Despite incessant provocation for two years, since the "Lusitania" incident, President Wilson had held to his neutral policy, and if his excess of patience angered many of his own people it at least was the means of consolidating American opinion and reconciling it as a whole to intervention in the war. Meantime he strove by speech and by the agency of Col. House—his unofficial ambassador—to find a basis of peace on which the belligerents could agree. This effort was doomed to failure by its misunderstanding of the psychology of the warring peoples and of the fundamental objects for which they were fighting. He was still thinking in terms of traditional warfare, between governmental policies, while the conflict had long since passed into the wider sphere of the struggle of peoples dominated by the primitive instinct of self-preservation.

The declaration of the unlimited submarine campaign brought convincing proof of the futility of these peace hopes and of the reality of the German intentions, and when followed by the deliberate sinking of American ships and an attempt to instigate Mexico to action against the United States, President Wilson hesitated no longer, and on April 6, 1917, America entered the war against Germany.

Her potential force in man-power and material was illimitable but, even more unready than Britain in 1914, it must be long in exerting more than a moral influence, and Germany confidently anticipated that the submarine campaign would take decisive effect within a few months. How near her calculation came to fulfilment the record of 1917 and 1918 bears witness.

The Western Front Campaign of 1917.—The year 1916 closed in gloom for the Entente The simultaneous offensive on all fronts, planned a year before, had misfired, the French army was at a low ebb, the Russian still lower, the Somme had failed to produce visible results in any way proportional to its cost, and another fresh ally had been overrun. At sea the negativeness of Jutland was a disappointment, and although Germany's first submarine campaign had been abandoned a stronger one was threatened. To offset these debits, the Entente could only show the capture of distant Baghdad and the limited Italian success at Gorizia in August, whose value, however, was mainly as a moral tonic to Italy herself.

Among the Allied peoples and their political representatives there was a growing sense of depression. On the one hand it took the form of dissatisfaction with the conduct of the war and, on the other, of discouragement over the prospects of a victorious conclusion to the war, and a tendency to discuss the possibilities of a peace by negotiation. The first-named tendency was the first to come to a head and was signalized in London, the political mainspring of the Allies, by the replacement of Asquith's Government on Dec. 11 by one with Lloyd George as its chief. The order of precedence in events had a significant effect. For Lloyd George had come into power as the spokesman of a widespread demand for a more vigorous and more efficient prosecution of the war.

The second tendency received an impulse from the German peace move of Dec. 12, after the fall of Bucharest, which proposed an opening of peace discussions. This suggestion was rejected as insincere by the Allied Governments, but it afforded the opportunity of President Wilson, on whose behalf Col. House had long been sounding the belligerent Governments as to the prospects of mediation, to invite these to define their war aims as a preliminary to practical negotiation. The German reply was evasive, the Allied replies were considered by their opponents inacceptable as a basis of discussion, and the tentative peace moves subsided.

But while this wave of depression was surging on the "home-front," the Allied commanders continued optimistic. In November Joffre assembled, at Chantilly, a further conference of the commanders at which it was agreed that the Germans were in great difficulties on the Western front, and that the situation of the Allies was more favourable than it had ever been.

The fighting strength of the British army had grown to about 1,200,000 men, and was still growing. The fighting strength of the French army had been increased by the incorporation of native troops to some 2,600,000, so that, including the Belgians, it was estimated that the Allies disposed of about 3,900,000 men against about 2,500,000 Germans.

Joffre declared that the French army could maintain its strength for one more great battle, but that thereafter it must progressively decline, as France had no longer a sufficient number of men of military age to replace losses. He therefore warned Haig that during the coming year the burden must fall more and more upon the British army. It was also agreed that in view of these factors the relative superiority of the Allies on the Western front would be greater in the spring of 1917 than at any time which could be

foreseen with certainty. In consequence it was decided to take the earliest opportunity of pressing the advantage gained on the Somme, and to continue the process of exhausting the enemy's reserves as preparation for an effort which should be decisive. An alternative proposal was made by Gen. Cadorna that the French and British should co-operate in a combined thrust from the Italian front against Austria with the object of knocking this "weaker partner" out of the war. But it was rejected by the French and British commanders, despite Lloyd George's espousal of it at the Allied conference held in Rome in January. Their objection was that it involved a fresh diversion of strength away from the main front, where alone, they held, success could have decisive results.

The Entente plan for 1917 was soon to be complicated by changes in the command. French opinion had tired of the meagre results of Joffre's attrition strategy, and the method of the limited objective had fallen into disfavour because of the unlimited losses on the wrong side, which accompanied it without apparent gain. They contrasted the dull course of his strategy with the brilliant results gained by Mangin at Verdun, in the autumn, under Nivelle's direction, and as a result Joffre gave place to Nivelle, who promised a real break-through. His confidence so inspired Lloyd George, the new British prime minister, that Haig was subordinated to him for the forthcoming operations—an arrangement which violated the axiom that a general cannot direct one force while exercising executive command of another. For carrying out a plan essentially audacious, Nivelle had two further handicaps; he failed to convert several of his subordinates to the idea, and he was given less rein by the Government than his predecessor. Again, while Joffre had intimated that the British must take the chief part, Nivelle changed this policy, and in his desire to conserve the glory for France overlooked how severely the French fighting power had been strained. Joffre's plan had been for a convergent attack on the great German salient Lens-Noyon-Reims, first against its west flank and then against its south—the British to attack north of the Somme, including but extending beyond the old battle ground, and the French south of it to the Oise. The attacks were to begin early in February and to be followed by a French main attack in Champagne. Nivelle's change was to ask the British to take over more of the front—south of the Somme—in order to release French troops for the Champagne blow, and as a result the start was postponed a month.

Before it could begin the Germans had dislocated it. Ludendorff's first step had been to set on foot a complete programme for the reorganization and expansion of German man-power, munitions and supplies. While this was developing, he intended to stand on the defensive, hoping that the new submarine campaign would either decide the issue or pave the way for a decisive blow on land when his new reserves of men and material were ready. Anticipating the renewal of the Entente advance on the Somme, he had a new line of defence, of great artificial strength, built across the chord of the arc Lens-Noyon-Reims. Then after devastating the whole area inside the arc, he began a methodical retirement, by stages, to the new line called by the Germans the "Siegfried" and by the Allies the "Hindenburg" line. A consummate manoeuvre, if brutal in application, it showed that Ludendorff had the moral courage to give up territory if circumstances advised it. The British, confronted with a desert, were inevitably slow in pursuit, and their preparations for an attack on this front were thrown out of gear, limiting them to the sector around Arras (*q.v.*), where the front was unchanged.

On April 9 Allenby's 3rd Army opened the spring offensive at this point, taking the long-sought Vimy ridge, but failed to develop its initial success, and continued the attack too long after the resistance had hardened. This costly action was partly prolonged in order to take the pressure off the French. For the French blow between the Somme and the Oise had been stultified by the German retirement, and the main attack on April 16 east and west of Reims (*see* CHAMPAGNE, BATTLES IN) was a worse fiasco with a dangerous sequel. With a prolonged bombardment giving away any chance of surprise, and without first drawing away the German reserves, the idea of a rapid break-through was doomed to fail. The high hopes that had been raised caused the greater reaction, and the troops were weary of being thrown against barbed wire and machine-guns to no apparent effect. Accentuated by service grievances, mutinies broke out in the French armies, and no less than 16 corps were affected. In these circumstances Nivelle was replaced by Pétain, whose first concern was to restore the shaken morale of the French troops, and for the rest of the year the British bore the brunt of the campaign. Their strength in France was now at its highest—64 divisions, supplied with an abundance of artillery and ammunition. The strain, however, was increased by the failure of Russia to make any effective contribution to the pressure on Germany, owing to the revolution which broke out in March. Haig decided to keep the Germans occupied by carrying out the original plan for an offensive in Belgium, and if the principle was right the method and choice of site were open to criticism.

The initial move was an attack on the Messines (*q.v.*) ridge in order to straighten out the Ypres salient and attract the enemy's reserves. Carried out by the 2nd Army under Plumer, with Harington as chief of staff, it proved a model example of the "limited" attack with success economically gained by able staff work and co-operation between the arms.

It was followed on July 31 by the main attack at Ypres (*see* YPRES, BATTLES OF, 1917) which, hampered by the heavy rain, was foredoomed by its own destruction of the intricate drainage system of the area. The British command had persevered for two and a half years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success, and that, unlike all the great captains of history, they could disregard the element of surprise. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in early November, threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable. The discomfiture was increased by the new German method of defence, which Ludendorff introduced, of thinning the front defences and using the men so saved for prompt local counter-attacks. The defence was built up of a framework of machine-guns distributed in concrete "pill-boxes" and disposed in great depth. On the British side the profitless toll of this struggle in the mud was to some extent mitigated by better staff work when the direction of the attack was handed over to Plumer's 2nd Army.

Three months of dreadful struggle came to an end with the British not appreciably nearer their immediate object of driving the Germans from their submarine bases in the Belgian ports, and if they had worn down the German strength they had worn down their own still more.

The Renaissance of Surprise at Cambrai.—The 1917 campaign in the West closed, however, on a note brighter in promise if not in accomplishment. Appreciating from the first days the futility of using tanks in these Flanders swamps, the Tank Corps headquarters looked around for an area where they could try out a new and different method. The chief general staff officer, Col. Fuller, drew up a project for a large scale raid to scour a canal-enclosed "pocket" near Cambrai (*q.v.*), where the rolling downland lent itself to tank movement. The basic idea was the release of a swarm of tanks without any preparatory bombardment to give warning of the attack. When their hopes at Ypres waned, the British command adopted the scheme, retaining the basic idea, but transforming the operation into a definite offensive with far-reaching aims, for which they had not the resources because of the drain of Ypres. The operation was to be carried out by Byng's 3rd Army with six divisions, and the date was fixed for Nov. 20. Led by nearly 400 tanks, the attack came as a complete surprise, and despite minor checks achieved a penetration far deeper and at less cost than any past British offensive. But all the available troops and tanks were thrown into the first blow, and the higher command failed to give Byng the few reserves they still possessed in time to exploit the success. The cavalry, as always throughout the operations on the Western front, proved

totally unable to carry out this important rôle.

Thus the advance died away, and on Nov. 30 the German army commander, Marwitz, launched a counter-stroke against the flanks of the salient created by the British advance. In the north it was parried, but in the south broke through, and a disaster was only averted by the superb counter-attack, first of the Guards Division and later of a tank brigade. But if Cambrai was a disappointment it revealed that surprise and the tank were the combination by which the trench barrier could be unlocked. Meanwhile Pétain, after overhauling his instrument, the French army, sought to test its readiness for 1918. In August a stroke by Guillaumat's army recovered all the remainder of the ground lost in 1916, and in October Maistre's army flattened the south-west corner of the German front, seizing the Chemin des Dames ridge.

The Collapse of Russia.—The temporary breakdown of the French fighting power was not the worst of the troubles which together crippled the Entente offensive in 1917. The collapse, first partial and then complete, of Russia was a loss which even the entry of America into the war could not possibly compensate for many months, and before the balance was restored the Western Allies were to be perilously near the brink of defeat. Russia's enormous losses, due to her own defective machine but incurred in sacrifice for her Allies, had undermined the morale even more than the material endurance of her forces. Revolution broke out in March, superficially against the corrupt *entourage* of the tsar, but with more deep-seated moral causes beneath. The tsar was forced to abdicate and a moderate Provisional Government climbed into the saddle, but without reins. This was only a makeshift, and in May another succeeded it, more Socialist in tendency and outwardly led by Kerensky. While clamouring for a general peace and undermining discipline by a system of committee control suitable to a trade union but not to the field of battle, Kerensky imagined he could send troops against the enemy by platform appeals.

Brusilov succeeded Alexeiev in the supreme command, and on July 1 the army gained some initial success against the Austrians, especially in the region of Stanislau, only to stop as soon as real resistance was met, and to crumble directly the Germans counter-attacked. By early August the Russians had been driven out of Galicia and the Bukovina, and it was only policy which halted the Austro-German forces on the frontiers of Russia itself. In September the Germans took the opportunity to practise their new method of attack intended for use in France, and this surprise attack, under Hutier's command, resulted in the capture of Riga. Next month the Bolsheviks under Lenin overthrew the wordy Kerensky, imposed their self-constituted rule on the Russian people and sought an armistice with Germany, which was concluded in December.

Italy's Caporetto Disaster.—The defection of Russia did not end the Entente tale of woe. Each autumn, with demoralizing regularity, Germany had seized an opportunity to eat up one of the weaker Allies. In 1915 it had been Serbia's fate, in 1916 Rumania's, and now it was Italy's turn, or so the Germans intended. Ludendorff's decision, taken in September, was determined by the appeals of the Austrian authorities, who felt that their troops could not endure the strain of another defensive battle on the Italian frontier. In May, Cadorna had attacked once more on the Isonzo front, but an Austrian counter-attack in the Carso sector had retaken part of the small gains. Losses, however, were more nearly balanced than formerly. The question of Allied co-operation on the Italian front was raised afresh without result, but Cadorna, nevertheless, initiated in August an "eleventh battle of the Isonzo." Capello's 2nd Army captured a large part of the Bainsizza plateau, north of Gorizia, but a long sustained effort brought no further success and Cadorna was forced to break off the offensive after four weeks' struggle. But it had so strained the Austrian resistance that, in Ludendorff's words, "it became necessary to decide for the attack on Italy in order to prevent the collapse of Austria-Hungary."

Ludendorff had a difficult problem to solve. Russia had not yet capitulated, the front there was already weakly held for its extent, and the British offensive in Flanders made impossible a large withdrawal of troops from France. All he could spare was his slender general reserve of six divisions, which had already been his instrument in countering the Kerensky offensive and in the Riga coup. His adviser in the strategic design of operations, Lt.-Col. Wetzell, was, however, of opinion that the application of even this small force at a "soft spot" such as was offered by the Tolmino-Caporetto sector, north of the Bainsizza plateau, would suffice to cripple the Italian menace. The result proved him right—the trouble was that it unduly exceeded the most sanguine expectations. On Aug. 29 Waldstätten, of the Austrian general staff, had brought to Ludendorff a scheme for a break-through at Tolmino, followed merely by rolling up the Isonzo front. But this plan was expanded into a more ambitious one without an increase of means. The Germans at Caporetto, like the British subsequently at Cambrai, were to provide an example of the profound strategic error of not "cutting your coat according to your cloth."

On hearing the Austrian proposals Ludendorff sent Gen. Krafft von Dellmensingen, an expert in mountain warfare and commander of the Alpine Corps in the Rumanian campaign, to reconnoitre the ground, and on receiving his report, approved the scheme. The six German divisions with nine Austrian formed the 14th German Army under Otto von Below, with Krafft as chief of staff and guiding brain. These troops were to penetrate the mountain barrier at the north-east corner of the Venetian salient, while Boroevic's two Austrian armies were to advance along the stretch of lower ground near the Adriatic shore. The organization and deployment of the attack in such mountainous country were difficult, but were ably overcome. Guns were brought up mostly by hand and at night; the infantry came up by night marches with all their ammunition and supplies on pack animals. Thanks to skilful precautions and the Italians' limited air reconnaissance, the concentration was undiscovered. On Oct. 24, after four hours' gas shell bombardment and one hour general, the blow was launched and pushed deep down the western slopes of the mountains, imperilling the Italian forces to both south and north. On Oct. 28 Below's van reached Udine, the former Italian general headquarters, and on Oct. 31 the Tagliamento.

Not the least significant feature of this offensive was the way it was prepared by a moral bombardment. Propaganda has been exploited for months as a means of sapping the Italian discipline and will to resist. But its effect can be exaggerated—the most formidable propaganda, as with the French in April, was that supplied by the attrition strategy of the Italian command, which had sickened the troops by its limited results at unlimited cost. Cadorna, too, offset undoubted ability by his lack of touch with and understanding of the fighting troops. Troops already too highly tried were kept too long without relief. Despite warnings of a hostile offensive, he had paid too little heed to Capello's complaints about the defensive suitability of the positions on which the Italian offensive had stopped, and had overruled his desire to forestall the enemy by a flank thrust northwards from the Bainsizza plateau.

But the result also surprised Ludendorff, who, with his slender forces, had not calculated on such distant objectives as were now possible of attainment. Boroevic was slow in following up the Italian right, and Ludendorff tried to switch part of his force to Conrad's army which flanked the north of the Venetian salient, but was foiled by the inadequacy of the rail communications. Even so, Cadorna, with his centre broken through, only saved his wings by a precipitate retreat to the line of the Piave, covering Venice, and on Nov. 9 the whole Italian army was behind this river, except for 250,000 prisoners in the enemy's hands, and nearly twice as many other casualties—killed, missing or sick. The same day Cadorna was superseded in supreme command by Diaz. Italy's allies had begun to rush reinforcements, a British and a French army corps, to her aid, and on Nov. 5 their political and military chiefs arrived at Rapallo for a conference, out of which sprang the Allied Council at Versailles, and ultimately a unified command.

The invaders had outrun their transport, and the resistance of

the Italians, morally braced by the emergency, succeeded in holding the Piave (*q.v.*) in face of direct assaults and strenuous efforts by Conrad to turn their left flank from the Trentino. Here Cadorna's preparations for defence had been long initiated and were well matured. At the beginning of December the British and French, who had been waiting in reserve in case of a fresh breakthrough, moved forward to take over vulnerable sectors, but the attack was only renewed in the north, and on Dec. 19 it came to an end with the snows. If Caporetto seriously damaged Italy, it also purged her, and after an interval of recuperation she was to vindicate herself at Vittorio Veneto.

The Capture of Jerusalem.—Once more a distant theatre of war provided the sole triumph of the Entente cause during the year—this time in Palestine (*q.v.*). The second reverse at Gaza, in April 1917, had led to a change in command, Murray being succeeded by Allenby, who was strong enough and fortunate enough to obtain the adequate force for which Murray had asked in vain. The British Government was anxious for a spectacular success to offset the moral depression of the Nivelle failure and the decline of Russia, and the British general staff desired to dislocate the Turkish attempt to recapture Baghdad by drawing away their reserves.

Allenby took over in July and devoted the first three months to intensive preparations for an autumn offensive, when the season would be suitable. The command was reorganized, the communications developed, and his own headquarters moved forward from Cairo to the front. By complete secrecy and ruses he deceived the Turks as to the main point of attack. The defences of Gaza were bombarded from Oct. 20 onwards, and an attack followed on Nov. 1 to pin the enemy and draw in his reserves. Meanwhile, as a necessary preliminary to the real blow, the inland bastion of Beersheba was seized by a convergent manoeuvre on Oct. 31, a prelude to the decisive attack on Nov. 6, which broke through the enemy's weakened centre and into the plain of Philistia.

Falkenhayn, now in command at Aleppo, had also been planning an offensive, but the better communications of the British had decided the race, and although Falkenhayn tried to stem the tide by a counter-stroke against Beersheba, the breaking of his centre compelled a general retreat. The pursuit was hampered owing to lack of water, but, even so, by Nov. 14 the Turkish forces were driven apart in two divergent groups, the port of Jaffa was taken, and Allenby wheeled his main force to the right for an advance inland on Jerusalem. He gained the narrow hill passes before the Turks could block them, and after a necessary pause to improve his communications, brought up reserves for a fresh advance, which secured Jerusalem on Dec. 9. By the time the winter rains set in the British had expanded and consolidated their hold on the region. As a moral success the feat was valuable, yet viewed strategically, it seemed a long way round to the goal. If Turkey be pictured as a bent old man, the British, after missing their blow at his head—Constantinople—and omitting to strike at his heart—Alexandretta—had now resigned themselves to swallowing him from the feet upwards, like a python dragging its endless length across the desert.

The Conquest of East Africa.—The year 1917 witnessed another overseas success, the clearing of German East Africa, although not the close of the campaign. More than a year elapsed after the rebuff at Tanga before a serious attempt was made to subdue the last German stronghold on the African continent. To spare troops from the main theatres was difficult, and the solution was only made possible by the loyal co-operation of the South African Government. In Feb. 1916 Gen. Smuts was appointed to command the expedition, and formed the plan of a drive from north to south through the difficult interior, in order to avoid the fever-rampant plain on the coast. In conjunction with this central wedge, a Belgian force under Tombeur was to advance eastwards from Lake Tanganyika, and a small British force under Northey was to strike in from Nyasaland in the south-west. The Germans under Lettow-Vorbeck were weak in numbers but handled with masterly skill, and with all the advantages of an equatorial climate, a vast and trackless region—mountainous in parts and covered with dense bush and forest—to assist them in impeding the invader. From Dar-es Salaam on the coast to Ujiji on Lake Tanganyika ran the one real line of rail communication, across the centre of the colony. After driving the Germans back across the frontier and seizing the Kilimanjaro gap, Smuts moved direct on this railway at Morogoro, over 300 m. distant, while he dispatched a force under Van Deventer in a wide sweep to the west to cut the railway further inland and then converge on Morogoro. Lettow-Vorbeck delayed this manoeuvre by a concentration against Van Deventer, but Smuts's direct advance compelled him to hurry his force back, and thus enabled Van Deventer to get astride the railway.

However, Letto-Vorbeck evaded the attempt to cut him off and fell back in September on the Uluguru mountains to the south. The Belgians and Northey had cleared the west, and the net had been drawn steadily closer, confining Lettow-Vorbeck to the south-east quarter of the colony. Early in 1917 Smuts returned to England, and Van Deventer conducted the final operations which ended with Lettow-Vorbeck, avoiding envelopment to the end, slipping across the frontier into Portuguese Africa. Here he maintained a guerrilla campaign throughout 1918 until the general Armistice. With an original force of only 5,000, 5% being Europeans, he had caused the employment of 130,000 enemy troops and the expenditure of £72,000,000.

The Mastering of the Submarine.—The military side of 1917 is thrown into shadow by the naval, or more strictly the economic, side. The vital issue turned on the balance between Germany's submarine pressure and Britain's resistance. April was perhaps the most critical month. The Allies lost nearly a million tons of shipping, 60% British, and although the German navy's promise of victory by the end of the month was proved a miscalculation, it was clear that, ultimately, the continuance of such a ratio of loss must starve the civilian population and automatically prevent the maintenance of the armies. Britain, indeed, had only food enough to sustain her people for another six weeks. The British Government sought to counter the menace by the indirect means of rationing, increasing home production and the expansion of shipbuilding; by the direct means of the system of convoys with naval escorts, and a counter-offensive against the submarine. Aided by new devices to detect the presence of submarines and the use of thousands of patrol craft, this highly organized campaign exacted an ever-rising toll, and by the end of 1917 the menace, if not broken, was at least subdued. In this task America's aid became a potent factor long before her military assistance. It embraced her provision of light craft to reinforce the British anti-submarine fleet, her rapidly developed construction of new mercantile ships, and still more her financial aid. By July 1917 Britain had spent over £5,000,000,000, her daily expenditure had risen to £7,000,000, and the burden of financing her Allies as well as her own efforts was straining even her resources, when America's aid came to ease the pressure.

These were the defensive benefits; the offensive were at least as great. No longer was the grip of the naval blockade hampered by neutral quibbles, but instead, America's co-operation converted it into a strangle-hold under which the enemy must soon grow limp, since military power is based on economic endurance. As a party to the war, the United States, indeed, wielded the economic weapon with a determination, regardless of the remaining neutrals, far exceeding Britain's boldest claims in the past years of controversy over neutral rights. The submarine menace, crippled in 1917, was ended to all intents during the early months of 1918. To this conclusion the greatest single contribution was the laying of a mine-barrage by the American navy across the 250 m. wide passage between Norway and Scotland. This was a direct counter to the main submarine operations against the ocean-brought supplies of Great Britain. For the small submarines which carried out the shorter range operations the ports on the Belgian coast had afforded a base unpleasantly close to English shores, but these also were now closed by the daring attacks of Sir Roger Keyes's force on Zeebrugge and Ostend. Yet the removal of the menace should not lead to an

underestimate of its powers for the future. The 1917 campaign was launched with only 148 submarines and from the most unfavourable strategic position. Great Britain lay like a huge breakwater across the sea approaches to northern Europe and the submarines had to get outside through narrow and closely-watched outlets before they could operate against the arteries of supply. And despite these handicaps they almost stopped the beat of England's heart.

The Air Offensive.—Another new form of action reached its crest at the same time as the submarine campaign. As the submarine was primarily an economic weapon, so was the aeroplane primarily a psychological weapon. The explosive bullet had virtually ended the Zeppelin raids in 1916, but from early in 1917 aeroplane raids on London grew in intensity until, by May 1918, the air defences were so thoroughly organized that the raiders thereafter abandoned London, as a target, for Paris. If the stoicism of the civil population took much of the sting from a weapon then in its infancy, the indirect effect was serious, interrupting business and checking output in industrial centres, as well as drawing off, for defence, many aircraft from the front. In reply the British formed an Independent Air Force, which carried out extensive raids into Germany during the closing months of the war, with marked effect on the declining morale of the "home front." To relate the action of aircraft in the military sphere is not possible, for it formed a thread running through and vitally influencing the whole course of operations, rather than a separate strategic feature.

The beginning of 1918 witnessed the development and thorough organization of another psychological weapon, when Lord Northcliffe was appointed director of propaganda in enemy countries, and for the first time the full scope of such a weapon was understood and exploited.

IX. GERMANY'S BID FOR VICTORY

On the Threshold of 1918.—The middle years of the World War had been, in a military sense, a tussle between a lean Hercules and a bulky Cerberus. The Germanic alliance was weaker in numbers but directed by a single head, the Entente stronger in numbers but with too many heads. Owing to their own excessive losses, diffusion of effort and the collapse of Russia, the Entente, at the end of 1917, were faced with the grim fact that the numerical balance had been reversed, and months must elapse before the prospective stream of America's new divisions came to tilt the scales once more in their favour. The emergency paved the way for the creation of a unified command, but it still needed disaster to bring it into being.

At the conference at Rapallo in November, the formation of a Supreme War Council was decided upon, to be composed of the principal ministers of the Allies, with military representatives, and to sit permanently at Versailles. If the fundamental defect was that it merely substituted a formal for an informal committee, a further flaw was that the military representatives had no executive status. In the economic sphere, where deliberation rather than instant action was necessary, it led to a real improvement in the combination of shipping, food and munition resources. Militarily, it was futile, for it set up a dual advisorship—the Versailles representatives on the one hand and the chiefs of the national general staffs on the other. As the menace of the German attack grew closer and with it the need for common action, this advisory body was converted into a military executive committee to handle an inter-Allied general reserve, a fresh compromise which set up a dual control—the commanders-in-chief and the Versailles committee.

If concentration of control was lacking, so also was concentration of force. Since early in November the stream of German troop-trains from East to West had been steadily swelling. When the 1917 campaign opened there had been a proportion of nearly three Allies to two Germans—actually, in March 178 British, French and Belgian divisions against 129 German divisions. But now the Germans had a slight balance and the likelihood of bringing still more. But the Allied statesmen, recalling how often their own offensive had failed with equal or greater superiority of force, were slow to appreciate the gravity of the menace or to respond to the sudden fall in the temperature of military opinion. Nor could they agree to draw reinforcements from the other fronts. The Italians strove against any withdrawal of the Allied contingents from their front, and the French opposed any reduction of the Salonika force. Lloyd George went further and urged an offensive in Palestine, a scheme which was sanctioned on the understanding that no reinforcements went there from France, but which also meant that none came from there to France. Robertson, the chief of the imperial general staff, disagreed both with this Palestine plan and the creation of the Versailles executive committee, and resigned, being succeeded by Sir Henry Wilson. The position was still further weakened by the insistence of Clemenceau, the new French premier, that the British should extend their front south to the Oise. This meant that Gough's 5th Army was dangerously stretched out and took over ill-prepared defences on the very front that Ludendorff was about to strike. Meantime, the German strength had increased to 177 divisions by the end of January, with 30 more to come. The Allied strength, owing to the despatch of divisions to Italy and the breaking up of others owing to the French shortage of drafts, had fallen to the equivalent of 173—counting as double the four and one-half large size American divisions which had arrived. For the French and British had been constrained to follow the Germans in reducing their divisions from 12 to 9 battalions each.

The prolonged pouring of soldiers' lives into the swamps beyond Ypres had led Lloyd George and his cabinet to withhold reinforcements for fear of encouraging fresh squandering. This undoubtedly weakened Haig's initial power of resistance to the German onslaught, yet it is just to point out that it was weakened worse—in quality as well as quantity—by the 400,000 British casualties suffered in the offensive of the later part of 1917. Moreover, we should not forget that the Government had the heavy responsibility of being the trustees for the lives of the nation. The real ground of criticism is that it was not strong enough to make a change in, or place a check upon, a command which it did not trust, while supplying the reinforcements necessary for defence. And for this lack of moral strength the public must share the blame, for they had already shown themselves too easily swayed by clamour against political interference with the generals, and too prone to believe that the politician is invariably wrong on such occasions. The civilian public, indeed, is apt to trust soldiers too little in peace, and sometimes too much in war.

These political handicaps, and their accompanying tendency to work deviously towards what dared not be demanded openly, were also seen in the project for a unified command. The prime minister, indeed, had gone so far in December as to disclaim faith in his own long-sought cure. Instead he sought a palliative in an inter-Allied executive committee, under Foch's chairmanship, which should control a common general reserve of 30 divisions. This scheme was stillborn in face of the opposition of the respective commanders-in-chief, Haig and Pétain. The decisive act came from Haig, who, when called on by Foch for his contribution of seven divisions, replied that he could spare none. He and Pétain united in preferring an arrangement between themselves for mutual support.

When the test came, a week later, this broke down, and Haig then took a foremost part in hastening and facilitating the appointment of a generalissimo, which he had formerly opposed. For the actual breakdown the blame has been commonly thrown upon the French, and there is no question that Haig understood from Pétain on March 24 that if the Germans continued their rapid progress the French reserves would have to be used to cover Paris. But in fairness it is essential to add that, whereas the original compact had only pledged the aid of some six French divisions, Pétain actually sent nine by March 24, and 21 (including four of cavalry) by March 26. If these reinforcements were, perhaps, slower in coming into action than in despatch, it does not affect the fact that the original pledge was amply exceeded. Thus, the fundamental fault would seem to lie

in trusting to an arrangement for such slender support by either Ally.

The German Plan.—On the German side the submarine panacea for victory had been replaced by a military panacea, and hopes were perhaps exaggerated by the unexpected collapse of Russia. But although Ludendorff promised victory in the field, he did not disguise that a Western offensive would be a far harder task than the conquests in the East. He realized also that it would be a race between the effect of Germany's blow and the arrival of American reinforcements, although he hoped to win the race. To secure the rear of his offensive, a definite peace was won from the Bolshevik Government of Russia by a military demonstration, and also forced on Rumania. And to secure if possible the economic base of his offensive the Ukraine was occupied, for its wheat supplies, with little resistance except from Czechoslovak troops, who had formerly been taken prisoners from the Austrian army.

Ludendorff's next problem was to decide his first point of attack. The sector between Arras and St. Quentin was chosen, on the western face of the great salient formed by the German front in France. The choice was governed by tactical reasons—this sector was the enemy's weakest point and the ground offered fewer difficulties than elsewhere—although Ludendorff had in mind the possibility of separating the Allied armies and driving the British back against the Channel coast, too closely penned in to evade the blows. From the experience of the vain Allied attacks Ludendorff had drawn the deduction that "Tactics had to be considered before purely strategical objects which it is futile to pursue unless tactical success is possible." Hence he formulated a strategical plan based on the principle of taking the tactical line of least resistance. Presumably he hoped by firm control to guide these tactical movements to a strategic destination. If so, he failed.

Where did the fault lie? The general view at the end of the war was that the tactical bias had led Ludendorff to change direction and dissipate his strength. That if the Franco-British command had previously erred by aiming at the strategically correct target without enough attention to the tactical difficulties, the German command had followed it with an equal if opposite error by concentrating on tactical success at the expense of the strategical goal. But a closer examination of the German documents since available, and of Ludendorff's own orders and instructions, throws a different light on the question. It would seem, indeed, that the real fault was that Ludendorff failed to carry out in practice the new principle he had adopted in theory; that he either did not grasp or shrank from the full implication of this new theory of strategy. He dissipated too large a part of his reserves in trying to redeem tactical failures and hesitated too long over the decision to exploit his tactical successes. Ludendorff's strategy in the East had been so masterly and so far-sighted that his indecision and short-sight in the West is difficult to explain. Perhaps he himself was feeling the strain of directing so many vast operations; perhaps it was that he missed the strategical insight and balanced view of Hoffmann who, after being at his side throughout the 1914–16 campaigns, had stayed in the East when Ludendorff went to the supreme command. The modern vice of seniority prevented Germany from making the fullest use of the man who perhaps approached nearer to military genius than any other military figure of the war.

In any case the campaign leaves the impression that Ludendorff had neither his former clearness as to the goal, nor quite the same grip on the changing situations. But in the organization of his attacks his powers were at their highest level. Surprise was to be the key by which a gate in the long-locked front was opened. In forging the key gas-shell was to be the main constituent, for Ludendorff had failed to grasp the significance of the tank and neglected to develop it in time. Only in Aug. 1918, when it was used to strike him a mortal blow did he put it in the "urgent" class of war material. The troops were trained in the new infiltration tactics already tested at Riga, and the most thorough arrangements were made for concealing and for exploiting the attacks. The assaulting divisions were to be brought up over night, the masses of artillery brought close to the front line in concealment, and their ranges obtained by methods which did away with preliminary "registration." The bombardment was to be brief but intense, and its surprise effect to be increased by lavish use of gas and smoke shell. Further, while Ludendorff had settled to strike first on the Somme sector, to which blow the code-name "Michael" was given, he also made preparations for successive attacks at other points, which besides being in readiness for the future helped to mystify the enemy. Two were on the British front and one on the French—"St. George I." against the Lys sector, "St. George II." against the Ypres sector and "Blücher" in Champagne.

The "Michael" attack was to be made by the German 17th, 2nd, and 18th Armies (62 divisions in all) on the 47 m. front Arras-St. Quentin-La Fere, but its main force was intended to be exerted north of the Somme, and after breaking through, the 17th and 2nd Armies were to wheel north-west and press the British army against the coast, while the river and the 18th Army guarded their flank. This plan was radically changed in execution because Ludendorff gained rapid success where he desired it little and failed to gain success where he wanted it most. The attack was launched on March 21 (*see* ST. QUENTIN, BATTLE OF 1918), and the surprise was helped by an early morning mist. But while the thrust broke through completely south of the Somme, where the defence—but also the attacking force—was thinnest, it was held up near Arras, a check which reacted on all the attack north of the river. Ludendorff, violating his new principle, spent the following days in trying to revive his attack against the strong, and strongly held bastion of Arras, maintaining this direction as his principal line of effort. Meantime he kept a tight rein on the 18th Army which was advancing in the south without serious check from its opponents. As late as March 26 he issued orders which restrained it from crossing the Avre and tied it to the pace of its neighbour, the 2nd, which in turn was held back by the very limited success of the 17th Army near Arras.

Thus we see that in reality Ludendorff was bent on breaking the British army by breaking down its strongest sector of resistance in a direct assault. And because of this obsession he failed, until too late, to throw the weight of his reserves along the line of least resistance south of the Somme. The intended wheel to the north-west might have come to pass if it had been made after passing the flank, and thus being directed against the rear, of the Arras bastion. On March 26 the attack north of the Somme (by the left wing of the 17th Army and the right of the 2nd Army) was visibly weakening as the price of its hard-earned gains. South of the Somme the left of the 2nd Army reached, and was now to be embarrassed by, the desert of the old Somme battlefields—a brake on progress and supply. The 18th Army alone was advancing with unslackened impetus. This situation led Ludendorff to adopt a new plan, but without relinquishing his old. He ordered for March 28 a fresh and direct attack on the high ground near Arras—by the right of the 17th Army and to be followed by a 6th Army attack just to the north between Vimy and La Bassée. But the promising situation south of the Somme led him to indicate Amiens as an additional main objective. Even so, he restrained the 18th Army from pushing across the Avre without further orders! On March 28 the fresh Arras attack was launched, unshielded by mist or surprise, and failed completely in face of the well prepared resistance of Byng's 3rd Army. Only then did Ludendorff abandon his original idea, and direct his main effort, and some of his remaining reserves, towards Amiens. By March 27 the advance had penetrated nearly 40 m. and reached Montdidier, cutting one railway to Paris; by March 30 the German flood was almost lapping the outworks of Amiens. Once the crust was broken, the very elaboration of the methods of control communication built up during three years of static warfare caused the greater flux behind the front. The extent of the retreat was primarily the measure of the loss of control by the British commanders.

Disaster had driven the Allies to an overdue step, and on Haig's appeal and Lord Milner's intervention Foch had been appointed

on March 26 to "co-ordinate" the operations of the Allied armies. If he had fallen into disfavour owing to the heavy cost of his attacks in Artois during 1915 and the barren fruit of the Somme in 1916, his will-power and energy earned and created confidence. On April 14 he was definitely made commander-in-chief of the Allied armies. But before this a fresh German menace had developed—though not intended as such.

When Ludendorff decided to change his main line of attack to the sector south of the Somme, he diverted reserves thither. But meantime he ordered the 18th Army to mark time for two days. When the attack was renewed in force on March 30 it made little progress in face of a resistance that had been afforded time to harden, helped by the cement of French reserves which were now being poured into the breach. A further effort on April 4 had still less success and Ludendorff, rather than be drawn into an attrition struggle, suspended the attack towards Amiens. With a large part of his reserves holding the vast bulge south of the Somme, Ludendorff turned, if without much confidence and merely as a diversion, to release, on April 9, his "St. George I." attack. (*See* LYS, BATTLE OF THE, 1918.) Its astonishing early success against a weakened front led him to convert it bit by bit into a major effort. The British were desperately close to the sea, but their resistance stopped the German tide after a 10 m. invasion just short of the important railway junction of Hazebrouck, and an attempt to widen the front towards Ypres was nullified by Haig's swinging his line back just before and by the gradual arrival of French reinforcements. Haig complained strongly that Foch was too slow in sending French reserves northward, but the event justified Foch's reluctance to commit himself thither and his seeming excess of optimism in declaring that the danger was past. Ludendorff had doled out reserves sparingly, usually too late and too few for real success; so apprehensive that his new bulge would become another sack, that after the capture of Kenmel Hill, when opportunity opened its arms, he stopped the exploitation for fear of a counter-stroke.

Thus Ludendorff had fallen short of strategic results; on the other hand he could claim huge tactical successes—the British casualties were over 300,000. The British lion had been badly mauled, and although fresh drafts to the number of 140,000 were hurried out from England and divisions brought back from Italy, Salonika and Palestine, months must elapse before it could recover its offensive power. Ten British divisions had to be broken up temporarily, while the German strength had now mounted to 208, of which 80 were still in reserve. A restoration of the balance, however, was now in sight. A dozen American divisions had arrived in France and, responding to the call, great efforts were being made to swell the stream. Further, Pershing, the American commander, had placed his troops at Foch's disposal for use wherever required. For Germany the sands were running out, and, realizing this, Ludendorff launched his "Blücher" attack between Soissons and Reims, on May 27. Falling by surprise with 15 divisions against seven, it swept over the Aisne and reached the Marne on May 30, where its impetus died away. (*See* CHEMIN-DES-DAMES, BATTLE OF THE, 1918.) This time the German superiority of force had not been so pronounced as before nor aided by nature's atmospheric cloak. It would seem that the extent of the opening success was due in part to the strategic surprise—the greater unexpectedness of the time and place of the blow—and in part to the folly of the local army command in insisting on the long-exploded and obsolete method of massing the defenders in the forward positions—there to be compressed cannon-fodder for the German bombardment. Pétain's recent instructions for a deep and elastic system of defence had been disregarded. This indeed was an additional form of surprise, for the object of all surprise is the dislocation of the opponent's *moral* and mind and the effect is the same whether he be caught napping by deception or allows himself to be trapped with his eyes open. Further, the Germans' success on May 27, 1918, deserves study in comparison with their other offensives whose success was almost in mathematical ratio to their degree of surprise. This final year, indeed, read in the light of previous years, affords fresh proof that surprise—or, more scientifically, the dislocation of the enemy's balance—is essential to true success in every operation of war. At the bar of universal history, any commander who risks lives without seeking his preliminary guarantee stands condemned.

But once again Ludendorff had obtained a measure of success for which he was neither prepared nor desirous. The surpriser was himself surprised. The attack had been conceived merely as a diversion, to attract the Allied reserves thither preparatory to a final and decisive blow at the British front in Flanders. But its opening success attracted thither too large, yet not large enough, a proportion of their own reserves. Blocked frontally by the river, an attempt was made to push west, but it failed in face of Allied resistance—notable for the appearance of American divisions at Chateau-Thierry, where they gallantly counter-attacked.

Ludendorff had now created two huge bulges, and another smaller one, in the Allied front. His next attempt was to pinch out the Compiègne "tongue" which lay between the Amiens and Marne bulges. But this time there was no surprise, and the blow on the west side of the "tongue," June 9, was too late to coincide with the pressure on the east. A month's pause followed. Ludendorff was anxious to strike his long-cherished decisive blow against the British in Belgium, but he considered that their reserves here were still too strong, and so again decided to take the line of least tactical resistance, hoping that a heavy blow in the south would draw off the British reserves. He had failed to pinch out the Compiègne "tongue" on the west of his Marne salient; he was now about to attempt the same method on the east, by attacking on either side of Reims. But he needed an interval for rest and preparation, and the delay was fatal, giving the British and French time to recuperate, and the Americans to gather strength. The British divisions previously broken up had now been reconstituted, and as a result of an urgent appeal made to President Wilson in the crisis of March, and the provision of extra shipping, American troops had been arriving at the rate of 300,000 a month since the end of April. The tactical success of his own blows had been Ludendorff's undoing; yielding to their influence, he had pressed each too far and too long, so using up his own reserves and causing an undue interval between each blow. He had driven in three great wedges, but none had penetrated far enough to sever a vital artery, and this strategic failure left the Germans with an indented front which invited flanking counter-strokes.

X. THE FINAL PHASE

The Turning of the Tide.—On July 15 Ludendorff launched his new attack, but its coming was no secret. East of Reims it was foiled by an elastic defence, and west of Reims the German penetration across the Marne merely enmeshed them more deeply to their downfall—for on July 18 Foch launched a long-prepared stroke against the other flank of the Marne salient. (*See* MARNE, SECOND BATTLE OF THE.) Here Pétain, who directed the operation, turned the key which Ludendorff lacked, using masses of light tanks to lead a surprise attack on the Cambrai method. The Germans managed to hold the gates of the salient open long enough to draw their forces back into safety and straighten their line. But their reserves were depleted, Ludendorff was forced to postpone if not yet to abandon the offensive in Flanders and the initiative definitely and finally passed to the Allies. Foch's first concern was to keep it, by giving the enemy no rest while his own reserves were accumulating. To this end he arranged with Haig, Pétain and Pershing for a series of local offensives, aimed to free the lateral railway communications and to improve the position of the front ready for further operations. To Haig he proposed an attack in the Lys sector, but Haig saw "no advantage in an advance over this flat and marshy region" and suggested instead the Somme area as more suitable and more strategically effective. Already, before the Marne counter-stroke, Rawlinson, commanding the British 4th Army in front of Amiens (*q.v.*), had submitted to Haig a plan for a large surprise attack there, and Foch agreed to this in place of his own proposal. He also placed under Haig the French 1st Army (Debeney) to

extend the attack to the south. Rawlinson's army was doubled, and by skilful precautions the enemy were kept in the dark until, on Aug. 8, the attack was delivered—led by 450 tanks. The blow had the maximum shock of surprise, falling on an opponent who had done nothing to strengthen his position by entrenchments, and south of the Somme the troops of the Australian and Canadian Corps rapidly overran and overwhelmed the German forward divisions. By Aug. 12 when the advance came to a halt through reaching the tangled wilderness of the old 1916 battlefields, if also through lack of reserves, the 4th Army had taken 21,000 prisoners at a cost of only 20,000 casualties. Great, if not fully exploited, as a material success, it was far greater as a moral one.

Ludendorff has said: "Aug. 8 was the black day of the German army in the history of the war. . . . It put the decline of our fighting power beyond all doubt. . . . The war must be ended." He informed the emperor and the political chiefs that peace negotiations ought to be opened before the situation became worse, as it must. After July 18 Ludendorff had by no means lost hope and as late as Aug. 2 was ordering preparations for four fresh attacks, including his cherished Flanders design, if on a reduced scale. But after Aug. 8 these dreams vanished. The conclusions reached at a Crown Council held at Spa were that "We can no longer hope to break the war-will of our enemies by military operations" and "the object of our strategy must be to paralyse the enemy's war-will gradually by a strategic defensive." In other words the German command had abandoned hope of victory or even holding their gains, and hoped only to avoid surrender—an insecure moral foundation.

On Aug. 10 Foch issued a fresh *directive* for the preparation of an "advance" by the British 3rd Army "in the general direction of Bapaume and Peronne." Meantime he wished Haig to continue the 4th Army's frontal pressure, but Haig demurred to it as a vain waste of life and gained his point. Economy of force was henceforth to be added to the advantages of the new strategy now evolved. Thus the momentum of the 4th Army had hardly waned, before the 3rd Army moved. From then on Foch beat a tattoo on the German front, a series of rapid blows at different points, each broken off as soon as its initial impetus waned, each so aimed as to pave the way for the next, and all close enough in time and space to react on each other. Thus Ludendorff's power of switching reserves to threatened spots was stopped, as his balance of reserves was drained.

On Aug. 10 the French 3rd Army had struck to the south; then on Aug. 17 the French 10th Army still farther south; next, on Aug. 21, the British 3rd Army, followed by the British 1st Army on Aug. 26. Ludendorff's order to the troops holding the Lys salient to retire was hastened in execution by the attacks of the reformed British 5th Army, and by the first week in September the Germans were back on their original starting line—the strong defences of the Hindenburg line. And on Sept. 21 Pershing completed the series of preliminary operations by erasing the St. Mihiel (*q.v.*) salient—the first feat of the Americans as an independent army. Pershing had originally intended to make this a stepping stone to an advance towards the Briey coalfields and the eastern end of the Germans' main lateral railway near Metz, but the project was abandoned for reasons that will be referred to later. Thus no exploitation of the success was attempted.

The clear evidence of the Germans' decline and Haig's assurance that he would break the Hindenburg line where the German reserves were thickest, decided Foch to seek victory that autumn instead of postponing the attempt until 1919. All the Allied armies in the West were to combine in a simultaneous offensive.

The Collapse of Bulgaria.—But before it could develop an event occurred in the Balkans which, in the words of Ludendorff, "sealed the fate of the Quadruple Alliance." He had still hoped to hold fast in his strong lines in the West, falling back gradually to fresh lines if necessary, and with his strategic flanks in Macedonia and Italy covered, while the German Government was negotiating for a favourable peace. At the same time there was alarm as to the moral effect of the Western front defeats on the German people, their will-power already undermined by shortage of food, and perhaps also by propaganda.

But on Sept. 15 the Allied armies in Salonika (*q.v.*) attacked the Bulgarian front, which crumpled in a few days. Guillaumat, who had succeeded Sarrail in Dec. 1917, had prepared the plan for an offensive, and when recalled to France in the crisis of July as governor of Paris he won over the Allied Governments to consent to the attempt. His successor in Salonika, Franchet d'Esperey, concentrated a Franco-Serb striking force, under Michich, on the Sokol-Dobropolye sector, west of the Vardar, where the Bulgarians trusted to the strength of the mountain ridges and were weak in numbers. On Sept. 15 Michich attacked and while the British attack at Doiran pinned a large part of the Bulgarian reserves, he broke right through towards Uskub. With their army split into two parts the Bulgarians, already tired of the war, sought an armistice, which was signed on Sept. 29. Franchet d'Esperey's achievement not only knocked away the first prop of the Central Alliance but opened the way to an advance on Austria's rear.

The Collapse of Turkey.—The offensive planned for the spring in Palestine had been interrupted by the crisis in France and the consequent withdrawal of most of Allenby's British troops. The depletion was made up by reinforcements from India and Mesopotamia, and by September Allenby was again ready to take the offensive. (*See* PALESTINE, CAMPAIGNS IN.) He secretly concentrated, on the Mediterranean flank, the mass of his infantry, and behind them the cavalry. In this way he changed a two to one superiority on the general front into four to one at the decisive point. At dawn on Sept. 19 the western mass attacked, rolling the Turks back north-east towards the hilly interior—like a door on its hinges. Through the open doorway the cavalry passed, riding straight up the coastal corridor for 30 m., before swinging east to cut the Turkish communications and close all exits of retreat. Completely trapped, the main Turkish armies were rounded up, while the British cavalry exploited the victory of Megiddo by a swift and sustained pursuit which gained first Damascus and finally Aleppo. Defenceless, and threatened with a direct advance of Milne from Macedonia on Constantinople, Turkey capitulated on Oct. 30.

The First Peace Note.—The capitulation of Bulgaria, convinced Ludendorff that it was necessary to take a decisive step towards securing peace. While he was scraping together a paltry half dozen divisions to form a new front in Serbia, and arranging a meeting with the political chiefs, Foch's grand assaults fell on the Western defences, Sept. 26–28, and the line threatened to crack.

The German supreme command lost its nerve—only for a matter of days, but that was sufficient, and recovery too late. On Sept. 29 they took the precipitate decision to appeal for an armistice, saying that the collapse of the Bulgarian front had upset all their dispositions—"troops destined for the Western front had had to be despatched there." This had "fundamentally changed" the situation in view of the attacks then being launched on the Western front, for though these "had so far been beaten off their continuance must be reckoned with."

This remark refers to Foch's general offensive. The American attack in the Meuse-Argonne had begun on Sept. 26, but had come practically to a standstill by the 28th. A Franco-Belgo-British attack had opened in Flanders on the 28th, but if unpleasant did not look really menacing. But on the morning of the 29th Haig's main blow was falling on the Hindenburg line, and the early news was disquieting.

In this emergency Prince Max was called to be chancellor to negotiate a peace move, with his international reputation for moderation and honour as its covering pledge. To bargain effectively and without confession of defeat he needed, and asked, a breathing space "of ten, eight, even four days, before I have to appeal to the enemy." But Hindenburg merely reiterated that "the gravity of the military situation admits of no delay," and insisted that "a peace offer to our enemies be issued at once."

Hence on Oct. 3 the appeal for an immediate armistice went out to President Wilson. It was an open confession of defeat to

the world, and even before this—on Oct. 1—the supreme command had undermined their own home front by communicating the same impression to a meeting of the leaders of all political parties.

Men who had so long been kept in the dark were blinded by the sudden light. All the forces of discord and pacifism received an immense impulse.

While the German Government was debating the conditions for an armistice and questioning Ludendorff as to the situation of the army for further resistance if the terms were unacceptable, Foch continued his military pressure.

The Final Advance.—The plan agreed upon between Foch and the Allied commanders had been for a series of convergent and practically simultaneous attacks:—

1 and 2. By the Americans west of the Meuse, and by the French west of the Argonne, both in the direction of Mezières—beginning on Sept. 26. (*See* MEUSE-ARGONNE, BATTLE OF THE.)

3. By the British on the St. Quentin-Cambrai front in the general direction of Maubeuge—beginning on Sept. 27. (*See* HINDENBURG LINE, BATTLES OF, 1918.)

4. By the Belgian and Allied forces in the direction of Ghent—beginning on Sept. 28.

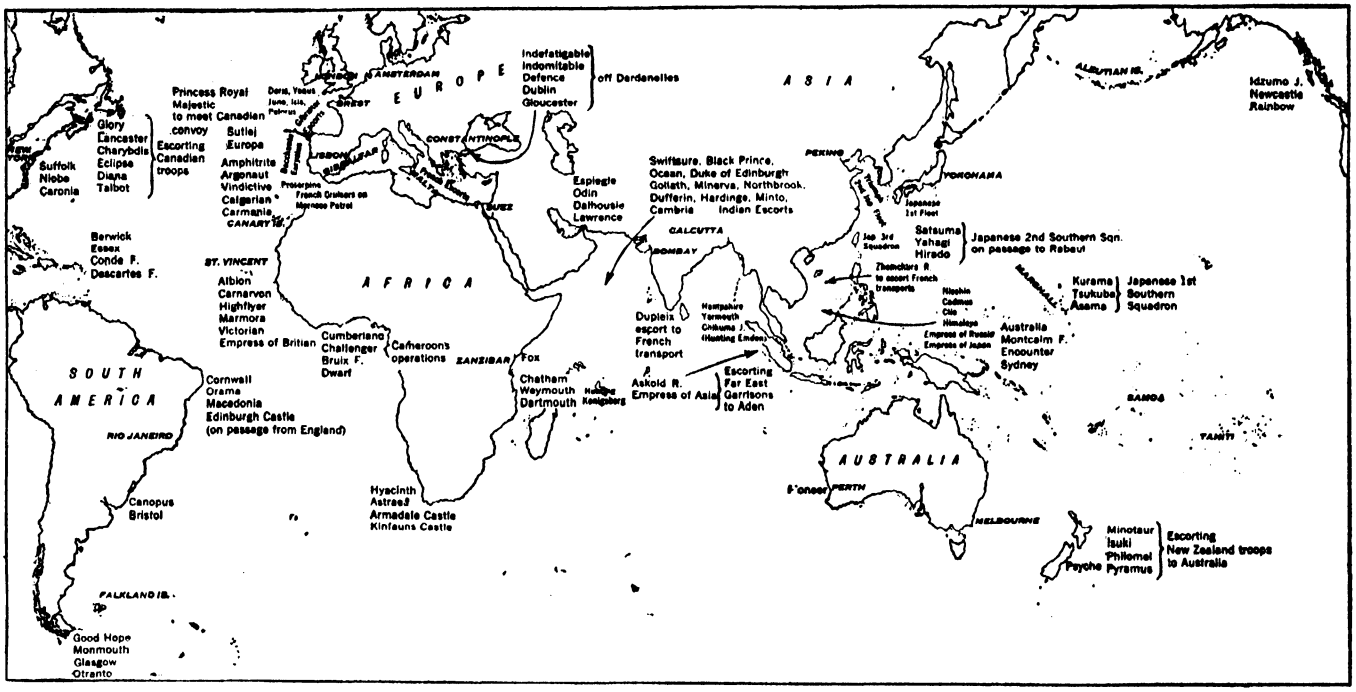
The general aspect was that of a pincer-like manoeuvre against the vast salient jutting out between Ypres and Verdun. The attack towards Mezières would shepherd that part of the German armies towards the difficult country of the Ardennes and away from their natural line of retreat through Lorraine; it was also dangerously close to the hinge of the Antwerp-Meuse line which the Germans were preparing in rear. The attack towards Maubeuge would threaten the other main line of communication and retreat through the Liège gap, but it had further to go. In these attacks, the Americans had the hardest natural obstacle, the Argonne forest; the British had to face the strongest defences and the heaviest weight of enemy troops.

Pershing's attack, adding surprise to its five to one superiority in numbers, opened well, but lost impetus owing to the difficulties of supply and exploitation in such country. When it was eventually suspended on Oct. 14, after bitter fighting and severe losses, the American army was still far distant from the vital railway. A new force, it was suffering the growing pains which the British had passed through in 1915–16. Pershing's difficulties were enhanced by the fact that he had waived his own proposal for an exploitation of the St. Mihiel success towards Metz in view of Haig's objection to a move which, however promising in its ultimate aim, would diverge from the general direction of the other Allied attacks. Haig desired that Pershing's attack should converge towards his in order more immediately to ease the task of the British troops. Foch's original plan for the general offensive had accordingly been readjusted, and in consequence Pershing had not only a more difficult sector but a bare week in which to prepare his blow. The shortness of time led him to use untried divisions instead of switching the more experienced divisions used at St. Mihiel. But in the outcome, Haig's insistence was proved unnecessary, for the British attack broke through the Hindenburg line before the Meuse-Argonne attack had drawn away any German division from his front.

Haig, by pushing forward his left wing first, facilitated the attack of his right on the strongest section of the Hindenburg line—the Canal du Nord—and by Oct. 5 the British were through the German defence system, with open country beyond. But on this front the attackers were in actually inferior numbers to the defenders, their tanks were used up, and they could not press forward fast enough to endanger the German retreat.

Within a few days the supreme command became more cheerful, even optimistic, when it saw that breaking into the Hindenburg line had not been followed by an actual break-through of the fighting front. More encouragement came from reports of a slackening in the force of the Allies' attacks, particularly in the exploitation of opportunities. Ludendorff still wanted an armistice, but only to give his troops a rest as a prelude to further resistance and to ensure a secure withdrawal to a shortened defensive line on the frontier. By Oct. 17 he even felt he could do it without a rest. It was less that the situation had changed as that his impression of it had been revised. It had never been quite so bad as he had pictured it on Sept. 29. But his first impression had now spread throughout the political circles and public of Germany—as the ripples spread when a pebble has been dropped in a pool.

The combined pressure of the Allied armies, and their steady advance, were loosening the will-power of the German Government and people. The conviction of ultimate defeat, slower to appeal to them than to the army chiefs, was the more forcible when it was realized. And the indirect moral effect of military and economic pressure was accentuated by the direct effect of peace propaganda, skilfully directed and intensively waged by Northcliffe. The "home front" began to crumble later but it crumbled quicker than the battle front.



The Collapse of Austria.—The last Austrian attempt at an offensive on the Italian front, in conjunction with the German assaults in France, had been repulsed on the Piave in June. Diaz waited until conditions were ripe for an offensive in return, until Austria's internal decay was spreading and she was without hope from Germany. On Oct. 24 Cavan's army moved to seize the crossings of the Piave and on Oct. 27 the main attack opened, driving towards Vittorio Veneto (*q.v.*) to divide the Austrians in the Adriatic plain from those in the mountains. By Oct. 30 the Austrian army was split in two and the retreat became a rout, and the same day Austria asked for an armistice, which was signed on Nov. 4.

The Curtain Falls on the Western Front.—Already on Oct. 23 President Wilson had replied to the German requests by a note which virtually required an unconditional surrender. Ludendorff wished to carry on the struggle in hopes that a successful defence of the German frontier might damp the determination of the Allies. But the situation had passed beyond his control, the nation's will-power was broken, and his advice was in discredit. On Oct. 26 he was forced to resign.

Then, for 36 hours, the chancellor lay in coma from an overdose of sleeping draught after influenza. When he returned to his office on the evening of Nov. 3, not only Turkey, but Austria, has capitulated. If the situation on the Western front was felt to be rather easier, Austrian territory and railways were now available as a base of operations against Germany. Several weeks before, military opinion had tended to regard such a contingency, then unrealized, "as decisive." Next day revolution broke out in Germany, and swept rapidly over the country. And in these last days of tremendous and diverse psychological strain the "reddening" glare behind was accentuated by a looming cloud on the Lorraine front—where the renewed American pressure, since Nov. 1, was on a point more sensitive than other parts, where "they must not be allowed to advance if the Antwerp-Meuse line was to be held any longer." If this continued the Rhine and not the frontier would have to be the next line of resistance.

But hourly the revolution was spreading, fanned as peace negotiations were delayed, by the Kaiser's reluctance to abdicate. Compromise with the revolutionaries was the only chance, and on Nov. 9 Prince Max resigned to the Socialist Ebert. Germany had become a republic in outward response to President Wilson's demand and in inward response to the uprising of the German people against the leaders who had led them into disaster. The German fleet had already mutinied when their commanders sought to send them out on a forlorn hope against the British.

On Nov. 6 the German delegates left Berlin to treat for an armistice. Their acceptance of the severe terms was hastened less by existing military events than by collapse of the "home front," coupled with the imminence of a fresh blow. The Allied advance was still continuing, in some parts seeming to gather pace in the last days, but the main German forces had escaped from the perilous salient, and their complete destruction of roads and railways made it impossible for supplies to keep pace with the advancing troops. A pause must come while these communications were being repaired, and thus the Germans would have breathing space to rally their resistance. The advance reached the line Pont à Mousson-Sedan-Mezières-Mons-Ghent by Nov.

FROM WINSTON CHURCHILL, "WORLD CRUISES," BY PERMISSION OF THE PUBLISHERS

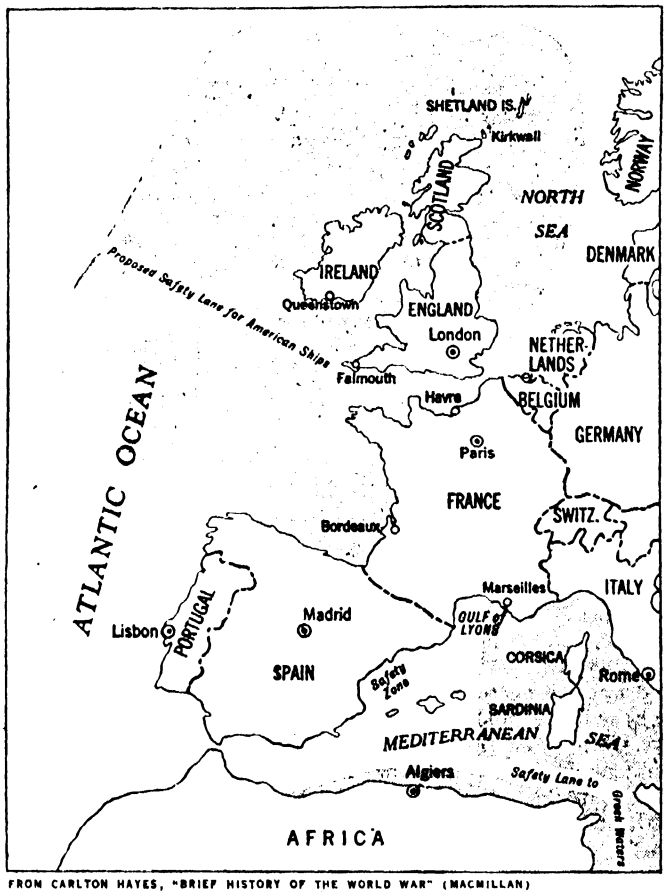
WORLD MAP SHOWING THE GENERAL NAVAL SITUATION OVERSEAS EARLY IN OCTOBER, 1914

11—the line of the opening battles in 1914—but strategically it had come to a standstill.

To meet this situation Foch had concentrated a large Franco-American force, of 28 divisions and 600 tanks, to strike below Metz directly east into Lorraine. The general Allied advance had almost absorbed the enemy's reserves, and now this decisive manoeuvre was to fall on his bared flank. It promised the chance of turning the whole of his new line of defence along the Meuse to Antwerp and if rapidly successful might intercept his retreat to the Rhine. In addition Trenchard's Independent Air Force was about to bomb Berlin, on a scale hitherto unattempted in air warfare. And the number of American divisions in France had risen to 42. Whether this final thrust, intended for Nov. 14, would have solved the hitherto insoluble problem of maintaining the momentum of advance after an initial break-through can never be known. The conditions behind the Lorraine front were at least more favourable. But the attempt was unnecessary. For with revolution at home and the gathering menace on their frontier—their frontiers indeed—the German delegates had no option but to accept the drastic terms of the Armistice, which was signed in Foch's railway-carriage in the Forest of Compiègne at 5 A.M. on Nov. 11, and at 11 o'clock that morning the World War came to an end.

XI. EPILOGUE

Controversy has long raged as to what was the deciding act of the conflict, what were the causes of victory, and, even less profitably, which country won the war. If it be accepted that the mind of the enemy's ruling power is the ultimate target, aimed at indirectly through the bodies of their troops and their civil foundations, then, so far as any military act was decisive, the memoirs of Ludendorff, amply confirmed from other sources, reveal that it was the attack of Aug. 8, reinforced by the overthrow of Bulgaria. But if these would have ensured peace it is most improbable that Germany would have accepted the conditions ultimately secured.



The truth is that no one act, still less one cause, was, or could be, decisive. The Western front, the Balkan front, the tank, the blockade and propaganda have all been claimed as the cause of victory. All claims are justified, none is wholly right. In this new warfare between nations victory is a cumulative effect, to which all weapons—military, economic, and psychological—contribute. Victory comes, and can only come, through the utilization and combination of all the resources existing in a modern nation, and the dividend of success depends on the way in which these manifold activities are co-ordinated.

Among the fundamental causes of Germany's surrender the blockade, wielded by the British navy, is seen to assume larger and larger proportions as the fog of war disperses in the clearer light of these post-war years. It was a constructive hold which the Germans were powerless to loosen and which their efforts only succeeded in tightening. Helplessness induces hopelessness, and history attests that loss of hope and not loss of lives is what ultimately decides the issue of war. The intangible all-pervading factor of the blockade intrudes into every consideration of the military situation. The question is often raised whether Germany, if she had stood on the defensive in the West and consolidated her gains in the East, would have fared better in the outcome. Militarily, there is every justification for such a view. But it overlooks the command of the sea. For it was the stranglehold of the British navy which, in default of a serious peace move, constrained Germany to carry out that final *felo de se* offensive in 1918. She was haunted by the spectre of slow enfeeblement ending in eventual collapse.

The naval factor again intervenes in the question whether Germany could have avoided capitulation in Nov. 1918 and whether, but for the revolution, her armies could have stood firm on their own frontiers. For even if the German people, roused to a supreme effort in visible defence of their own soil, could have held the Allied armies at bay the end could only have been postponed—because of the grip of sea-power.

But in hastening the surrender, in preventing a continuance of the war into 1919 military action ranks foremost. Hence the success of the Allied armies is chief among the immediate causes of victory. That conclusion does not necessarily, or even naturally, imply that at the moment of the Armistice Germany's military power was broken or her armies decisively beaten. Nor that the Armistice was a mistaken concession. Rather does the record of the last "hundred days," when sifted, confirm the immemorial lesson that the true aim in war is the mind of the hostile rulers, not the bodies of their troops; that the balance between victory and defeat turns on mental impressions and only indirectly on physical blows. It was the shock of being surprised and the feeling that he was powerless to counter potential strategic moves which shook Ludendorff's nerve more than the loss of prisoners, guns, and acreage.

It is even more futile to ask which country won the war; France did not win the war, but unless she had held the fort while the forces of Britain were preparing and those of America still a dream the release of civilization from this nightmare of militarism would have been impossible. Britain did not win the war, but without her command of the sea, her financial support and her army to take over the main burden of the struggle from 1916

FROM CARLTON HAYES, "BRIEF HISTORY OF THE WORLD WAR" (MACMILLAN)

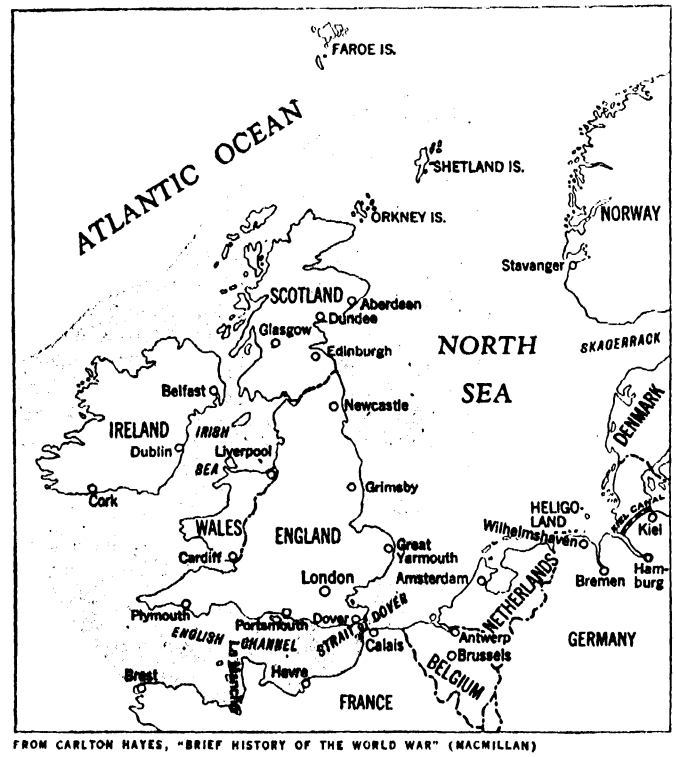
SAFETY LANES FOR NEUTRALS IN MINE FIELDS

onwards, defeat would have been inevitable. The United States did not win the war, but without their economic aid to ease the strain, without the arrival of their troops to turn the numerical balance, and, above all, without the moral tonic which their coming gave, victory would have been impossible. And let us not forget how many times Russia had sacrificed herself to save her Allies; preparing the way for their ultimate victory as surely as for her downfall. Finally, whatever be the verdict of history on her policy, unstinted tribute is due to the incomparable endurance and skill with which Germany more than held her own for four years against superior numbers, an epic of military and human achievement.

The development of the means and methods of warfare during the struggle are described in the articles: STRATEGY; TACTICS; TANKS; CAVALRY; ARTILLERY; INFANTRY; AIR WARFARE.

The campaigns and battles have received separate and detailed treatment in articles such as the following: ANTWERP, SIEGE OF, 1914; ASIAGO, BATTLE OF, 1916; BELGIUM, INVASION OF, 1914; BREST-LITOVSK, BATTLES OF, 1915; CAMBRAI, BATTLE OF, 1917; CAMEROONS, OPERATIONS 1914–16; CAPORETTO, BATTLE OF; CARPATHIANS, BATTLES OF THE; CAUCASUS, CAMPAIGNS IN THE; DARDANELLES CAMPAIGN; DUNAJEC-SAN, BATTLES OF THE; EAST AFRICA, MILITARY OPERATIONS 1914–18; FRONTIERS, BATTLES OF THE; JUTLAND, BATTLE OF; LEMBERG, BATTLES OF; LODZ, BATTLE OF, 1914; LUCK (LUTSK), BATTLES OF, 1916; MARNE, BATTLE OF THE; MASURIAN LAKES, BATTLES OF THE; MESOPOTAMIAN CAMPAIGN; NAREW, BATTLES OF THE, 1915; NAROCZ, BATTLE OF LAKE; WORLD WAR, NAVAL; PRZEMYSL, SIEGES OF 1914–15; SALONIKA CAMPAIGN; SERBIAN CAMPAIGN; SOMME, BATTLES OF THE; VERDUN, BATTLES OF; VISTULA-SAN, BATTLES OF THE; VITTORIO VENITO; YPRES, BATTLES OF: Battles of 1914; Battles of 1915; Battles of, 1917; YSER BATTLE OF THE; ZEEBRUGGE, ATTACK ON.

The mechanism of war, the organization of naval, military and air forces, and the scientific aspects of military machinery are also dealt with in such articles as those on ADMIRALTY, BOARD OF; AIR FORCES; BALLISTICS; BOMBS; BRIDGING, MILITARY; CAMOUFLAGE; CHEMICAL WARFARE; FLAME-THROWERS; INTELLIGENCE; MINELAYING AND MINESWEEPING; MOTOR TRANSPORT, MILITARY; ORDNANCE; PARAVANE; RANGE-FINDERS; SMALL ARMS; SUPPLY AND TRANSPORT, MILITARY.



(B. H. L. H.)

NAVAL

To follow the worldwide ramifications of naval operations during the World War it is best to consider, year by year, the events in each area. At the outset they covered all the seas of the earth, but as the net was drawn around the Central Powers, the area of naval warfare was gradually reduced to European waters and to the seas around the British Isles. In the end, it was due to the irresistible force of sea power (*q.v.*) that the war was brought to a close.

Preliminary Moves.—In July 1914 in place of the usual summer manoeuvres, a test mobilisation of the British Fleet in Home waters was carried out. The ships of the 2nd and 3rd Fleets, their crews completed from the Reserves, joined the 1st Fleet at Portland on July 16th for exercises in the Channel. On July 23, the day of the Austrian ultimatum to Serbia, the fleets were ordered to disperse. The ships of the 2nd and 3rd Fleets returned to their Home Ports.

The 1st Fleet remained at Portland, the defence flotillas were sent to their stations around the coast, and at the same time

FROM CARLTON HAYES, "BRIEF HISTORY OF THE WORLD WAR" (MACMILLAN)

GERMAN WAR ZONE, FEBRUARY, 1915

the Mediterranean fleet was ordered to concentrate at Malta. On July 29 the 1st fleet left Portland for Scapa Flow, and, by Aug. 2 the 1st and 2nd fleets were at their war stations, the 3rd fleet was on the move, the defence flotillas were at their posts, and the organisations for taking up auxiliaries and for arming merchant liners were in force. On Aug. 1 the order for general mobilisation was issued, followed next day by the calling up of the naval reserve. Owing to the recent exercise the machinery

of mobilisation worked smoothly and by the morning of Aug. 4 the state of naval readiness around the British Isles was such as to preclude the possibility of surprise before the outbreak of hostilities.

The German High Sea Fleet, which had been visiting Norwegian ports, was recalled. By July 30 all ships had returned to Wilhelmshaven and Kiel and no German ships were sighted by the British Fleet as it passed northward to its war stations.

Distribution of Fleets.—The following table shows the distribution of the British and German Fleets upon the outbreak of hostilities.

	British	German
North Sea and Home Waters		
Dreadnought battleships:		
13·5 inch guns	10	..
12 inch guns	10	9

*Including 5 "Canopus" and 9 "Majestics," obsolete ships of the third fleet.

†Including 10 obsolete "Wittelsbach" class stationed in the Baltic.

‡116 attached to Grand Fleet and Harwich Force. Remainder were old boats employed in patrol flotillas.

§Number is uncertain.

¶10 of these were non-seagoing river gunboats.

‖3 of these were old ships of the "P" class.

THE NORTH SEA AND CHANNEL 1914

The Commencement of Hostilities.—On the morning of Aug. 4 the Grand Fleet, commanded by Admiral Sir John Jellicoe, left Scapa Flow on the first of its many "sweeps" through the North Sea. Its object was to intercept any German commerce raiders that might put to sea before war was declared. At 11 P.M. that night all ships received the fateful wireless message to "commence hostilities against Germany." For three days the fleet cruised without seeing an enemy and on Aug. 7 returned to Scapa. The 10th Cruiser squadron, drawn from 3rd fleet cruisers, was not yet complete and this shortage of cruisers enabled one raider, the "Kaiser Wilhelm der Grosse," to escape through the cordon. Meanwhile the Harwich Force (Commodore Tyrwhitt) made a search of the Heligoland Bight, which resulted in the sinking of the minelayer "Königin Luise" by the "Amphion." But the German mines had been laid and the "Amphion" ran into them on her return and was sunk. Thus early was first blood drawn upon both sides and Germany showed her intention to disregard, not only the customs of the sea, but her own signature to the Hague convention, by laying mines without warning, in international waters.

The Expeditionary Force.—The decision, on Aug. 5, to send the Expeditionary Force to France threw upon the navy the duty of safeguarding its passage. In the Channel were stationed the 5th, 7th and 8th Battle squadrons (eighteen pre-dreadnoughts) with one French and two British Cruiser squadrons. The Dover Straits were guarded by British and French destroyer and submarine flotillas, and an aerial patrol was established between the North Foreland and Ostend. Further north the Harwich Force patrolled the "Broad Fourteens" to the Dutch coast and the Grand Fleet took up a position in the centre of the North Sea, its cruisers and destroyers spread southward, ready to counter any move of the High Sea Fleet. Several unsuccessful submarine attacks were made upon ships of the Grand Fleet and on Aug. 9, "U. 15" was rammed and sunk by the cruiser "Birmingham" close to the fleet rendezvous. Regardless of the submarine risk, the fleet maintained its watch and from Aug. 15 to 17, when the bulk of the troops were afloat the Heligoland Bight was closely blockaded. Nothing was seen of the German fleet, whose inertness appeared surprising, it not then being realised that the policy of the German High Command was to preserve its fleet and to make only minor attacks with submarines and mines. By Aug. 18 the first four divisions were in France without the loss of a man and five days later the 5th Division was safely across. The enemy made their only appearance on Aug. 18, when two cruisers were sighted but escaped without being brought to action. The safe transport of the main body of troops being complete the Grand Fleet battleships withdrew to the west coast of Scotland, leaving two battlecruisers in the Humber to support the southern force.

Heligoland Bight Action.—To assist the Belgian army in creating a diversion on the German flank a brigade of Royal Marines was sent to Ostend: they landed with difficulty, in bad weather, on Aug. 27–28 from battleships of the Channel Fleet. This force being exposed to a sudden blow from the German Fleet, the Harwich flotillas, supported by battlecruisers and cruisers from the Grand Fleet, made an organised drive towards the German coast on the morning of Aug. 28. The outcome was the battle of the Heligoland Bight (*q.v.*) in which three German light cruisers and a destroyer were sunk and several other ships damaged, whilst the damage to British ships was small. This success in the first serious contact with the enemy at sea, did much to dispel the gloom cast by the retreat of the Allied armies before the German advance.

The shifting of the British army base from the Channel Ports to St. Nazaire, following the retreat from Mons threw a heavy burden upon the navy and especially upon the Admiralty transport service. Ships could no longer be spared for the Ostend diversion and the Royal Marine brigade was withdrawn on Aug. 31. The moving of the base began on Sept. 2 and was smoothly and rapidly completed.

In the last days of August, German mines, laid in the open

sea off the Humber and Tyne caused the loss of several neutral ships and of the minesweeping gunboat "Speedy." Submarines were active in the North Sea and on Sept. 1, the report that one had entered Scapa Flow caused the Grand fleet to put hurriedly to sea. After sweeping in force to the Skaagerak the fleet returned on Sept. 5 to Loch Ewe to fuel and on that day the British navy suffered its first loss by submarine attack, when the scout "Pathfinder" was sunk by "U. 29."

On Sept. 10, in order to cover the passage of the 6th Division to France, a great sweep was made through the North Sea by the Grand Fleet supported by the Harwich Force and the Channel squadron. The Bight of Heligoland was searched but no German ships were seen excepting several submarines, one of which was rammed by the "Zealandia." On Sept. 12 the British submarines scored their first success when "E. 9" sank the cruiser "Hela" off Heligoland. The High Sea Fleet being known to be escorting troops in the Baltic, the opportunity was taken to give the Grand Fleet a few days rest, the first since war broke out. The fleet arrived at Loch Ewe on Sept. 13: its rest was but a short one for on the 17th it was again sweeping down the North Sea to the Horns Reef following the sinking of the "Cressy," "Hogue" and "Aboukir." These three cruisers were sunk within an hour by a single submarine ("U. 9"). They were steaming in line abreast on the "Broad Fourteens" patrol, having been deprived of their destroyer support by bad weather. The "Aboukir" was hit first and the other two were torpedoed in succession as they closed to pick up survivors. In this disaster 1,400 lives were lost: and orders were given that in future, heavy ships were not to stop to pick up survivors of consorts torpedoed by submarines, nor were armoured ships to be used for patrol or examining merchant ships in submarine waters.

The Fall of Antwerp.—In the closing days of September, the Belgian Government asked for assistance in the defence of Antwerp. Some naval guns were sent and a brigade of Royal Marines reached the city on Oct. 2, followed by two untrained brigades of the newly formed Royal Naval Division. On Oct. 2 the eastern approach to the Dover Straits was closed by a mine-field, extending from the Goodwins to Ostend, every publicity being given to its limits. The 7th Division was landed at Zeebrugge on Oct. 7 without loss, in spite of a number of submarine attacks, but this desperate attempt to support the Belgian Army failed. Antwerp surrendered on Oct. 10 and the coast ports fell into the hands of the enemy as the Belgian Army retreated to the line of the Yser. One of the Naval Brigades, in the retreat, was forced across the Dutch frontier and interned. The German pursuit of the exhausted Belgian Army along the coast was stayed by the gallant work of a British flotilla under the command of Rear-Admiral Hood. (*See* BELGIAN COAST OPERATIONS.) Meanwhile the Harwich Force watching for a move on the part of the Germans, obtained its reward on Oct. 16, when the "Undaunted" and four destroyers met and chased four German destroyers and sank them all. This was the only attempt, apart from submarine activities, by the German navy to interfere on the Belgian Coast at this phase.

Submarine Menace to the Grand Fleet.—The last days of September saw the Grand Fleet at Scapa Flow and from Oct. 2–12 the whole fleet was at sea engaged in safeguarding the passage of the Canadian convoy. On Oct. 7 a German submarine entered Loch Ewe, rendering that place unsafe as a fleet anchorage. The fleet returned to Scapa Flow, where a partial submarine obstruction was in place, on Oct. 12. At this time submarines were active in the vicinity of the northern bases and several attacks were made upon patrolling cruisers. On Oct. 15 the cruiser "Hawke" was sunk with heavy loss off the Aberdeen coast and the next day a submarine was again reported inside Scapa Flow. Knowing that the German fleet was still in the Baltic, Jellicoe decided to seek a safe anchorage to the westward until the submarine defences of Scapa Flow could be made secure. On Oct. 20 he took the fleet to Lough Swilly where it remained until the end of the month, resting and carrying out practices. Meanwhile three British "E" class submarines had entered the Baltic. They were not successful in attacking the German fleet, but their presence caused much anxiety and gave moral support to the Russian fleet.

Loss of the "Audacious."—On Oct. 26, whilst carrying out firing practices off Lough Swilly, the battleship "Audacious" struck a mine. In spite of endeavours to tow her into harbour, she sank some hours later, her crew being saved. The loss was a serious one and came at an unfortunate moment. On that day the Belgian army supported by Hood's flotilla were making their last grim stand upon the Yser (*see* BELGIAN COAST OPERATIONS) and news of the Grand Fleet so far away might tempt the Germans to strike a blow at Hood before help could reach him. Also war with Turkey hung in the balance and news of a disaster to the Grand Fleet might have affected the issue. Consequently the Government kept the loss secret until the necessity was past.

Lord Fisher.—On Oct. 29 Lord Fisher (*q.v.*) relieved the Marquis of Milford Haven as First Sea Lord. A conference was held at the Admiralty, which Admiral Jellicoe attended, to decide upon future naval policy. On Nov. 2 the British Government declared the whole of the North Sea a prohibited area and warned all neutrals that, unless they adhered to the routes prescribed by the British authorities, they used the area at their own risk. On Nov. 3 a German cruiser squadron appeared off the Suffolk coast in the morning mist, fired a few shells on to the beach at Gorleston and at the old gunboat "Hazard" and retired. The battle squadrons having left Lough Swilly on Nov. 2, remained in the north part of the North Sea whilst a search was made by the battlecruisers and light forces, and returned to Scapa Flow, on Nov. 17. The German cruiser "Yorck," on her way home from the Gorleston raid, struck a mine off the Jade River and was sunk. The defences of Scapa Flow were now far enough advanced to give a certain sense of security to the fleet, but between Nov. 23–26, when the fleet was absent in support of aerial operations in the Heligoland Bight, six submarines were sighted close to the base and one ("U. 18") was sunk by the local defence flotilla. Nov. 26 was marked by the loss of the battleship "Bulwark," which blew up at Sheerness owing to accidental ignition of cordite and sank with great loss of life.

The Scarborough Raid.—The Grand Fleet returned to Scapa Flow on Nov. 27 and there followed a month of gales of exceptional violence which delayed the completion of the submarine defences. On Dec. 15 a German force was reported at sea and the 2nd battle squadron and battlecruisers were sent south. The weather was so heavy that some of the light cruisers and destroyers had to be left behind, and to this fact and to the mist, the German force that raided Scarborough and the Hartlepools on Dec. 16, owe their narrow escape. The two towns were bombarded, 120 civilians were killed and over 400 wounded and, after laying mines off the Yorkshire coast, the Germans retired. In the mist and heavy sea a short, indecisive fight took place between the light forces, but the heavy ships, although very close, did not sight one another. The Grand Fleet swept in full force into the Bight on that day and Dec. 17, but the enemy had retired behind his minefields. It returned to Scapa on Dec. 20 and on Christmas Day was again in the Heligoland Bight, supporting an air raid upon Cuxhaven, after which it returned to Scapa on Dec. 27 in a heavy gale.

THE TRADE ROUTES 1914

Germany's oceanic trade was brought to a standstill at the very outset of the war, the approaches to her Home Ports being closed by the British Fleet, and with the cutting of the German cables in the Dover Straits on Aug. 5, she was isolated from the ports of the world. At the outbreak of hostilities there were permanent British squadrons stationed in China, Australia, the East Indies, at the Cape and in the Mediterranean, while the Home fleet protected the all important trade routes of the Atlantic. In August 1914, there was one light cruiser in the South Atlantic and the 4th Cruiser squadron (Craddock), detached from the 1st fleet, was in the West Indies. The 5th Cruiser squadron (Stoddart) was at once dispatched to the mid-Atlantic, between Africa and Brazil, and the ships of the 6th Cruiser squadron were scattered on special escort duties on the Atlantic Routes. The 9th Cruiser squadron (de Robeck) operated between Finisterre-Azores-Ma-

deira; the 10th Cruiser squadron (de Chair) formed the northern patrol with the Grand Fleet; the 11th Cruiser squadron was stationed off the west coast of Ireland and the 12th Cruiser squadron, supported by a French squadron, guarded the Channel approaches.

Germany was credited with the intention of arming merchant ships as commerce raiders and the small enterprise she displayed in this direction was one of the surprises of the early months of the war. Only five such ships appeared: the "Kaiser Wilhelm der Grosse," which evaded the Grand Fleet, the "Kronprinz Wilhelm" from New York, the "Cap Trafalgar" from the River Plate, the "Cormoran" and "Prince Eitel Friedrich" in China. The "Dresden" and "Karlsruhe," in the West Indies, were the only German cruisers in the Atlantic.

The British 11th and 12th Cruiser squadrons, besides protecting trade, were at first occupied in safeguarding the passage of the Expeditionary Force. De Robeck kept a close watch upon the Spanish ports where some of the 70 interned German ships were suspected of trying to get to sea and arm. None did so and on Aug. 26 the "Highflyer," of his squadron, found the "Kaiser Wilhelm der Grosse" coaling off the African Coast and sank her.

The North Atlantic.—The "Dresden" was at Port au Prince (Haiti) on July 26, and the "Karlsruhe" at Havana on July 28. Both sailed for unknown destinations and Craddock sent the "Berwick" and "Bristol" to locate them, following himself in the "Suffolk." On Aug. 6 the "Suffolk" came upon the "Karlsruhe" engaged in arming the "Kronprinz Wilhelm." The merchant ship made off and the "Suffolk" chased the "Karlsruhe" until dark, when she was headed off by the "Bristol." A short moonlight action ensued, but the German's superior speed enabled him to escape. The "Dresden's" whereabouts were unknown and Craddock, anxious for the safety of the North Atlantic trade, took his squadron to the northern area. Several German ships in New York were expected to attempt to get to sea and arm, but none ventured to move and by Aug. 13 the "Karlsruhe" had been located at Curaçoa and the "Dresden" off Pernambuco. The Admiralty on that day stated that British trade in the North Atlantic was proceeding as usual. Craddock, with his flag now in the "Good Hope," sailed south in search of the two German cruisers. Leaving two French cruisers to watch the West Indies, he searched the Pernambuco and mid-Atlantic areas and then joined hands with Stoddart. By the beginning of September, a number of armed merchant ships had joined the British Cruiser squadrons, which were also reinforced by four old battleships. By this time the North Atlantic was clear of enemy cruisers and owing to the movements of the squadron under von Spee, interest was transferred to the southern part of that ocean, to which Craddock's command was specially allocated.

The "Cap Trafalgar" which left the River Plate on Aug. 22 was found by the "Carmania" on Sept. 14 off Trinidada Island. After spirited action between the two armed merchant ships, the German ship sank and the damaged "Carmania" crawled back to Gibraltar for repairs. With the West Indian cruisers pre-occupied in watching the newly opened Panama Canal, the "Karlsruhe" was successful as a raider until she blew up at sea on Nov. 4; she had several narrow escapes and during her three months' career captured 17 ships.

THE FAR EAST AND PACIFIC 1914–15

When war was declared, Admiral Jerram was at Hongkong completing his mobilisation. With his squadron concentrated on Aug. 12, he destroyed the German wireless station at Yap Island. By Aug. 20 he had established a close watch on Tsingtau. Admiral von Spee was at the Caroline Islands with the cruisers "Scharnhorst," "Gneisenau" and "Nurnberg." He left on Aug. 6 for Pagan Island, where he was joined on the 12th by the cruiser "Emden," which had slipped out of Tsingtau, on Aug. 7, with supply ships. At Pagan Island von Spee heard of the Japanese ultimatum to Germany. Japan commenced hostilities against Germany on Aug. 22 and Jerram was thus freed to co-operate with the Australian squadron (Admiral Patey) in preventing von Spee from breaking through to the Indian Ocean.

The Fall of Tsingtau.—The primary objective of the Japanese was the German stronghold at Tsingtau. As soon as war was declared the port was blockaded by the Japanese Fleet and H.M.S. "Triumph" and Japanese troops were landed on Sept. 2. By Sept. 21 the fortress was invested by land and sea and on the next day, British troops having joined the Japanese, the general attack commenced. Tsingtau held out until Nov. 7 when it surrendered.

The Pacific Expeditions.—The Australian squadron, under Admiral Patey concentrated at Port Moresby on Aug. 7 and, on the 9th, appeared off Rabaul, the government centre of German New Guinea. No German ships were present and after destroying telegraphic communication the squadron sailed to meet the New Zealand Samoa Expedition at Suva. Von Spee's whereabouts being unknown, the presence of the battlecruiser "Australia" with this expedition was necessary. Samoa surrendered on Aug. 30 and Patey sailed to escort the Australian expedition against Rabaul. Little resistance was made to the landings on Sept. 11 and German New Guinea, with the Bismarck Archipelago, capitulated on Sept. 15. Patey's force was thus freed to attend to the Australian and New Zealand convoys, as by this time it was certain that von Spee's destination was South America.

The "Emden."—On Aug. 28 the German light cruiser "Emden" entered the Indian Ocean by way of the Molucca Strait and after being nearly found by the British cruiser "Hampshire" on Sept. 4 she made her dramatic appearance off the River Hoogly on Sept. 14. She ranged the Bay of Bengal until Sept. 25, bombarding Madras on the 22nd. Then for a month she cruised in the western approaches to Ceylon, coaling at Diego Garcia. On Oct. 21, after a narrow escape from the "Hampshire" and the armed merchant cruiser "Empress of India," she crossed the Indian Ocean, appearing off Penang on the 28th. There she sank the Russian cruiser "Zhemchug" and the French destroyer "Mousquet," and doubled back round the north of Sumatra. Unable to find her storeships, which had been sunk by the "Yarmouth," she made for the Cocos Islands. There on Nov. 9th, she was brought to action and sunk by H.M.A.S. "Sydney," so ending her remarkably successful raiding career in which she had sunk 15 ships.

Von Spee in the Pacific.—With Japan's entry into the war, von Spee's position in Chinese waters became untenable, and he decided to make for South America. After despatching the "Emden" on her memorable cruise, he sailed east, passing through the Marshall Islands on Aug. 22. Here he detached the "Nurnberg" to Honolulu and sailed himself for Christmas Island. Arriving on Sept. 6, the "Nurnberg" rejoined next day, having cut the British cables at Fanning Island. On Sept. 14 von Spee appeared off Samoa and finding the place already in British hands, again sailed east. By this date Craddock had taken over the command of the South Atlantic and was coming south in search of the "Dresden." Von Spee, after bombarding Tahiti on Sept. 22, visited the Marquesa Islands on Oct. 1 and arrived at Easter Island on Oct. 12. Here he was joined by the light cruisers "Leipzig" from North America and "Dresden" from the Atlantic. On Sept. 15 Craddock was ordered to concentrate his force upon the Falkland Islands and was promised reinforcements. He heard on Sept. 26 that the "Dresden" was off Chile and it was by then certain that South America was von Spee's destination. By Oct. 22 Craddock had collected his ships at the Falkland Islands and he then searched round the Horn, leaving the old and slow battleship "Canopus" to join him through the Magellan Straits. Meanwhile von Spee had arrived off Valparaiso and was cruising off the coast.

Coronel and the Falkland Islands Battles.—Craddock, after rounding the Horn, continued his search to the north and sent the light cruiser "Glasgow" into Coronel. Von Spee hearing of her at that port on Oct. 31, turned south to cut her off. Craddock, having heard the "Leipzig's" wireless, was searching for her on his way north. Neither admiral was aware of the proximity of the other until they met on the evening of Nov. 1, and the battle of Coronel (*q.v.*) was fought. The cruisers "Good Hope" and "Monmouth" were sunk and the other British ships made their escape and returned to the Falkland Islands. Von Spee, after

his victory, paid a visit to Valparaiso and then sailed south to St. Quintin Bay, about 300 miles north of the Magellan Straits.

The news of the Coronel defeat created consternation in England and immediate steps were taken to retrieve the position. The battlecruisers "Invincible" and "Inflexible," from the Grand Fleet, were placed under the orders of Admiral Sturdee, who was given a wide commission to seek out and destroy von Spee, wherever he might be, in the South Atlantic or Pacific Oceans. Sturdee left Plymouth on Nov. 11 and concentrated his force at the Abrolhos Rocks on Nov. 26, the same day that von Spee left St. Quintin Bay for the Falkland Islands. Now that von Spee's position was better known four other squadrons were quickly concentrated in order to deal with him. Patey, in the battlecruiser "Australia," with a squadron of British and Japanese ships watched the middle Pacific; a Japanese squadron was concentrated at the Galapagos Islands and the Battlecruiser "Princess Royal" was sent to the West Indies, in case von Spee should attempt to pass the Panama Canal. De Robeck on the African Coast and Stoddart off Montevideo were reinforced with armoured ships, in case von Spee should escape Sturdee, who, after searching the South American Coast, arrived at Port Stanley on Dec. 7 Von Spee rounded the Horn on Dec. 2, delayed for three days to coal from a prize in the Beagle Channel, and arrived off Port Stanley on the morning of Dec. 8. Sturdee put to sea and there followed the battle of the Falkland Islands (*q.v.*) in which the German squadron was destroyed, only one ship, the "Dresden," escaping.

The End of the Cruiser Campaign.—Despite the incessant demands for the protection of troop convoys and support for military expeditions that had so hampered the Admirals in their first duty of commerce protection, the British Navy in the first eight months of the war cleared the German flag from the outer seas. By the end of 1914, only one of the thirteen German cruisers abroad was unaccounted for and of the five armed merchantships only two remained at large. The "Dresden," escaping from the Falkland Islands battle, was hunted and helpless until she was sunk by the "Glasgow" and "Kent" at Juan Fernandez on Mar. 14. The "Kronprinz Wilhelm" (April 8) and "Prinz Eitel Friedrich" (Mar. 12) were interned at Newport News, and the "Königsberg," having been discovered in hiding in the Rufiji River was destroyed on July 11. By the end of Mar. 1915, the Canadian, Australian, New Zealand and Indian armies had been carried overseas, garrisons abroad had been replaced by territorial troops, without the loss of a troopship and naval support had been given to six considerable military operations. This was accomplished with the loss to the Navy upon the outer seas of three cruisers ("Good Hope," "Monmouth" and "Pegasus") and of 62 merchant ships. The German cruisers had caused a loss amounting to less than two thirds of 1% of British seaborne commerce during the period.

THE MEDITERRANEAN 1914

The Goeben and Breslau.—The first duty of the British Mediterranean squadron was to watch the movements of the German cruisers "Goeben" and "Breslau." On Aug. 3, their whereabouts being unknown, Admiral Milne stationed the 1st Cruiser squadron (Troubridge) with destroyers to prevent them entering the Adriatic and sent the battlecruisers "Indomitable" and "Indefatigable" towards Gibraltar to stop them interfering with the transport of Algerian troops or escaping into the Atlantic. At 10.30 A.M. on Aug. 4 the German cruisers, who that morning had bombarded Phillipville, were sighted by the British battlecruisers and were shadowed by them into Messina. On Aug. 5, the situation was complicated by the Italian declaration of neutrality and by Austria not yet being at war with Britain, while the information received by Milne was conflicting. Expecting the Germans to break westward, he placed his force to prevent them escaping from the north of Messina, leaving Troubridge to deny them the Adriatic. On the evening of Aug. 6th the Germans sailed from the south of the Straits, gallantly and skilfully shadowed by the "Gloucester." Troubridge did not bring them to action and when they passed Cape Matapan, the "Gloucester" was recalled from her precarious position. Milne followed into the Aegean on the 9th but was too late to prevent the two German ships entering the Dardanelles on Aug. 10. Their escape was unfortunate as it had a far-reaching effect upon subsequent events in the Near East.

After the safe passage of the Algerian troops the security of the Mediterranean was undertaken by the French fleet, which, using Malta as its base from Aug. 16, established a blockade of the Adriatic. Admiral Carden was appointed to command the reduced British force in the Mediterranean and with it he established a blockade of the Dardanelles. On Nov. 3rd, on Turkey declaring war, he bombarded the outer forts of the Dardanelles as a demonstration. The watch upon the Dardanelles was kept with few ships for the cruisers were called upon to guard the Malta–Port Said route during the passage of troop convoys. It was uneventful, except for the daring exploit of Submarine "B. 11," which on Dec. 13 dived through five rows of mines in the Dardanelles, torpedoed and sank the Turkish battleship "Messudieh" and returned safely.

OVERSEA CAMPAIGNS 1914–15

Togoland and the Cameroons.—A stroke by the Gold Coast forces on the outbreak of war led to the occupation of Togoland and the destruction of the important German wireless station at Kanima. Before the end of August the colony had surrendered and an attack was launched upon the German Cameroons. On Aug. 25 the British cruiser "Cumberland" and the gunboat "Dwarf" left Sierra Leone to attack Duala, followed by the cruiser "Challenger" and the Niger flotilla with a British and French military force. A base was established in the Cameroon estuary and after a month of flotilla warfare, in which the "Dwarf" played a prominent part, the river was cleared of mines and obstructions. The "Challenger" then entered and on Sept. 27 Duala surrendered to a combined naval and military attack. Nine large German steamers, a floating dock and two railway termini were captured. River warfare in support of the military advance inland then developed. The "Cumberland," "Challenger" and French cruiser "Bruix," being required elsewhere, were relieved by the cruiser "Astraea" from the Cape and with the arrival of the old cruiser "Sirius" and the sloop "Rinaldo" in April 1915 a blockade was established to prevent supplies reaching the enemy from the Spanish island of Fernando Po. The colony was, by this time, in Allied hands, but fighting in the hinterland continued for two years.

German South West Africa.—The attack upon this colony, started in Aug. 1914 by the South African Government, was delayed by the Boer revolt, but, the revolt having been suppressed, it was resumed early in 1915. The Union Army, escorted by the battleships "Albion," the "Astraea" and two armed merchant cruisers occupied Walfisch Bay and Swakopmund in January. The "Albion" was then sent to the Dardanelles and the "Astraea" to the Cameroons and, with the exception of some naval armoured cars the campaign became a purely military one. It was brought to a successful conclusion in July 1915 by the surrender of the colony.

German East Africa.—The German cruiser "Königsberg" was at sea on the outbreak of war and on Aug. 6 she made her only prize in the Gulf of Aden. Two days later, the "Astraea" and "Pegasus" appearing off Dar-es-Salam, the Germans blocked the entrance to the port, but agreed that the ships there should be considered British prizes, and the wireless station was destroyed. The "Königsberg," her base closed against her, was not heard of until Sept. 20, when she appeared off Zanzibar and finding the "Pegasus" with engines disabled in the roadstead, sank her at her moorings. Admiral Charlton, with the Cape squadron, was, by now, on the "Königsberg's" trail and she took refuge amidst the swamps of the Rufiji River, where she was located by the "Chatham." On Nov. 1 the East African Expeditionary Force, escorted by the battleship "Goliath" and cruiser "Fox," arrived from India. On Nov. 2 the troops landed at Tanga, under cover of the "Fox," but the attack made two days later was repulsed and the troops were re-embarked.

Following this reverse no serious military operations against the colony were undertaken until early in 1916. The 600 miles of coastline, with its many harbours, remained in the hands of the Germans and it was not until March 1915 that ships

could be spared to establish an efficient blockade. Meanwhile a strict watch had to be kept upon the "Königsberg" in the Rufiji River and several relief ships slipped through with arms and stores for the colony. On Dec. 14, boats sent in to Dar-es-Salam to take possession of the prizes, were fired upon and the town was then bombarded and the ships sunk. In the Rufiji River a ship was sunk to block the "Königsberg" in, but the cruiser was unapproachable until the arrival of shallow draught ships and aeroplanes. On June 3, 1915 the small monitors "Severn" and "Mersey" arrived with four seaplanes, and a month was occupied in preparing these craft for their work. On July 6 the first attack was made, the "Königsberg" was damaged but the monitors were forced to retire. On July 11 the attack was renewed and pressed home by the monitors, and the "Königsberg" was destroyed.

Persian Gulf and Mesopotamia.—An Indian Division, escorted by the "Ocean," and the sloops "Espiègle" and "Odin" arrived at Bahrein late in October and on the 30th received orders to commence hostilities against Turkey. On Nov. 6, after bombarding Fort Fao at the entrance of the Shatt-el-Arab, the troops landed. Advancing against considerable opposition, supported by the "Espiegle" and "Odin," an entrenched position was established at Abadan by Nov. 10. The force pressed forward supported by the two sloops and Basra was entered on Nov. 22, and a further advance ended on Dec. 9, in the occupation of Kurnah, at the junction of the Tigris and Euphrates. By this rapid and well planned stroke the command of the Persian Gulf and of the outlet from the Persian oilfields was assured.

In December the "Ocean" was withdrawn to the Dardanelles and the flotilla consisted of the "Espiègle" and "Odin," the vessels of the Royal Indian Marine and a number of armed river steamers and launches. In March of 1915 the "Clio" and four armed boats arrived from Egypt and in the late autumn the first of the new "Fly" class gunboats arrived from England.

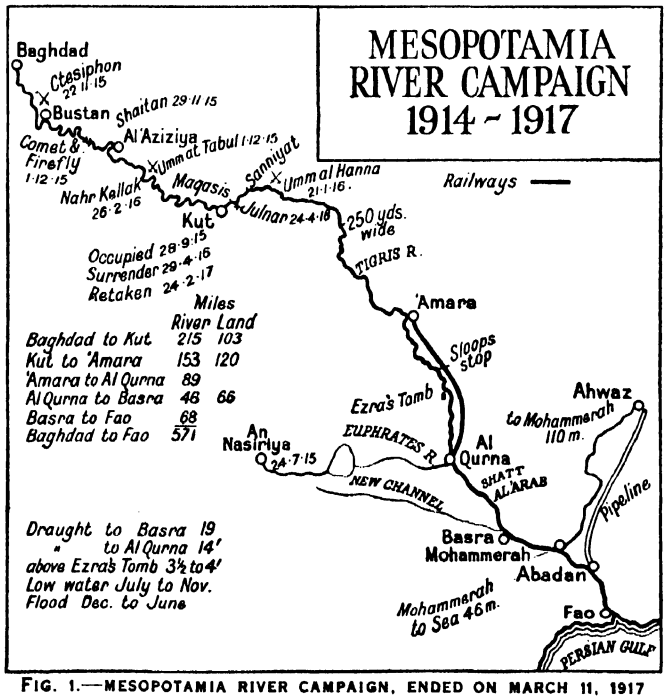

FIG. 1.—MESOPOTAMIA RIVER CAMPAIGN, ENDED ON MARCH 11, 1917

Throughout 1915 the flotilla formed the spearhead of the advance of the Army. It protected the oil pipe line by patrolling the Karun River and in April the Euphrates flotilla assisted in defeating the Turkish attack upon Basra. The remarkable amphibious battle north of Kurnah on May 31, was followed by the dash up the river by the flotilla after the retreating Turks, with General Townshend on board, and the capture of Amara. With the flotilla reinforced by four seaplanes from the Rufiji River, Townshend captured Kut and continued his pursuit of the Turks until he was brought up at Ctesiphon on Oct. 5. The political and military situation in the Near East then led to the illfated attempt upon Baghdad. The naval flotilla consisted of the gunboat "Firefly," the "Comet," two armed launches and four armed horse boats. After the repulse of the army at Ctesiphon, the withdrawal of the river transport was covered by the flotilla with the loss of "Firefly," "Comet" and "Shaitan," which grounded and were abandoned. Townshend reached Kut on Dec. 3, but by the 9th that place was invested and the flotilla was withdrawn down river.

Egypt.—By mid-November 1914, the careers of the "Emden" and "Königsberg" being ended the Indian Ocean was secure. The British cruisers were ordered homewards and Admiral Peirse, in the battleship "Swiftsure," reached Suez on Dec. 1 and detained in the Canal enough ships to meet the threatened Turkish attack upon Egypt. During December the "Doris" and the Russian cruiser "Askold" made a series of successful raids in the Gulf of Iskanderun and on the Syrian Coast. At the end of January 1915, when the Turkish attack developed, a strong naval force under Peirse's command took up its position in the Canal. The Turks made their attempt on the Canal on February 2 and 3 and were easily repulsed, the Canal traffic being but little interfered with. By Feb. 11, all threat to the Canal having disappeared, Peirse was able to send most of his ships to reinforce Carden's forces at the Dardanelles. A further threat to the Canal in April 1915 was frustrated by the presence of strong British and French naval forces.

HOME WATERS AND THE BALTIC 1915

The Battle of the Dogger Bank.—The year opened with the loss of the battleship "Formidable," which was torpedoed by "U. 24" off the Start on the morning of Jan. 1. In the North Sea the first weeks of January passed quietly, but on the 19th reports of German activity brought the British battlecruisers into the Heligoland Bight. Nothing was seen, but a Zeppelin raid on the East Coast indicated a repetition of the Scarborough raid. The battlecruisers remained concentrated in a position south of the Dogger Bank, supported by the Grand Fleet battleships to the northward. On the morning of the 24th the Germans were sighted and there followed the battle of the Dogger Bank (*q.v.*). The German squadron was driven back to its base with the loss of the cruiser "Blücher" and two battlecruisers badly damaged. Beatty's flagship "Lion" was severely damaged but returned safely to Rosyth. After the Dogger Bank action a change was made in the command of the High Sea Fleet and a policy of extreme caution was initiated. The German fleet put to sea only to cover minelaying operations and always retired behind its minefields on the approach of the enemy. Four of these "one day out and one day back" sorties in March, April and May were threatened by the Grand Fleet in force and the Germans retired.

The Baltic.—In the Baltic the Russian fleet, assisted by a few British submarines, was successful in holding the older ships of the German fleet in check. In June a German attempt to land troops in Courland in support of their army was defeated by the Russian destroyers and on July 2 the German minelayer "Albatross" was driven ashore by the Russian cruisers and the cruiser "Prinz Adalbert" was torpedoed and seriously damaged by the British submarine "E. 9." In August a part of the High Sea Fleet made a serious attempt to force the Gulf of Riga, but on Aug. 19 the battlecruiser "Moltke" was badly damaged by a torpedo from submarine "E. 1." The operations were abandoned and for some time the Baltic was the scene of only minor operations, but, in the closing months of 1915, the German iron trade with Sweden was harassed by British submarines, which sank 14 steamers engaged in the trade and the cruisers "Prinz Adalbert" and "Bremen" and a destroyer.

The Grand Fleet.—Improvements in the British intelligence, especially in directional wireless, gave timely warning of any movements of the German Fleet. By the end of the first quarter in 1915, the Allied flank in Flanders was stabilized, supplies to the army were ensured by the grip of the Dover and Harwich forces upon the narrow seas while the northern bases had been made

practically submarine proof. These factors led to a general redistribution of the British fleet. The Channel fleet was broken up and most of its ships were sent out to the Dardanelles. The Grand Fleet battle squadrons remained at Scapa Flow and Cromarty and the battlecruisers at Rosyth. During the year the Battle fleet swept down the North Sea to the Heligoland Bight no less than 17 times and many other searches were made of the Danish and Norwegian coasts by the battlecruisers and light forces. During one of these cruises "U. 29" was rammed by the "Dreadnought." The British Navy was short of destroyers until the autumn, when the new vessels began to appear. Until then constant calls were made upon the Grand Fleet for destroyers to assist the auxiliary patrol in hunting submarines. The work of the destroyers was incessant and arduous and due to their efficiency the Germans gained no major success with submarine or mine against the British fleet during the year. The northern blockade was maintained with increasing efficiency by the 10th Cruiser squadron, now composed entirely of armed merchant cruisers. The fleet base at Scapa Flow developed into a great training establishment for new personnel. A system of gunnery and other training was organised which brought the many new ships joining the fleet to a state of fighting efficiency in minimum time and new officers and men were trained for the ancillary services all over the world. This year of strenuous work was marked by no outstanding event after the Dogger Bank action and it closed with the disaster to the armoured cruiser "Natal," lost by internal explosion at Cromarty on New Year's eve. During August and September, Zeebrugge and Ostend were several times bombarded by the monitors and other ships of the Dover Patrol, in support of the Allied offensive. The results were inconclusive owing to the difficulties of fire observation and to the fact that the ships, finding themselves outranged by the heavy German shore guns were forced to keep at extreme range.

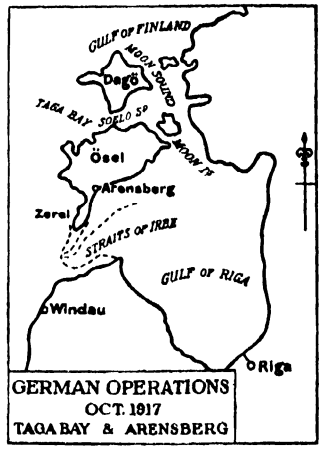

FIG. 2.—MAP SHOWING GERMAN OPERATIONS AT TAGA BAY AND ARENSBERG, OCTOBER, 1917

Submarine Warfare.—By the beginning of 1915 the ocean high-ways had been made safe for commerce, but the narrow seas around the British Isles were becoming unsafe for any traffic. On Feb. 17, 1915, Germany declared these waters to be a "War Zone" and announced her intention of using submarines to sink merchant-ships. Thus commenced the submarine campaign (*q.v.*). In the first quarter of 1915, 38 British ships were sunk by submarines and by Dec. 31 this number was swelled to 259. In the same period 48 ships were sunk by mines and the tonnage loss for the year approached 900,000 tons. For these two forms of warfare against trade Britain was unprepared and the submarine and minelaying tactics of the enemy produced a situation beyond the capacity of the weak and scattered coastal patrol and minesweeping flotillas. Trawlers, drifters, yachts and small steam and motor vessels of all kinds were armed to reinforce the flotillas. By the beginning of 1915, no less than 750 of these craft were in commission and their numbers were rapidly swelled at the opening of submarine warfare. By August 1915 the auxiliary patrol was a complete organization and the coastal waters were divided into twenty-one patrol areas. In each area destroyers and auxiliary craft were employed in submarine hunting, minesweeping, guarding channels, guiding traffic, rescue work and in many other duties. The auxiliary ships were manned by seamen, yachtsmen and fishermen, enrolled in the Royal Naval and Royal Naval Volunteer Reserves. As in days of old, the seafaring population of the country, of all classes, came forward in the hour of need and in its ceaseless watch around the coast until the end of the war, the auxiliary patrol paid a heavy price and rendered to the country service of incalculable value.

THE DARDANELLES CAMPAIGN

Early in 1915 political complications in the Balkans and the Russian wish for an open Dardanelles to ensure munitions supply, made imperative some demonstration of the Allied power in the Eastern Mediterranean. It was decided to attack the Dardanelles, where, since September, Admiral Carden had been keeping a close watch. In the redistribution of the British fleet, after the Falkland Islands battle, Carden was strengthened with a number of the older battleships and cruisers. The French Government offered a squadron and both naval and military aid was promised by Russia in the Black Sea. By the end of February, Carden's force consisted of the battlecruiser "Inflexible," the new battleship "Queen Elizabeth," 16 old battleships (4 French), 20 destroyers (6 French), a flotilla of 35 minesweeping trawlers and a seaplane carrier were on their way, and a varying number of cruisers and submarines were under his orders. Admiral de Robeck was appointed second in command. The Greek Government handed over the Island of Lemnos as an advanced base and Admiral Wemyss was appointed to command it.

From the first the naval view was that any attack upon the Straits by ships could be only a diversion unless it was backed by a strong military expedition. Steps were accordingly taken to send troops to the Aegean, but the situation on the eastern and western fronts caused delay and it was not until Feb. 20, after the first bombardment, that the decision was made to send out five divisions (4 British and 1 French).

The First Bombardment.—Bad weather in January made reconnaissance of the Straits difficult, but enough was done to enable Carden to recommend, on Feb. 15, that a naval bombardment was not a sound operation without a strong military force to consolidate the work of the fleet. But the political situation was critical and Carden was pressed by the War Council to

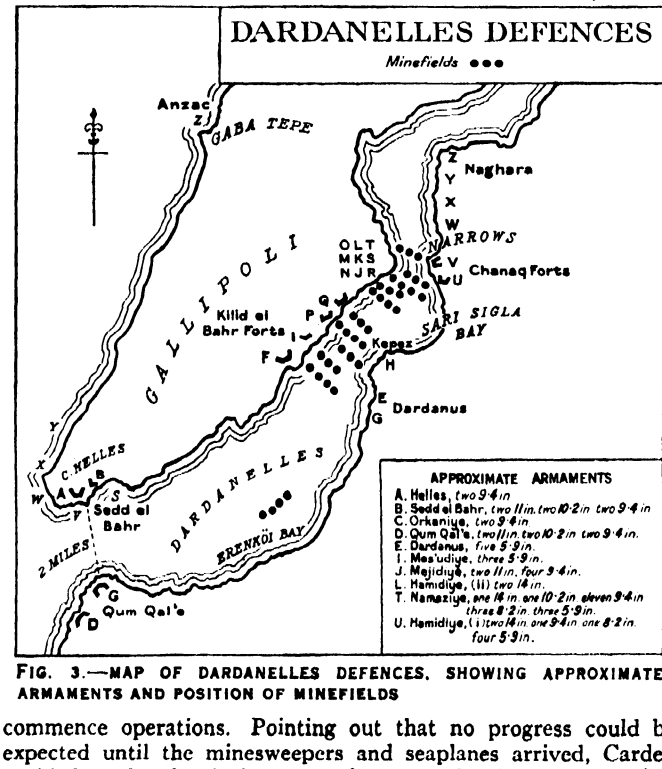

FIG. 3.—MAP OF DARDANELLES DEFENCES, SHOWING APPROXIMATE ARMAMENTS AND POSITION OF MINEFIELDS

commence operations. Pointing out that no progress could be expected until the minesweepers and seaplanes arrived, Carden decided to bombard the outer forts on the first opportunity. Owing to bad weather this did not occur until the 19th and at 10 A.M. on that day the battleship "Cornwallis" fired the first shot of the campaign at Fort Orkaniye. The forts were hit repeatedly and made no reply, but when the "Vengeance" (flying de Robeck's flag), closed to moderate range she received a hot fire from all guns. Thus early it was proved that long range bombardment of modern earthworks was ineffective unless the

ships can close to decisive range and knock out each gun by direct hits. (*See* NAVAL STRATEGY AND TACTICS.)

Carden was now informed that he was expected to force the Straits without military assistance. On February 25, after a four days gale, a bombardment, commencing at moderate range, was intensified by British and French ships closing in towards the shore. The four outer forts were silenced and the minesweepers began clearing the Straits. Next day, demolition parties, supported by marines landed to complete the destruction of the forts, and the fleet, going as far up the Straits as had been swept, bombarded the inner forts at long range. As before the forts made no reply when hit, but the ships were badly worried by mobile howitzers on each shore, which could not be located. Gales delayed operations for two days and on March 1 and 2 the Narrows were again attacked, with similar results, the ships being constantly hit by an increasing number of hidden howitzers. Each night the minesweepers were driven off by gunfire as they attempted to sweep the minefields off Kephez. On March 3 de Robeck reported that the Straits could not be forced unless one shore or the other were occupied and that no progress was possible without military assistance. This was emphasized on March 4 by the repulse of the demolition parties, showing that the time was past for employing small forces onshore.

As yet, no definite decision had been made as to the scope of any military operations. In spite of the Admiralty's reiterated demands for troops and the doubts of General Birdwood on the spot, that the fleet could force a passage unaided, Lord Kitchener, at the War Office, in his instructions to General Sir Ian Hamilton, on the latter's appointment as commander-in-chief, only contemplated "the employment of military force on any large scale . . . at this juncture. . . . in the event of the fleet failing to get through after every effort has been exhausted." (*See* W. S. Churchill, *The World Crisis*.) Mr. Winston Churchill, as First Lord, continued to urge the fleet to new efforts and on March 11, Admiral Carden was told "the results to be gained are . . . great enough to justify loss of ships and men if success cannot be obtained without it."

A naval attack was, therefore, planned for March 18, by which time General Sir Ian Hamilton would have arrived. Meanwhile daily bombardments of the forts produced indefinite results and desperate attempts were made nightly without success to sweep up the Kephez minefields. All experience proved that until the mobile guns were suppressed they could prevent minesweeping operations, and until the minefields were cleared ships could not approach to decisive range at which alone they could destroy modern earthworks. On March 16 Admiral Carden's health broke down and he was forced to hand over his command to Admiral de Robeck, who at once proceeded to carry out the attack planned.

The Naval Attack of March 18.—The plan of attack arranged for the four modern ships ("Inflexible," "Queen Elizabeth," "Lord Nelson" and "Agamemnon") to engage the inner forts at 14,000 yards, whilst a British and French division, of four old ships each, alternately pressed home the attack to 10,000 yards, which was the limit of the swept area. Two old battleships on each side were to attempt to keep down the fire of the small guns onshore. The action commenced at 11.30 A.M. on the 18th. Little reply came from the forts, but unseen guns opened a heavy fire. The "Agamemnon" was frequently hit and the "Inflexible" forced out of the line with her forebridge burning. At noon the French division passed through the British line, closed to 10,000 yards and received a hot fire from the forts. The "Gaulois" was forced out of action and the "Bouvet" was heavily hit, but the squadron gallantly held its place and by 1.45 the fire of the forts was slackening. De Robeck then sent the British division in to relieve the French and ordered the minesweepers up to clear the channel. At 2.0 P.M. as the French squadron was steaming out the "Bouvet," struck a mine, blew up and sank in a few minutes, with nearly all hands. The British division engaged the forts with apparent success until 3.0 P.M. when the "Irresistible" struck a mine and sank, her crew being saved. The fire from the forts now became intermittent, but at 4.5 P.M. the "Inflexible" was mined and ten minutes later a similar fate befell the "Ocean." The "Inflexible" reached Tenedos and was beached, but the "Ocean" was abandoned and sank. The ships withdrew just after 6 P.M. and as they did so the forts opened a heavy but inaccurate fire; the attempt to force the Straits thus ended in failure. The forts had been damaged but were not put out of action and the minefields were still intact. The loss to the Allies had been severe: three battleships sunk, three heavy ships badly damaged and others severely handled.

The First Landings.—For political reasons the campaign had to be continued and the failure of the fleet to force the Straits necessitated the landing of an army upon the Peninsula. For this operation the transports were unprepared and the army was concentrated in Egypt to reorganise, a valuable month thus being lost. (*See* DARDANELLES CAMPAIGN.) Meanwhile the fleet reconnoitred and prepared for the landing and, when the weather permitted, harassed the Turkish reinforcements now crowding on to Gallipoli. Smyrna was strictly blockaded and the Russian fleet was active off the Bosphorus.

By April 23, the transports had reassembled at Mudros and the work of getting into position for the landings commenced. The weather favoured the operation and early on the morning of the 25th, landings were effected on five beaches around Cape Helles and Gaba Tepe (Anzac). At the same time, French troops gained a footing on the Asiatic side and a demonstration was made in the Gulf of Xeros; 18 battleships, 12 cruisers, 29 destroyers, 8 submarines and a host of small craft supported the landing. At each beach, the covering ships went close inshore in support, whilst the attendant ships carried the troops and aided by small craft and boats suited to the particular beach, landed them. Opposition was severe and losses very heavy but by sunset the army was established ashore and the naval parties had the work of organising the beaches well in hand. Thenceforward the campaign became mainly a military one in which the rôle of the Navy was to support the troops by gunfire, to evacuate wounded and to ensure the supply of food, water, stores, munitions and reinforcements to the beaches. This task was an arduous and dangerous one and casualties on the beaches were heavy. The old battleships "Albion" (April 28) and "Prince George" (May 5) were so damaged by gunfire that they had to be docked and on May 13, the "Goliath" was torpedoed by a Turkish destroyer and sank with great loss of life. The appearance of German submarines in the Mediterranean now rendered the position of heavy ships employed off the Peninsula precarious. The "Queen Elizabeth" was ordered home to join the Grand Fleet and the replacement of battleships by monitors and old "bulged" cruisers commenced, but two more battleships were lost: the "Triumph" on May 25 and the "Majestic" on May 27, both torpedoed at night by "U. 21."

Lord Fisher Resigns.—The War Council decision on May 14 to continue the campaign led to the resignation of Lord Fisher (*q.v.*). This was followed by the reconstruction of the Government and the removal of Mr. Winston Churchill from the office of First Lord of the Admiralty. Throughout the summer months the navy supported and supplied the army on the peninsula, and more troops being sent out, a successful landing was made at Suvla Bay on the night of Aug. 6–7. But neither here nor at the other positions was any appreciable progress made onshore and all idea of forcing the Straits with the fleet was consequently abandoned. Submarines alone could pass the Narrows and of the 12 boats (9 British and 3 French) which made the adventure, 7 were lost. The presence of these vessels in the Marmora, however, produced such alarm as greatly to interfere with the Turkish supplies to the Peninsula.

The Evacuation.—By the end of October the defeat of the Serbian Army and the opening of the Salonika Campaign hastened the decision to withdraw from Gallipoli, and preparations for this difficult operation commenced. Night by night, the vast accumulation of stores were removed and on the night of Dec. 18–19 the troops were withdrawn from Suvla Bay and Anzac under cover of the fleet. So successful was the operation that the Turks knew nothing about it and awoke to find that their enemy had vanished. The more difficult evacuation of the Helles Beaches was accomplished on Jan. 8–9, 1916, without the loss of a man. Little of value was left in the hands of the enemy and

with these two wonderful examples of naval and military co-operation the ill-fated campaign was brought to a close.

HOME WATERS 1916

Heavy weather in January hampered the work of the 10th Cruiser squadron on the northern patrol and caused damage to the submarine defences of Scapa Flow and on the 6th the battleship "King Edward VII.," struck a mine off Cape Wrath and was lost. Scheer succeeded von Pohl in command of the High Sea Fleet in January and he at once adopted more energetic tactics. On Feb. 10 German destroyers appeared on the Dogger Bank and sank the sloop "Arabis," whilst minesweeping. A sweep by the Grand Fleet followed with the usual barren result. During the dark February nights the raider "Moewe" slipped homeward through the blockade after her successful cruise and the "Greif," another raider, in attempting to break out was brought to action by the armed merchant cruiser "Alcantara" on Feb. 29 and both ships were sunk. Cruising constantly during March the Grand Fleet saw nothing of the enemy until March 24–25 when the Harwich Force met a Division of enemy destroyers at night. The German "G. 194" was rammed and sunk by the light cruiser "Cleopatra" and a British destroyer was lost by collision. On April 23 the German fleet put to sea, the battlecruiser "Seydlitz" being forced to return after striking a British mine. Zeppelins raided the East Coast on the night of April 23–4 and at daybreak Yarmouth and Lowestoft were bombarded by the German battlecruisers. The Harwich Force engaged them and the light cruiser "Conquest" received heavy damage from their fire as they hurriedly retired eastward, reaching their minefields just in time to escape Beatty's battlecruisers. The 3rd Battle squadron (7 King Edward's) was stationed in the mouth of the Thames at the end of April to deal with the coastal raids and on April 26 a heavy mine and net barrage was laid in the Straits by the Dover Patrol. On May 4–5 an aerial attack, supported by the Grand Fleet, was made upon the Zeppelin sheds at Tondern. One Zeppelin was destroyed at sea. Mines were laid off the Horns Reef and Borkum before the fleet returned north.

The Battle of Jutland.—At the end of April, in deference to protests from the United States and other neutrals, the German submarines received orders to cease sinking merchant ships without warning. Scheer thereupon determined to use the submarines thus released in an attempt to trap the British fleet. By May 23, 22 submarines were stationed off the British bases, and the High Sea Fleet was to put to sea on that day in the hope of enticing the Grand Fleet over them. The plan had to be modified as the weather delayed the German fleet until May 30. On that day, following upon reports of unusual activity by the enemy, the Grand Fleet sailed on one of its periodical southerly sweeps. On May 31, after a preliminary action between the rival battlecruiser forces in which the British suffered heavy losses, the two main fleets met and the battle of Jutland (*q.v.*) was fought. The German fleet after sustaining severe damage and being skilfully extricated from a very dangerous situation, eluded the British fleet at night and retired behind its minefields at daylight on June 1. The Grand Fleet returned to its bases on the 2nd and 3rd of that month.

June 5 was marked by the tragic loss of the "Hampshire," with Lord Kitchener on board, after striking a mine on the Orkney coast.

There were no large fleet movements during June as the High Sea Fleet was repairing its damage after Jutland. All the damaged British ships rejoined the Grand Fleet by the middle of July when a number of exercise cruises took place. In the second week in August, just as before Jutland, an unusual number of submarines were reported in the North Sea. Expecting another move on the part of the High Sea Fleet, Jellicoe swept south in force on August 18. Next morning ten Zeppelins were located stretched across the North Sea. By noon a fleet action appeared imminent, the battle fleets being only 42 miles apart, but warned by the Zeppelins, Scheer turned and made for home, and was soon beyond pursuit. The German battleship "Nassau" was twice torpedoed by a British submarine as the fleet put to sea; the cruisers "Nottingham" and "Falmouth" were torpedoed and sunk; and two submarines were accounted for by the British flotillas during the operation.

During the autumn British squadrons were constantly at sea on observation cruises, while regular British cruiser patrols were established in the North Sea and a submarine patrol was maintained off the German ports. But the German fleet made no move until the night of Oct. 26, when two German destroyer flotillas, working from Zeebrugge, made their first raid on the Dover Straits, sinking two British destroyers and seven drifters and escaping unscathed. On Nov. 5 a division of the German fleet put to sea to help a stranded submarine. The British submarine "J. 1" was waiting and succeeded in torpedoing and damaging the battleships "Kronprinz" and "Grosser Kurfürst."

Jellicoe, First Sea Lord.—The long winter nights at the end of November enabled the raiders "Moewe" and "Wolf" to break through the blockade. This was annoying but not serious, for it was the submarine which had now become the menace to shipping and exceptional measures were called for to deal with it. At the end of November, therefore, Admiral Jellicoe was appointed First Sea Lord to take over this great task. Admiral Beatty succeeded him in command of the Grand Fleet.

In September war against merchant ships was renewed with ever increasing vigour. During 1916, 436 British merchant ships were lost, totalling 1,250,000 tons. Of these 322 were sunk by submarines, 88 by mines and 26 by raiders, etc. During the year a further 218 merchant ships had been attacked by submarines and had escaped.

THE MEDITERRANEAN 1915–16

The French fleet based upon Malta blockaded the Straits of Otranto watching for the Austrian "Dreadnought" squadron. The latter made no move but the Austrian submarines were active and the battleship "Jean Bart" (Dec. 1914) and the cruiser "Leon Gambetta" were torpedoed and sank. The French admiral withdrew his heavy ships to Malta and kept watch upon the narrow waters of the Adriatic with cruisers and destroyers. In May 1915, after prolonged negotiations as to the distribution and command of the Allied fleets in the Mediterranean, Italy declared war against Austria. The Italian fleet, reinforced by 4 British battleships and 4 light cruisers and by 12 French destroyers and 7 submarines became responsible for the Adriatic blockade. The French Admiral remained nominally in command of the Mediterranean, controlling the western basin, whilst naval operations in the Levant were under British control. The Italian battle squadron was based upon Taranto, but it was upon the cruisers, working from Brindisi, that the principal burden devolved. The cruisers "Dublin" (June 9) and "Giuseppe Garibaldi" (July 18) were torpedoed by Austrian submarines and the latter sank. In September a barrage of British net drifters was placed across the Straits of Otranto, but owing to the depth of water it was not very effective.

The Dardanelles campaign dominated other events in the Mediterranean during 1915 and, with the appearance of German submarines in that sea during the summer, the task of protecting the stream of transports and supply ships became very difficult. In the autumn the almost simultaneous decision to evacuate Gallipoli and to commence the Salonika Campaign (*q.v.*) made demands upon the British transport service which all but stressed its powers to breaking point, and the losses caused by submarines became very serious.

Dedeagatch was bombarded on Oct. 21 and a British squadron was constantly operating at Salonika and on the Bulgarian coast until the end of the war. The collapse of Serbia in November 1915 was followed by an Austrian naval raid upon Durazzo. The raiding force was engaged by the "Dartmouth," "Weymouth" and "Nino Bixio" (Italian), the Austrians escaping with the cruiser "Helgoland" badly damaged and a destroyer sunk. Corfu was occupied as a base for the Serbian army in Jan. 1916 but the subsequent vacillating conduct of Greece did much to hamper the Allies during the Salonika campaign (*q.v.*).

The year 1916 in the Mediterranean was a continual struggle with the German and Austrian submarines, whose use of the

Greek ports and islands called for constant British and French activity around that coast. In December after an Allied force, landed from the fleet, was treacherously fired upon at Athens, a strict blockade of Greece was declared and enforced by the Allies. The British Aegean squadron, which was reinforced at the end of the year by four battleships, kept a close watch upon the Dardanelles and the Syrian coast during 1916.

Overseas Campaigns.—On Feb. 28, 1916, the final surrender of the colony brought the Cameroon Campaign to an end. In East Africa, although the coast was blockaded by the Cape squadron, the coast towns remained in German hands until September 1916. By this time all were occupied and the colony was cut off from the sea. The command of Lake Tanganyika was established by two British motor boats, carried 2,000 miles overland from Capetown, but fighting in the interior continued until after the Armistice. In Mesopotamia, 1916 was a year of pause and preparation for the next campaign. Kut surrendered on April 29 after a gallant naval attempt to relieve the town had failed five days previously.

UNRESTRICTED SUBMARINE WARFARE 1917

After the refusal of the Allies to consider her proffered peace terms at the end of 1916, Germany saw that her fate was sealed unless she could by some means, break the Allies' sea power (*q.v.*). The German High Naval Command was granted its wish and it was proclaimed that, after Feb. 1 submarines would sink all merchant ships on sight and without warning. The commencement of this ruthless campaign (*see* SUBMARINE CAMPAIGN) was followed by the severance of diplomatic relations between the United States and Germany and on April 6 the United States entered the war against the Central Powers. The German aim was to strike a fatal blow by bringing the Allied, and more especially the British, seaborne trade to a standstill by sinking so many ships as to reduce seriously available tonnage and to make the merchantmen refuse to face the risk of sailing. To some extent this latter was successful at first, in the case of neutral shipping, but British merchantmen continued to put to sea in spite of the heavy toll taken by the submarines. During February and March a weekly average of 23 British ships were lost and in April, the darkest month for British shipping, 196 vessels of nearly 600,000 tons were sunk. These losses were so serious, that, had they continued, success must have ultimately rewarded the German effort.

The Convoy System.—Every known method of protecting shipping at sea was adopted: camouflage (*q.v.*), defensive gun armaments, zig-zag courses in submarine waters and directing traffic along routes patrolled by craft armed with every anti-submarine device were all tried; but still the toll of losses grew. In spite of constant changing of the patrolled routes, by the end of March this system had definitely broken down and the Convoy System (*q.v.*) was adopted. To this there was, at first, much opposition, both from the fleet and from merchant owners and ship masters, and the difficulties appeared insuperable. Chief amongst these was the finding of sufficient escort ships, mainly destroyers, for the convoys. The destroyers from the Grand Fleet and Harwich could not be spared, as the High Sea Fleet was still in being and a menace, and there were but few others. The arrival of an American flotilla at Queenstown and of a Japanese one in the Mediterranean eased the situation: the Admiralty under Jellicoe persevered and by the end of May the Convoy System was in full swing. Its effects were immediate. In the second quarter of 1917 the weekly average losses amounted to over 30 merchant ships: in the third quarter this was reduced to just over 20 and in the last quarter to well below that figure, whilst in 1918 the average weekly loss was under 15. In all, 88,000 ships sailed under convoy during the war with a loss of only one half of 1%. During 1917, 1,134 British ships were sunk by submarines, whilst 841 others were attacked and escaped: 137 were sunk by mines, mostly laid by submarines and 38 by surface craft. The total tonnage loss for the year was over 3,500,000 tons and as a counter to this great loss 75 German submarines were sunk.

VARIOUS OPERATIONS 1917

The Dover Raids.—The German submarine and destroyer bases at Zeebrugge and Ostend were frequently bombarded by the monitors of the Dover Patrol but, although much damage was done, the lock gates and basins were not hit. The mine and net barrage in the Straits was constantly patrolled by destroyers and drifters and German destroyers made several attempts, by night raids on the patrols, to open a way for their submarines into the Channel. On the night of March 17 a German flotilla attacked the patrol, sank the destroyer "Paragon" and damaged the "Llewellyn." On April 20, they were not so successful, for the raiding flotilla was met by the "Swift" and "Broke" and, in the spirited hand-to-hand fight that ensued the German destroyers "G. 42" and "G. 45" were sunk. Thereafter, except for ineffectual sorties on April 26 and May 2, no raid was made upon the Dover Straits for nearly a year. Further north the Harwich Flotilla was constantly on the alert and on Jan. 23, in a night melée with a flotilla off the Dutch coast, the German leader was forced into Ijmuiden badly crippled, another boat was driven back to Zeebrugge and the British destroyer "Simoon" was sunk.

The Scandinavian Convoy.—Although to a great extent covered by the Grand Fleet cruisers and escorted by destroyers, the Scandinavian convoy was open to bold attack by the German surface craft and two such attacks were successful. On Oct. 17 two German light cruisers met this convoy of nine vessels, sank the escorting destroyers "Strongbow" and "Mary Rose" and the ships of the convoy without warning and escaped unscathed. Again on Dec. 12 a German flotilla attacked the convoy and sank the destroyer "Pellew" and four armed trawlers, most of the merchant ships escaping. These two mishaps led to a reorganization of this convoy route and to the strengthening of the escorts.

The Action of November 17.—Owing to delays in the production of mines, the British policy of intensive mining off the entrances to the German ports was not put in force until October. This was followed by a great increase in the German minesweeping service, some of the flotillas having to work as far as 150 miles from Heligoland. In November the Grand Fleet cruisers constantly raided the Bight and the Cattegat and on Nov. 2 the decoy ship "Kronprinz Wilhelm" was sunk in the latter area. On Nov. 17, two British light cruiser squadrons, supported by battlecruisers, attacked the German minesweepers and their covering force in the Bight. A long range action followed, the Germans retiring under smoke-screens to the minefields, when two battleships appeared in support and the British force withdrew. In this indecisive affair the light cruiser "Königsberg" was heavily hit and one German outpost vessel was sunk and on the British side the light cruiser "Calypso" was hit and her captain killed. On Dec. 23 three destroyers escorting the Dutch convoy steamed into a German minefield off the Maas Lightship and were sunk in quick succession. The Grand Fleet suffered a heavy loss when the battleship "Vanguard," on July 9, was lost at Scapa Flow with nearly all hands, owing to an internal explosion.

At the end of the year Admiral Wemyss relieved Admiral Jellicoe as First Sea Lord and Vice-Admiral Keyes took over the command of the Dover Patrol, in succession to Vice-Admiral Sir Reginald Bacon.

The Baltic in 1917.—A few British submarines operated in the Baltic throughout the year, being employed mainly on reconnaissance work by the Russian Admiral. In October, after Riga was captured by the German Army, an attempt to open up the Gulf of Riga was made by the High Sea Fleet, and a military force was successfully landed on Osel Island. The Straits of Irben were swept but the battleships "Bayern," "Grosser Kurfürst" and "Markgraf" all struck mines. The Russian battleship "Slava" was sunk but after three German battleships had been attacked by British submarines the naval force was withdrawn, leaving Osel Island in military occupation.

Mesopotamia, 1917.—After many months of preparation, General Maude commenced his advance up the Tigris in Feb. 1917. The army was supported by a flotilla of eight new river gunboats and a number of armed river steamers. Kut was retaken on Feb. 24 and in the heavy fighting that followed the

naval flotilla played a prominent part. The 6-inch and 4-inch guns of the gunboats did much to convert the Turkish retreat into a rout and the British flag was hoisted over Baghdad on March 11. (*See* MESOPOTAMIA OPERATIONS.)

The Mediterranean, 1917.—Allied naval strategy was centred in the Adriatic during the year, for the French and Italian battle squadrons had to keep a watchful eye upon the Austrian dreadnoughts. But the enemy submarines and not the battleships became the dominating factor and, using the Austrian bases, they operated all over the Mediterranean. Their target was a vast one consisting of the great volume of trade to the East, swelled by troop and supply ships feeding the armies at Salonika (*q.v.*), in Egypt, in Syria (*q.v.*) and in Mesopotamia. The 40-mile Otranto Straits were too deep for mining and were patrolled by 50 British North Sea drifters, supported by British and Italian cruisers and destroyers. Stopping the passage of enemy submarine was a difficult task and the patrols were always open to sudden raids. On May 15 Austrian cruisers and destroyers descended upon the patrols and sank 14 drifters before they were chased back to Cattaro by the cruisers "Weymouth" and "Dartmouth." The latter ship was torpedoed during the action but did not sink.

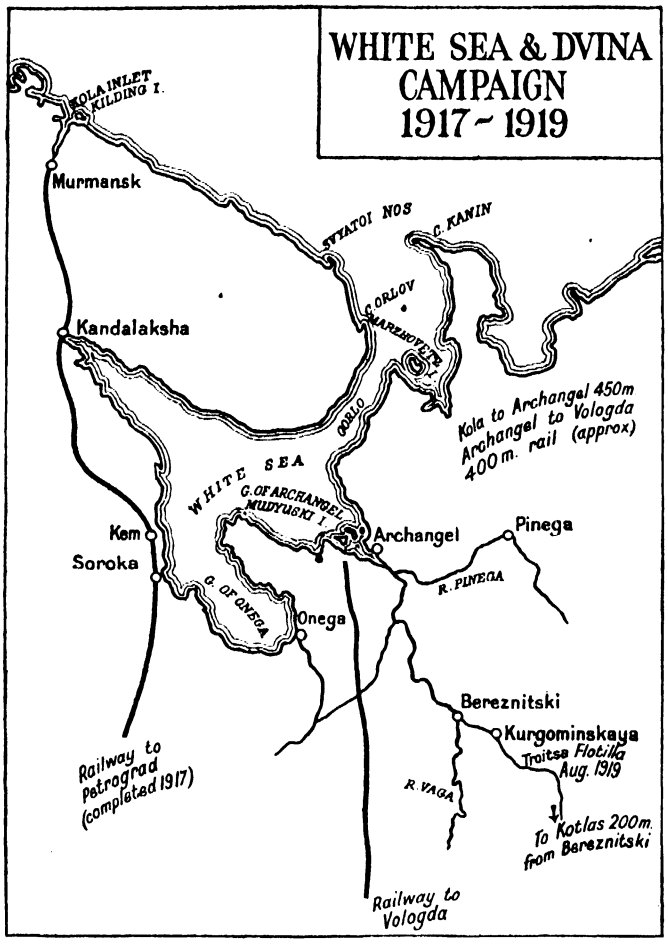
Owing to separate commands in the different areas, difficulties arose in the co-ordination of the methods of protecting merchant ships from submarines and by the middle of the year the losses in the Mediterranean became very serious. In August a British commander-in-chief was appointed to Malta as the single authority responsible for trade protection in that sea. A convoy system was started, under the escort of British and Japanese destroyers and the toll of losses was gradually reduced. A further co-ordination of naval effort followed the meeting of the Allied Naval Council at Malta in November. During the year a British squadron of two battleships and a number of cruisers cruised in the Levant, watching the Dardanelles and co-operating with the Salonika force. On the Palestine coast, a flotilla of monitors, destroyers and gunboats took an active part in the battles of Gaza (*q.v.*), which led to the fall of Jerusalem (Nov. 11).

THE NORTH SEA AND CHANNEL 1918

During 1918 the mine became predominant as a counter to the submarine and a duel developed between the two weapons. The mine barrage in the Dover Straits was strengthened and with the patrol craft armed with every known anti-submarine device nine submarines were accounted for in that area during the early weeks of the year and it became evident to the German naval command that the passage of the Straits was virtually closed to them. They made two attempts to reopen the Straits. On Feb. 15 a destroyer flotilla raided the patrols at night, sank seven drifters and a trawler and escaped without being brought to action. On March 21 a similar raid was not so fortunate, the German flotilla being met by British destroyers. One German destroyer was rammed and cut in half by the "Botha," another was sunk by gunfire and the Germans were chased into Ostend. The "Botha" was torpedoed but reached Dover safely.

Zeebrugge and Ostend.—This proved to be the last German attempt upon the Straits, but as long as their bases at Zeebrugge and Ostend remained in being, raids were to be expected. As early as 1914, Jellicoe had proposed an attempt to block these places, but it was not until the last months of his time at the Admiralty that active steps were taken to put the plan into execution. Admiral Keyes was appointed to Dover to carry it out. After weeks of secret preparation, the mixed force selected sailed on the afternoon of April 22 to attempt to block the entrances at Zeebrugge and Ostend. (*See* BELGIAN COAST OPERATIONS.) The flotilla returned to Dover next morning, its mission at Zeebrugge accomplished. At Ostend the blockships failed to find the entrance, but this was remedied a fortnight later, when a volunteer crew took the "Vindictive," of Zeebrugge fame, into Ostend and sank her in the entrance. These two brilliant actions did not entirely block the Flanders Coast bases, but their moral influence was great and they acted as an added inducement to the German submarines to shun the waters of the Dover command and to confine their efforts to gain the open sea to surmounting the lesser perils of the northabout route.

Last Sortie of the German Fleet.—The Scandinavian convoy remained a bait for the High Sea Fleet and on April 23 it put to sea, for the last time in full strength, to try to intercept it. The date was an unfortunate one for the German enterprise for on that day both outward and homeward bound convoys were in the vicinity of the Forth. The British intelligence system, usually efficient, failed this time to warn Beatty that enemy were at sea and the German battlecruisers reached the Norwegian coast at Lat. 60 N. before they were reported. Here the "Moltke" broke down and had to be taken in tow. The German fleet made for home at its best speed; the "Moltke" was torpedoed by Submarine "E. 42" on her way south, but managed to reach her base.



The Northern Barrage.—Frequent raids were made by the British cruisers and destroyers upon the flotillas engaged in clearing ways for the German submarines through the minefields and on April 15, during a raid into the Cattegat, 14 German trawlers were sunk. From the commencement of the British intensive mining policy in the autumn of 1917 until Feb. 1918 over 16,000 mines had been laid in the Heligoland Bight. On Feb. 15 a deep minefield was laid in the Cattegat and the following month saw the beginning of the greatest minelaying operation of the war, the laying of the Northern Barrage. (*See* article SUBMARINE MINES.) This vast undertaking, the closing by mines of the northern entrance to the North Sea from the Orkneys to the Norwegian coast, involved the laying of over 70,000 mines. The mines were made in the United States and were laid by British and American vessels, escorted by the squadrons of the Grand Fleet, with which for some time an American battle squadron had been working. The Northern Barrage was successful both as a moral deterrent and by the number of submarines destroyed in it.

The End of the Submarine Campaign.—By the middle of 1918 the mastery of the Allies over the submarine was in sight, both from the number destroyed and from the lessening toll they took of merchant ships. In the first nine months of the year over 60 submarines were sunk by the Allied naval forces: the average weekly loss of British merchant ships was over 17 in the first quarter of the year and by the third quarter this figure was reduced to under 11. During 1918, 1,108 submarine attacks were made upon British merchant ships; of these 581 were sunk and 527 escaped, a far higher percentage than hitherto. During 1918 only 8 British ships were lost by mines, a figure that attests the efficiency of the Auxiliary Patrol and Minesweeping services.

On July 19 a naval air raid, supported by the Grand Fleet, was made upon Tondern and a Zeppelin shed was destroyed. In another raid on August 11 made into the Heligoland Bight by cruisers and coastal motor boats, a Zeppelin was brought down and destroyed, but the motor boats suffered heavily from the enemy air craft. These proved to be the last two important operations of the Grand Fleet during the war.

The White Sea, 1918–19.—The closing of the Black Sea and the Baltic brought the northern route to Russia into prominence and vast quantities of munitions and fuel were, in 1917, sent to the ice free port of Murmansk (connected by rail to Petrograd in 1917) and to Archangel, which was open from July to October. When Russia collapsed in 1917 the old battleship "Glory" and the cruisers "Cochrane" and "Amiral Aube" (Fr.) were sent to Murmansk and were followed in May 1918 by the cruiser "Attentive," the seaplane carrier "Narana" and a force of 9,000 troops (2,100 British). The object of the expedition was to prevent Germany using these ports as submarine bases, to keep open supplies and give support to the anti-Bolshevik forces under Kolchak (*q.v.*). Archangel was occupied in August after a spirited duel between the "Attentive" aided by the Narana's seaplanes and the forts, and an advance was made along the railway towards Vologda and up the Dwina river towards Kotlas, the latter being supported by a flotilla, which included a British monitor and a number of local river steamers fitted out as gunboats and motor launches, mostly manned by British crews. Troitsa, 250 miles from Archangel, was occupied

in September, when the flotilla had to retire before the river began to freeze. In April 1919 a British flotilla, which eventually included 6 monitors, 6 river gunboats, minesweepers, and coastal motor boats, 18 seaplanes and a kite balloon, assisted in the attempt to advance to Kotlas, but Kolchak's effort failed and political influences caused the Allied Governments to order a withdrawal from North Russia. The flotilla successfully covered

the re-embarkation with the loss of two small monitors. By the end of Sept. 1919 the evacuation was complete.

The Baltic, 1918.—The British submarine flotilla, working under the orders of the Russian commander-in-chief, was stationed at Helsingfors during the winter of 1917–18. After the break-up of Russia, the Germans advanced upon Helsingfors, and on April 3, 1918, the flotilla of seven boats was taken to sea through the ice and sunk to avoid falling into the hands of the enemy.

The Mediterranean and Black Sea, 1918.—Early on the morning of Jan. 20, the "Goeben" and "Breslau" suddenly reappeared in the Mediterranean. Shadowed down the Dardanelles by two British destroyers, they made for Imbros Island, where they found the monitors "Raglan" and "M. 28" at anchor. The two British ships were soon set on fire and sunk but in rounding the south of the island the Germans met disaster. The "Breslau" struck a mine and sank and the "Goeben" shortly afterwards struck two mines in quick succession. In a sinking condition she crept back into the Straits and was beached in the Narrows. Continuous attacks upon her from the air failed to do material damage and a desperate attempt to torpedo her, made by "E. 14," resulted in the loss of the submarine. Eventually the "Goeben" was towed off and once more made her escape to Constantinople.

The loss of merchant tonnage on the congested traffic lanes of the Mediterranean remained severe and although the unified control of Trade Protection gradually reduced this loss the Mediterranean was one of the chief danger areas on the trade routes until the end of the war. The Otranto barrage, though a deterrent, was unable to close the passage to the German and Austrian submarines and its patrols were always open to sudden raids. On April 22 Austrian destroyers made a descent upon the patrols but were driven off and in June the Austrian dreadnought squadron at last moved out of Pola and sailed for Cattaro with the intention of attacking the barrage. The squadron was attacked by Italian torpedo boats, the dreadnought "Svent Istvan" was sunk, the attack was abandoned and the Austrians returned to Pola. On Oct. 31 the defences of that port were pierced by the Italian mosquito craft and the battleship "Viribus Unitis" was torpedoed and sunk. During the closing months of the war a flotilla of British monitors and small craft were employed on the northern shores of the Adriatic in co-operating with the flanks of the Italian Army in their final struggle with the Austrians.

The Black Sea.—Until the break up of Russia, sporadic fighting took place between the Turko-German naval forces and the Russian Black Sea fleet, in which the Russian dreadnoughts dominated the situation. After the mutiny of the Black Sea fleet, a danger arose that one or more of the battleships might fall into the hands of the Germans as potential fighting units. The Allied Aegean squadron was therefore strengthened in 1918 by 4 French battleships and 2 British dreadnoughts. It was one of the latter ("Superb") that on Nov. 12, 1918 led the Allied fleets up the Dardanelles and subsequently to Constantinople.

THE FINAL PHASE

As the months of 1918 drew on the menace of the submarine waxed less and less and during May, June and July over 600,000 American troops were safely carried across the Atlantic and landed in France. It was the beginning of the end. In August the German Western Front began to crack under the blows of the French and British armies: Austria was breaking up: September saw the Bulgarian front give way and, in October, Germany, racked by internal troubles, was forced to her knees.

Scheer, who had relinquished the command of the High Sea Fleet to von Hipper on being called to Headquarters in August as Chief of the Naval Staff, received orders late in September to be prepared to leave the Flanders Coast. In October the retirement began, hastened from the sea by the ships of the Dover Patrol. Ostend was clear of German troops on Oct. 17 and two days later they were in full retreat from Zeebrugge. Eighteen destroyers and torpedo boats escaped to the Bight but a number of submarines were left behind and blown up.

Mutiny in the German Fleet.—After its futile sortie in April the High Sea Fleet made no move and signs were not wanting that its fighting spirit had departed. As early as May 1917 there had been unrest amongst the personnel and outbreaks of mutiny occurred in the battleships "Westfalen," "Kaiser," "Kaiserin" and "König Albert." In the spring and early summer of 1918 further outbreaks called for stern repressive measures. The continued inactivity of the fleet and the withdrawal of the best of its personnel for service in the submarines and in the flotillas, so undermined its morale that when called upon to make a final effort it failed.

Scheer had planned a last raid into the Channel by the whole High Sea Fleet, whilst a concentration of submarines in the North Sea attacked the Grand Fleet on its way south. The submarines were recalled from their war upon commerce at the end of October and were stationed off the Scottish coast, but, when, on Oct. 29, the signal was made to prepare for sea, open mutiny broke out and the fleet refused to sail. From that moment the High Sea Fleet ceased to exist as a fighting machine and the war at sea was over. Most of the crews of the destroyer and submarine flotillas remained loyal until the end and one of the latter inflicted the last casualty of the war upon the British navy when, on Nov. 10, the old battleship "Britannia" was torpedoed off Cape Trafalgar.

The Armistice.—Under the terms of the Armistice, Germany agreed to surrender 10 battleships, 6 battlecruisers, 8 light cruisers, 50 destroyers and all submarines. These terms were enforced without delay and two scenes followed that will be forever memorable in the long sea history of Britain. On Nov. 20, Rear-Admiral Tyrwhitt, with the Harwich flotillas, met the surrendering submarines off the Essex coast and escorted them into Har-

wich. Slowly, the long line of 129 submarines passed into the harbour, watched, in dead silence, by great crowds on either shore. Thus was the greatest menace to Britain's sea power laid to rest. The next day, Nov. 21, Admiral Beatty with the Grand Fleet, met the German Fleet off the Firth of Forth. Between two long lines of British ships the High Sea Fleet steamed to its anchorage below the Forth Bridge and there, at sunset, the German flag was hauled down and was not hoisted again. Thus the proud fleet of Germany surrendered to its enemy, who for over four years had watched and thwarted its every move.

The Peace Terms.—In June 1919 the naval conditions of the Peace terms were signed. They were drastic and reduced Germany at a blow from the position of a great sea power to that of a minor one. The maximum strength of the German navy was fixed at 6 small battleships, 6 cruisers, 12 destroyers, 12 torpedo boats and no submarines, with a personnel not to exceed 15,000 officers and men.

Within two months of the signature, the remaining 8 dreadnoughts with 8 light cruisers and 92 of the latest destroyers and torpedo boats were surrendered, disarmed but with their guns on board, and, within one month, all submarines, either built or building, were either surrendered or broken up.

The disposal of this great array of ships became the subject of delicate discussion between the Allies. Great Britain wanted to destroy them all but France and others wished to add their share to their fleets. The question was partially settled by the Germans themselves, when on June 21, the fleet interned at Scapa Flow, was scuttled. There were at anchor in the war base of the Grand Fleet, 11 battleships, 5 battlecruisers, 8 light cruisers and a number of destroyers. At 10 A.M., by preconcerted signal, the crews opened the valves and the ships began to sink. Only four, the "Baden" (the latest battleship) and three light cruisers remained afloat. This act cost Germany dear, for she had to surrender in place of the battleships, 300,000 tons of floating docks, her remaining five light cruisers and 42,000 tons of floating cranes, etc., in lieu of the destroyers.

Comparative Naval Losses.—The warship losses of the powers engaged are shown in the following table.

	Great Britain	France	Italy	Japan	United States	Russia	Turkey	Austria	Germany	
									Losses	Surrendered
Dreadnoughts	2*	..	1*	1*	..	2*	..	2	..	18
Pre-dreadnoughts	11*	4	3	..	..	2	1	1	1	..
Battlecruisers	3	..	..	1*	..	..	..	..	1	6
Cruisers	13*	5	1	..	1	2	..	..	6	..
Light cruisers	12	..	2	2	..	..	1	3	17*	23
Destroyers	67	12	8	1	2	20	3	6	66	92†
Submarines	54	14	8	..	..	20	..	14**	199	All

*One lost by accidental internal explosion. †Also 50 of the newest torpedo boats.
**By the peace terms Austria was left without coast line and her navy ceased to exist.

In addition to those shown in the table, Great Britain lost 60 minor war vessels (torpedo boats, sloops, gunboats, monitors, coastal motor boats, etc.), her losses in this type being heavier in proportion than that of the other Allies. British losses of auxiliary vessels totalled 17 armed merchant cruisers and 828 other vessels. This latter figure included 288 colliers and oilers, 246 trawlers and 130 drifters. Submarines accounted for 35% of the loss amongst auxiliary vessels, 28% were sunk by mines and 9% were lost by wreck or fire.

Under the urgent stress of war, science brought about the rapid development of certain new weapons and new methods; the submarine and the mine and their countermeasures; the increased range of the great gun and in the power of explosives; the use of poison gas and the birth of aircraft as fighting machines. Reference to all these matters will be found elsewhere; they were common to all belligerents and did not alter the course of the war at sea. For, upon the sea, history was repeated. Like France and Spain in the wars of the 18th century, Germany found herself, at the outset, in the grip of the blockade of the British Fleet. Isolated from the world and cut off from oversea supplies, she attempted by her submerged blockade, like Napoleon with his Continental System (*q.v.*), to strike a vital blow at Britain's seaborne trade. Like the Continental System, the Submerged Blockade came near to success, but, in the end, under the steady pressure of the Allied navies, it failed. With supplies unlimited the wasteful struggles between the great armies might have been prolonged indefinitely, but with the Central Powers denied their wants by the Allied blockade at sea, whilst the Allied armies received their every need from overseas, there could be but one end.

Upon the British Merchant Navy fell by far the greatest burden of carrying the seaborne trade that kept the Allied armies in the field and fed the civilian populations; heavy indeed was the price it paid in the faithful performance of this duty. To the Royal Navy fell the lion's share of the fighting upon the sea: its great traditions were maintained and glorified and when the Armistice called a halt the two navies of Britain had once again carried the country in triumph to the end of a great war.

BIBLIOGRAPHY

The following list of books, carefully selected from several thousands on the subject, is designed to give the general reader the best information available in book form concerning the World War as regards both its main aspects and the events which were of most importance therein. An effort has also been made to give the names of at least one or two books relating to events in each of the minor theatres or sub-theatres of the War, and where controversial matter still exists references to books on both sides are given.

Books in foreign tongues have been confined to those in French, German and Italian. Where books in several volumes have been published at intervals, the date given is usually that of the last

volume to appear.

WORM, a term used popularly to denote almost any kind of elongated, apparently limbless creature, from a lizard, like the blindworm, to the grub of an insect or an earthworm. In old usage it sometimes denoted a mythical dragon. The word "worm" is applied to many objects resembling the animals in having a spiral shape or motion, as the spiral thread of a screw, or the spiral pipe through which vapour is passed in distillation (*q.v.*). As a term of disparagement and contempt the word is also used of persons, from the idea of wriggling or creeping on the ground, partly, too, perhaps, with a reminiscence of Genesis iii. 14. Linnaeus applied the Latin term *Vermes* to the modern zoological divisions, Mollusca, Coelentera, Protozoa, Tunicata, Echinoderma (*qq.v.*), as well as to those forms which modern zoologists recognize as worms. As a matter of convenience the term *Vermes* is still employed, for instance, in the *International Catalogue of Zoological Literature* and the *Zoological Record,* to cover a number of worm-like animals. In systematic zoology, however, the use of a division *Vermes* has been abandoned, as it is now recognized that many of the animals that even a zoologist would describe as worms belong to different divisions of the animal kingdom. The so-called flatworm (Platyhelminthes, *q.v.*), including the Planarians, the Flukes (*see* TREMATODES), and Cestodes (*see* TAPEWORM) are no doubt related. The marine Nemertine worms (*see* NEMERTINA) are isolated. The thick-skinned round worms, such as the common horseworm and the threadworms (*see* NEMATODA), together with the Nematomorpha (*q.v.*), the Chaetosomatida, the Desmoscolecida and the Acanthocephala (*q.v.*), form a fairly natural group. The Rotifera (*q.v.*), with possibly the Kinorhyncha (*q.v.*) and

Gastrotricha (*q.v.*), are again isolated. The remaining worms are probably all coelomate animals. There is a definite Annelid group (*see* ANNELIDA), including the Archiannelida, the bristleworms of which the earthworm (*q.v.*) is the most familiar type, the Myzostomida (*q.v.*) Hirudinea (*see* LEECH) and the armed Gephyreans (*see* ECHIUROIDEA). The unarmed Gephyreans (*see* GEPHYREA) are now separated from their former associates and divided into two groups of little affinity, the Sipunculoidea (*q.v.*) and the Priapuloidea (*q.v.*). The Phoronidea and the Chaetognatha (*q.v.*) are also isolated.

Mention is made under TAPEWORM of the worms of that species inhabiting the human body as parasites. Another common human parasite is *Ascaris lumbricoides* or round worm, found chiefly in children and occupying the upper portion of the intestine. (*See* NEMATODA.)

The threadworm or *Oxyuris vermicularis,* also a Nematode, is a common parasite infecting the rectum.

WORM, a screw which touches tangentially and which rotates a toothed wheel (the worm-wheel), and gives a very smooth drive. Among many other uses it is largely applied to the transmission of power from electric motors, and to the axles of road vehicles. Ball or roller bearings are fitted to the shafts, to take the journal running, and the end thrust, and, in good practice, the worm and wheel are submerged in an enclosed oil-bath. The worm is best made of steel, hardened and ground accurately on the threads, and the wheel of phosphor-bronze. In order to save expense, it is usual to make the wheel in the shape of an annular ring, and bolt it to an iron hub or rim. If increase in speed of rotation of the wheel is required for a given speed of worm, the latter is made with double or triple threads instead of a single helix. What is termed a *drop-worm* is extensively employed in machine-tools and other machines. Its bearings are hinged so that when the limit of desired travel has been reached, an automatic knock-off device allows the worm to fall out of mesh with the wheel.

A conveyor worm is a helix surrounding a shaft (*see* CONVEYORS). A worm condenser consists of a coil of piping (*see* CONDENSER).

WORMS, a city of Germany, in the republic of Hesse-Darmstadt, situated on the left bank of the Rhine, 25 m. S. of Mainz, 20 m. N.W. of Heidelberg and 9 m. by rail N.W. of Mannheim. Pop. (1925) 47,015.

History.—Worms was known in Roman times as Borbetomagus, which in the Merovingian age became Wormatia. The town had before Caesar's time become the capital of a German tribe, the Vangiones. Drusus is said to have erected a fort here in 14 B.C. In 413 the emperor Jovinus permitted the Burgundians under their king Guntar or Guntiar to settle on the left bank of the Rhine between the Lauter and the Nahe. Here they founded a kingdom with Worms as its capital. Adopting Arianism they came into conflict with the Romans, and under their king Gundahar or Gundicar (the Gunther of the *Nibelungenlied*) rose in 435 against the Roman governor Aetius, who called in the Huns against them. The destruction of Worms and the Burgundian kingdom by the Huns in 436 was the subject of heroic legends afterwards incorporated in the *Nibelungenlied* (*q.v.*) and the *Rosengarten* (an epic probably of the late 13th century). Worms was rebuilt by the Merovingians, and became an episcopal see, first mentioned in 614, although a bishop of the Vangiones had attended a council at Cologne as early as 347. There was a royal palace from the 8th century, and in it the Frankish kings, including Charlemagne, occasionally resided.

Under the German kings the power of the bishops of Worms gradually increased. Otto I. granted extensive lands to the bishop, and in 979 Bishop Hildbold acquired comital rights in his city. Burchard I. (bishop, 1000–25) destroyed the castle of the Franconian house at Worms, built the cathedral and laid the foundations of the subsequent territorial power of the see. There were frequent struggles between the bishops and the citizens, who espoused the cause of the emperors against the church, and were rewarded by privileges which fostered trade. The city retained its freedom until 1801, in spite of the bishops, who ruled a small territory south of the city, on both sides of the Rhine, and resided at Ladenburg near Mannheim till 1622.

The city of Worms was frequently visited by the imperial court. The concordat of Worms closed the investiture controversy in 1122. The "perpetual peace" (*ewiger Landfriede*) was proclaimed by the emperor Maximilian I. at the diet of 1495, and Luther appeared before the famous diet of 1521 to defend his doctrines in the presence of Charles V. Four years later, Worms formally embraced Protestantism, and religious conferences were held there in 1540 and 1557. It suffered severely during the Thirty Years' War. The French under Mélac burnt the city almost entirely in 1689, and it has only fully recovered from this blow in recent years. Thus the population, which in its prosperous days is said to have exceeded 50,000, had sunk in 1815 to 6,250.

By the treaty of Worms in 1743 an offensive alliance was formed between Great Britain, Austria and Sardinia. The city was annexed to France at the peace of Lunéville in 1801, together with the bishop's territories on the left bank of the Rhine. The remaining episcopal dominions were secularized in 1803 and given to Hesse-Darmstadt, which acquired the whole by the Vienna Congress in 1815.

Antiquities.—Some parts of the ancient walls and towers still remain. The cathedral of SS. Peter and Paul ranks besides those of Spires and Mainz among the noblest Romanesque churches of the Rhine. This basilica, built of red sandstone, with a choir at each end, has an imposing exterior. Only the ground plan and the lower part of the western towers belong to the original building consecrated in 1110; the remainder was mostly finished by 1181, but the west choir and the vaulting were built in the 13th century, the elaborate south portal was added in the 14th century, and the central dome has been rebuilt. The baptistery contains five remarkable stone reliefs of the late 15th century. The church of Our Lady (*Liebfrauenkirche*) is a handsome Gothic edifice outside the town, finished in 1467. The principal Protestant place of worship is the Trinity church, built in 1726. Second in interest to the cathedral is the church of St. Paul, also in the Romanesque style, and dating from 1102–16, with a choir of the early 13th century, cloisters and other monastic buildings. This church has been converted into a museum. The late Romanesque church of St. Andrews is not used. The old synagogue, an unassuming building erected in the 11th century and restored in the 13th, is completely modernized. The Jewish community of Worms claims to be the most ancient in Germany and to have existed continuously since the very early Christian era, though the earliest authentic mention of it occurs in 588.

The old Bischofshof, in which the most famous Diet of Worms (1521) was held, has been replaced. The Luginsland is an old watch-tower of the 13th century. The Lutherplatz contains a group of statuary commemorating the Protestant reformers and their forerunners. Extensive burial-grounds, ranging in date from neolithic to Merovingian times, have been discovered near the city.

Worms is the centre of a vine-growing country. The manufactures include patent leather, machinery, cloth, chemicals, paints, cork, furniture, slates, etc. Worms possesses a good river harbour, and carries on a considerable trade by water.

WORMSEED, the name given to various plants whose seeds are used as vermifuges. Among the best known is the Levant wormseed (*Artemisia santonica*), from whose dried flower-heads is extracted the drug santonin, very efficacious in expelling round worms. The American wormseed (*Chenopodium anthelminticum*), called also Mexican tea, yields wormseed oil, an officinal vermifuge. (*See* ARTEMISIA; CHENOPODIUM.)

WORMWOOD, the popular name for an aromatic herb known botanically as *Artemisia Absinthium,* a member of the family Compositae. It grows from 1 to 3 ft. high and is silkily hairy; the leaves are small and much cut, and the flowers are small yellow hemispherical heads among the leaves at the end of the branches. It is a native of Europe, grows in waste places in the British Isles, is widely naturalized in eastern North America, and is cultivated for use in domestic medicine. It is a

tonic and vermifuge and used to flavour drinks, such as absinthe. Various other species of *Artemisia* are called wormwood: *A. pontica* is Roman wormwood; *A. Stelleriana,* beach wormwood, etc. (*See* MUGWORT.)

WORSHIP (*i.e.*, "worth-ship"), honour, dignity, reverence, respect. The word is used in a special sense of the service, reverence and honour paid, by means of devotional words or acts, to God, to the gods, or to hallowed persons, such as the Virgin Mary or the saints, and hallowed objects, such as holy images or relics. It must, however, be borne in mind that the Roman Catholic Church distinguishes three kinds of worship: (1) *latria,* the worship due to God alone (from Gr. λατρεία, service, esp. the service of the gods, worship), and (2) *hyperdulia,* the worship or adoration due to the Virgin Mary as the Mother of God (from Gr. ὑπέρ, above, and δουλεία, service), and (3) *dulia,* that due to the saints. The public service of God in church is known as "divine worship" or "divine service."

WORSTED MANUFACTURE. The essential feature of a worsted yarn is straightness of fibre. Prior to the introduction of automatic machinery there was little difficulty in attaining this characteristic, as long wool was invariably employed and the sliver was made up by hand and then twisted. With the introduction of Arkwright's "water frame" or "throstle" the necessity for prepared slivers became apparent, and with the later introduction of cap and mule spinning the necessity for perfectly prepared slivers has been so accentuated that the preparatory machinery has quite exceeded the actual spinning machine in extent and complexity. To-day there are three distinct methods of producing worsted yarn. First, there is the preparing of the sliver and spinning of the true worsted thread, this being

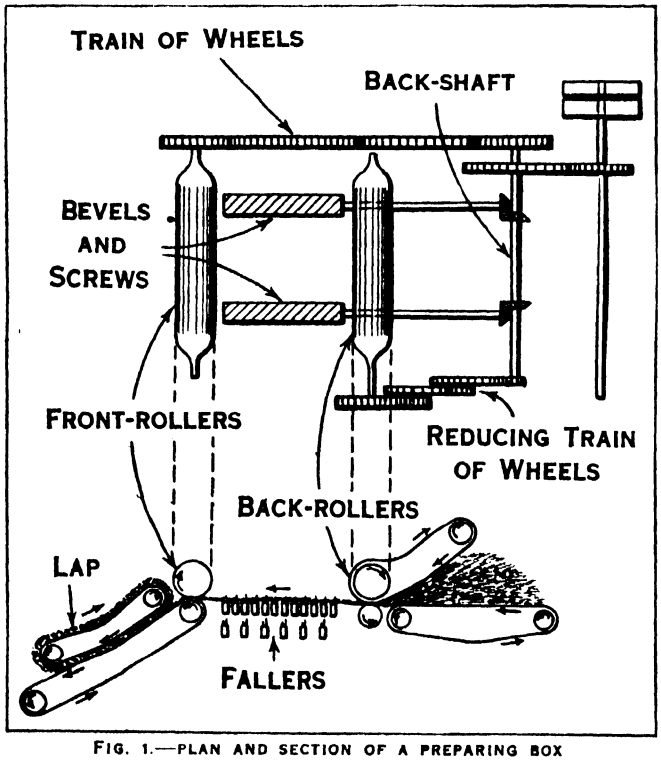

FIG. 1.—PLAN AND SECTION OF A PREPARING BOX

made from long English or colonial wool. In this class should also be included mohair and alpaca. Secondly, there is the preparing and spinning of what are known as cross-bred and botany yarns, these being made from cross-bred and botany wools. Thirdly, there is the preparing and spinning of short botany wools on the French system. There is a fourth class of worsted yarns, principally carpet and knitting yarns, which are treated in a much readier manner than any of the foregoing, but as the treatment is analogous—with the elimination of certain processes—to the second of the foregoing, it is not necessary to refer specially to it.

To obtain a sliver or "roving" which can be satisfactorily spun into a typical worsted thread the following operations are necessary:—preparing (five or six operations), back-washing, straightening, combing, straightening and drawing (say six operations), and finally spinning on the flyer frame.

Preparing.—After long wool has been scoured and dried it is necessarily considerably entangled, and if it were to be combed

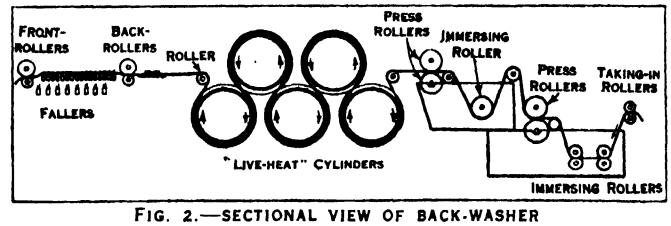

FIG. 2.—SECTIONAL VIEW OF BACK-WASHER

straight away a large proportion of the long fibres would be broken and combed out as "noil" or short fibre. To obviate this the wool is fed as straight as possible into a sheeter gill-box; after this it passes through other two sheeter gill-boxes, then through say three can gill-boxes. As shown in fig. 1 the main features of a preparing or gill-box are the following: the feed sheet upon which the wool is "made up," the back rollers B which take hold of the wool and deliver it to the fallers F which, working away from the back rollers more quickly than the wool is delivered, comb it out. The fallers in turn deliver the wool to the front rollers D, which, taking in the wool more quickly than the fallers delivering it, again draft and comb it, but with a reversing of the former combing operation. The wool emerges from the front rollers as a thin attenuated continuous film about 12 in. wide, which is wound upon an endless leather sheet H from which the box takes its name. When a sliver of sufficient thickness has been wound upon the sheet, it is broken across and fed up at the next gill-box. The fourth gill-box delivers into cans instead of on to a sheet. A number of cans are then placed behind the fifth box and the slivers from these fed up into the back rollers, and similarly with the sixth. The primary object of "preparing" or gilling is to straighten and parallelize the fibres in the sliver. This is effected by means of the combining or doubling and drafting to which the slivers are subjected.

Back-washing.—Oil will have been added to the wool at the first preparing-box to cause the fibres to work well. Were this all, there would perhaps not be the necessity for back-washing. But the slivers during their passage through the preparing-boxes become sullied naturally, and in addition, owing to the opening out of the locks of wool, dirt which was not "got at" in the scouring now works out and further sullies the slivers. It is consequently necessary to scour the slivers again, this being effected in what is termed a back-washing machine. This machine as shown in fig. 2 usually consists of two scouring tanks with immersing rollers, drying cylinders, a gill-box and oiling motion. The slivers on emerging from this machine should be clean, fairly straight and in good condition for combing. Their condition may be further improved by passing them through one or two more gill-boxes, prior to combing, to ensure straightness of fibre and even distribution of the lubricant.

Combing.—Prior to the mechanical era wool was combed immediately after scouring; there was no preparatory process. As a matter of fact the first combing process took the place of the processes just described and was termed "straightening," the "combing proper" following. Prior to the invention of a really satisfactory mechanical comb, between 1850 and 1860, the combing operation was the limitation of the worsted trade. English wools could be satisfactorily combed by hand, and perhaps the results of combing botany or fine wools by hand were satisfactory so far as quality of result was concerned, but the cost was largely prohibitive. The history of the colonial wool trade is inextricably bound up with the combing industry. How eventually botany wools were combed by machinery and how the wool industry was thereby revolutionized can only be briefly referred to here. About 1779 Dr. Edmund Cartwright invented two distinct types of

combs, the vertical and the horizontal circular. The former type was developed on the Continent by Heilmann and others, and has only within the last twenty years taken its rightful place as a successful short wool comb in this country. The latter type was worked upon by Donisthorpe, Noble, Lister, the Holdens and others, and largely through the "driving" force of Lister (later Lord Masham) was made a truly practical success about the year 1850. Latter-day combs of this type may be readily grouped under three heads. The Lister or "nip" comb is specially suitable for long wools and mohair and alpaca. The Holden or square-motion comb is specially suited for short and very good quality wools.

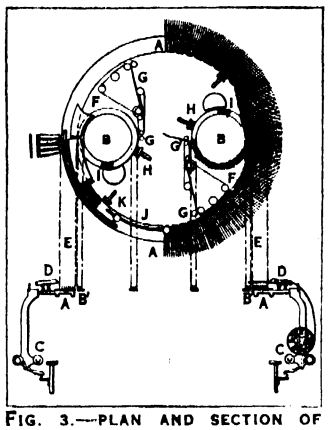

FIG. 3.—PLAN AND SECTION OF NOBLE COMB

The last type, the Noble, is the most popular of all and, by a change of large and small circles, may be adapted to the combing of long, medium or short wools. As the great bulk of cross-bred and a considerable proportion of botany wool is combed upon the Noble comb a brief description is here called for. The object of all wool combing is to straighten the long fibres and to comb out from the slivers treated all the fibres under a certain length, leaving the long fibres or "top" to form the sliver which is eventually spun into the worsted yarn. The Noble comb, which so effectually accomplishes this, consists in the main of a large revolving pinned circle A inside which revolve two smaller pinned circles B, B′ as shown in fig. 3, each of which touches the larger comb circle at one point only. At this point the slivers of wool to be combed are firmly dabbed into the pins of both the large and small circles. As the circles continue to revolve they naturally begin to separate, combing the wool fibres between them, the short fibres or "noil" being retained in the teeth of both small and large circles, the long fibres hanging on the inside of the large circle and on the outside of the small circle. A stroker or air blast at F now directs these long fibres towards the vertical rollers, G and G′, shown here in plan, which separate them from the short fibres.

There are at least four pairs of drawing-off rollers in a comb, and the fibres drawn off by each—be it noted continuously—are united to form a sliver which is passed through a revolving funnel into a can. The short fibres, or "noil," are lifted out of the pins of the small circle by "noil knives." The continuous slivers, the ends of which remain in the pins of the large circle after the drawing-off rollers have been passed, are now lifted up until these ends are above the pins, at the same time an additional length of sliver being drawn into the comb, so that, as the slivers reach the second small circle, they are ready to be again dabbed into the pins of both circles and the combing operation is repeated. Thus the combing on a Noble comb is absolutely continuous. All the movements of this machine—with the exception of the dabbing-brush motion—are circular, so that mechanically it is an almost perfect machine.

After combing it is usual to pass the "top" through two gill-boxes termed "finishers." The last of these boxes, and often the first, delivers the "top" in the form of a ball, thus it is often spoken of as a "balling gill-box." This stage marks one of the great divisions of the worsted trade, the comber taking the wool up to this point, but now handing it forward in the shape of top to the "worsted spinner," who draws and spins the slivers into the most desirable worsted yarns.

Drawing.—English tops are usually prepared for spinning by seven or eight operations. Three of these operations are effected in gill-boxes of a somewhat similar type to the preparing-box, only lighter in build. The remaining four are drawing-boxes, *i.e.*, as shown in fig. 4, they consist of back and front rollers with small carrying-rollers—not gills—to support the wool in between. Thus an English set of drawing usually consists of a single-can gill-box, a double-can gill-box, a two-spindle gill-box, a four-spindle-drawing-box, a four-spindle weigh-box, a six-spindle drawing-box, two six-spindle finishers and three thirty-spindle rovers. About fifteen flyer frames of 160 spindles each will be required to follow this set, although the balance varies partly in accordance with the counts spun to, 1/32's English being the standard.

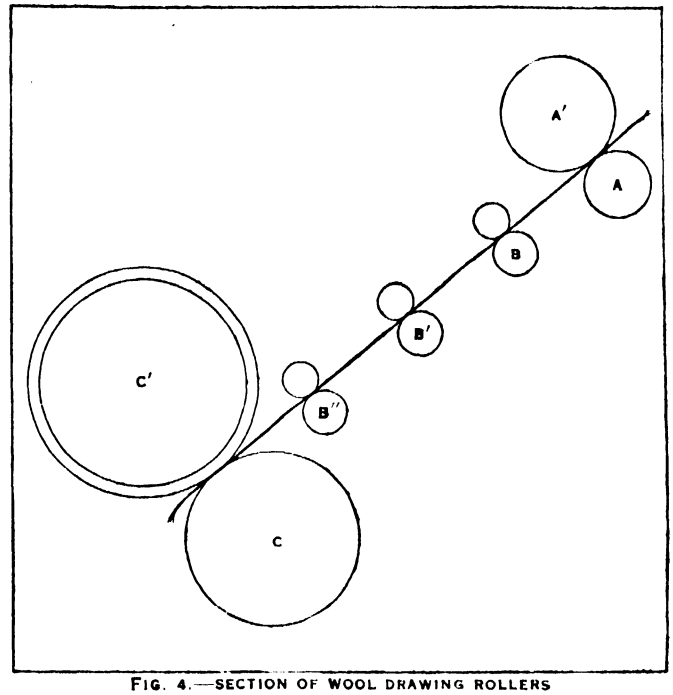

FIG. 4.—SECTION OF WOOL DRAWING ROLLERS

The object of drawing is to obtain firstly a level sliver from which an even thread may be spun, and secondly to reduce the comparatively thick top down to a relatively thin roving from which the required count of yarn may be spun. Of course parallelism of fibres must be retained throughout, so far as possible. To accomplish these objects doubling and drafting is resorted to. Thus the ends put up at the back of the above boxes will be 6, 6, 4, 4, 3, 3, 2 respectively, while the drafts may be 5, 6, 8, 8, 6, 9, 9 approximately. As the drafts markedly preponderate over the doublings so will the sliver be reduced in thickness.

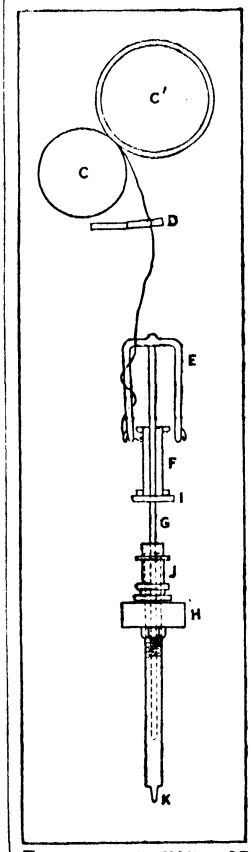

FIG. 5.—SECTION OF FLYER SPINDLE

Spinning.—The flyer spinning frame is very similar to the drawing frame, consisting of back rollers, carriers and front rollers, with the necessary spindle and flyer to put twist into the yarn and to wind it upon the bobbin. From the two-spindle gill-box to the spinning frame the spindle, bobbin and flyer combination is employed with the object just mentioned. From fig. 5 the action of this combination will be clearly understood. Drafting takes place as usual between the back and front rollers, the carriers controlling the sliver between the two. On emerging from the front rollers the yarn usually passes through an eyelet to centre it over the centre of the spindle; it then takes a turn or two round the flyer leg, through the twizzle or eyelet on the flyer and on to the bobbin F. The flyer may be freely rotated by means of the wharl J and through the spindle G upon the top of which it is screwed. The bobbin fits loosely over the spindle and rests lightly upon the lifter; this latter, being controlled by the lifter mechanism, slowly raises and lowers the bobbin during the "spin"

past the fixed plane of delivery of the yarn, *i.e.*, the eyelet of the revolving flyer. Now, if for one moment it be considered that the bobbin may not revolve on the spindle but may be slid up and down by the lifter motion, then, if the front rollers deliver the necessary yarn, the flyer will wrap it in successive layers upon the bobbin—but no twist will be inserted.

On the other hand, if the bobbin is perfectly free upon the spindle and the front rollers cease delivering yarn, then the flyer, by means of the yarn, will pull the bobbin round at the same speed as it goes itself, and the yarn will be twisted but not wound upon the bobbin. By obtaining an action in between these two extremes both twisting and winding on to the bobbin is effected. The speed of the bobbin is suitably retarded by washers placed between it and the lifter plate, so that it just drags sufficiently to wind up the yarn "paid out" by the front rollers. The turns per inch are in proportion to the yarn delivered and the revolutions of the flyer. Thus if, while 1 in. of yarn is delivered, the flyer revolves twelve times the turns per inch will be approximately twelve. This is the theory of the spindle, flyer and bobbin action.

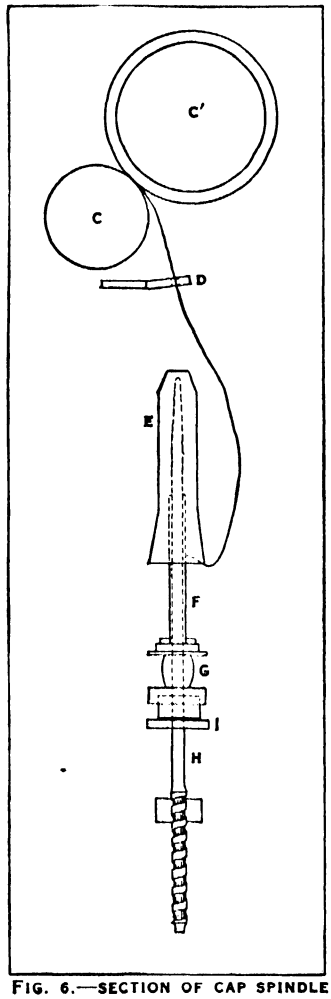

FIG. 6.—SECTION OF CAP SPINDLE

Preparing Short Wools.—Wools not more than 7 in. long are usually prepared for combing by the operation of carding. On first thought it might be imagined that carding would result in broken fibres and a poor yield of top. That this is not so is evident from the fact that there is a tendency to card wools from 7 to 10 in. long, this tendency being due to the relative cheapness of carding as compared with preparing. If long wools were fed directly on to a swift, no doubt serious breakage of fibre would occur, but it is customary to place before the first swift of a worsted card a series of four opening rollers and dividers—with their accompanying "burring rollers"—to open out the wool gradually, so that when it eventually reaches the first swift it is so

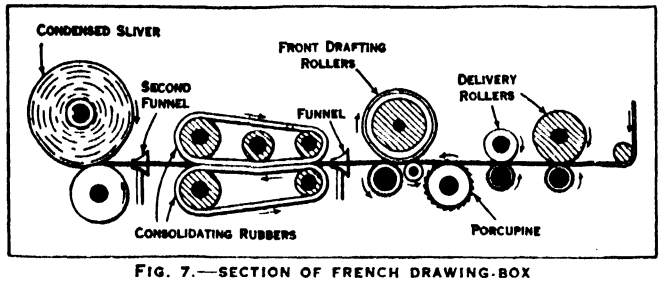

FIG. 7.—SECTION OF FRENCH DRAWING-BOX

opened out that further opening out instead of breakage occurs. Some carders use a breast of small swift in place of these opening rollers—mostly on account of economy. The swift is usually surmounted with four workers and strippers and is very similar to the woollen carder, save that the workers and doffer are larger, thereby effecting more of a combing action and working economically by reason of the greater wearing surface brought into play. As botany wool is usually brought directly from the wash bowl to the feed sheet of the card, it is usual to clothe the first cylinders with galvanized wire clothing.

After the carding the wool is back-washed and gilled—on similar lines to English wool—and then is ready for combing. After combing, the tops are "finished" by being passed through two finisher-boxes, the last of which "balls" the tops for market.

Short wools are drawn and spun on very similar lines to the longer wools, save that the boxes are more in number and are in some cases lighter in build. The boxes usually employed in a botany set are as follows: two double-head can gill-boxes, two two-spindle gill-boxes, a four-spindle drawing-box, a six-spindle weigh-box, an eight-spindle drawing-box, two eight-spindle finishing-boxes, two twenty-four-spindle second finishers, three thirty-two-spindle dandy reducers, ten thirty-two-spindle dandy rovers, with ten two-hundred-spindle cap spinners to follow.

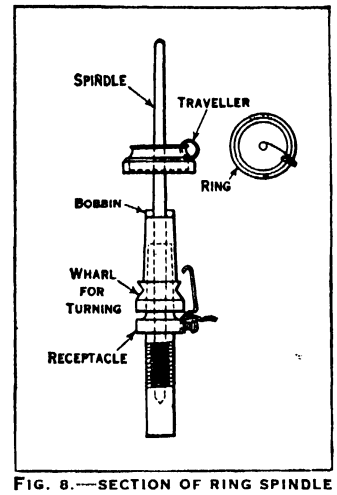

FIG. 8.—SECTION OF RING SPINDLE

The doublings as a rule are about 7, 6, 6, 6, 5, 5, 5, 4, 4, 2 and the drafts 5, 6, 6, 7, 7, 7, 8, 8, 8 at the respective boxes, an endeavour as a rule being made to obtain a roving of which 40 yds. = 2 drams, as this is the most convenient size for being spun into fine botany count of yarn.

Following the lead of the cotton trade endeavours have been made to control the driving and speed of both flyer and bobbin in all the drawing frames of such sets as that described above. Such control is usually effected by a pair of cones, from which this system has taken its name, viz., "cone" drawing. The chief advantages of this system seem to be the possibilities of employing larger bobbins, and thus obtaining greater production, the consumption of relatively less power, and more particularly the production of a softer sliver with less twist, partaking more of the character of a French roving.

Spinning is usually effected upon the cap frame (*see* fig. 6)—a frame in which the bobbin, resting upon a fixed spindle, is itself driven at say 5,000 revolutions per minute to put in the twist, while the friction of the yarn on the cap which covers the bobbin, or air-friction, enables the bobbin to wind up upon itself the yarn as delivered by the front rollers. The weakness and the strength of the cap frame is that to make reasonably hard bobbins the bobbins must be driven at a high speed.

French Drawing and Spinning.—The French are noted for a special system of worsted spinning, which, producing soft botany yarns of a marked type, is worthy of more than passing comment. The preparation is very similar to the preparation of botany yarns for the English system save that as a rule the order of the operations are carding, gilling, combing, back-washing and finishing. The characteristic features of the method lie in the subsequent drawing and spinning. The drawing-box as shown in fig. 7 consists of back rollers, porcupine or revolving gill, front rollers, rubbers and winding-up arrangement. Thus there is no twist inserted, the slivers being treated softly and openly right away through the processes. A set of this type usually consists of two gill-boxes, preparing for combing, comb, back-washing machine and two finishing gill-boxes, first drawing frame, second and third drawing frame, the slubbing frame, the roving frame and the self-acting mule. After leaving the last box as a fine soft pith-like sliver, spinning is effected upon the worsted mule. The main differences between the worsted and the woollen mule are firstly, the worsted mule is fitted with preliminary drafting rollers, and secondly, there is little or no spindle draft, the worsted spindle being tapered as against thick-ended in the woollen mule. As the mule is an intermittent worker it is natural to contrast it with the cap frame, which runs continuously. What the real advantage is it is difficult to say, but the mule-spun worsted yarn trade is becoming yearly of more importance. The French-treated slivers

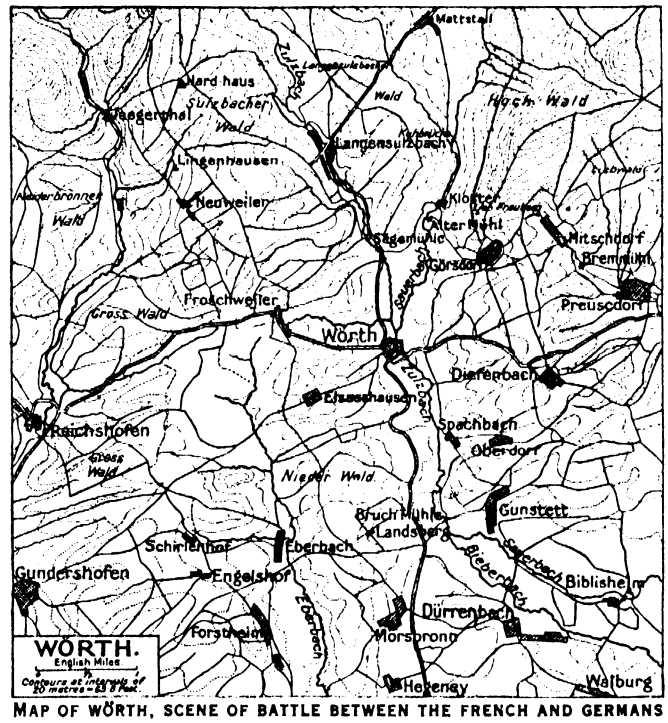
are "dry-combed," no oil being employed. Normal English slivers contain from 3% to 5% of oil.

Doubling, Twisting, etc.—Upon whichever system the yarns have been spun it will frequently be necessary to twofold them and sometimes to three- and fourfold them. Again the fashion sometimes runs upon fancy twists, and then it is necessary to be able to produce the various styles of cloud, loop, curl, knop, etc., yarns. Twofolding is done upon the flyer, cap and ring frames. The main difference between the cap and the ring frame is that in the latter a small bent piece of wire, termed a traveller, revolved round a ring by the pull of the spindle through the yarn, serves as the retarder to enable the bobbin to wind the yarn, delivered by the front rollers. (*See* fig. 8.) Fancy twisters are almost universally on the ring system.

Yarns are placed on the market in eight forms, viz., in hank, on spools, on paper tubes, on bobbins, on cops, in cheeses, in the warp ball form and dressed upon the loom beam. Thus the manufacturer can order the yarn which he requires in the form best suited to his purpose.

Finishing Processes.—Although in some few cases special means must be employed for the weaving of woollens, worsteds and stuff goods, still the main principles are the same for all classes of goods. (*See* WEAVING.)

Worsted cloth finishing is very similar to woollen cloth finishing save that some of the operations are less severe. Mending, scouring, milling and tentering are similar. The raising as a rule is effected by brushing, although it is by no means uncommon to raise worsteds on the gig. Cropping, crabbing, pressing and steaming are the same as for woollen fabrics. Of course the real difference between the woollen and the worsted cloth is due to the selection of the right material, to correct roving, spinning and fabric structure: finishing simply comes as a "developer" in the case of the woollen fabric, while in the case of the typical worsted fabric it simply serves as a "clearer," the cloth really being made in the loom. A woollen cloth as it leaves the loom is unsightly and in a sense may be said to be made in the finishing, although it is truer to say "developed" in the finishing: in the case of the worsted cloth it is altogether otherwise.



The principal styles of worsted cloths are coatings and trouserings, delaines, voiles, merinos, cashmeres, lastings, crêpe-de-chines, amazons, Orleans, lustres of various types (plain and figured), alpacas, Italians and moreens. Many are made entirely of worsted yarns, but others are compound so far as material or yarn is concerned. Thus amazons are made from mule-spun worsted warp and a woollen weft. (*See* also WOOLLEN MANUFACTURE.)

WORTH, CHARLES FREDERICK (1825–1895), the famous dressmaker, was born at Bourne, Lincolnshire, in 1825 and was sent to London as an apprentice to Swan & Edgar, drapers. In 1846, he went to Paris, without capital or friends, and after 12 years in a wholesale silk house he began business as a dressmaker in partnership with a Swede named Dobergh. He won the patronage of the empress Eugénie, and, through her, of fashionable Paris. After the Franco-German War Worth continued the business with his two sons John and Gaston—both naturalized Frenchmen. For more than 30 years he set the taste and ordained the fashions of Paris. He died on March 10, 1895.

WÖRTH, a village of Alsace, on the Sauer, 6 m. N. of Hagenau, which gives its name to the battle of Aug. 6, 1870, fought between the Germans under the crown prince of Prussia and the French under Marshal MacMahon. The battle is also called Reichshoffen and Fröschweiler.

The events which led up to the engagement, and the general situation on the 6th are dealt with under FRANCO-GERMAN WAR. During Aug. 5 the French concentrated in a selected position running nearly north and south along the Sauer Bach on the left front of the German III. Army, which was moving south to seek them. The position is marked from right to left by Morsbronn, the Niederwald, the heights west of Wörth and the woods north-east of Fröschweiler. East of the Sauer the German III. Army was moving south, when their cavalry found the French position about noon. Thereafter the German vedettes held the French under close observation, while the latter moved about within their lines and as far as the village of Wörth as if in peace quarters.

About 5 P.M. some horses were being watered at the Sauer, when a sudden swoop of the enemy's hussars drove the party back to camp. The alarm was sounded, tents were struck and the troops fell in and remained under arms until the confusion died down, when orders were sent to fall out, but not to pitch the

MAP OF WÖRTH, SCENE OF BATTLE BETWEEN THE FRENCH AND GERMANS AUGUST 6, 1870

tents. The army there bivouacked, and but for this incident the battle of the next day might not have been fought. A sudden storm broke over the bivouacs, and when it was over, many of the men, wet and restless, broke out of camp and went into Wörth, which was unoccupied, though Prussians were only 300 yds. from the sentries. These fired, and the officer commanding the Prussian outposts, hearing the confused murmur of voices, ordered up a battery, and as soon as there was light enough dropped a few shells into Wörth. The stragglers rushed back, the French lines were again alarmed, and several batteries on their side took up the challenge.

The Prussian guns, as strict orders had been given to avoid all engagement that day, soon withdrew and were about to return to camp, when renewed artillery fire was heard from the south and presently also from the north. In the latter direction, the II. Bavarian Corps had bivouacked along the Mattstall-Langensulzbach road with orders to continue the march if artillery were heard to the south. This order was contrary to the spirit of the III. Army orders, and, moreover, the V. Prussian Corps to the south was in ignorance of its having been given.

The outpost battery near Wörth was heard, and the Bavarians at once moved forward. The leading divisional commander, anxious to prove his loyalty to his new allies—his enemies in 1866—ordered his troops to attack, giving the spire of Fröschweiler, which was visible over the woods, as the point of direction. The French, however, were quite ready and a furious fusillade broke out, which was multiplied by the echoes of the forest-clad hills out of all proportion to the numbers engaged. The Prussian officers of the V. Corps near Diefenbach, knowing nothing of the orders the Bavarians had received, were amazed; but when about 10.30 A.M. their comrades were seen retiring, part in disorder, the corps commander, Kirchbach, decided that an effort must be made to relieve the Bavarians. He communicated his intention of attacking to the XI. Corps (Bose) on his left and asked for all available assistance. A report was also despatched to the crown prince at Sulz, 5 m. away.

Meanwhile the XI. Corps had become involved in an engagement. The left of the V. Corps' outposts had over night occupied Gunstett and the bank of the Sauer, and the French shortly after daylight on the 6th sent down an unarmed party to fetch water. As this appeared through the mist, the Prussians naturally fired upon it, and the French General Lartigue (to whose division the party belonged), puzzled to account for the firing, brought up some batteries in readiness to repel an attack. These fired a few rounds only, but remained in position as a precaution.

Hearing the firing, the XI. Corps' advanced guard, which had marched up behind in accordance with the general movement of the corps in changing front to the west, promptly came up to Spachbach and Gunstett. In this movement across country to Spachbach some bodies appear to have exposed themselves, for French artillery at Elsasshausen suddenly opened fire, and the shrapnel bursting high, sent showers of bullets on to the house roofs of Spachbach, in which village a battalion had just halted. The major in command thereupon ordered the march to be resumed, and as he gave the order, his horse ran away with him towards the Sauer. The leading company, seeing the battalion commander gallop, moved off at the double, and the others of course followed. Under the impression that they were intended to attack, they deployed and crossed the river. By this time the French outposts lining the edge of the Niederwald, were firing heavily. The line of smoke was naturally accepted by all as the objective, and the German companies with a wild rush reached the edge of the wood.

A similarly unpremeditated encounter had happened at Gunstett and both sides brought up reinforcements. The Prussians, with all their attention concentrated on the wood in their front, and having as yet no superior commanders, soon exhibited signs of confusion, and thereupon Gen. Lartigue ordered a counter attack towards the heights of Gunstett, when all the Prussians between the Niederwald and the Sauer gave way. The French followed with a rush, and, fording the Sauer opposite Gunstett, for a moment placed the long line of German guns upon the heights in considerable danger. At this crisis a fresh battalion arrived and attacked the French on one flank whilst the guns swept the other. The momentum of the charge died out, and the French retired.

In the centre the fight had been going badly for the V. Corps. As soon as Kirchbach's 84 guns between Dieffenbach and Spachbach opened fire the French disappeared from sight. There was no longer a target, and, perhaps to compel his adversary to show himself, Kirchbach ordered four battalions to cross the river. These, however, were overpowered and driven back by infantry fire. But, once more, the dashing counter-attack of the French was thrown into confusion by the Prussian shell fire, and as the French fell back the Prussian infantry, now reinforced, followed them up (about 1 P.M.). The commander-in-chief of the German III. Army (the crown prince Frederick) now appeared on the field and ordered Kirchbach to stand fast until the pressure of the XI. Corps and Württemberg Division could take effect against the French right wing. The majority of these troops had not yet reached the field. Bose, however, seeing the retreat of the troops of the V. Corps, had independently determined to renew the attack against the Niederwald, and had ordered Schkopp's brigade, which was then approaching, to join the troops collecting to the east of Gunstett. Schkopp, however, seeing that his present line of advance led him direct on to the French right about Morsbronn and kept him clear of the confusion to be seen around Gunstett, disregarded the order and continued to advance on Morsbronn. This deliberate acceptance of responsibility really decided the battle, for his brigade quietly deployed as a unit and compelled the French right wing to fall back.

To cover the French retreat Michel's brigade of cavalry was ordered to charge. Without reconnoitring or manoeuvring for position, the French cavalry rode straight at the first objective which offered itself. Hence the charge was costly and only partly successful. However, the Prussians' attention was sufficiently absorbed while the French infantry rallied for a fresh counter-stroke. This was made, about 1.20 P.M., with the utmost gallantry, and the Prussians were driven back. But the counter-attack soon came under the fire of the great artillery mass above Gunstett, and Bose having at length concentrated the main body of the XI. Corps in the meadows between the Niederwald and the Sauer, the French had to withdraw. Their withdrawal involved the retreat of the troops who had defended Niederwald all day.

By 3 P.M. the Prussians were masters of the Niederwald and the ground south of it on which the French right wing had originally stood, but they were in indescribable confusion after the prolonged fighting in the dense undergrowth. Before order could be restored came another fierce counterstroke. As the Prussians emerged from the northern edge of the wood, the French reserves suddenly came out from behind the Elsasshausen heights, and striking due south drove the Prussians back. It was a grave crisis, but at this moment Schkopp, who throughout all this had kept two of his battalions intact, came round the north-west corner of the Wald, and these fresh battalions again brought the French to a standstill. Meanwhile Kirchbach, seeing the progress of the XI. Corps, had ordered the whole of his command forward to assault the French centre, and away to the right the two Bavarian corps moved against the French left, which still maintained its original position in the woods north-east of Fröschweiler.

MacMahon, however, was not beaten yet. Ordering Bonnemains' cavalry division to charge by squadrons to gain time, he brought up his reserve artillery, and sent it forward to case-shot range to cover a final counter-stroke by his last intact battalions. But from his position near Fröschweiler he could not see into the hollow between Elsasshausen and the Niederwald. The order was too late, and the artillery unlimbered just as the counter attack on the Niederwald alluded to above gave way before Schkopp's reserve. The guns were submerged in a flood of fugitives and pursuers. Elsasshausen passed into the hands of the Germans. To rescue the guns the nearest French infantry attacked in a succession of groups, charging home the bayonet with the utmost determination. Before each attack the Prussians immediately in front gave way, but those on the flanks swung inwards, and under this converging fire each French attempt died out, the Prussians following up their retreat. In this manner, step by step, in confusion which almost defies analysis, the Prussians conquered the whole of the ground to the south of the Fröschweiler-Wörth road, but the French still held on in the village of Fröschweiler itself and in the woods to the north of the road, where throughout the day they had held the two Bavarian corps in check with little difficulty. To break down this last stronghold, the guns of the V. and XI. Corps, which had now come forward to the captured ridge of Elsasshausen, took the village as their target; and the great crowd of infantry, now flushed with victory but in the direst confusion, encouraged by the example of two horse artillery batteries, which galloped boldly forward to case-shot range, delivered one final rush which swept all resistance before it.

The battle was won and cavalry only were needed to reap its consequences, but the Prussian cavalry division had been left behind without orders and did not reach the battlefield till late at night. Under cover of darkness the French escaped, and on the following day the cavalry division was quite unable to discover the direction of the retreat.

MacMahon received no support from the neighbouring French troops (*see* FRANCO-GERMAN WAR). The battle was won by overpowering weight of numbers. The Prussian general staff were able to direct upon the field no fewer than 75,000 infantry, 6,000 cavalry and 300 guns, of which 71,000 rifles, 4,250 sabres and 234 guns came into action against 32,000 rifles, 4,850 sabres and 101 guns on the French side. The superiority of the French chassepot to the needle guns may reasonably be set against the superior number of rifles on the German side, for though the Germans were generally, thanks to their numbers, able to bring a converging fire upon the French, the latter made nearly double the number of hits for about the same weight of ammunition fired, but the French had nothing to oppose to the superior German artillery, and in almost every instance it was the terrible shell fire which broke up the French counter attack. All of these attacks were in the highest degree honourable to the French army, and many came nearer to imperilling the ultimate success of the Germans than

is generally supposed even by students of military affairs.

The losses of the Germans were 9,270 killed and wounded and 1,370 missing, or 13%; those of the French were about 8,000 killed and wounded, and perhaps 12,000 missing and prisoners, representing a total loss of about 41%.

See the French and German official histories of the war; H. Bonnal, *Fröschwiller* (1899); H. Kunz, *Schlacht von Wörth* (1891) and *Kriegsgesch, Beispiele,* Nos. 13–18; R. Tournès, *De Gunstett au Niederwald* and *Le Calvaire;* and Commandant Grange, "Les Réalités du champ de bataille," *Revue d'infanterie* (1908–10). (F. N. M.)

WORTHING, a municipal borough and seaside resort in the Horsham and Worthing parliamentary division of Sussex, England, 61 m. S. by W. from London on the Brighton and Portsmouth section of the S. railway. Pop. (1921) 35,215. It has a fine marine parade, and a promenade pier, and there is a long range of firm sands. The town is sheltered from the north by the Chalk Downs. The mother parish of Worthing is Broadwater, the church of which, 1 m. N. of Worthing, is a cruciform building, and a fine example of transitional Norman work. A Roman villa, evidence of the existence of pottery works, and a so-called mile-stone, have been discovered at Worthing. The town was incorporated in 1890. A modern and important industry of Worthing is the raising of flowers and fruit, especially tomatoes, in glass houses.

WORTHINGTON-EVANS, SIR LAMING (1868–), British statesman, was born on Aug. 23, 1868 and became a solicitor in 1890. In 1910, after one unsuccessful attempt, he was elected Conservative M.P. for Colchester, and in 1918 for the Colchester division of Essex, which he represented in succeeding parliaments. In 1916 he entered the Coalition Government as parliamentary secretary to the Ministry of Munitions. He left the Ministry of Munitions in 1918 to become minister of blockade, and afterwards filled the following offices under Lloyd George and Baldwin: minister of pensions, 1918–20; minister without portfolio, 1920–21; secretary for war, 1921–22; postmaster-general, 1923–24; and again secretary for war, 1924. He has written books on company law.

WOTTON, SIR HENRY (1568–1639), English author and diplomatist, son of Thomas Wotton (1521–1587) and grand-nephew of the diplomatist Nicholas Wotton (*q.v.*), was born at Bocton Hall in the parish of Bocton or Boughton Malherbe, Kent. He was educated at Winchester school and at New college and Queen's college, Oxford. At Oxford he was the friend of Albericus Gentilis, then professor of civil law, and of John Donne. During his residence at Queen's he wrote a play, *Tancredo,* which has not survived, but his chief interests appear to have been scientific. About 1589 Wotton went abroad, with a view probably to preparation for a diplomatic career, and his travels appear to have lasted for about six years. At Altdorf he met Edward, Lord Zouch, to whom he later addressed a series of letters (1590–93) which contain much political and other news. These (*Reliquiae Wottonianae,* pp. 585 *et seq.* 1685) provide a record of the journey. He travelled by way of Vienna and Venice to Rome, and in 1593 spent some time at Geneva in the house of Isaac Casaubon. Wotton returned to England in 1594, and in 1595 was admitted to the Middle Temple. While abroad he had from time to time provided Robert Devereux, second earl of Essex, with information, and he now definitely entered his service as one of his agents or secretaries to supply intelligence of affairs in Transylvania, Poland, Italy and Germany. Wotton was not actually involved in Essex's downfall, but he left England, and within 16 hours of his patron's apprehension he was safe in France, whence he travelled to Venice and Rome. In 1602 he was resident at Florence, and a plot to murder James VI. of Scotland having come to the ears of the grand-duke of Tuscany, Wotton was entrusted with letters to warn him of the danger, and with Italian antidotes against poison. As "Ottavio Baldi" he travelled to Scotland by way of Norway. He was well received by James, and remained three months at the Scottish court, retaining his Italian incognito. He then returned to Florence, but on receiving the news of James's accession hurried to England. James knighted him, and offered him the embassy at Madrid or Paris; but Wotton, knowing that both these offices involved ruinous expense, desired rather to represent James at Venice. He left London in 1604 accompanied by Sir Albertus Morton, his half-nephew, as secretary, and William Bedell, the author of an Irish translation of the Bible, as chaplain.

Wotton spent most of the next twenty years, with two breaks (1612–16 and 1619–21), at Venice. He helped the Doge in his resistance to ecclesiastical aggression, and was associated with Paolo Sarpi, whose history of the Council of Trent was sent to King James as fast as it was written. In 1611 Caspar Schoppe, whom Wotton had offended, wrote a scurrilous book against James entitled *Ecclesiasticus,* in which he fastened on Wotton a saying which he had incautiously written in a friend's album years before. It was the famous definition of an ambassador as an "honest man sent to lie abroad for the good of his country." Wotton was at the time on leave in England, and made two formal defences of himself, one a personal attack on his accuser addressed to Marcus Welser of Strasbourg, and the other privately to the king. He seems to have won back James's favour by obsequious support in parliament of his claim to impose arbitrary taxes on merchandise. In 1614 he was sent to the Hague and in 1616 he returned to Venice.

In 1620 he was sent on a special embassy to Ferdinand II. at Vienna, to do what he could on behalf of James's daughter Elizabeth, queen of Bohemia. Wotton's devotion to this princess, expressed in his exquisite verses beginning "You meaner beauties of the night," was sincere and unchanging. At his departure the emperor presented him with a jewel of great value, which Wotton received with due respect, but before leaving the city he gave it to his hostess, because, he said, he would accept no gifts from the enemy of the Bohemian queen. After a third term of service in Venice he returned to London early in 1624 and in July he was installed as provost of Eton College. This office did not relieve him from his pecuniary embarrassments, and he was even on one occasion arrested for debt, but he received in 1627 a pension of £200, and in 1630 this was raised to £500 on the understanding that he should write a history of England. He did not neglect the duties of his provostship, and was happy in being able to entertain his friends lavishly. His most constant associates were Izaak Walton and John Hales. A bend in the Thames below the Playing Fields, known as "Black Potts," is still pointed out as the spot where Wotton and Izaak Walton fished in company. He died at the beginning of December 1639 and was buried in the chapel of Eton College.

Sir Henry Wotton was not an industrious author, and his writings are very small in bulk. Of the twenty-five poems printed in *Reliquiae Wottonianae* only 15 are Wotton's. But of those 15 two have obtained a place among the best known poems in the language, the lines already mentioned "On his Mistris, the Queen of Bohemia," and "The Character of a Happy Life."

During his lifetime he published only *The Elements of Architecture* (1624), which is a paraphrase from Marcus Vitruvius Pollio, and a Latin prose address to the king on his return from Scotland (1633). In 1651 appeared the *Reliquiae Wottonianae,* with Izaak Walton's *Life.* An admirable *Life and Letters,* representing much new material, by Logan Pearsall Smith, was published in 1907. *See* also A. W. Ward, *Sir Henry Wotton, a Biographical Sketch* (1898).

WOUND, a solution in the continuity of the soft parts of the body. Contused wounds, or bruises, are injuries to the cellular tissues in which the skin is not broken. In parts where the tissues are lax the signs of swelling and discoloration are more noticeable than in the tenser tissues. The discoloration is caused by haemorrhage into the tissues (*ecchymosis*), and passes from dark purple through green to yellow before it disappears. If a considerable amount of blood is poured forth into the injured tissues it is termed a *haematoma.* The treatment of a bruise consists in the application of cold lotion, preferably an evaporating spirit-lotion, to limit the subcutaneous bleeding. The haemorrhage usually becomes absorbed of its own accord even in haematomata, but should suppuration threaten an incision must be made and the cavity aseptically evacuated.

Open wounds are divided into incised, lacerated, punctured and gunshot wounds. *Incised* wounds are made by any sharp instrument and have their edges evenly cut. In these wounds there is usually free haemorrhage, as the vessels are cleanly divided.

Lacerated wounds are those in which the edges of the wound are torn irregularly. Such injuries occur frequently from accidents with machinery or blunt instruments, or from bites by animals. The haemorrhage is less than from incised wounds, and the edges may be bruised. *Punctured* wounds are those in which the depth is greater than the external opening. They are generally produced by sharp-pointed instruments. The chief danger arises from puncture of large blood-vessels, or injury to important structures such as those in the thorax and abdomen. The great danger of all open wounds is that pathogenic micro-organisms will be introduced at the time of injury.

The treatment of incised wounds is to arrest the bleeding (*see* HAEMORRHAGE), cleanse the wound and its surroundings, removing all foreign bodies (splinters, glass, etc.), and obtain apposition of the cut surfaces. This is usually done by means of sutures or stitches of silk, catgut, silkwormgut or silver wire. If the wound can be rendered aseptic, incised wounds usually heal by first intention. In lacerated wounds there is danger of suppuration, sloughing, erysipelas, while if soil, particularly cultivated and heavily manured soil, be carried into the tissues during the injury there is risk of gas-gangrene, malignant oedema or tetanus. These wounds do not heal by first intention, and there is consequently considerable scarring. The exact amount of time occupied in the repair depends upon the presence or not of septic material, as lacerated wounds are very difficult to cleanse properly. Carbolic acid lotion should be used for cleansing, while torn or ragged portions should be cut away and provision made for free drainage. It is not always possible to apply sutures at first, but the wound may be packed with antiseptic gauze, and later, when a clean granulating surface has been obtained, skin-grafting may be required. In extensive lacerated wounds, especially in conjunction with comminuted fractures, amputation of a limb may be called for. Punctured wounds should be syringed with carbolic lotion, and all splinters and foreign bodies removed. The location of needles and other bodies opaque to the rays is facilitated by the use of the Röntgen rays; the wound can then be packed with gauze and drained. If a large vessel should have been injured, the wound may have to be laid open and the bleeding vessel secured. Should paralysis indicate that a large nerve has been divided, the wound must also be laid open in order to suture the injured structure.

It is only possible here to mention some of the special characteristics of *gunshot* wounds. A remarkable collection, largely added to during the World War, is contained in the Museum of the Royal College of Surgeons of England and smaller collections are to be found in some other great centres. With the modern small-bore rifle of high velocity, machine guns and Lewis guns the aperture of entry is small and the aperture of exit larger and more slit-like. There is usually but little haemorrhage. Should no large vessel be torn, and should no portion of septic clothing be carried in, the wound may heal by first intention. Such bullets may be said to disable without killing. They may drill a clean hole in a bone without a fracture, but sometimes there is much splintering. Abdominal wounds may be so small that the intestine may be penetrated and adhesions of neighbouring coils of intestine cover the aperture. Martini-Henry bullets make larger apertures, while soft-nosed or "dum-dum" bullets spread out as soon as the bullet strikes, causing great mutilation and destruction of the tissues. Shell wounds cause extensive lacerations. Small shot may inflict serious injury should one of the pellets enter the eye. In gunshot wounds at short distance the skin may be blackened owing to the particles of carbon lodging in it. The chief dangers of gunshot wounds are haemorrhage, shock and the carrying in of septic material or clothing into the wound.

WOUWERMAN, PHILIP (1619–1668), Dutch painter of battle and hunting scenes, was born at Haarlem, where he was baptised on May 24, 1619. He learned the elements of his art from his father, Paul Joosten Wouwerman, a painter from Alkmaar. He then became a pupil of Frans Hals and probably of J. Wynants and of Pieter Verbeek, a painter of horses. He became a member of the guild of painters at Haarlem in 1642, and there he died on May 10, 1668. About 800 pictures were enumerated in John Smith's *Catalogue raisonné* (1840) as the work of Philip Wouwerman, and in C. Hofstede de Groot's enlarged *Catalogue*, vol. ii. (1909), the number exceeds 1,200; but probably many of these are the productions of his brothers Pieter (1623–1682) and Jan (1629–1666), and of his many other imitators. His authentic works are distinguished by great spirit and are infinitely varied, though dealing recurrently with cavalry battle-pieces, military encampments, cavalcades, and hunting or hawking parties. He is equally excellent in his vivacious treatment of figures, in his skilful animal painting, and in his admirable and appropriate landscape backgrounds. Horses were his favourite study, and a white horse is generally introduced. Three different styles have been observed as characteristic of the various periods of his art. His earlier works are marked by the prevalence of a foxy-brown colouring, and by a tendency to angularity in draughtsmanship; the productions of his middle period have greater purity and brilliancy; and his latest and greatest pictures possess more of force and breadth, and are full of a delicate silvery-grey tone.

See H. de Groot, *Catalogue of Dutch Painters* (1909).

WRAITH, a general term in popular parlance for the appearance of the spirit of a living person. (*See* "Phantasms of the Living," under PSYCHICAL RESEARCH.)

WRANGEL, FRIEDRICH HEINRICH ERNST, COUNT VON (1784–1877), Prussian general field marshal, was born at Stettin, on April 13, 1784. He entered the Prussian army in 1796 and distinguished himself in the campaigns against Napoleon. He was in command of the 13th Division, with headquarters at Münster, in Westphalia, in 1834, when riots occurred owing to differences between the archbishop of Cologne and the crown, and the determination and resolution with which he treated the clerical party prevented serious trouble. He was promoted lieutenant-general, received many honours from the court, enjoyed the confidence of the Junker party, and commanded successively at Königsberg and Stettin. In 1848 he commanded the II. Corps of the German Federal army in the Schleswig-Holstein campaign, was promoted general of cavalry, and won several actions. In the autumn he was summoned to Berlin to suppress the riots there. As governor of Berlin and commander-in-chief of the Mark of Brandenburg (appointments which he held till his death) he proclaimed a state of siege, and ejected the Liberal president and members of the Chamber. Thus on two occasions in the troubled history of Prussian revival Wrangel's uncompromising sternness achieved its object without bloodshed. In 1856 he was made a field marshal. At the age of eighty he commanded the Austro-Prussian army in the war with Denmark in 1864. The prestige of his name, and the good work of his subordinates, made the campaign a brilliant success. After the capture of Düppel he resigned the command, was created a count, and received other honours. In 1866 "Papa" Wrangel assisted in the Bohemian campaign, but without a command on account of his great age. He took a keen interest in the second reorganization of the cavalry arm 1866–1870, and in the war with France in 1870–71. He died at Berlin on Nov. 2, 1877.

See supplement to *Militär. Wochenblatt* (1877), and lives by von Köppen and von Maltitz (Berlin, 1884).

WRANGEL, KARL GUSTAV VON (1613–1676), Swedish soldier, was descended from a family of Estonian origin, branches of which settled in Sweden, Russia and Germany. His father, Hermann von Wrangel (1587–1643), was a Swedish field marshal in Gustavus Adolphus's wars. Karl Gustav was born near Uppsala on Dec. 23, 1613, and at the age of twenty distinguished himself as a cavalry captain in the war against the Army of the League. Three years later he was colonel, and in 1638 major-general, still serving in Germany. In 1644 he commanded a fleet at sea, which defeated the Danes at Fehmarn on the 23rd of October. In 1646 he returned to Germany as a field marshal and succeeded Torstensson as commander-in-chief of the Swedish army in Germany, which post he held during the last three campaigns of the Thirty Years' War. Under Wrangel and Turenne the allied Swedish and French armies marched and fought in Bavaria and Württemberg. At the outbreak of a fresh Polish

war in 1655 Wrangel commanded a fleet, but in 1656 he was serving on land again and commanding, along with the Great Elector of Brandenburg, in the three days' battle of Warsaw. In 1657 he invaded Jutland and in 1658 passed over the ice into the islands and took Kronborg. In 1657 he was appointed admiral and in 1664 general of the realm, and as such he was a member of the regency during the minority of Charles XI. But his last campaign was unfortunate. Commanding, ineffectively owing to his broken health, in the war against Brandenburg, he was recalled after his stepbrother Waldemar, Freiherr von Wrangel (1647–1676), had been defeated at Fehrbellin. He died at Rügen on July 5, 1676.

WRANGEL, PETER NICHOLAIEVICH, BARON (1878–1928), Russian general, was born at St. Petersburg (Leningrad) on Aug. 15, 1878, of a noble family of Swedish descent. After experience in the ranks of the horse guards and as a mining engineer in Siberia, he served as an officer in a Cossack regiment, transferring after the Russo-Japanese War to the horse guards as a captain. During the World War he commanded successively a squadron, a regiment and a division of Cossacks. He was one of the first officers to join Kaledin against the Bolsheviks. After Kaledin's suicide Wrangel allied himself to Alexeyev and Denikin, distinguishing himself particularly by his defence of Tsaritsyn in the summer of 1919. On April 4, 1920, after Denikin's retreat, Wrangel was appointed commander-in-chief of the volunteer army. He was in Constantinople when the summons came. He arrived in the Crimea to find a force completely disorganized. In a very short space of time he had turned it into an effective force with which he held the Bolsheviks in check, and indeed made some advance. But after the signing of a peace treaty between Poland and the Bolsheviks the tide turned. On Nov. 15 Sebastopol was lost and the evacuation of the army carried out. Wrangel embarked with about 130,000 refugees, who were dispersed in the Balkans and other parts of Europe. He kept a staff for some time in Belgrade, from which centre he tried to organize the settlement of his soldiers. After a time he took a post as mining engineer in Brussels, where he died on April 25, 1928.

WRANGEL ISLAND, in the Arctic sea, 85 m. N.E. of Cape Billings, eastern Siberia, extends between 176° W. and 179° E. in about 71° N. It is 80 m. long and 18–30 m. wide and has an area of about 2,000 sq.miles. The mountainous interior rises to 2,500 ft. in Berry Peak, but there is much low land on the south and north. Shoals and sandspits project to sea on the north and south-west. The west and east coasts are steep and lofty. The small Rodgers harbour is on the south-east. There are no true glaciers. Tundra covers many parts. Polar bears and foxes are numerous. Walrus and seals frequent the shores. In summer there are duck, geese, gulls and other birds. Driftwood is abundant. Mammoth tusks have been found. No minerals of value occur. Herald island lies 40 m. E. of Wrangel island. It is 5 m. long and 900 ft. high. The shores are mostly steep. There are no resources. Both islands are generally surrounded by pack-ice. Hunters do not visit them and there has never been a native population. Reports of land seen to the north by natives of eastern Siberia were investigated by F. von Wrangel in 1824, but he failed to reach the island. In 1849 Captain H. Kellett, R.N., discovered and landed on Herald island, from which he reported lands to the west, Plover and Kellett's Lands, thought to be parts of an Arctic continent. Commander J. Rodgers, U.S.N., landed on Herald island in 1855, and the American whaler T. Long sailed along the south of Wrangel island and gave it its name in 1867. The first certain record of landing is by Capt. C. L. Hooper, U.S.N., in 1881. The same year Captain R. M. Berry, U.S.N., explored the island and dispelled the idea of extensive land in that region. Russians first landed in 1911 when the "Taimir" and "Vaigach" erected a beacon. The survivors of V. Stefansson's "Karluk" lived on the island from March to Sept. 1914 (*see* ARCTIC REGIONS); in 1921 Stefansson sent another party of five under A. Crawford to establish a Canadian claim by occupation in view of the use of the island as a base in transpolar aerial trade routes. The party perished through accident with the exception of the Eskimo seamstress. In 1923 a party of Eskimos under an Alaskan trapper was established with the same end in view, but Russia, laying stress on a claim made in 1916, removed the colony in Aug. 1924 and shortly afterwards brought 50 Chuckhee to form a settlement under Soviet officials. The Soviet flag was also hoisted on Herald island in 1926. The colony was visited by Russian aeroplanes in 1927. These claims were not officially disputed by Britain, Canada or the United States.

(R. N. R. B.)

WRASSE, a name given to the fishes of the family *Labridae*. They are abundant in the tropical zone, less so in the temperate, and disappear altogether in the Arctic and Antarctic. Their body is compressed, like that of a carp, and covered with smooth scales; they possess one dorsal fin only, the anterior portion of which consists of numerous spines. Many wrasses are recognized by their thick lips, the inside of which is sometimes curiously folded. The dentition consists of strong conical teeth, of which some are larger than others. But the principal organs with which they crush shell-fish, and other hard substances are the solid and strongly-toothed pharyngeal bones, of which the lower are coalesced into a single flat triangular plate. All wrasses are surface fishes. Rocky parts of the coast overgrown with seaweed are their favourite haunts in the temperate, and coral-reefs in the tropical seas. Some 450 species of wrasses (including parrot-fish, *q.v.*) are known, chiefly from the tropics.

Of the British wrasses the ballan wrasse (*Labrus maculatus*) and the striped or red or cook wrasse (*L. mixtus*) are the most common. The goldsinny or corkwing (*Crenilabrus melops*) is much more frequent on the southern coasts of England and Ireland than farther north. It rarely exceeds 10in. in length. The commonest American species is the tautog.

WRECK, a term which in its widest sense means anything without an apparent owner that is afloat upon, sunk in, or cast ashore by the sea; in legal phraseology, it has a narrower meaning. Formerly an appreciable source of revenue to the Crown, afterwards a valuable addition to the income of a landowner on the sea-coast, wreck has almost within modern times ceased to be a perquisite of either, or to enrich the casual finder at the expense of its rightful owner.

History.—The general rule in the civilized maritime countries of Europe was that the right to wreck belonged to the sovereign, and formed part of the royal revenue. This was so under the Roman, French and feudal law; and in England the common law set out in the statute *De praerogativa regis* (17 Edw. II., 1324) provided that the king has wreck of the sea, whales and sturgeons taken in the sea and elsewhere within the kingdom, except in certain places privileged by the king. This right, which it is said had for its object the prevention of the practice of destroying the property of the shipwrecked, was, however, gradually relaxed; and the owner of wreck was allowed to recover it if he made claim to it, and gave proof of his ownership within a certain time —fixed at a year or a year and a day alike by a decree of Antonine the Great, the feudal law, the general maritime law, the law of France and English law. Early in the 15th or at the close of the 14th century, it became usual for the Crown to grant to the lord-admiral by his patent of appointment, amongst other *proficua et commoditates* appertaining to his office, wreck of the sea; and when, early in the reign of Henry VIII., vice-admirals of the coast were created, the lord-admiral by patent under his own hand delegated to them his rights and duties in the several counties, including those in connection with wreck. He did not, however, part with the whole of his emoluments; his vice-admirals were required to render an account of the proceeds of wreck, and to hand over to him a part, usually one-half, of their gains. This system lasted until 1846 when an act (9 & 10 Vict. c. 99) was passed forbidding the vice-admirals to intermeddle with wreck, and it required the receivers of droits of admiralty to receive all wreck from the finders and to detain it for 12 calendar months; at the end of that period it was to be sold and the proceeds carried to the credit of the consolidated fund. The

ancient law by which the unfortunate owner was deprived of his property, if no living thing escaped from the wreck, had during the 16th and 17th centuries been gradually but tacitly relaxed; it required, however, a decision of Lord Mansfield and the king's bench in 1771 to settle the law definitely that, whether or no any living creature escaped, the property in a wreck remains in the owner. In Scotland it seems that the same law had been laid down in 1725, and there are indications that upon the continent of Europe there had before this date been a relaxation of the old law in the same direction. In the 17th century working salvors established the right to a lien upon property saved as a security for adequate remuneration of their exertions in saving it; and if the vice-admirals restored to its owners wreck that had come to their hands, they did so only upon payment of extravagant demands for salvage, storage, and often legal expenses. Stories of wilful wrecking of ships and of even more evil deeds are probably exaggerations, but modern research has authenticated sufficient abuses to show that further legislation was necessary to regulate the taking possession of wreck and ships in distress by "sea-coasters." Previously to the passing of the Act of 1846 the only substantial protection against plunder which owners of a wrecked ship could get was to apply to the admiralty judge for a commission enabling them or their agents to take possession of what came ashore, but to obtain such a commission took time and cost money, and before the commissioners arrived at the scene of the wreck a valuable cargo would have disappeared and been dispersed through the country. Plunder of wrecks was common, and the crowds that collected for the purpose set law at defiance. The vice-admirals, even if they had been able, did little to protect the ship wrecked. Many of the vice-admirals' accounts of the 17th and following centuries are extant. Most of them are for trifling sums, but occasionally the amounts are considerable. At the close of the 17th century the vice-admirals were required to make affidavits as to the amount of their gains; in 1709 20 of them swore that their office was worth less than £50 in the year.

The right of the warden of the Cinque Ports to wreck was derived from charters granted to the ports by Edward I. and his successors; many other seaports enjoyed a similar right under early charters. It would seem that these rights were of some value, for in 1829 the little towns of Dunwich and Southwold litigated at a cost of £1,000 the question whether a tub of whisky picked up at sea belonged to the admiralty jurisdiction of the one town or the other; and the town of Yarmouth is said to have spent no less than £7,000 upon a similar question. The Municipal Corporations Act of 1835 put an end to all dealings with wreck by local admiralty courts, except those of the Cinque Ports.

Grants of wreck to individuals are earlier than those to towns. Even before the Conquest it seems to have been not unusual for grantees from the Crown of lands adjoining the sea to get the franchise of wreck included in their grants. The lords of counties palatine had *wreccum maris* within their areas as part of their *jura regalia*, but yet inferior lords might prescribe for wreck belonging to their several manors within a county palatine.

From early times a distinction was made in English law between wreck cast ashore and wreck that is floating or sunken below low-water mark. Wreck proper, or common law wreck, *ejectum maris*, is what is cast by the sea upon the shore; for "nothing shall be said to be *wreccum maris*, but such goods as are cast or left upon the land" (*Sir H. Constable's Case*, 1599, 5 Rep. 106), and this belonged to the king *jure coronae*, and was dealt with by the common law. Floating and sunken wreck belonged to the Crown as *inter regalia*, but was granted to the lord-admiral *jure regis*. Even when the office of lord high admiral is in abeyance, and the duties are performed by commissioners, as now, these rights are distinguished from the other royal revenues as belonging to the Crown in its office of admiralty, or, as they are commonly known, droits (*q.v.*) of the Admiralty. From early times the lord-admiral tried to usurp, and there are several instances of his actually usurping jurisdiction over wreck proper; and in the reign of Richard II. special statutes (which were only declaratory of the common law) were passed for the purpose of confining his jurisdiction to its proper limits. Droits are flotsam, jetsam, lagan, derelict. In Lord Coke's words, flotsam is "when a ship sinks or otherwise perishes, and the goods float on the sea"; jetsam is "when goods are cast out of a ship to lighten her when in danger of sinking, and afterwards the ship perishes"; and ligan, or lagan, is "when heavy goods are, to lighten the ship, cast out and sunk in the sea tied to a buoy or cork, or something that will not sink, in order that they may be found again and recovered." Derelict is a ship or cargo, or part of it, abandoned by its master and crew *sine spe recuperandi et sine animo revertendi*. "None of these goods," adds Coke, "which are so called, are called wreck so long as they remain in or upon the sea; but if any of them by the sea be put upon the land then they shall be said to be wreck" (*Sir H. Constable's Case*, 1599, 5 Rep. 106; and 2 Inst. 167). Contrary to the opinion of Hale, Lord Stowell held that what is found anywhere derelict on the seas is acquired beneficially for the sovereign, if no owner shall appear. It seems that this was also Coke's view (2 Inst. 168).

The provisions of the Merchant Shipping Act, 1894, mentioned below, upon the subject of droits of admiralty are not clear. In practice the only droits of the admiralty that are commonly dealt with are anchors that have been slipped or parted from in heavy weather. In the Downs and other roadsteads these are "swept" for by creepers towed over the sea bottom, and in former days sweeping for anchors was a common industry. In the Downs large sums have been made after gales in this way. In the 17th century it became customary to obtain from the Crown grants of the right to fish for sunken wreck and treasure not only upon English coasts but all over the world.

The method of dealing with wreck outside territorial waters (which does not come within the scope of the act) is governed by the previous general law relating to droits of admiralty. The Board of Trade, and receiver-general, in its instructions to receivers, directs that wreck picked up at sea out of the limits of Great Britain, or brought to it by British ships, is to be taken possession of by the receiver and held by him on behalf of the owners, or, if the owners do not claim it, on behalf of the Crown. Derelict ships picked up at sea outside territorial limits and brought into British ports must be delivered to the receiver and kept by him until the owner can be found (but not longer than a year and a day). Wreck picked up out of territorial limits by a foreign ship need not be interfered with by the receiver, unless upon application by a party interested.

Although a ship on board which, or by means of which a man was killed, might be a deodand (*q.v.*), yet *qua* wreck she was not subject to forefeiture as deodand.

Present British Law.—The Merchant Shipping Act, 1894, contains the whole of the existing statute law upon the subject of wreck within the territorial waters of Great Britain, and under the Sea Fisheries Act, 1883, it applies to fishing boats. For its purposes wreck includes jetsam, flotsam, lagan and derelict, found in or on the shores of the sea or any tidal water. The term does not extend to a barge adrift in the Thames, nor a raft of timber adrift; it must be the hull, cargo or appurtenances of a vessel.

The provisions of the Merchant Shipping Act dealing with wreck are of a detailed and administrative character and are concerned with the duties of the Board of Trade, receivers of wreck, finders of wreck and other matters. They will be found in part IX. of the act and are included in ss. 510–537.

The owner of a wrecked ship, sunk by his negligence in a navigable highway, so as to be an obstruction to navigation, if he retains the ownership of her, is liable in damages to the owner of any other ship which without negligence runs into her, unless he has taken steps to indicate her position, or the harbour authority at his request has undertaken to do so. He may, however (whether the sinking was due to his negligence or not), abandon the ship, and can thus free himself from any further liability in respect of her. If he abandons her to any other person—*e.g.*, an underwriter—who pays for her as for a total loss, that person does not become liable for her unless he takes possession or control in any way. Harbour authorities generally have under the Merchant Shipping Act, 1894, or by local statute, as they have by the general Harbours, Docks and Piers Clauses Act, 1847 (if incor-

porated in their own act), the power of removing the wreck in such a case, and recouping themselves for their expenses from its proceeds. The general act also gives a personal right of action against the owner for any balance of expense over the value of the wreck; but if the owner has abandoned it, and no one else has taken it, neither he nor anyone else is liable. A particular or local act (as *e.g.*, one of the State of Victoria) may, however, fasten this liability on the person who is owner at the time when the ship is wrecked, and then he cannot free himself of it. A harbour authority is not obliged to remove a wreck because it has power to do so, unless it takes dues from vessels using the harbour where the wreck lies, or in some way warrants that the harbour is safe for navigation, in which case it is under an obligation to do so. Further statutory provision is now made in this respect by the Merchant Shipping Act, which empowers harbour authorities to raise, remove or destroy (and meantime buoy or light), or to sell and reimburse themselves out of the proceeds of any vessel or part of a vessel, her tackle, cargo, equipment and stores, sunk, stranded or abandoned in any water under their control, or any approach thereto, which is an obstruction or danger to navigation or lifeboat service. They must first give due notice of such intention, and must allow the owner to have the wreck on his paying the fair market value. The act gives similar powers to lighthouse authorities, with a provision that any dispute between a harbour and lighthouse authority in this respect is to be determined finally by the Board of Trade.

By an Act of 1896 it is now the duty of the master of a British ship to report to Lloyd's agent, or to the secretary of Lloyd's, any floating derelict ship which he may fall in with at sea. By the Merchant Shipping Convention Act, 1914, a master must on finding a wreck communicate with the shore. But the operation of the act was suspended by order in council till Jan. 1, 1929. It will supersede previous acts when it comes into force. Under the Merchant Shipping Act it is a felony to take wreck found in territorial limits to a foreign port, and it is punishable by fine to interfere with a wreck. The receiver has power, by means of a search warrant from a justice, to search for wreck which he has reason to believe is concealed. By the law of Scotland plundering wreck is punishable at common law; and in England and Ireland it is a felony to plunder or steal any wreck or part thereof, to destroy any wreck or part thereof, to prevent or impede any person on board a wreck from saving himself, and to exhibit any false signal with the intent of endangering any ship, or to do anything tending to the immediate loss or destruction of a ship for which no other punishment is provided.

WREN, SIR CHRISTOPHER (1632–1723), English architect, the son of a clergyman, was born at East Knoyle, Wiltshire, on Oct. 20, 1632; he entered at Wadham College, Oxford, in 1646, took his degree in 1650, and in 1653 was made a fellow of All Souls. While at Oxford Wren distinguished himself in geometry and applied mathematics, and Newton, in his *Principia*, p. 19 (ed. of 1713), speaks very highly of his work as a geometrician. In 1657 he became professor of astronomy at Gresham College, and in 1660 was elected Savilian professor of astronomy at Oxford. It is, however, as an architect that Wren is best known, and the great fire of London, by its destruction of the cathedral and nearly all the city churches, gave Wren a unique opportunity. Just before the fire Wren was asked by Charles II. to prepare a scheme for the restoration of the old St. Paul's. In May 1666 Wren submitted his report and designs (in the All Souls collection), for this work; the old cathedral was in a very ruinous state, and Wren proposed to remodel the greater part, as he said, "after a good Roman manner," and not, "to follow the Gothick Rudeness of the old Design." According to this scheme only the old choir was left; the nave and transepts were to be rebuilt after the classical style, with a lofty dome at the crossing—not unlike the plan eventually carried out.

In September of the same year (1666) the fire occurred, and the old St. Paul's was completely gutted. From 1668 to 1670 attempts were being made by the chapter to restore the ruined building; but Dean Sancroft was anxious to have it wholly rebuilt, and in 1668 he had asked Wren to prepare a design for a wholly new church. This first design, the model for which is preserved in the South Kensington Museum, is very inferior to what Wren afterwards devised. In plan it is an immense rotunda surrounded by a wide aisle, and approached by a double portico; the rotunda is covered with a dome taken from that of the Pantheon in Rome; on this a second dome stands, set on a lofty drum, and this second dome is crowned by a tall spire. But the dean and chapter objected to the absence of a structural choir, nave and aisles, and wished to follow the mediaeval cathedral arrangement. Thus, in spite of its having been approved by the king, this design was happily abandoned—much to Wren's disgust; and he prepared another scheme with a similar treatment of a dome crowned by a spire, which in 1675 was ordered to be carried out. Wren apparently did not himself approve of this second design, for he obtained the king's permission to alter it as he liked, without showing models or drawings to any one, and the actual building bears little resemblance to the approved design, to which it is superior in almost every point.

Wren's earlier designs have the exterior of the church arranged with one order of columns; the division of the whole height into two orders was an immense gain in increasing the apparent scale of the whole, and makes the exterior of St. Paul's very superior to that of St. Peter's in Rome, which is utterly dwarfed by the colossal size of the columns and pilasters of its single order. The present dome and the drum on which it stands, masterpieces of graceful line and harmonious proportion, were very important alterations from the earlier scheme. As a scientific engineer and practical architect Wren was perhaps more remarkable than as an artistic designer. The construction of the wooden external dome, and the support of the stone lantern by an inner cone of brickwork, quite independent of either the external or internal dome, are wonderful examples of his constructive ingenuity. The first stone of the new St. Paul's was laid on June 21, 1675; the choir was opened for use on Dec. 2, 1697; and the last stone of the cathedral was set in 1710.

Wren also designed a colonnade to enclose a large piazza forming a clear space round the church, somewhat after the fashion of Bernini's colonnade in front of St. Peter's, but space in the city was too valuable to admit of this. Wren was an enthusiastic admirer of Bernini's designs, and visited Paris in 1665 in order to see him and his proposed scheme for the rebuilding of the Louvre. Bernini showed his design to Wren, but would not let him copy it, though, as he said, he "would have given his skin" to be allowed to do so.

After the destruction of the city of London Wren was employed to make designs for rebuilding its fifty burnt churches, and he also prepared a scheme for laying out the whole city on a new plan, with a series of wide streets radiating from a central space. Difficulties arising from the various ownerships of the ground prevented the accomplishment of this scheme.

Among Wren's city churches the most noteworthy are St. Michael's, Cornhill; St. Bride's, Fleet Street, and St. Mary-le-Bow, Cheapside, the latter remarkable for its graceful spire; and St. Stephen's, Walbrook, with a plain exterior, but very elaborate and graceful interior. In the design of spires Wren showed much taste and wonderful power of invention. He was also very judicious in his expenditure; he did not fritter away his limited resources in an attempt to make the whole of a building remarkable, but devoted it chiefly to one part or feature, such as a spire or a rich scheme of internal decoration. Thus he was in some cases, as in that of St. James's, Piccadilly, content to make the exterior of an almost barnlike plainness.

Wren's buildings were very numerous. Among the principal

ones are:—the Custom House, the Royal Exchange, Marlborough House, Buckingham House, and the Hall of the College of Physicians—now destroyed; others which exist are—at Oxford, the Sheldonian theatre, the Ashmolean museum, the Tom Tower of Christ Church, and Queen's College chapel; at Cambridge, the library of Trinity College and the chapel of Pembroke, the latter at the cost of Bishop Matthew Wren, his uncle. The western towers of Westminster Abbey are usually attributed to Wren, but they were not carried out till 1735–1745, many years after Wren's death, and there is no reason to think that his design was used. Wren (D.C.L. from 1660) was knighted in 1673, and was elected president of the Royal Society in 1681. He was in parliament for many years, representing Plympton from 1685, Windsor from 1689, and Weymouth from 1700. He occupied the post of surveyor of the royal works for fifty years, but by a shameful cabal was dismissed from this office a few years before his death. He died on Feb. 26, 1723, and is buried under the choir of St. Paul's; on a tablet over the inner north doorway is the well-known epitaph—*Si monumentum requiris, circumspice*. At the bi-centenary of his death on Feb. 26, 1923, a memorial service was held in St. Paul's Cathedral.

For further information the reader should consult the *Parentalia*, published by Wren's grandson in 1750, an account of the Wren family and especially of Sir Christopher and his works; also the two biographies of Wren by Elmes and Miss Phillimore; Milman, *Annals of St. Paul's* (1868); and Longman, *Three Cathedrals dedicated to St. Paul in London* (1873), pp. 77 *seq.* *See* also Clayton, *Churches of Sir C. Wren* (1848–1849); Taylor, *Towers and Steeples of Wren* (London, 1881); Niven, *City Churches* (London, 1887), illustrated with fine etchings; A. H. Mackmurdo, *Wren's City Churches* (1883); A. Stratton, *The Life, Work and Influence of Sir Christopher Wren* (1897); Lena Milman, *Sir Christopher Wren* (1908). The proceedings and publications of the Wren Society, incl. the vol. of drawings (1923); Sir Laurence Weaver K.B.E., *Sir Christopher Wren* (1923); *Letters (Tom Tower) to Fell, Bishop of Oxford* (Oxford, 1923); and the bi-centennial memorial volume published by the Royal Institute of British Architects (1923). In the library of All Souls at Oxford are preserved a large number of drawings by Wren, including the designs for almost all his chief works, and a fine series showing his various schemes for St. Paul's Cathedral. (J. H. Mi.)

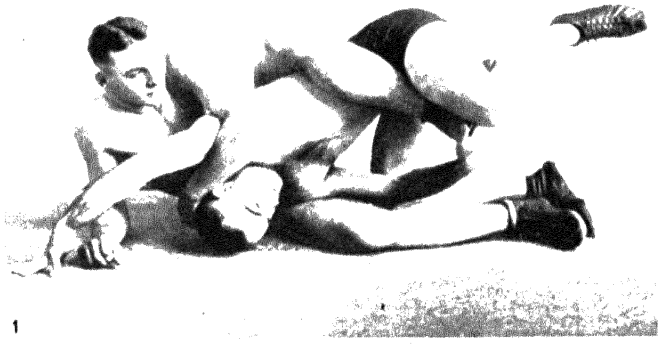
WREN, the popular name for birds of the Passerine family *Troglodytidae*, of which the best known is *Troglodytes troglodytes*, the little brown bird with its vigorous song and its short tail cocked on high, that braves the winter of the British islands, and even of the European continent, and figures largely in folklore. In St. Kilda, isolation has brought about the evolution of a distinct sub-species.

The better known forms in the United States are the house-wren, common in the eastern states but in bad odour for its egg-eating proclivities; the winter-wren, remarkable for its resonant and brilliant song; the Carolina wren, also a fine singer; and the marsh-wren, besides the cactus-wrens and the cañon-wrens of the western States.

Wrens have the bill slender and arched: their food consists of insects, larvae and spiders, but they will also take any small creatures, such as worms and snails, and occasionally eat seeds. The note is shrill. The nest is usually a domed structure of ferns, grass, moss and leaves, lined with hair or feathers, and from three to nine eggs are produced, in most of the species white.

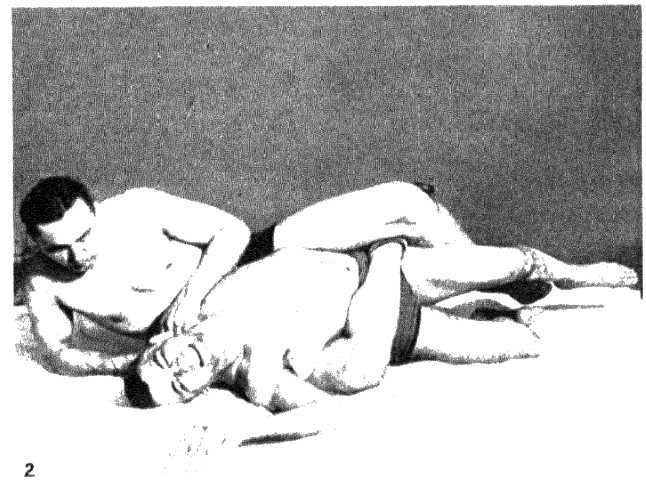
The headquarters of the wrens are in tropical America, but they reach Greenland in the north and the Falkland Islands in the south. Some genera are confined to the hills of tropical Asia, but *Troglodytes*, the best known, ranges over North and South America, Asia and Europe.

The *Troglodytidae* by no means contain all the birds to which the name "wren" is applied. Several of the *Sylviidae* bear it, especially the beautiful little golden-crested wren (*see* GOLDCREST), and the group forming the genus *Phylloscopus* (*see* WARBLER), habitual summer visitants. The largest *P. sibilatrix*, is usually called the wood-wren. The willow-wren *P. trochilus*, is in many parts of Great Britain the commonest summer bird, and is the most generally dispersed. The third species, *P. collybita*, is the chiffchaff.



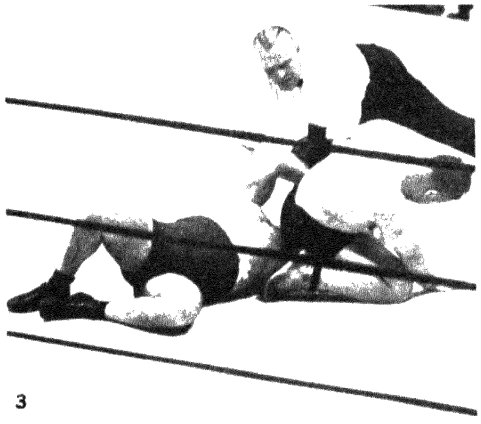
WRESTLING, a sport in which two persons strive to throw each other to the ground. It is one of the most primitive and universal of sports. Upon the walls of the temple-tombs of Beni Hasan, near the Nile, are sculptured many hundreds of scenes from wrestling matches, depicting practically all the "holds" and "falls" known at the present day, thus proving that wrestling was a highly developed sport at least 3,000 years before the Christian era. The description of the bout between Odysseus and Ajax in the 23rd book of the Iliad, and the evolutions of the classic Greek wrestlers, tally with the sculptures of Beni Hasan and Nineveh. The sport, in an organised and scientific form, may have been introduced into Greece from Egypt or Asia, though Greek tradition ascribed its invention and original rules to the legendary hero, Theseus. In Homer's celebrated description of the match between Ajax and Odysseus the two champions wore only a girdle, which was, however, not used in the classic Greek games. Neither Homer nor Eustathius, who also minutely depicted the battle between Ajax and Odysseus, mentions the use of oil, which, however, was invariably used at the Olympic games, where wrestling was introduced during the 18th Olympiad (about 704 B.C.). Wrestling contests for boys were added later. The Greek wrestlers, after the application of the oil, were rubbed with fine sand, to afford a better hold.

Wrestling was a very important branch of athletics in the Greek games, since it formed the chief event of the *pentathlon*, or quintuple games. (*See* GAMES, CLASSICAL.) All holds were allowed, even strangling, butting, and kicking. Crushing of the fingers was used, especially in the *pancration*, a combination of boxing and wrestling. Wrestlers were taught to be graceful in all their movements, in accordance with the Greek ideas of aesthetics. There were two varieties of Greek wrestling, the *πάλη ὀρθή*, or upright wrestling and the *ἀλίνδησις* (*κύλισις*, *lucta volutatoria*) which included ground wrestling after the contestants had fallen, the struggle continuing until one acknowledged defeat. This was the variety employed in the *pancration*, and was an "all in" struggle, no "fouls" being recognised. The upright wrestling was very similar to the catch-as-catch-can style, though leg holds were infrequent. In this, three falls out of five decided a contest; a variation of this style was that in which one of the contestants stood within a small ring and resisted the efforts of his adversary to pull or push him out of it. Other local varieties existed in the different Greek states. The most celebrated wrestler of ancient times was Milo of Croton (*c.* 520 B.C.), who scored thirty-two victories in the different national games, six of them at Olympia. Greek athletic sports were introduced into Rome in the last quarter of the 2nd century B.C., but they never attained to the popularity they had enjoyed in Greece.



Among the Teutonic peoples wrestling, as a method of fighting as well as a form of athletic recreation, was always practised; how popular it had become as a sport during the middle ages is proved by the frequent references to the historic personages notable for their skill in the art, and still more so by the voluminous literature on the subject which appeared after the invention of printing, the most celebrated work being the *Ringer-Kunst* of Fabian von Auerswald (1539). Albrecht Dürer made 119 drawings illustrating the different holds and falls in vogue in the 15th and 16th centuries; while Romeyn de Hooge provided 71 similar illustrations for Nicolas Petter's *Worstel-Kunst* (1674). The holds and throws shown singularly resemble those used in the Greek games, even to certain brutal tricks, practically identical with grips and locks included in modern Ju-Jutsu.

In Switzerland and some of the Tirolese valleys a style of wrestling flourishes under the name of *schwingen* (swinging). The wrestlers wear *schwinghosen* or wrestling breeches, with stout belts, on which the holds are taken. Lifting and tripping are prevalent, and the first man down loses the bout. In Styria wrestlers stand firmly on both feet with right hands clasped. When the word is given, each tries to pull or push the other from his stance, the slightest movement of a foot sufficing to lose. In Russia, belt wrestling, and in Iceland, the glima, are popular styles. Both require the wearing of a kind of harness about the loins and thighs, and otherwise are similar to *schwingen*. In the Balkan states, the favourite style is catch-as-catch-can.



The popularity of wrestling has survived in many Asiatic

WRESTLERS AND WRESTLING HOLDS

1. Stecher starting a scissors hold
2. Stecher applying a figure-four scissors, using pressure with his legs and pinning opponent's shoulders with his arms
3. Lewis getting out of a head-lock or arm-lock
4. Sonnenberg, winner of the heavyweight championship of the world in Boston in 1928
5. Lewis using a jack-knife hold
6. Stecher applying a double wrist-lock in standing position
7. Lewis about to use an arm grip shoulder throw
8. A head chancery in standing position
9. Lewis applying his famous head-lock

BY COURTESY OF THE JAPANESE CONSULATE, NEW YORK

WRESTLING MATCH IN JAPAN

Japanese wrestlers struggling in a 12 ft. ring. Contests are usually of brief duration. Great reliance is placed upon weight, some champions scaling 300 lb. and upward. After taking the initial hold whichever contestant touches the ground with any part of his person, except his feet, loses the match. A cloth around the loins is the only covering for the body

SOME OF THE HOLDS USED IN WRESTLING

(A) Double leg hold, (B) Chancery back heel, (C) Side chancery, (D) Cross buttock and waist hold, (E) Near leg hold and arm lock, (F) Waist lock secured rom rear and breaking the hold, (G) Ready to secure fall with waist hold secured from front, (H) Fall imminent from waist lock, (J) Leg hold and inside ack-heel, (K) Half Nelson and further leg hold, (L) Referee's hold, (M) Full Nelson, (N) Three-quarter Nelson, (O) Quarter Nelson, (P) Half Nelson

countries, particularly in Japan, where the first match recorded took place in 23 B.C., the victor being Sukune, who has ever since been regarded as the tutelary deity of wrestlers. In the 8th century the emperor Shômu made wrestling one of the features of the annual harvest "Festival of the Five Grains," the victor being appointed official referee and presented with a fan bearing the legend, "Prince of Lions." In 858 the throne of Japan was wrestled for by the two sons of the emperor Buntoku, and the victor, Koreshito, succeeded his father under the name of Seiwa. Imperial patronage of wrestling ceased in 1175, after the war which resulted in the establishment of the shogunate, but continued to be a part of the training of the *samurai* or military caste. About 1600, professional wrestling again rose to importance, the best men being in the employ of the great *daimios* or feudal nobles. It was, nevertheless, still kept up by the *samurai*, and eventually developed into two separate systems, the national style called *Sumo*, and that peculiar and scientific combination of wrestling and self-defence known as *ju jutsu* (*q.v.*), the purpose of which is to disable an adversary. The national championships were re-established in 1624, when the celebrated Shiganosuke won the honour, and have continued to the present day. The Japanese (*Sumo*) wrestlers place great reliance upon weight, some of the champions scaling 300 lb. and upwards; and as a result of highly specialised methods of physical training, they are generally of huge bulk and great strength, although surprisingly light on their feet. They form a guild which is divided into several ranks, the highest being composed of the *joshiyori*, or elders, in whose hands the superintendence of the wrestling schools and tournaments lies. The badges of the three highest ranks are damask aprons richly embroidered. The wrestling takes place within a ring 12 ft. in diameter, the wrestlers being naked but for a loin cloth; and each contest is preceded by certain preliminaries of a quasi-religious significance. At the command of the referee the wrestlers crouch with their hands on the ground and watch for an opening. The contests are usually of brief duration. The method is very similar to that of the modern catch-as-catch-can style, except that touching the ground with any part of the person, the feet excepted, after the first hold has been taken, loses the bout. To step or be forced outside the actual wrestling circle is equivalent to losing a fall.

Indian wrestling resembles that of Japan in the great size of its champions and the number and subtlety of its attacks, called *penches*. It is of the "loose" order, the men facing each other nude, except for a loin-cloth, called *chaddi*, and manoeuvring warily for a hold. Both shoulders placed on the ground simultaneously constitute a fall, which is seldom gained without much ground wrestling. It is highly scientific, though including many tricks that Western rules exclude as "fouls."

In Great Britain wrestling was cultivated at a very early age, both Saxons and Celts having always been addicted to it, with the men of Cornwall always holding a special eminence; and English literature is full of references to the sport. On St. James's and St. Bartholomew's days special matches took place throughout England, those in London being held in St. Giles's field, whence they were afterwards transferred to Clerkenwell. The Lord Mayor and his sheriffs were often present on these occasions, but the frequent brawls amongst the spectators eventually brought these public matches into disrepute. English monarchs have not disdained to patronise the sport, and Henry VIII. is known to have been a powerful wrestler.

Cumberland Style.—This style prevails chiefly in the north of England (except south Lancashire) and in the south of Scotland. In this the wrestlers stand chest to chest, each grasping the other with locked hands round the body, his chin on the other's right shoulder. The right arm is below and the left above the adversary's. When the hold has been firmly taken the umpire gives the word and the bout proceeds until one man touches the ground with any part of his person except his feet, or he fails to retain his hold, in either of which cases he loses. If both fall together, the one who is underneath, or first touches the ground, loses. If both fall simultaneously side by side, it is a "dog-fall," and the bout begins anew. The different manoeuvres used to throw the adversary are called "chips," the most important being the "back-heel," in which a wrestler gets a heel behind his opponent's opposite heel, from the outside, and forces him over backwards; the "outside stroke," in which, after a sudden twist of his body to one side, the opponent is struck with the edge of the opposite foot on the outside of the ankle; the "hank," or locking a leg and lifting the opponent with a sudden turn to the right, so that both fall together, but with the opponent underneath; the "inside click," the locking of an opposite leg applied after jerking the opponent forward, the pressure then being straight back; the "outside click," a back-heel applied by the defender as he is on the point of being lifted from the ground—it prevents this and often results in oversetting the opponent; the "cross-buttock," executed by turning the left hip under the opponent's body, throwing the leg across both his and striking backwards, while partially lifting and throwing him forward; the "buttock," in which the hip is thrust still further under the opponent, who by the action of the arms is thrown right over one's back; the "hipe" or "hype," executed by lifting the opponent off his feet, and while carrying him to the right or left, placing the opposite knee under one of his legs and raising it as high as possible before throwing him sideways to the ground; the "swinging hype," in which the opponent is lifted and swung nearly or quite round before the knee stroke is made; and the "breast stroke," which is a sudden powerful twist, first to one side, then the other, followed by a throw. There is but a single "foul"—direct kicking.

West Country Style.—In the Cornwall and Devon or "West Country" style the wrestlers wear stout, loose canvas jackets, the hold being anywhere above the waist or by any part of the jacket, though any manipulation of the jacket collar to strangle an opponent is forbidden. A fall is gained when both hips and a shoulder, or both shoulders and a hip (three points), touch the ground simultaneously. A throw that does not secure a fall is a "hitch." Ground wrestling is forbidden, and a man, when he feels himself falling, will try to turn and land on his side or chest. Many of the "chips" used by Cumberland and Westmorland wrestlers are possible in this style, with slight differences of execution required by the different method of taking hold and under other names—"forehip" (cross-buttock); "inside lock" (hank), etc. More distinctive throws are the "heave," and the "flying mare," a chip of universal use in which the opponent's wrist is grasped with the opposite hand, the upper part of the same arm by the other hand, the back turned and the captured limb drawn across a shoulder, over which the opponent is vigorously shot forward. Until comparatively recently there was a difference between the styles of Cornwall and Devon, the wrestlers of the latter county having worn heavily soled shoes, with which it was legitimate to kick the adversary's shins.

Catch-as-catch-can.—The Lancashire style, generally known as "catch-as-catch-can," is practised in Lancashire, throughout Great Britain generally, and is the most popular style in the United States, Canada, Australia, Switzerland and some other countries. It is the legitimate descendant of the ancient Greek upright wrestling combined with ground struggling, but minus the "all-in" freedom the Greeks permitted, and undoubtedly is representative of the wrestling of the middle ages. A fall is gained when both shoulders of one wrestler touch the ground together, and very seldom are falls registered from standing throws. This necessitates most contests being completed while struggling on the ground or mat. Much of this ground work is admittedly very skilful. No kicking, striking, or other foul practices are permitted, but theoretically every hold is legitimate. Exceptions are made of strangle holds or others designed to cut off an opponent's breathing, also grips or forms of attack causing acute pain or intended to force the defender to roll on his shoulders to avoid injury by dislocation or fracture. The style contains practically all the manoeuvres known to other methods with many peculiar to itself; and because of its freedom and opportunity for the display of strategy, skill, and strength, is, when upstanding wrestling and tripping—the very essence of wrestling—are not neglected, the most preferable.

In Scotland a combination of the Cumberland and Westmor-

land and catch-as-catch-can styles is sometimes practised, the contest commencing in the first named style and continued on the ground if a direct fall on both shoulders does not result from a throw.

In Ireland, the national style is called "collar and elbow" (practised in America also), from the holds taken by the two hands, and first down, any part (in America, any three points) is loser.

Graeco-Roman Style.—The style chiefly affected by the continental European wrestlers is the Graeco-Roman (so-called, though it bears almost no resemblance to classic wrestling), which arose about 1860, and is a product of the French wrestling schools. It is a very restricted style, neither tripping nor any hold below the hips being allowed, the result being that the bouts consist chiefly of ground struggling. When no time limit is enforced, contests are usually tediously long. British and American wrestlers, accustomed to their own freer styles, seldom compete under Graeco-Roman rules. These, however, of late years have been revised by the governing body of international wrestling, the International Amateur Wrestling Federation (inaugurated 1921), with the result that the character and quality of this style of wrestling have greatly altered and improved. The pre-eminence that French wrestlers formerly held has been transferred to the Scandinavian countries. The Finnish wrestlers show a marked advance. Finland shared with Sweden the wrestling championships at the Olympic games of 1912, held at Stockholm, repeated the success at Antwerp in 1920, and won four of the six weights at Paris, in 1924. The Swedes, Hungarians and Germans are also formidable exponents of this style, the last named taking the chief honours at Amsterdam in 1928.

Wrestling in the Olympic Games.—The popularity of wrestling as an amateur sport has received a considerable development through the institution of the modern Olympic games, as is proved by the increase in the number of nations entering competitors at this quadrennial athletic festival. In 1908, when the games were held in London, 15 nations were represented (Graeco-Roman and catch-as-catch-can styles); at the games of 1924, 25 countries sent competitors. In 1914, the permanent inclusion of catch-as-catch-can (free style) wrestling in the standard programme was secured by Great Britain, and since then this style has made great progress, the nations entering for these competitions in 1924 numbering 11 as compared with the five at the games of 1908; with an increase to 15 for the games of 1928 at Amsterdam. In 1924, Japan, Turkey, and Egypt were represented for the first time, with results indicating that the Western styles of wrestling are being well studied throughout the East. The International Amateur Wrestling Federation has fixed the number of championship weights at seven for the catch-as-catch-can style and six for the Graeco-Roman. Under authority of the I.A.W.F., European (amateur) championships in both styles have been instituted and are decided annually (except in the year when an Olympiad takes place); and numerous international matches are disputed every year, leading to a higher development of the sport and a marked increase in public interest, which will be yet further extended if the proposal to bring the two styles within one code of rules is carried into effect.

In Great Britain, apart from the professional tournaments organised by local associations in the northern and western counties, it seems probable the sport would have disappeared altogether but for the exertions of the National Amateur Wrestling Association. This organisation has kept the sport alive by the promotion (the years of the World War excepted) of annual championships at various weights in the Cumberland and Westmorland and catch-as-catch-can styles.

THE UNITED STATES

Wrestling in America is considered second in importance to boxing in the category of sports of a bodily combat nature. Although professional wrestlers attract greater audiences than amateurs, the participation of college and athletic club performers has perhaps brought the sport into more popular favour. In professional contests, as with amateurs, the catch-as-catch-can style of wrestling is preferred to the Graeco-Roman style.

Among the heavyweight stars, Frank Gotch is considered the peer of all time because of the science he imparted to the game. As undisputed world's champion he successfully defended his title before the onslaught of Hackenschmidt in 1908; Mahmont, the Turk, in 1911; Hackenschmidt again in 1912; and numerous other contests, after which he retired undefeated. In the following years there were many so-called championship matches, but none of the contestants won a clear title to a world's championship. Ben. F. Roller of Seattle won the American Championship in 1912 by defeating C. Cutler of Chicago, after the latter had beaten Ordeman in Minneapolis. After Americus had defeated Beel, Roller won from Americus at Springfield in 1913. Ed. ("Strangler") Lewis defeated Roller in New York in 1915 and Earl Caddock in 1921. Munn beat Lewis in Kansas City in 1923; Stanislaus Zbyszko defeated Munn in Philadelphia in 1924; Joe Stecher beat Zbyszko in 1925; Lewis defeated Stecher in 1928; Gus Sonnenberg defeated Lewis in Boston in 1929, winning the world's championship.

Some of the most remarkable performances on the wrestling mat were exhibited by Roller when he and Frank Gotch met all comers during a four months' tour from New York to Los Angeles and return in 1910. Roller, though 50 years old, wrestled 191 men in all, defeating each in less than 15 min., winning the stake of $250 offered for each contest.

Among the lightweights, George Bothner has often been acclaimed the greatest in the world. He performed during 1899–1918, defeating such top-notchers as Tom Riley, of England, holder of the Lonsdale belt, in 1899; Jack Harvey in 1901; Ed. O'Connell in 1903; Higashi, the Japanese, in 1905; Will Bingham, champion of England, in 1907; Pierre Colosse, the 390-lb. champion of France, in 1915; and others.

The National Collegiate Association controls amateur wrestling in the colleges, a set of rules being formulated by H. R. Reiter, Lehigh university, chairman of the rules committee. Amateur wrestling is under the jurisdiction of the Amateur Athletic Union of the United States and all bouts are contested under its rules. Besides various sectional, State and city championships, held annually, wrestling meets are staged by the New York A.C.; Penn. A.C.; Illinois A.C.; and others, as well as by Y.M.C.A.'s, turnvereins and numerous athletic and civic organizations in all parts of the United States. (J. B. P.)

WREXHAM (Welsh *Gwrecsam*, in the Anglo-Saxon Chronicle *Wrightesham*), a market town and municipal borough of Denbighshire, North Wales, 12 m. S.W. of Chester, with stations on the G.W.R. & L.N.E.R. Pop. (1921) 18,703. Wrightesham was of Saxon origin, and lying east of Offa's Dyke, was yet reckoned in Mercia. It was given (with Bromfield and Yale, or *Îâl*) by Edward I. to Earl Warenne. St. Giles's church is of the 14th, 15th and 16th centuries, with a panelled tower; the interior is Decorated. Wrexham is the seat of the Roman Catholic bishop of Menevia, whose diocese includes all Wales except Glamorganshire. With the development of the North Wales coalfield in the 19th century Wrexham grew in importance and has interests in the by-product industries.

WRIGHT, SIR ALMROTH EDWARD (1861–), British bacteriologist, was born at Middleton Tyas, Yorks., on Aug. 10, 1861. He was educated at Dublin university, subsequently obtaining his scientific and medical training at the Universities of Leipzig, Strasbourg and Marburg. In 1887 he became a demonstrator of pathology at Cambridge, in 1889 a lecturer in physiology at Sydney, and from 1892 to 1902 professor at the army medical school at Netley, being then appointed professor of experimental pathology in the University of London. He was in addition principal of the institute of pathology and research at St. Mary's hospital. He was knighted and elected F.R.S. in 1906.

Sir Almroth Wright became prominent by his researches in parasitic diseases. He introduced anti-typhoid inoculation and did much valuable work on the preparation of other vaccines and

toxins. He carried out many important experiments in bacterial infection and in measuring the protective matter of human blood. He acted as consulting physician to the army in France from 1914–1919 and was in 1919 created K.B.E. He was a member of many learned societies and received numerous British and foreign awards and honours including the gold medal of the Royal Society of Medicine in 1920. He published a short treatise on *Anti-Typhoid Inoculation* (1904), *Principles of Microscopy* (1906) and *Studies in Immunisation* (1909) besides many papers. In 1913 appeared *The Unexpurgated Case against Woman Suffrage* which provoked much discussion. (*See* HUMANITY.)

WRIGHT, CARROLL DAVIDSON (1840–1909), American statistician, was born at Dunbarton, N.H., on July 25, 1840. Paying his way by teaching, he became a lawyer although his studies were interrupted by service in the Civil War, in which he advanced from private to colonel and assistant adjutant-general in the Shenandoah valley campaign. In 1872–73 he served in the senate of Massachusetts, and from 1873 to 1888 he was chief of the Massachusetts bureau of statistics of labour. He was U.S. commissioner of labour from 1885 to 1905. Avoiding polemics, he directed the energies of the national bureau into investigation of the economic conditions surrounding labour and study of the methods for promoting the welfare and uplift of the working classes. He was a persistent advocate of the principle of collective bargaining and of the sliding-scale method of wage adjustment. In 1902 he was chosen president of Clark college, Worcester, Mass., where he was also professor of statistics and social economics from 1904 until his death on Feb. 20, 1909. Among his works of general interest are *The Industrial Evolution of the United States* (1895), *Outline of Practical Sociology* (1899), *Some Ethical Phases of the Labor Question* (1902) and *The Battles of Labor* (1906).

See the article on him by S. N. D. North (Amer. Statist. Assoc., *Pub.*, new ser. 86, 1909) and the bibliography (*ibid.*, 87, Sept., 1909).

WRIGHT, ORVILLE (1871–), American inventor, was born at Dayton, Ohio, on Aug. 19, 1871. He early became associated with his brother, Wilbur (*q.v.*), in the bicycle repair business, and from the first shared his interest in mechanical flight. Shop experiments led to the development of a power driven heavier-than-air machine which was piloted by Orville Wright on its first successful flight made on Dec. 17, 1903 at Kitty Hawk, N.C. Further experiments led to the development of an aeroplane which established a new record on Sept. 12, 1908 by remaining in the air one hour and 15 minutes. An accident on Sept. 17 terminated his experiments for that year but on July 27 and 30, 1909, his demonstrations at Ft. Meyer, Va., satisfied the tests, and secured the acceptance of his machine by the U.S. Government. Numerous demonstrations made in Europe during 1908 and 1909 caused many honours to be bestowed on the two brothers. In Dec. 1928, the 25th anniversary of the first successful flight was celebrated at Kitty Hawk.

WRIGHT, SILAS (1795–1847), American political leader, was born at Amherst, Mass., on May 24, 1795. He graduated at Middlebury college, Vermont, in 1815, was admitted to the bar in 1819, and began practice at Canton, in northern New York. He was appointed surrogate of St. Lawrence county in 1820, and was successively a member of the state Senate in 1824–26, a member of the national House of Representatives in 1827–29, comptroller of the state in 1829–33, U.S. senator in 1833–44, and governor of New York in 1844–46. During his public life he had become a leader of the Democratic party in New York, Martin Van Buren being his closest associate. He was an influential member of the so-called "Albany regency," a group of Democrats in New York, including such men as J. A. Dix and W. L. Marcy, who for many years virtually controlled their party within the state. He died at Canton on Aug. 27, 1847.

The best biography is that by J. D. Hammond, *Life and Times of Silas Wright* (Syracuse, N.Y., 1848), which was republished as vol. iii. of that author's *Political History of New York*.

WRIGHT, WILBUR (1867–1912), American inventor, son of Milton and Susan Catharine (Koerner) Wright, was born near Millville, Ind., on April 16, 1867. When Wilbur Wright was one month old his father was elected editor of the official organ of the Church of the United Brethren in Christ, necessitating moving his family to Dayton, O.; and eight years later he was elected a bishop of that denomination requiring other changes of residence. As a result Wilbur Wright received his education in the public schools of Dayton, Ohio, Richmond, Indiana, and Cedar Rapids, Iowa. Just when he was expecting to enter college, an accident, while playing in a game of ice hockey, disabled him for some six or eight years for active work. These years of poor health he devoted to the care of his invalid mother and to assisting his father in legal matters connected with the church. In 1890 he joined his brother, Orville, who was publishing a small weekly newspaper.

Experiments in Gliding.—Reading of the experiments of Otto Lilienthal in Germany, Wilbur and his brother became intensely interested in gliding as a sport. Lilienthal's experiments were suddenly ended in 1896 by his death, resulting from an accident due to insufficient control of the equilibrium of his glider. Lilienthal had balanced his machine by shifting the weight of his body. The brothers, believing this method incapable of expansion to meet the requirements of flight, set about to develop a more effective system. They developed a system in which the centre of gravity remained constant and the equilibrium was maintained by varying the air pressures on different parts of the machine through adjustments of the angles of the wings and auxiliary surfaces. This system, patented by them, is now generally known as aileron control.

Although Wilbur and his brother had taken up aeronautics merely as a sport, their chief interest soon turned to its more scientific aspects. Having found in their experiments that the existing scientific data was almost altogether untrustworthy, they cast it all aside and began investigations of their own, using methods which avoided many of the errors in the work of their predecessors. In 1901 they set up a small wind tunnel in their work-shop at Dayton in which they made measurements of the lift and drag of a great number of different-shaped aerofoils at angles from zero to 45 degrees. The results derived from this tunnel so stimulated their interest that often they worked into the early hours of the morning. Measurements also were made to determine the position of the centre of pressure on cambered surfaces and to determine the effect on the lift and drag when one surface was placed above another or when one surface followed another.

The First Motor-driven Aeroplane.—With this mass of data in their possession they thought it now possible to predict from calculation the performance of a flying machine; they thought they could design a machine which would require not over one-half to one-fourth of the power that would have been necessary for any of the earlier proposed machines. Accordingly in Oct. 1902, they began the design of a motor-driven aeroplane. When completed the machine including the pilot weighed 750 lb. and was propelled by a four cylinder petrol motor of 12 horse power. Tested at Kitty Hawk, N.C., on Dec. 17, 1903, the machine carrying a man made four sustained free flights. The longest of these had a duration of 59 seconds and a speed of 30 m. an hour. This machine is now exhibited in the Science museum at South Kensington, London.

Experiments were continued in 1904, but it was not until Sept. 1905, that they learned to avoid the "tail-spin" in making short turns. The flights then rapidly increased in length, and on Oct. 5 Wilbur Wright flew for 38 min. over a small circular course covering a distance of 24 miles. Believing the machine now to be developed to a stage of practical usefulness, the Wrights spent several years in finding a market for the invention. Wilbur Wright went to Europe in 1908 to make the tests required in the sale of the French rights to a syndicate. While there, his flights at Le Mans and Pau, France and at Rome, attracted world-wide attention and the kings of England, Spain and Italy went to see them. In recognition of his pioneer work he received many honours and medals in European countries and in America.

During the last three years of his life he served as president of the Wright Company, which had taken over the patent rights for

America. Much of this time he devoted to upholding the Wright aeroplane patents in law courts of America and Europe. He died of typhoid fever at Dayton, O., on May 30, 1912. (O. W.)

WRIST, in anatomy, the carpus or carpal articulation in man, the joint by which the hand is articulated with the forearm (*see* ANATOMY: *Superficial and Artistic;* and SKELETON: *Appendicular*).

WRIT, in law, is a species of formal order from the Crown or a delegated officer to an inferior officer or to a private person, enjoining some act or omission. The word represents the Latin *brevis* or *breve* (sometimes Englished into "brief" in the older authorities), so called from its "shortly" expressing the intention of the framer (*quia breviter et paucis verbis intentionem proferentis exponit*).

History.—The writ in English law still occupies a very important position, which can scarcely be understood without a sketch of its history. The whole theory of pleading depended in the last resort upon the writ, the plaintiff's claim simply expanding its terms.

The *breve* can be traced back as far as Paulus (about A.D. 220), who wrote a work *Ad edictum de brevibus,* cited in the Vatican Fragments, § 310. In the *Corpus iuris* the word generally means a note-book or list. The *interdictum* of Roman law sometimes represents the writ of English law; *e.g.,* there is considerable likeness between the Roman *interdictum de libero homine exhibendo* and the English writs of *habeas corpus* and *de homine replegiando.* From Roman law the *breve* passed into the *Liber feudorum* and the canon law, in both in a sense differing from that at present borne by the writ of English law. The *breve testatum* of the *Liber feudorum* was an instrument in writing evidencing the transfer of land.

The *breve testatum* in England developed into the deed of grant; in Scotland into the charter, and later into the disposition. In canon law *breve* or *brevilegium* denoted a letter from the pope, sealed with the seal of the fisherman and less formal than a bull. In old English ecclesiastical law a brief—still named in one of the rubrics of the Book of Common Prayer—meant letters patent to church-wardens or other officers for the collection of alms. (For counsel's brief *see* BRIEF.)

The origin of the writ is disputed, but its development was clearly influenced by both Anglo-Saxon and Norman law before the Conquest. The Anglo-Saxon contribution appears in the shape of diffuse royal charters, which were used to express the king's commands or wishes. Next, the form of these charters was infected by royal letters employed primarily for the publication of new laws, which were communicated by such letters to the shire-moots and, presumably, to the hundred-moots and important persons. These documents, cross-bred between charter and writ, show progress, but fall far short of the pure writ, which was concise, secular, practical and implicit with power. Writ-charters similar to those in England existed in Normandy before the Conquest. After that event, the chancery, or royal office which in England framed the king's orders, had some counterpart in Normandy, which did the like. The exact stages by which the writ disembarrassed itself of the charter element are not certain, but at any rate the process was a rapid one. The distinction between the two is known to have existed as early as 1071. The growth of a more robust Central Government hastened the separation, and in Glanvill's book (1187–89) not only are many writs included, but the idea has become so common that the author does not take the trouble to explain it. The writ, as thus developed, was of supreme importance in the growth of law and government. From the latter part of the 13th century to the early 18th century, if a man had no legal remedy he had no legal right. Without a writ he could not, in general, begin an action, and if there were no writ that covered his complaint he had no remedy. Nor was the writ confined to the initiation of litigation. It was also a machine for hosts of executive acts which never passed to the law courts at all. The chancery from which writs were issued was styled *officina brevium,* or "writ-shop." Writs had to be paid for, though occasionally poor men might get them free. Nor did Magna Carta c. 40, make any difference in this respect, except to forbid prohibitive charges for writs in common form ("de cursu," or "of course").

Collections of writs were made at an early period. They were entitled *Registra Brevium,* and the oldest one extant is dated 1227. These collections were unofficial, though of course the writs embodied in them originated in the chancery. For three centuries *Registrum Brevium* continuously multiplied in copies and swelled in bulk. The mss. of it are at present beyond computation. Their number and increasing length testify to the industry of the chancery and to the striking import of the writ as one of the modes of keeping law and government reasonably abreast of the needs of the community. *Registrum Brevium* was first printed in 1531. After that it practically ceased to grow, for it was being outgrown by the law itself, which needed something more elastic.

The chief reason why the writ fell into the background as an agency in the growth of our law is that the centre of gravity in legal procedure shifted from the writ to the plaintiff's written "declaration," which specified the details of his claim. It was this rather than the writ which came to determine the form of action. The correct form of action was vital to success in litigation. If the plaintiff chose the wrong one, he was, in general, without a remedy. True, a selection of the wrong writ was, even till the 19th century, equally disastrous, but then, in most cases, it had ceased to be compulsory on a plaintiff to begin his action by an original writ, though its existence was always assumed. There were many other ways in which litigation could be begun, and there is reason to think that they were usually preferred to the original writ, which was neither cheap nor convenient. The transference of energy from the writ to the declaration was a gradual process. So long as the pleadings in an action were oral, the writ must of necessity have attracted to itself all the weight which the written word carries as against the spoken word. But by degrees litigants adopted the practice of exchanging written pleadings. This was well recognized in the 16th and 17th centuries, though the seeds of it are traceable some time before. The multiplicity of writs and of other devices for commencing a common law action was remedied with respect to personal actions by the Uniformity of Process in Personal Actions Act, 1832 (2 Will. IV. c. 39), which substituted for these methods a simple, uniform, writ of summons. Further amendments were made in 1833, by 3 and 4 Will. IV. c. 27, s. 36, which abolished writs in real actions with the exception of those relating to dower, *quare impedit,* and ejectment, and by 3 and 4 Will. IV. c. 42, in connection with the writs of debt and of detinue. The Common Law Procedure Act, 1852, s. 3, dispensed with the need of mentioning any form of action in the writ on a personal action, and the Judicature Acts, 1873–75, contain the complete remodelling of procedure under which English civil law is administered in the Supreme Court of Judicature. The Rules of the Supreme Court, 1883, made in pursuance of this legislation, now require every action in the High Court to be commenced by a writ of summons, indorsed with a statement of the nature of the claim made, or of the relief or remedy required in the action. The writ, therefore, nowadays differs considerably in form from its ancient predecessor. And an equally striking distinction is to be found in its much narrower scope as compared with the writs of *Registrum Brevium.* They dealt with almost every conceivable matter of executive government as well as with legal procedure. But now the province of writs has shrunk to the institution of litigation except in the realm of constitutional law, where writs still issue for the election of members to the House of Commons and for the attendance of individual members in the House of Lords. Elsewhere, more convenient methods of expressing the will of the executive have ousted the writ; such are Orders in Council, Royal Proclamations, Letters Patent, and regulations made by Government departments.

The writ, though issuing from the king's chancery, did not, where it was concerned with litigation, necessarily direct the trial of the question in the king's court. In whatever court it was returnable, it frequently called in the aid of the sheriff as executive officer. In such cases, it was either addressed to him or, if addressed to the party alleged to be in default, it concluded with

a threat of constraint by the sheriff in the event of disobedience, generally in these terms, *et, nisi feceris, vicecomes de N. faciat ne amplius clamorem audiamus pro defectu iustitiae.* If the writ was returnable in the county court or the lord's court, the sheriff or the lord sat as the deputy of the king, not by virtue of his inherent jurisdiction. The writ was not necessary for the initiation of proceedings there or before the justices in eyre.

There are several divisions of writs (excluding those purely financial and political), the most important being that into original and judicial, the former (tested in the name of the king) issued to bring a suit before the proper court, the latter (tested in the name of a judge) issued during the progress of a suit or to enforce judgment. The nature of a third class, *magistralia*, is an unsolved puzzle. Bracton regarded them as writs which were capable of variation in order to meet the plaintiff's grievance; Coke considered them to be a variety of original writs which generated actions upon the case. Possibly the later writers attached more technicality to Bracton's expressions than they were meant to bear, and in any event the use of *magistralia* for purposes of classification was of little import by the time that *Registrum Brevium* was printed, for the primary division there is only twofold, original and judicial.

No ms. register known to the author of this article contains even this twofold division. Coke and other authorities mention numerous other divisions, but those which have been named appear to be the principal, of writs.

Writs of Historical Interest.—A great number of the older writs are now obsolete. The details relating to them can be found in the printed *Registrum Brevium* and in Sir Anthony Fitzherbert's "New Natura Brevium," a work of the highest authority which ran into 18 editions, or reprints, between 1534 and 1794. Some of these ancient writs had such a great influence on the history of English law that they need brief descriptions here. The *prerogative writs* are treated in the paragraph on "Writs at the present day"; historically they had a large share in securing the administration of justice, and the personal freedom of the subject. In the domain of private law, the *writ of right* (*breve de recto*) was styled by Fitzherbert "the highest writ in law," and *Registra Brevium* invariably commence with it. It was employed for the recovery of real estate. The principle that no man need answer for his freehold without a royal writ was laid down in Henry II.'s reign. This compelled everyone who demanded freehold land from another person to obtain a writ, in effect the writ of right, if he were asserting title to the land. The insistence on the writ of right had political significance, for it furthered the centralization of justice. The procedure upon it became intolerably clumsy and tedious, and the possessory assizes, or actions which determined the question of possession (a matter which, for practical purposes, generally settled the dispute between the parties) became much more popular. They are also attributable to Henry II. and were speedy and deft in operation. The writ of right was "much out of use," even in Sir Matthew Hale's time (1609–1676) and, except in connection with dower, was abolished in 1833. The writ *de nativo habendo* is of interest in English social and economic history. If a *nativus* or serf ran away from his master, he could be reclaimed by this writ, which bade the sheriff deliver to the claimant his *nativus*, unless he had taken refuge on the royal demesne. An assertion of freedom by the person thus claimed excluded the sheriff's power, and the question of liberty was settled by a writ *de libertate probanda* triable by the king's justices. The writ *quare eiecit infra terminum*, introduced about 1237, was for the benefit of the termor, or tenant of land for years, to whom the writ of right and other real actions were not available because his holding was not a freehold. Indeed, his holding was regarded as no more than a matter of contract between him and the lessor, and he was not protected against third parties at all. This writ enabled him to recover the land from any person who ejected him, at least if that person claimed under the lessor. No writ had wider effect than the *writ of trespass*. In origin, the word "trespass" covered nearly every wrongful act or default, whether it be what we should now call a crime or a tort. In that sense, it is traceable as early as John's reign, but the writ of trespass did not become a writ "of course" until the latter part of Henry III.'s reign, just after the conclusion of the Barons' war. Very likely it was one of the agencies in clearing up the litter of disorder left by civil strife. The action which the writ of trespass *vi et armis* originated was quasi-criminal. It was aimed at serious and forcible breaches of the king's peace. Though it was begun by the injured individual, it ended in the punishment of the defendant as well as in compensation to the plaintiff. It was more popular than the "appeal of felony" because the same precision in pleading was not required and the trial was not by the detested method of battle. Its scope was also wider, and damages were obtainable. Later, trespass developed on one side into misdemeanours (now one branch of criminal law) and on the other into the law of torts, or civil injuries. In the 14th and 15th centuries, statutes often fixed the action of trespass as an appropriate remedy for the offences created by them, because criminal "appeals" were falling into disuse, there was no organized police, the judges were often corrupt, except in the central courts, and were not always pure even there. The three chief kinds of the writ of trespass *vi et armis*, were for assault and battery, for injury to land (*quare clausum fregit*), and for taking away goods (*de bonis asportatis*). The writ could therefore be employed by any landholder for the recovery of damages done to his possession, but not, at first, for the recovery of possession itself. This extension was not recognized till the middle of the 15th century, and it resulted in the writ of trespass, *de ejectione firmae*, which appears first as a remedy enabling the termor, or lessee for years, to sue anyone who had ejected him, whether his lessor or another person, and then becomes the best remedy of the ejected freeholder. He borrowed this "action of ejectment" from the termor, because his own proprietary and possessory remedies had become so inadequate. A cloud of legal fictions veiled the borrowing, but in spite of the duration of some of these till the Common Law Procedure Act, 1852, the action of ejectment was greatly superior to the dilatory remedies which it thrust in the background. The law of torts, as it is now called, also owes a heavy debt historically to writs of *trespass upon the case*, which were adaptations of the writ of trespass made to meet special cases.

Writs of interest to the clergy were *de apostata capiendo*, for the re-capture of a runaway monk, *de excommunicato capiendo, de excommunicato deliberando* (which explain themselves), *de haeretico comburendo*, issued for the burning of an heretic on a certificate of conviction for heresy by an ecclesiastical court, *darrein presentment* and *quare impedit*, connected with disputes as to the right of presentation to a living, *utrum*, for determining whether land be lay or ecclesiastical, and *de vi laica removenda*, for reinstating a parson violently ejected by a rival with the assistance of laymen; all these have become obsolete, or have been expressly abolished, or replaced by improved remedies.

Freedom from unwarrantable arrest or imprisonment of the person was secured by the writs *de odio et atia, de homine replegiando, de manucaptione* and *mainprise*. These have long been superseded by the more efficient writs of *habeas corpus*, though these latter are themselves of very ancient origin.

Writs at the Present Day.—The vast majority of writs at the present day deal with the initiation, progress, or results of litigation; but purely administrative writs still exist, such as those for summoning representatives to parliament, or for assembling an ecclesiastical convocation. Writs are now issued from the central office of the Supreme Court, which was created by the Supreme Court of Judicature (Officers) Act, 1879, and thereby absorbed the Crown office of the Queen's Bench Division. The Crown office is an institution of the greatest antiquity, and the clerk of the Crown in Chancery has important duties relating to parliamentary writs, which are noticed below. Some writs require the Great Seal, *e.g.*, those for summoning new parliaments; writs of summons in actions are under the seal of the court, and are tested in the name of the lord chancellor, but writs issuing from the Crown office side are tested in the name of the lord chief justice of England. Instead of the Great Seal, the Crown Office Act, 1877, allows wafer great seals made on embossed paper, wax, wafer, or any other material, in accordance

with rules drawn up by a committee of the Privy Council, to be attached to documents authorized by such rules to be thus validated. As to writs connected with litigation, the commonest type is the writ of summons which originates a civil action in the High Court of Justice. Indeed, it is now the only way in which such an action can be commenced. It is a formal document by which the king commands the defendant to "enter an appearance" within eight days, if he wishes to dispute the plaintiff's claim, and notifying him that, in default, judgment will be signed against him. It must be indorsed with a statement of the nature of the claim made. It may be issued either from the central office of the Supreme Court in London, or from one of the district registries which exist in many of the large provincial towns. Issue consists in taking two copies of the proposed writ to the writ department of the central office or to a district registry, signing one copy and paying 30s., whereupon the official impresses a 30s. stamp on the signed copy, files it, stamps the other with a "seal," and hands it back to the applicant. This then becomes the writ in the action. Technical defects in the writ are no longer fatal, for the plaintiff can amend them with the leave of the practice master in the King's Bench Division or of the chief clerk of the writ in the Chancery Division. Bracton's statement nearly 700 years ago, *non potest quis sine brevi agere,* is true of procedure in the High Court even now, but the great difference between the writs of his day and those of our own is the elasticity of claim which the latter allow. We are not limited to a certain number of actions, each with its appropriate writ, to be chosen rightly at the plaintiff's peril; the writ is always the same except for its indorsement, and, in effect, any claim which it is probable that the courts will enforce can be indorsed on it. If the plaintiff lose his case, it will be either because he has not evidence to support it, or because he fails to satisfy the requirements of the substantive law, and not because he has selected the wrong form of writ. After issue of the writ, it must be served on the defendant. This is done by showing him, or his solicitor, the original, and then leaving with either of them a correct copy of it. As a rule, the writ cannot be served on a Sunday. The entry of appearance by the defendant does not involve his personal presence. This, and all other proceedings on the writ, prior to the trial of the action, can be, and usually are, conducted on behalf of the parties by their respective solicitors. The officials who deal with these preliminary proceedings are the masters of the Supreme Court. No leave for the issue of the writ is necessary, unless the defendant be out of England, or the plaintiff seek to join on his writ causes of action for the joinder of which leave is required. Proceedings in the county court, in which most civil actions for claims of small amount are tried, are begun by the entry of a plaint, followed by a summons to the defendant.

Besides the writ commencing an action, there are others which facilitate it, or give effect to its result. Attendance of witnesses is secured by the writ of *subpoena.* Redress for contempt of court may be effected by writ of *attachment.* The writs employed for the execution of judgment against an unsuccessful defendant are *fieri facias* against his goods, *elegit* against his lands, *possession* for the recovery of land adjudged to be the plaintiff's, and *delivery* or *attachment,* or *sequestration* for the recovery of any property other than land or money. The writ of attachment also applies where a judgment directs the performance of any specific act other than the payment of money, *e.g.,* the removal of a nuisance, or requires anyone to abstain from doing a thing; and the writ of sequestration also extends to cases in which a person wilfully disobeys an order or judgment which directs him to pay money into court or to do any other act within a limited time; the writ enables his property to be seized.

The *prerogative writs* deserve special notice both for their historical interest and their practical utility. They are extraordinary remedies issued upon cause shown in circumstances where the ordinary legal remedies are inapplicable or inadequate. The most important of those now in use are *certiorari, habeas corpus, mandamus,' procedendo,* and *prohibition.* They usually issue from the Crown office side of the central office of the Supreme Court, and, in general, they are not obtainable as a matter of course. Some probable cause must be shown why such extraordinary remedies should be invoked. A rule *nisi* is issued in the first instance by the court calling upon the party to whom the writ is addressed to show cause why he should not comply with the writ. If he shows sufficient cause, the rule is discharged, otherwise it is made absolute and the party must obey the writ. But in urgent cases, the rule may be made absolute from the first in some of the writs, *e.g., habeas corpus.* The writ of *certiorari* proceeds from a superior court and directs an inferior court, whether civil or criminal, to transmit to the superior court the record of proceedings pending before the inferior court, in order to ensure speedier and better justice to the applicant for the writ. Its object is to give relief against inconvenience arising from the likelihood that the lower court will not dispose of the case as effectually as will the superior. The procedure by this writ must be distinguished from appeals by dissatisfied litigants. These come after judgment, whereas *certiorari* generally deals with cases still pending and, even where it is used for the purpose of getting a conviction quashed, it does not enable the superior court to review the case on its merits, but to deal with some matter like lack of jurisdiction. There are several writs of *habeas corpus,* but the best known variety is the *habeas corpus ad subiiciendum,* which provides for the personal freedom of the subject. (*See* HABEAS CORPUS.) *Mandamus* directs a person, a corporation, or an inferior court of judicature, within the king's dominions, to do some particular thing which appertains to the office or duty of any of them. (*See* MANDAMUS.) The writ of *procedendo* is a possible sequel to *certiorari,* for it applies where the superior court considers it expedient or necessary to restore the record to the inferior court whose proceedings are in question. The writ commands the lower court to proceed with the case. The writ of *prohibition* forbids an ecclesiastical or inferior temporal court to continue proceedings therein in excess of its jurisdiction or in contravention of the laws of the land. (*See* PROHIBITION.) Another prerogative writ has taken the place of the writ *de excommunicato capiendo;* this is *de contumace capiendo* for compelling persons duly cited to appear in the ecclesiastical courts and for enforcing compliance with their orders and punishing contempts in the face of such courts. As to writs relating to the assembly of parliament, the king, on the advice of the Privy Council, issues a proclamation expressing the royal pleasure to call a new parliament and announcing an Order in Council to the lord chancellor to issue the necessary writs on the authority of the proclamation. In practice, the clerk of the Crown in Chancery does not receive direct authority from the chancellor for the issue of the writs, but regards the proclamation itself as sufficient for that purpose. Parliament must meet at any time not less than 20 clear days after the proclamation. Individual writs of summons are sent to those who are entitled to sit in the House of Lords; but for the election of members to the House of Commons the writs are sent to the returning officers of the various constituencies. The writs of summons issued to peers of the United Kingdom are of historical note, for adjudication of disputed peerage claims has often centred in the validity or scope of the writ. Even now, though such a peerage is invariably created by letters patent, these are accompanied by a writ of summons, and it rests with the committee for privileges of the House of Lords to decide whether the writ is valid, or indeed whether it can be issued at all; a familiar recent instance was their refusal to issue the writ to a peeress in her own right (*Viscountess Rhondda's Claim,* Law Reports [1922] 2 Appeal Cases, 339).

Scotland.—"Writ" is a more extensive term than in England. Writs are either judicial or extrajudicial, the latter including deeds and other instruments—as, for instance, in the Lord Clerk Register (Scotland) Act, 1879, and in the common use of the phrase "oath or writ" as a means of proof. In the narrower English sense both "writ" and "brieve" are used. The brieve was as indispensable a part of the old procedure as it was in England, and many forms are given in *Regiam Maiestatem and Quoniam Attachiamenta.* It was a command issued in the king's name, addressed to a judge, and ordering trial of a question stated therein. It was drawn by the writers to the signet, originally

clerks in the office of the secretary of State. Its conclusion was the will of the summons. In some cases, proceedings which were by writ in England took another form in Scotland. For instance, the writ of attaint was not known in Scotland, but a similar end was reached by trial of the jury for wilful error. Most proceedings by brieve, being addressed to the sheriff, became obsolete after the institution of the court of session, when the sheriffs lost much of that judicial power which they had enjoyed to a greater extent than the English sheriff. (*See* SHERIFF.) An English writ of execution is represented in Scotland by diligence, chiefly by means of warrants to messengers-at-arms under the authority of signet letters in the name of the king. The only brieves in practical use are those for serving a tutor-at-law, for kenning to the terce, and for cognition of insane persons. The two former are rare; the third was substituted by the Court of Session (Scotland) Act, 1868, for the old brieves of furiosity and idiotry. Other kinds of brieve have been superseded by simpler procedure, *e.g.*, the brieve of service of heirs, representing the older *breve de morte antecessoris*, by a petition to the sheriff under the Titles to Land Consolidation (Scotland) Act, 1868, and the brieve of perambulation by action of declarator. Writs *eo nomine* have been the subject of much modern legislation. The writs of *capias, habeas, certiorari* and extent were replaced by other proceedings by the Exchequer Court Act, 1856. The writs of *clare constat*, resignation and confirmation (whether granted by the Crown or a subject superior) were regulated by the Titles to Land Act (*supra*). By the same act Crown writs are to be in the English language and registered in the register of Crown writs. Writs need not be sealed unless at the instance of the party against whom they are issued. Writs of progress (except Crown writs, writs of *clare constat* and writs of acknowledgment) were abolished by the Conveyancing (Scotland) Act, 1874. The *clare constat* writ is one granted by the Crown or a subject superior for the purpose of completing title of a vassal's heirs to lands held by the deceased vassal.

(P. H. W.)

United States.—The system of original writs seems never to have obtained in the United States. From the earliest colonial times actions were begun by the issuance of a writ of summons directed to a sheriff or constable, briefly setting forth the character of the claim, and directing that official to summon the defendant. This writ of summons as distinguished from the early English chancery writs was a judicial and not an executive writ. Its issuance was simply a means for securing the presence of the defendant before the court, not as in England giving the court jurisdiction to hear the particular claim. The form of the writ of summons followed in the main the old English writ, briefly stating the cause of action. Probably because of this similarity, despite the absence of original writs, the common law forms of action continued to survive in the United States. Until the adoption of procedural reforms by the codes during the middle of the 19th century, they persisted with all their common law vigour. Under the codes there is usually but one form of action, which is begun by the issuance of a summons prepared by the plaintiff's attorney and served by any one not a party to the suit. The summons is brief, does not disclose the nature of the action, though a copy is commonly attached to and served with the summons.

Writs in the Federal courts are by Act of Congress to be tested in the name of the chief justice of the United States. By State law writs in the State courts are generally bound to be in the name of the people of the State, in the English language, and tested in the name of the chief justice of the State. The common law prerogative writs such as *mandamus*, prohibition, *certiorari, quo warranto* and *habeas corpus* are well known in the United States. The Constitutions or statutes of the several States confer upon their courts power to issue these writs. The cases in which they may issue are generally governed by statute, and the courts issue them as a matter of sound discretion and not as a matter of right. In trying questions of title to real property, writs of entry and other real actions, which before the settlement of the colonies had become nearly obsolete in England, were until the middle of the 19th century the common remedies in the U.S. courts. They were, however, stripped of the cumbrous feudal appendages which made them intolerable in England. The action of ejectment begun by summons in the manner of any personal action has now supplanted them. Two prerogative writs have much importance in the Federal courts. These are the writ of error (now abolished in England) and the writ of *certiorari*. From 1879 until 1914, writ of error was the only means by which a decision of a State court could be reviewed in the Supreme Court of the United States. In that year *certiorari* was added as another method for review, having been available since 1891 as a method for reviewing decisions of the inferior Federal courts in the Supreme Court. In 1928 the writ of error was abolished and appeal substituted in its place. The writ of assistance has its interest in constitutional history. Before the War of Independence it was issued to revenue officers to search premises for smuggled goods. It was on this writ that it was first contended in 1761 that a colonial court had jurisdiction to examine the constitutionality of a legislative Act authorizing the issue of the writ. (*See Quincy's Massachusetts Rep.*, app., I. 520.)

(J. M. LA.)

BIBLIOGRAPHY.—For the history of the writ see *Registrum Brevium* and Sir Anthony Fitzherbert, *La nouvelle Natura Brevium* (1534 or 1537; Eng. trans., 1652, 9th ed., 1794), both noticed above; *Natura Brevium*, which changed its name to *Old Natura Brevium* after Fitzherbert's book was published; it exists in a great number of editions, the earliest of which is about 1516, the last 1584; *Novae narrationes; Articuli ad novas narrationes; Returna Brevium;* Simon Theloall, *Le digest des briefs originals* (1579); *Thesaurus brevium* (*c.* 1661); R. Brownlow, *Brevia judicialia* (1662); *Officina brevium* (1679); Sir E. Coke, *Institutes* (1628, many later editions); C. Dufresne du Cange, "Brevis" in *Glossarium* (Leyden, 1688; best ed. Henschel 1840–1850); G. Booth, *Real Actions* (1701); W. Tidd, *Practice* (1790–97); H. J. Stephen, *Pleadings* (1824; 7th ed., 1868); R. J. and A. B. Corner, *Practice of the Crown Side* (1844); M. M. Bigelow, *History of Procedure in England* (1880); F. Pollock and F. W. Maitland, *History of English Law before the time of Edward I.* (1895); W. S. Holdsworth, *History of English Law* (1903, etc., especially vols. ii. and iii.); W. S. McKechnie, *Magna Carta* (1905; 2nd ed., 1914); T. A. Street, *Foundations of Legal Liability*, vol. iii. (1907); F. W. Maitland, *Equity, also the Forms of Action at Common Law* (edit. A. H. Chaytor and W. J. Whittaker, 1909); also *Collected Papers*, vol. ii. (edit. H. A. L. Fisher, 1911); W. Stubbs, *Select Charters* (9th ed., 1913); P. H. Winfield, *Chief Sources of English Legal History* (1925); and E. Jenks on "Prerogative Writs" in *The Yale Law Journal* (April 1923).

For current law, there is no book which deals with writs both exclusively and completely. Taken in the aggregate, the following books cover the topic: *The Annual Practice;* W. G. Clay, *The Law and Practice relating to Writs of Summons* (1894); F. H. Short and F. H. Mellor, *Practice on the Crown Side of the King's Bench Division* (2nd ed., 1908); E. R. Daniell, *Chancery Practice* (8th ed., S. E. Williams and F. Guthrie Smith, 1914), and *Chancery Forms* (6th ed., R. White, F. E. W. Nicholls and H. G. Garrett, 1914); T. E. May, Baron Farnborough, *Parliamentary Practice* (13th ed., T. L. Webster, 1921); W. B. Odgers, *Pleading and Practice* (10th ed., 1926); Alduson, *Judicial Writs and Process* (1895); and *see* "Writ" in index to the Earl of Halsbury, *The Laws of England* (31 vols., 1907–17, with supplement, 1910, etc.).

WRITERS TO THE SIGNET, in Scotland, a society of law agents who, along with others, correspond to solicitors in England. They were originally clerks in the secretary of State's office and prepared the different writings passing the signet. They have no charter but are usually considered a corporation by long custom; they have office-bearers and are members of the College of Justice.

WRITING. The earlier history of writing is dealt with in the articles ALPHABET, PALAEOGRAPHY, PICTOGRAPHY. The subject of the present article is handwriting in its common uses in Europe since the period when the invention of printing superseded its employment for the making of books.

Speaking broadly, the ordinary handwritings of modern Europe result from the competition and interaction of two contrasted forms of script which existed side by side in most countries for many generations, and which still maintain an independent existence in Germany. These are the Italian, or Roman, and the national, not very accurately called Gothic, current hands. In England the most important type of native current hand was known in the 16th century as Secretary. The acute stage of the rivalry here may be said to last from about 1480 till the reign of Charles I., whose own hand is not a bad example of the compromise which shows the resultant of the two forces. In the Plate Endymion

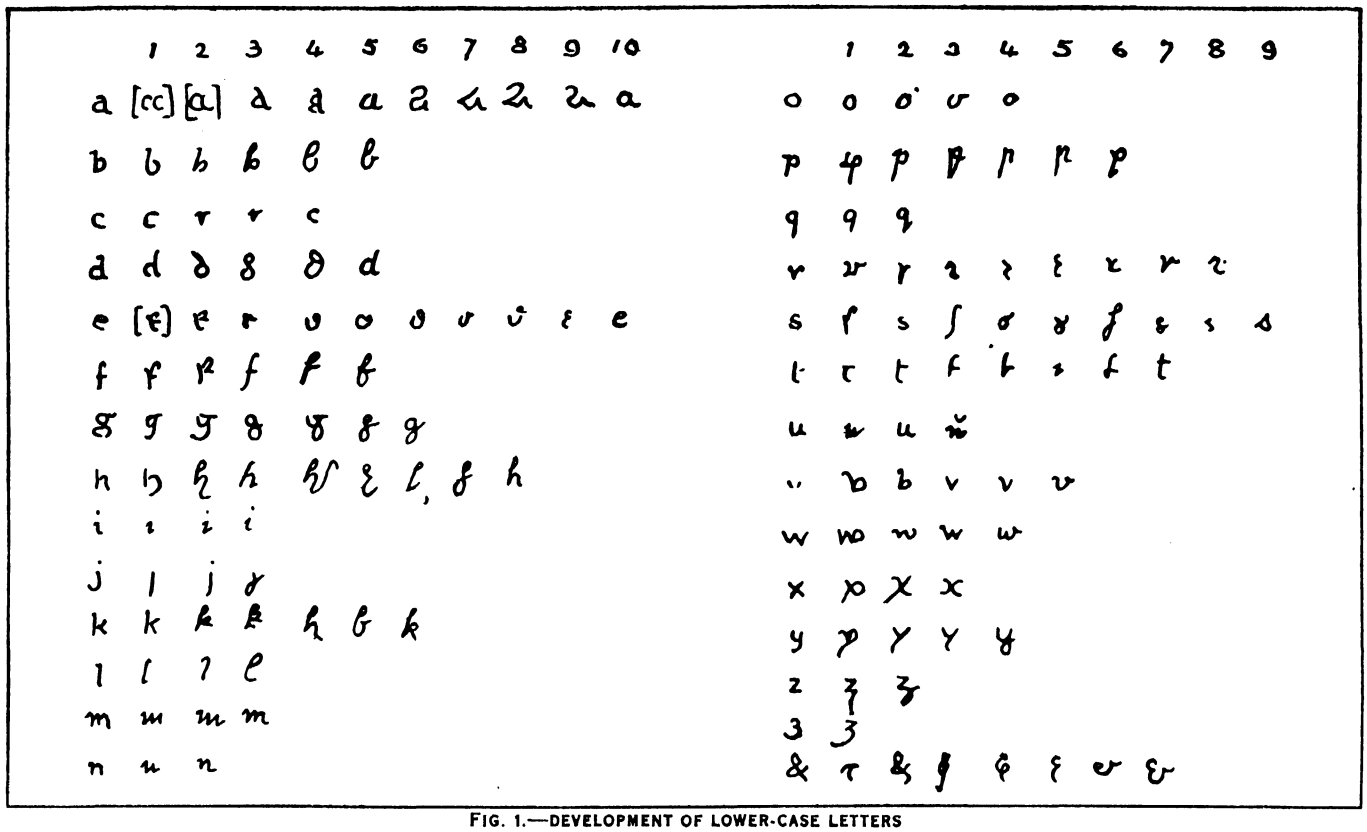

FIG. 1.—DEVELOPMENT OF LOWER-CASE LETTERS

Porter's hand gives an even better specimen.

The Italian Hand.—The great and singular achievement of the Italian renaissance in the matter of hand writing, the creation or revival of what is known as humanistic script (*see* art. PALAEOGRAPHY) might seem, since that hand was properly a book-hand, to lie outside our present subject. This, however, would not be altogether true. If the type used in this Encyclopædia follows so closely the forms of letters evolved 11 centuries ago that a Latin book printed in it would have been easily read by a scholar of Charlemagne's court, it is because the Caroline hand set up a standard of legibility and simplicity from which other beautiful scripts were felt to fall away. As cheapened and, as it were, stereotyped by its adoption for printing, it has retained the same compelling power in a higher degree. To make one's hand "as plain as print" has been and is an aim the effects of which recur again and again in the history of writing. Before, however, it could have any direct influence on ordinary handwriting the humanistic script had to submit to certain changes, the general tendency of which can be gathered by comparing the printers' Roman with the printers' Italic type. This more cursive type of Italian script is seen in the hand of Petrus Carmelianus, tutor to the children of Edward IV., which serves also to show that the script had made its way into England before 1483.

Its rapid spread in England, perhaps, owed something to Royal patronage, for although Henry VIII. did not write it himself, he had it taught to his children, but through the 15th and first half of the 16th centuries a very large proportion of educated Englishmen both could and did write both in Italian and Secretary hand.

The different uses to which men put the two hands indicate that the superior legibility of the Italian was recognized, for in a letter or tract written mainly in Secretary it is common practice to write sub-headings, proper names, foreign words and the like in Italian script, in fact to use it much as we do italic print or leaded type.

Before we compare the merits and defects of the Italian current script with the fully-developed Secretary hand it is necessary to say something further concerning the scripts from which the latter had evolved.

Sources of Secretary Hand.—A critical study of the development of popular current script in England in the 14th–15th century is still a desideratum. Insufficient attention seems to have been paid to the needs which it rose to meet. Collections of specimens of writing from the beautiful book-hands of monastic scriptoria, or the workshops of artist-illuminators fail to illustrate it, and so, to a great degree, do collections of official writings from the administrative offices of State, written by clerks trained in their particular departments, a conservative class given to a professional pride in writing unlike the general public. Secretary hand, it is true, is considerably influenced by a type of script used in the chancery for documents intended to be read by laymen, an example of which may be taken from a formulary of Henry IV. It was influenced likewise by a type of vernacular book-hand, of which a specimen may be taken from a mid-15th century ms. of Occleve's poems. And it was influenced also by a form of script the origin of which seems to be French or Flemish, though it was popular in England. Our illustrative example is from a book which was written in France for presentation by the earl of Salisbury to Queen Margaret at or immediately after her marriage to Henry VI. in 1445.

This is apparently the script known to French writers of the time as "lettres bastardes," to indicate its intermediate position between the stiff precision of the "lettres de forme" of the most expensive mss. and informal current or court hand called "lettre de cour." In the main, however, "Secretary" derives from none of these styles so much as from the styleless writing of the ordinary man of the 14th century, and its first beginnings are to be seen as soon as the need for any large amount of writing by the ordinary man began to be felt. Many circumstances combine to fix this at about the 50 years 1260–1310. Great monasteries began late in Henry III.'s reign to keep elaborate court-rolls and account-rolls of their manors. Changes in land tenure under Edward I. led to a vast output of deeds dealing with little bits of land. A little later allusions to the "paper of the market" show a new and cheap writing material fostering the growth of ephemeral business records. And lastly, legal documents were coming to be written in French and English, and by persons unskilled in the elaborate system of abbreviations which learned Latinists had devised to

shorten their labour. In these conditions, the requirements for a popular hand were speed and simplicity rather than beauty, and even at the cost of a high degree of legibility.

Analysis of Letters.—The subjoined table of lower case alphabets (fig. 1) is meant to illustrate, by reference to the numerals at the top, the forms of letters mentioned in the remarks which follow. Forms in brackets do not belong to our period, but are alluded to historically. The alphabets are far from exhaustive as a list of forms admissible or usual in 15th–18th century hands, and the facsimiles should be studied to supplement them and illustrate the mode of use of the letters. In what follows Secretary and Italian hands will be referred to as *Sec.* and *It.*

a. The normal form in both *Sec.* and *It.* is a^5. Formed in one stroke, its greater rapidity caused it to displace the Carolingian (or printer's) *a* (a^3) though the latter with its variant a^4 survived in some legal as well as book hands; a^5 may be regarded either as a simplification of a^3, by neglect of the top hook, or as a revival of the precaroline a^2 (the earlier type of which was a^1), which had never been completely driven out by a^3. a^5–a^9 are characteristic 16th–17th century forms developed from an overhead fore-link, but often used initially and where no link was needed; a^7 indeed, has ceased to function as a link altogether and become a senseless flourish like the long up-stroke often prefixed to initial *m*; a^8, a not very common form, has received a good deal of attention from its occurrence in one of the Shakespeare signatures.

b. b^1 is the normal *It.*, with b^2 and b^3 as variations, b^4 the usual *Sec.* form, developing at an early date into the modern b^5.

c. c^2 made in one stroke, had replaced in *Sec.* the mediaeval c^1, in which the downward curve was written first and the horizontal top added afterwards. It thus avoided the disastrous similarity of c^1 and t^1, which makes the two letters as often as not indistinguishable in mediaeval documents. But it became too like an ill-formed *e* (e^3 or e^7). *It.* did good service in restoring the simple curve (c^4), the ultimate victory of which was assured.

d. Of the two forms d^1 and d^2, about equally frequent in 12th century use, d^2 had gradually driven out d^1 in 15th century England, and, with the addition of a loop for after-link, established itself in *Sec.* *It.* partially reintroduced d^1, and the two forms have been alternatives ever since. In the 16th century the ambiguity of d^4 with the e^4 of *Sec.* more than counterbalanced the ambiguity of d^5 with *cl.* d^3 is an abnormal, but not rare, form of d^2 fore-linked and written the wrong way round.

e, the letter of most frequent occurrence, whether in Latin or the vernacular, has perhaps undergone more changes than any other. The early mediaeval e^1 is formed in three pieces, beginning with the downward curve; e^2 is a modification written in two motions. The gradual development of the characteristic *Sec.* form e^6 through the stages e^4 and e^5 was the work of the 14th century. Its ambiguity with d^4 was perhaps the cause of a marked tendency in the 16th century to lift the pen before forming the final loop (as in e^8), or to reduce the loop to its smallest size as in e^7. In well-formed *It.* it had practically the modern shape e^{10}, but English writers show a strong inclination to revert to other forms. (*See*, for example Plate 1*b* line *e* in the same plate. 1, *quietness*, where the second *e* exactly resembles c^3, and *d*, where Elizabeth prefers the *Sec.* e^6, whereas Burleigh uses something resembling e^2.) The eventual victory of e^{10} was assured in the 17th century, though e^6 lingered on well into the 18th, and not only in legal hands. Final *e*, like final *s*, is always specially liable to slurring. The epsilon form e^9 occurs fairly often from Elizabethan *It.* onwards, but is somewhat indicative of academic education.

f in *Sec.* is analogous in formation to *e*, starting with the middle of the shaft downwards and completing the top in one or two motions, f^1 and f^2. The *It.* f^3 is a simple two-piece letter, but needs adaptation to make it current. If the fore-link was added on the *r*, and the after-link on the *l*, as in f^4, it is too like h^7 and s^6. The difficulty is eventually solved by the form f^5.

g, rather a complicated letter throughout the middle ages, tending continually to diverge from, and return to the figure-of-8 form of the minuscule, never attained in *Sec.* a form of satisfactory simplicity. In g^1 and g^2 after writing the *y* part of the letter the pen was carried far to the left below the line, and must be lifted to make the horizontal top-stroke. The *It.* g^3 links well but the bottom loop, made large and far to the right, was rather cumbrous. An alternative g^5 was liable to confusion with h^7 and other letters, and many 16th–17th century writers used the complicated g^4. Eventually the modern g^6 begins to take shape about Charles I.'s reign.

h. The mediaeval form h^1 as a letter ending to the left below the line early acquired a curved link to carry it back to the line in the form of the *Sec.* h^2, often extended in Elizabethan use into an overhead link as in h^4. Even without this, it was a long letter, in which the angles tended to become slurred into the shapes h^5, h^6 and h^7, the last being too close to f^4 and s^6. The *It.* h^3 easily changed into the modern h^8.

i and *j* need little comment, except that their distinctive use for the vowel and consonant (though a few mediaeval instances may be found) is an innovation belonging rather to the history of printing than of writing, and was little observed even by printers till the 17th century. Previous to this, lower case *j* occurs as the last rather than the first of two or more *i*'s coming together, especially in numerals, as xiij., and in Latin words like *conijcio*. Dotting of these letters, though well known to mediaeval scribes and obviously useful to distinguish *i* from a part of *m*, *n*, or *u*, was also not an obligatory process in good writing till the printer set the example.

k, if not much wanted in Latin or Italian is common in Germanic tongues and the continental form k^1 competed with the more complicated *Sec.* k^2 and k^3. More current shapes k^4 and k^5 were liable to confusion with *h* and *b*, and k^6 is a natural development.

l, *m*, *n*, nearly identical in ordinary *Sec.* and *It.* forms, need no comment, and of

o we need only remark the ambiguity of the negligently formed o^3, with open loop, and e^6 and e^7.

p has the characteristic form p^1 in Elizabethan *Sec.*, later slurred into p^6, resembling x^1. The *It.* p^2, in the effort to write it currently sometimes took the form p^3, but a simpler change, by slight opening of the loop, led through p^4 to p^5.

q needs no comment, but

r is another letter of complicated history, and an illustration of the way in which alternative forms have arisen and maintained themselves for centuries. The modern alternatives r^7 and r^8 have a story reaching back more than a thousand years, the latter originating in the ligature of the uncial letters OR in the shape ꝛ and thence introduced into minuscule writing, particularly in the common Latin genitive termination orum, written as (ꝯ), but admissible anywhere where *r* follows *o*. From about the 12th

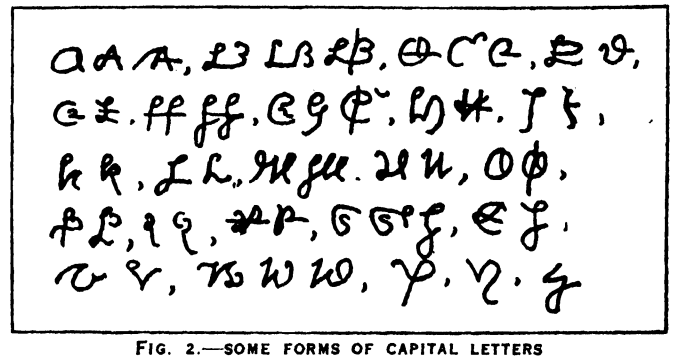

FIG. 2.—SOME FORMS OF CAPITAL LETTERS

century the use of this 2-shaped *r* was extended to cases where it followed the letters *p* and *b*, the last curve of which is similar to that of *o*. In the course of the 13th century the analogy of the masculine orum seems to have brought the 2-shaped *r* into the feminine arum, and in the 14th and 15th century it slowly creeps in after *i*, *e*, *u* and other letters, and last of all as an initial. Normally however, when not following *o* the form r^2 (with longer or shorter shaft) is retained in English as well as *It.* hands until early in the 16th century, when a short horizontal stroke on the line is introduced, making the typical *Sec.* form r^1. From the

short-shafted variety of r^2 is developed r^6, and from the 2-shape r^3 come r^4, and r^5, all characteristic of 16th-17th century hands. Several other varieties could be noted if space allowed.

s is another letter of two forms (*s* and *f*) the use of which in writing as in print (until about 1800) depended on the position of the letter in a word. From aesthetic motives apparently scribes of the 10th–12th century gradually discarded the use of the minuscule or long *s* in a final position and substituted the short or uncial *s*, which was slowly modified first into a shape like a Greek final sigma *s* then into something like a medial sigma σ, *viz.*, s^4 or s^5. The use of s^4 in an initial position is one of the earliest signs of the popular current hand of about 1300. In Italy the current hand, abandoning the minuscule long *s* of the formal humanistic script, reverted to the old Roman cursive s^3, which it used along with the uncial short s^2. We have therefore in Elizabethan hands the four forms s^1–s^4 in regular use medially or initially together with the final forms s^5 or s^2. The addition of fore- and after-links convert s^2 and s^3 into s^7 and s^6 respectively, but in 17th century hands the one is often shortened or the other lengthened so as to become hardly distinguishable. Slurring of the upper loop converts s^2 into s^8, but the further development into the modern s^9 is scarcely recognized as a copybook form till the 18th century.

t in the regular mediaeval shape t^1 had been barely distinguished from c^1. The writers of *Sec.* therefore, influenced, perhaps, by the form in Bastard hand, preferred t^3, while t^2 is the normal *It.* In cursive writing and especially in a final position, where slurring is most prevalent, it took the shapes t^4, t^5, and t^6. t^7 is the later development of its medial use.

u needs little comment, except that a practice of distinguishing it from *n* by adding a curved mark over it, u^3, is a fairly sure sign, if not of German or Netherlands, then of Scottish influence.

With regard to the use of *u* and *v* the case is similar to that of *i* and *j*. Until about 1600, *v* is merely the initial form of the letter written medially as *v*. *v, w*. v^1 v^2, w^1 w^2 are the *Sec.* forms.

x. The *Sec.* form x^1 closely resembles p^6; x^2 is the usual *It.*, but x^3 occurs before 1600.

y, z. y^1 is the *Sec.* form. *z* nearly always has a tail.

Of the two surviving extra letters of the Anglo-Saxon (runic) alphabet, the thorn þ disappears about the beginning of our period (*circ.* 1460), being replaced by *y* in the abbreviations y^e and y^t for *the* and *that*. *yok* survives a little longer but is often written like *z*.

The last line of our table shows a few forms of the ampersand, or abbreviation for *and* (or *et*). Of other abbreviations common in Elizabethan English few will give much trouble to the reader. The stroke above the line for *m* or *n*, *r* above the line in such words as your (yor) and after (aft^r), *p* for per or par, and the stroke above for *i* in the termination cion (our tion), *e.g.*, devocon, deserve notice, as also the sweeping curve for *es* or *s*, as in the words *lands* and *ends* in the example of Burleigh's hand.

Capital letters have so many forms depending on individual taste, that a detailed analysis in the space at command would be impossible. The very small selection given includes some of the Elizabethan forms which are most different from modern usage. For bibliography *see* CALLIGRAPHY.

WROUGHT IRON: *see* IRON AND STEEL.

WRYNECK, a bird, *Jynx torquilla*, so called from its way of writhing its head and neck. It is a summer visitant to most parts of Europe, generally arriving a few days before the cuckoo, and is often known as "cuckoo's leader" and "cuckoo's mate."

The unmistakable note of the wryneck is merely a repetition of what may be syllabled *que, que, que,* many times in succession, rapidly uttered at first, but gradually slowing and in a continually falling key. This is only heard during a few weeks, and for the rest of the bird's stay in Europe it seems to be mute. It feeds mainly on insects, especially on ants. It is larger than a sparrow with beautifully variegated plumage of black, brown, buff and grey. The wryneck lays its translucent white eggs on the bare wood of a hole in a tree, and it is one of the few wild birds that can be induced to go on laying by abstracting its eggs day after day, and thus upwards of forty have been taken from a single hole—but the proper complement is from six to ten. When disturbed on the nest, the female writhes and hisses like a snake. As regards Britain, the bird is most common in the south-east, its numbers decreasing rapidly towards the west and north.

Other species of the genus are found in various parts of Africa. The wrynecks (*see* WOODPECKER) form a subfamily *Jynginae* of the *Picidae*, from the more normal groups of which they differ in coloration and in having the tail-quills not stiffened to serve as props as in the climbing *Picinae*.

WRY-NECK (Lat. *Torticollis*), a congenital or acquired deformity, characterized by the affected side of the head being drawn downwards towards the shoulder together with deviation of the face towards the sound side. There are various forms. (1) The congenital, due to a lesion of the sterno-mastoid muscle. (2) The rheumatic, due to exposure to a draught or cold. This is commonly known as "stiff-neck." (3) The nervous or spasmodic, the result of (*a*) direct irritation of the spinal accessory nerve or its roots, or (*b*) the result of cerebral irritation. Many cases are also due to hysteria and some to spinal caries. When wry-neck is congenital, massage and manipulation may be tried and some form of apparatus. Failing this, division of the muscle surgically may be practised. In the spasmodic forms, anti-neurotic treatment is recommended. In rheumatic torticollis the spasm is usually overcome by the application of hot compresses and appropriate anti-rheumatic treatment.

WUCHANG: *see* HANKOW.

WUCHOW, a treaty port in the province of Kwang-si, China, situated on the left bank of the Sikiang at its junction with the Fu or Kwei-kiang (Cassia) river. It is 220 m. above Canton and the river is navigable the whole distance for vessels drawing up to 8 ft. of water. The situation of Wuchow makes it the natural distributing centre between Kweichow, Kwang-si and Canton. The imports from Canton consist chiefly of cotton and cotton goods, kerosene oil, woollens, etc., while sugar, various oils, hides and aniseed are the chief exports. During summer floods the water pent up by the gorges rises 50 or 60 ft. at Wuchow. In consequence of the variation of river level the principal offices and shops are built upon pontoons which are moored alongside the river bank. The native population is estimated at 65,000. It was opened to foreign trade in 1897 and has telegraphic communication with Hong Kong and Shanghai.

WUHU, a city in the province of An-hwei, China, about 1 m. from the south bank of the Yangtsze-Kiang, with which it is connected by a straggling suburb. It is about 50 m. above Nanking. It is connected by canals with Ning-kwo Fu, T'ai-p'ing Hien, Nan-ling Hien and Ching Hien, the silk districts in the neighbourhood of the two last cities being within 50 m. of Wuhu. There is much coal in the country around. The principal exports are rice, cotton, wheat, tea, furs and feathers. The population is estimated at between 120,000 and 175,000. It was marked out as a treaty port as early as 1858, but was not opened to trade until 1877. A general foreign settlement was opened in 1905, and there has been a great increase in its prosperity during the 20th century.

WULFENITE, a mineral consisting of lead molybdate, $PbMoO_4$, crystallizing in the hemimorphic-tetartohedral class of the tetragonal system. Crystals usually have the form of thin square plates bevelled at the edges by pyramidal planes. They have a brilliant resinous to adamantine lustre, and vary in colour from greyish to bright yellow or red: the hardness is 3, and the specific gravity 6·7. Small amounts of calcium are sometimes present isomorphously replacing lead. The mineral occurs in the oxidation zone of veins containing lead and molybdenum. Good yellow crystals come from Bleiberg in Carinthia and bright red ones from Arizona. The mineral has been produced on a commercial scale, as an ore of molybdenum, at the Mammoth mine, Arizona.

WULFHERE (d. 675), king of the Mercians, a younger son of King Penda, was concealed for some time after his father's death in 655, but in 658 or 659, when the Mercians threw off the supremacy of Oswio, king of Northumbria, Wulfhere became king. He did much to spread Christianity inside and outside his kingdom. In 657 he gained Lindsey from Northumbria, and he was successful against Wessex, extending his borders in all directions.

Wulfhere married Eormenhild, a daughter of Erconberht, king of Kent, and was succeeded by his brother Aethelred. His only son, Coenred, became king in 704, in succession to Aethelred, and his daughter, St. Werburga or Werburh, was abbess of Ely.

See Bede, *Historia ecclesiastica*, edit. C. Plummer (Oxford, 1896); and J. R. Green, *The Making of England* (1897–99).

WULFSTAN, archbishop of York from 1003 until his death in May 1023, and also bishop of Worcester (1003–16), is generally held to be the author of a remarkable homily in alliterative English prose. Its title, taken from a ms., is *Lupi sermo ad Anglos, quando Dani maxime prosecuti sunt eos, quod fuit anno 1014.* It is an appeal to all classes to repent in the prospect of the imminent day of judgment, and gives a vivid picture of the desperate condition of England in the year of King Aethelred II.'s flight (1014). Of the many other homilies ascribed to Wulfstan very few are authentic. Subsequent legislation, especially that of Canute, bears clear traces of his influence.

See the edition of his homilies by A. Napier (Berlin, 1883); the same writer's *Über die Werke des altenglischen Erzbischofs Wulfstan* (Göttingen dissertation, 1882), and his paper in *An English Miscellany* (Oxford, 1901, pp. 355 f.); also A. Brandl in H. Paul's *Grundriss der germanischen Philologie* (2nd ed., 1901–09), ii., pp. 1110–1112.

WULFSTAN, ST. (*c.* 1012–1095), bishop of Worcester, born at Little Itchington near Warwick and educated in the monastic schools of Evesham and Peterborough, became a monk at Worcester, and schoolmaster and prior in the cathedral monastery there. Chosen bishop of Worcester in 1062, he accepted with some reluctance, and was consecrated at York in September. Wulfstan submitted to William the Conqueror, and helped to check the rebellious barons during the revolt of 1075. He was equally loyal to William II. in his struggle with the Welsh. Wulfstan's relations with his ecclesiastical superiors were not so harmonious, and at one time both Lanfranc of Canterbury and Thomas of York unsuccessfully demanded his removal. He died on Jan. 18, 1095. In 1203 he was canonized by Pope Innocent III. By his preaching at Bristol Wulfstan is said to have put an end to the kidnapping of English men and women and selling them as slaves. He rebuilt the cathedral church of Worcester, and some parts of his building still remain.

Lives of St. Wulfstan by Hemming and Florence of Worcester are in H. Wharton's *Anglia sacra* (1691). *See* also E. A. Freeman, *Norman Conquest* (1867–79).

WUNDT, WILHELM MAX (1832–1920), German physiologist and philosopher, was born on Aug. 16, 1832 at Neckarau, in Baden. He studied medicine at Tübingen, Heidelberg and Berlin, and in 1857 began to lecture at Heidelberg. In 1864 he became assistant professor there, and in 1866 was chosen to represent Heidelberg in the Baden Chamber, but soon resigned. In 1875 he became professor of philosophy at Leipzig, where he founded an institute for experimental psychology, the precursor of many similar institutes. The list of Wundt's works is long and comprehensive, including physiology, psychology, logic and ethics. He died near Leipzig on Aug. 31, 1920.

WUNTHO, a native state of Upper Burma annexed by the British and incorporated in the district of Katha in 1892. When the British annexed Upper Burma in 1885 the state became a refuge for rebels. Finally in 1891 it broke into open rebellion, the sawbwa was deposed, and a force of 1,800 troops under General Sir George Wolseley occupied the town of Wuntho and reduced the state to order.

WU PEI-FU (1873–), Chinese general, was born in Shantung. He joined the Third Army Division, commanded by Tsao Kun, distinguished himself in several minor campaigns, and was rewarded by Tsao Kun in 1916 with the command of a division. By 1917 he was the Peking Government's chief bulwark against the Monarchists, Sun Yat-sen's independent republic at Canton and the ambitions of Marshal Chang Tso-lin, the governor general of Manchuria. Sun Yat-sen was not in a position to take the offensive, but Chang Tso-lin invaded Chihli in the spring of 1922 and, being defeated by the forces of Wu Pei-fu launched another attack in 1924. Wu Pei-fu was defeated in a great battle near Tientsin in Oct. and fled, after which he remained in retirement at Yochow.

WÜRTTEMBERG, a republic, and a component State of the German Reich, forming a tolerably compact mass in the south-west angle of Germany. In the south it is cleft by the long narrow territory of Hohenzollern, belonging to Prussia; and it encloses several small enclaves of Baden and Hohenzollern, while it owns some small exclaves within the limits of these two states. It lies between 47° 34′ 48″ and 49° 35′ 17″ N., and between 8° 15′ and 10° 30′ E. Its greatest length from north to south is 140 m.; its greatest breadth is 100 m.; its boundaries, almost entirely arbitrary, have a circuit of 1,116 m.; and its total area is 7,530 sq.m. It is bounded on the east by Bavaria, and on the other three sides by Baden, with the exception of short distances on the south, where it touches Hohenzollern and the lake of Constance.

Physical Features.—The undulating fertile terraces of Upper and Lower Swabia may be taken as the characteristic parts of this agricultural country. The usual estimates return one-fourth of the entire surface as "plain," less than one-third as "mountainous," and nearly one-half as "hilly." The average elevation above the sea-level is 1,640 ft.; the lowest point is at Böttingen (410 ft.), where the Neckar quits the country; the highest is the Katzenkopf (3,775 ft.), on the Hornisgrinde, on the western border.

The chief mountains are the Black Forest (*q.v.*) on the west, the Swabian Jura or Rauhe Alb stretching across the middle of the country from south-west to north-east, and the Adelegg Mountains in the extreme south-east, adjoining the Algau Alps in Bavaria. The Rauhe Alb or Alp slopes gradually down into the plateau on its south side, but on the north it is sometimes rugged and steep, and has its line broken by isolated projecting hills. The highest summits are in the south-west, viz., the Lemberg (3,326 ft.), Ober-Hohenberg (3,312 ft.) and Plettenberg (3,293 ft.). To the south of the Rauhe Alb the plateau of Upper Swabia stretches to the lake of Constance and eastwards across the Iller into Bavaria. Between the Alb and the Black Forest in the north-west are the fertile terraces of Lower Swabia, continued on the north-east by those of Franconia.

About 70% of Württemberg belongs to the basin of the Rhine, and about 30% to that of the Danube. The principal river is the Neckar, which flows northward for 186 m. through Württemberg to join the Rhine, and with its tributaries the Rems, Kocher, Jagst, Ens, etc., drains 57% of the country. The Danube flows from east to west across the south half of Württemberg, a distance of 65 m., a small section of which is in Hohenzollern. Just above Ulm it is joined by the Iller, which forms the boundary between Bavaria and Württemberg for about 35 m. The Tauber in the north-east joins the Main; the Argen and Schussen in the south enter the lake of Constance. The lakes of Württemberg, with the exception of those in the Black Forest, all lie south of the Danube. The largest is the Federsee (1 sq.m.), near Buchau. About one-fifth of the lake of Constance is reckoned to belong to Württemberg. Mineral springs are abundant; the most famous spa is Wildbad, in the Black Forest.

The climate is temperate, and colder among the mountains in the south than in the north. The mean temperature varies at different points from 43° to 50° F. The abundant forests induce much rain, most of which falls in the summer.

Population.—The population of the four divisions (*Kreise*) into which the kingdom is divided is shown below:—

Division (*Kreis*)	Area in sq.m.	Pop. 1900	Pop. 1925	Density 1925
Neckar	1,285	745,669	966,071	751·8
Black Forest (Schwarzwald)	1,844	509,258	604,868	328
Jagst	1,984	400,126	420,947	212
Danube (Donau)	2,417	514,427	599,454	248
Total	7,530	2,169,480	2,591,340	344

The population is particularly dense in the Neckar valley from Esslingen northward. The people of the north-west belong to the Alamannic stock, those of the north-east to the Franconian, and those of the centre and south to the Swabian.

The largest towns in the kingdom are Stuttgart (with Cannstadt), Ulm, Heilbronn, Esslingen, Reutlingen, Ludwigsburg,

Göppingen, Gmünd, Tübingen, Tuttlingen and Ravensburg.

Agriculture.—Württemberg is essentially an agricultural State; 64% of its total area is under cultivation, while 31% is under forest. It possesses rich meadowlands, cornfields, orchards, gardens, and hills covered with vines. The chief agricultural products are oats, spelt, rye, wheat, barley, hops. To these must be added wine (mostly of excellent quality), peas and beans, maize, fruit, chiefly cherries and apples, beets and tobacco, and garden and dairy produce. Of live stock, cattle, sheep and pigs are reared in considerable numbers, and attention is paid to horse-breeding.

Mining.—The salt industry was developed at the beginning of the 19th century. The iron industry is of great antiquity, but it is hampered by the absence of coal. Other products are granite, limestone, ironstone and fireclay.

Manufactures.—Linen, woollen and cotton fabrics are made at Esslingen and Göppingen, and paper at Ravensburg, Heilbronn and other places in Lower Swabia. The manufacturing industries assisted by the government developed rapidly during the later years of the 19th century, notably metal-working, especially such branches of it as require exact and delicate workmanship. Of particular importance are iron and steel goods, locomotives (Esslingen), machinery, motor-cars, bicycles, small arms (in the Mauser factory at Oberndorf), all kinds of scientific and artistic appliances, pianos (at Stuttgart), organs and other musical instruments, photographic apparatus, clocks (in the Black Forest), electrical apparatus, and gold and silver goods. There are also extensive chemical works, potteries, cabinet-making workshops, sugar factories, breweries and distilleries. Water-power and petrol largely compensate for the lack of coal.

Commerce.—The principal exports are cattle, cereals, wood, pianos, salt, oil, leather, cotton and linen fabrics, beer, wine and spirits. The chief commercial cities are Stuttgart, Ulm, Heilbronn and Friedrichshafen. The book trade of Stuttgart, called the Leipzig of South Germany, is very extensive.

Communications.—In 1924 Württemberg had 1,292 m. of full gauge railways. The Neckar, the Schussen and the lake of Constance are all navigable for boats; the Danube begins to be navigable at Ulm. The roads of Württemberg are fairly good; the oldest of them are Roman.

Constitution.—The Constitution of the Republic of Württemberg bears date Sept. 25, 1919. The supreme power in the State is vested in the Landtag, composed of 80 members elected by universal suffrage for 4 years, in accordance with the electoral law of April, 1924. The Landtag appoints the State Ministry, the President of which is styled "State President."

For administrative purposes the country is divided into the City of Stuttgart, 62 districts (Oberämter), and 1,887 communes (Gemeinden).

Religion.—At the census of 1925 the various creeds numbered as follows:—Protestants, 1·72 million; Roman Catholics, 796,196; Jews, 10,752; and others 50,216. At the head of the Evangelical (Protestant) Church stands a President, who with a Church Council is responsible for its administration. The Roman Catholic Church is subject to the bishop of Rottenburg, in the archdiocese of Freiburg.

Education.—The higher branches of learning are provided in the university of Tübingen, in the technical high school (with academic rank) of Stuttgart, the veterinary high school at Stuttgart, the commercial college at Stuttgart, and the agricultural college of Hohenheim. There are gymnasia and other schools in all the larger towns, while every commune has a school. There are numerous schools and colleges for women. There is also a school of viticulture at Weinsberg.

HISTORY

Origins.—The origin of the name Württemberg is uncertain. Early forms of it are Wirtenberg, Wirtembenc, Wirtenberc, Wirtemberg and Würtemberg. In 1806 Württemberg was adopted as the official spelling.

As far as we know, the first inhabitants of the country were the Celts, and then the Suebi. In the 1st century A.D. the Romans included it in the area defended by the *limes Germanicus* (*q.v.*). Early in the 3rd century the Alamanni drove the Romans beyond the Rhine and the Danube, but in their turn they were conquered by the Franks under Clovis, the decisive battle being fought in 496. In the 9th century it was incorporated with the German duchy of Swabia.

The duchy of Swabia was ruled by the Hohenstaufen family until the death of Conradin in 1268, when a considerable part of it fell to the count of Württemberg, the representative of a family first mentioned about 1080, a certain Conrad von Beutelsbach, having called himself after his ancestral castle of Württemberg. The earliest count about whom anything is known is Ulrich, who ruled from 1241 to 1265. Under his sons, Ulrich II. and Eberhard I., and their successors the power of the family grew steadily. Eberhard (d. 1325) doubled the area of his county and transferred his residence from Württemberg to Stuttgart. His successors all added something to the area of Württemberg. The lands of the family were several times divided, but in 1482 they were declared indivisible and were united under Count Eberhard V. In 1495 the county was raised to the rank of duchy.

Religion.—The long reign (1498–1550) of Duke Ulrich I., who succeeded to the duchy while still a child, was a most eventful period for the country. His extortions excited a rising known as that of the *arme Konrad* (poor Conrad) and in 1514 by the treaty of Tübingen the people undertook to pay the duke's debts in return for various political privileges, which in effect laid the foundation of the constitutional liberties of the country. A few years later Ulrich quarrelled with the Swabian league, and its forces expelled him and sold his duchy to the Emperor Charles V. Charles handed over Württemberg to his brother, the German king, Ferdinand I., but discontent caused by the oppressive Austrian rule, disturbances in Germany leading to the Peasants' War and commotions aroused by the Reformation gave Ulrich an opportunity to recover it. Aided by Philip, landgrave of Hesse, and other Protestant princes, he fought a victorious battle against Ferdinand's troops at Lauffen in May 1534, and then by the treaty of Cadan he was again recognized as duke, but was forced to accept his duchy as an Austrian fief. He now introduced the reformed doctrines and proceeded to endow Protestant churches and schools throughout his land. Ulrich's connection with the league of Schmalkalden led to another expulsion, but in 1547 he was reinstated by Charles V., although on somewhat onerous terms.

Ulrich's son and successor, Christopher (1515–68), completed the work of converting his subjects to the reformed faith. He introduced the system of church government known as the *Grosse Kirchenordnung*. Frederick I. (1557–1608) by paying a large sum of money, induced the emperor Rudolph II. in 1599 to free the duchy from the suzerainty of Austria. Thus once again Württemberg became a direct fief of the empire. Under the reign of the next duke, John Frederick (1582–1628), Württemberg suffered severely from the Thirty Years' War. His son and successor Eberhard III. (1614–74) plunged into the war as an ally of France and Sweden in 1633, but after the battle of Nördlingen in 1634 the duchy was occupied by the imperialists and he himself was for some years an exile. He was restored by the peace of Westphalia to a depopulated and impoverished country. During the reign of Eberhard IV. (1676–1733), Württemberg suffered from French invasions.

Alexander, who became duke in 1733, embraced the Roman Catholic faith. His favourite adviser was the Jew Süss Oppenheimer, and it was thought that master and servant were aiming at the suppression of the diet and the introduction of the Roman Catholic religion. The sudden death of Charles Alexander in March 1737 put an abrupt end to these plans, and the regent, Charles Rudolph, had Oppenheimer hanged.

Frederick Eugene (d. 1797) educated his children in the Protestant faith. Thus when his son Frederick II. became duke in 1797, the ruler of Württemberg was again a Protestant and the royal house adhered to this faith since that date. During Frederick Eugene's short reign the French invaded Württemberg, compelled the duke to withdraw his troops from the imperial army and to pay a sum of money.

French Wars.—Frederick II. (1754–1816) took part in the

war against France against the wishes of his people, and when the French again invaded and devastated the country he retired to Erlangen, where he remained until after the conclusion of the peace of Lunéville in 1801. By a private treaty with France (March 1802) he ceded his possessions on the left bank of the Rhine, receiving in return nine imperial towns, among them Reutlingen and Heilbronn, and some other territories, amounting altogether to about 850 sq.m. and containing about 124,000 inhabitants. He also accepted from Napoleon the title of elector. In 1805 Württemberg took up arms on the side of France, and by the peace of Pressburg in Dec. 1805 the elector was rewarded with various Austrian possessions in Swabia and with other lands in the neighbourhood. On Jan. 1, 1806, Frederick assumed the title of king and abrogated the constitution.

In 1806 he joined the Confederation of the Rhine and received further additions of territory containing 160,000 inhabitants; a little later, by the peace of Vienna in Oct. 1809, about 110,000 more persons were placed under his rule. In return for these favours Frederick joined Napoleon in his campaigns against Prussia, Austria and Russia. After the battle of Leipzig he deserted the French emperor, and by a treaty made with Metternich at Fulda in Nov. 1813 secured the confirmation of his royal title and of his recent acquisitions of territory, while his troops marched with those of the allies into France. In 1815 the king joined the Germanic Confederation. He died on Oct. 30, 1816.

The new king, William I., granted a new constitution in Sept. 1819. A democratic constitution, proclaimed during the revolution of 1848, was abrogated as soon as the movement had spent its force and the constitution of 1819 was restored.

Charles I. (1823–1891) succeeded his father William as king in July 1864. In 1866 Württemberg took up arms on behalf of Austria, but three weeks after the battle of Königgrätz her troops were decisively beaten at Tauberbischofsheim, and the country was at the mercy of Prussia. The Prussians occupied the northern part of Württemberg and peace was made in August 1866; Württemberg paid an indemnity of 8,000,000 gulden and concluded a secret offensive and defensive treaty with her conqueror.

On the outbreak of the Franco-Prussian War in 1870 its troops took a creditable part in the battle of Wörth and in other operations of the war. In 1871 Württemberg became a member of the new German empire, but retained control of her own post office, telegraphs and railways. She had also certain special privileges with regard to taxation and the army. On Oct. 6, 1891, King Charles died suddenly, and was succeeded by his cousin William II. (b. 1848), who continued the policy of his predecessor. The reform of the constitution continued to be discussed, and the election of 1895 was memorable because of the return of a powerful party of democrats.

Later Politics.—Between 1900 and 1910 the political history of Württemberg centred round the settlement of the constitutional question. The constitution was revised in 1906. No further changes were made until Oct. 1918, when the Weizsäcker ministry, which held office during the War, resigned, and revolution broke out on Nov. 9. For two days the direction of affairs was exclusively in Socialist hands, but on Nov. 11 a coalition was formed, from which the Spartacists were excluded, and representatives of the bourgeois parties admitted. The king abdicated on Nov 30. The Spartacist rising of Jan. 1919, had its echo in Württemberg chiefly in the form of industrial disturbances, after which the Independent Social Democrats left the ministry. A new republican constitution was adopted on Sept. 25, 1919. A peculiarity of the Württemberg constitution is that councils (*Beiräte*), formed from the different classes according to occupations (*Berufsstände*), are attached to the Ministries. Since then Württemberg history has followed the general course of German history: the political influence of the Social Democrats has slowly declined and in 1924, for the first time, a purely Bourgeois coalition took power.

WURTZ, CHARLES ADOLPHE (1817–1884), French chemist, was born at Wolfisheim, near Strasbourg. When he left the Protestant Gymnasium at Strasbourg in 1834 he studied medicine, and in 1839 was appointed "Chef des travaux chimiques" at the Strasbourg faculty of medicine. In 1845 he became assistant to J. B. A. Dumas at the École de Médecine, and in 1849 lectured on organic chemistry in his place. In 1852 Wurtz was appointed to the combined chairs of organic chemistry and of mineral chemistry and toxicology at the faculty of medicine. In 1875 he became the first occupant of the chair of organic chemistry which he had induced the government to establish at the Sorbonne. He died in Paris on May 10, 1884.

Wurtz's first published paper was on hypophosphorous acid (1842), and the continuation of his work on the acids of phosphorus (1845) resulted in the discovery of phosphorus oxychloride, as well as of copper hydride. But his original work was mainly in the domain of organic chemistry. Investigation of the alkyl isocyanates (1848) led him to the discovery of the amines (1849), and later (1851) the compound ureas. In 1855 he showed that the combination between two hydrocarbon radicles could be brought about by the action of sodium on the alkyl iodides; this important reaction is known by his name. About the same time he reached the conclusion that glycerin is a body of alcoholic nature formed on the type of three molecules of water, as common alcohol is on that of one, and was thus led (1856) to the study of the glycols, bodies similarly related to the double water type. The oxidation of the glycols led him to homologues of lactic acid, and a controversy about the constitution of the latter with H. Kolbe resulted in a better understanding of the relations between the hydroxy- and the amino-acids. In 1867 Wurtz prepared neurine synthetically by the action of trimethylamine on glycol-chlorhydrin, and in 1872 he discovered aldol, pointing out its double character as at once an alcohol and an aldehyde. In addition reference may be made to his work published from 1865 onwards, on abnormal vapour densities. While on the olefines he noticed that a change takes place in the density of the vapour of amylene hydrochloride, hydrobromide, etc., as the temperature is increased, and in this he saw a powerful argument in favour of the view that abnormal vapour densities, such as are exhibited by ammonium chloride or phosphorus pentachloride, are to be explained by dissociation.

From 1852–72 Wurtz published in the *Annales de chimie et de physique* abstracts of chemical work done out of France. The publication of his great *Dictionnaire de chimie pure et appliquée*, in which he was assisted by many other French chemists, was begun in 1869 and finished in 1878; two supplementary volumes were issued 1880–86, and a second supplement was completed in 1908. Among his books are *Chimie médicale* (1864), *Leçons élémentaires de chimie moderne* (1867), *Théorie des atomes dans la conception du monde* (1874), *La Théorie atomique* (1878), *Progrès de l'industrie des matières colorantes artificielles* (1876) and *Traité de chimie biologique* (1880–85).

For his life and work, with a list of his publications, *see* Charles Friedel's memoir in the *Bulletin de la Société Chimique* (1885); also A. W. von Hofmann in the *Ber. deut. chem. Ges.* (1887), reprinted in vol. iii. of his *Zur Erinnerung an vorangegangene Freunde* (1888).

WÜRZBURG, a university town and episcopal see of Bavaria, Germany, capital of the province of Lower Franconia, situated on the Main, 60 m. by rail S.E. from Frankfort and at the junction of main lines to Bamberg and Nürnberg. Pop. (1925) 89,910. The site of the Leistenberg was occupied by a Roman fort, and was probably fortified early in the 13th century. *Wircebirgum* is the old Latin form of the name of the town; *Herbipolis* (herb town) first appears in the 12th century. The bishopric was probably founded in 741, but the town appears to have existed in the previous century. About the 12th century the bishops had ducal authority in Eastern Franconia. Quarrels broke out between the bishops and the citizens, and, after long struggles, the citizens submitted in 1400. Several imperial diets were held in Würzburg,

chief among these being the one of 1180 when Henry the Lion was placed under the ban. By the peace of Lunéville the bishopric was secularized, and in 1803 Würzburg passed to Bavaria. The peace of Pressburg in 1805 transferred it to Ferdinand, formerly grand-duke of Tuscany, who joined the confederation of the Rhine and took the title of grand-duke of Würzburg. In 1815 the congress of Vienna restored Würzburg to Bavaria. The bishopric of Würzburg at one time embraced an area of about 1,900 sq.m. and had about 250,000 inhabitants. A new bishopric of Würzburg was created in 1817.

An ancient stone bridge (1474–1607), 650 ft. long and adorned with statues of saints, and two modern bridges connect the two parts of the town on each side of the river. On the Leistenberg stands the fortress of Marienberg, which from 1261 to 1720 was the residence of the bishops. Many of the houses are interesting specimens of mediaeval architecture; and the numerous old churches recall the fact that it was long the capital of an ecclesiastical principality. The principal church is the imposing Romanesque cathedral, a basilica with transepts, begun in 1042 and consecrated in 1189. The four towers, however, date from 1240, the (rococo) façade from 1711–19, and the dome from 1731. The transepts terminate in apses. The exterior was restored in 1882–83. Other interesting buildings are the Marienkapelle, the Haugerstifts church, the Neumünster church, the church of St. Burkhard, the palace, formerly the residence of the bishops and grand-dukes of Würzburg, and the Julius hospital, and the town hall dates in part from 1456. Walter von der Vogelweide is buried in the cloisters adjoining the Neumünster church.

A university was founded at Würzburg in 1403, but it only existed for a few years. The present university was founded by Bishop Julius in 1582. Here W. K. Röntgen discovered the "Röntgen rays" in 1896. Würzburg was long the Jesuit stronghold in Germany, and the Roman Catholic theological faculty still attracts large numbers. The university has 125 on its teaching staff and is attended by (1925) 2,124 students.

Würzburg is surrounded by vineyards, which yield some of the best wine in Germany. Its principal industries are the manufacture of tobacco, furniture, machinery, scientific instruments and railway carriages. It has also breweries, and produces bricks, marmalade, pianos, sugar, malt and chocolate.

See S. Göbl, *Würzburg, Ein Kulturhistorisches Städtebild* (Würzburg, 1896); F. X. von Wegele, *Geschichte der Universität Würzburg*, (Würzburg, 1882); *Geschichte des Bischofstums Würzburg* (Würzburg, 1899–1901).

WURZEN, a town of Germany in the republic of Saxony, on the Mulde, 15½ m. by rail E. of Leipzig on the main line (via Riesa) to Dresden. Pop. (1925) 18,286. Wurzen was founded by the Sorbs, and was a town early in the 12th century, when the bishop of Meissen founded a monastery here. In 1581 it passed to the elector of Saxony. It has a cathedral dating from the 12th century and a castle, at one time a residence of the bishops of Meissen and now utilized as law courts.

WYANDOTTE, a city of Wayne county, Michigan, U.S.A., on the Detroit river and the Dixie highway, 8 m. S. by W. of Detroit. It is served by the Detroit and Toledo Shore line, the Detroit, Toledo and Ironton, the Michigan Central and the New York Central railways. The population was 13,851 in 1920 (29% foreign-born white) and was estimated locally at 36,000 in 1928. Beneath the city, at depths of from 790 to 1,200 ft., lie four vast salt beds (from 25 to 90 ft. thick) containing originally more than 400,000,000 tons. Limestone also is abundant. Chemical plants which convert the salt into soda ash, caustic soda, bicarbonate of soda, and other products, and make bleaching powders out of the limestone, are the city's principal manufacturing industries. The total factory output for 1925 was valued at $27,677,716. Wyandotte was settled in 1820, was incorporated as a village in 1854 and as a city in 1866.

WYANDOTTE CAVE, a cave in Crawford county, southern Indiana, U.S.A., 38° 14′ N. lat. and 86° 18′ W. longitude. It is but one of the many caves of southern Indiana dissolved and eroded in the relatively pure, massive, horizontally bedded Mississippian limestones that extend southward into the cave-bearing regions of Kentucky and Tennessee. Like Mammoth cave of Kentucky, Wyandotte cave owes its early history to the demand for nitre for gunpowder in the War of 1812, the nitrate industry beginning in that year and terminating in 1817. The environs of the mouth of the cave afford a scene of sedate quiet, the narrow valley of the Blue river stretching across from the entrance to Greenbrier mountain, with its sharp conical crest and steep slopes, belted with massive cliffs of rock and set with tapering cedars. The entrance is about 200 ft. above Blue river. The cave has been as accurately mapped as cave conditions permit, but the aggregate length of its passages can only be estimated, for some have not been explored; the total probably exceeds 25 miles. The "old cave" constitutes that portion of the cave discovered before 1850. In that year the new cave was discovered, a long extension with many passages and chambers that add materially to the beauty and interest of the cave. The mouth of the old cave is 20 ft. wide and 6 ft. high. One hundred feet within the entrance the gallery widens into a spacious corridor known as Faneuil Hall, whence issues the Columbian Arch, a semi-cylindrical tunnel 75 ft. long, which in turn opens into Washington Avenue, a grand passageway, 275 ft. long, 30 ft. wide, and 40 ft. high. This passage terminates in a low gallery which expands into Banditti Hall, the common entry into both the old and new caves. The old cave ends in the Senate Chamber, an imposing rotunda like, but not quite so large as, Rothrock's cathedral with its magnificent Wallace's Grand Dome rising above Monument mountain, beyond Rothrock's Straits in the new cave.

The Senate Chamber, one of the most picturesque features of Wyandotte cave, is a vast elliptical amphitheatre, 145 ft. long and 56 ft. wide, converging upward to a gigantic dome. In the centre of the chamber a mass of fallen rock constitutes Capitol Hill, 32 ft. high, out of the centre of which rises the grandest spectacle of the cave—the massive, fluted column of satin-spar, or calcite, known as the "Pillar of the Constitution." Quite cylindrical, 25 ft. in diameter, this majestic column of spectral white calcite extends from the peak of Capitol Hill to the centre of the dome far above. Tiny streamlets of water trickle down its fluted sides, evaporating and leaving their burdens of calcium carbonate crystallized upon the ever-growing column. A relatively sparse cave fauna and a few evidences of Indian activity are found in the cave. The temperature of the cave is uniformly 53° F and the air is sweet and pure.

See list of 22 titles referring to Wyandotte and other Indiana caves given on pp. 210–212, of the 21st *Annual Report* of the Department of Geology and Natural Resources of Indiana (1896). (W. E. E.)

WYANT, ALEXANDER H. (1836–1892), American artist, was born at Port Washington (O.), on Jan. 11, 1836. He was a pupil of Hans Gude in Carlsruhe, Germany. A trip with a government exploring expedition in the west of America undermined his health and he painted mainly in the high altitudes of the Adirondack mountains. He was elected a full member of the National Academy of Design, New York, in 1869 and died in New York city on Nov. 29, 1892. His fame was deferred until after his death.

WYAT, SIR THOMAS (1503–1542), English poet and statesman, elder son of Henry Wyat, or Wiat, afterwards knighted, and his wife Anne, daughter of John Skinner of Reigate, Surrey, was born at Allington Castle, near Maidstone, Kent, in 1503. His father (1460–1537) belonged to a Yorkshire family, but bought Allington about 1493. He was an adherent of the Lancastrian party, and was imprisoned and put to the torture by Richard III. The family records (in the possession of the earl of Romney) relate that during his imprisonment he was saved from starvation by a cat that brought him pigeons. At the accession of Henry VII. he became knight of the Bath (1509), knight banneret (1513) and held various offices at court. His son, Thomas Wyat, was admitted at St. John's College, Cambridge, when about twelve years of age, took his B.A. degree in 1518, and proceeded M.A. in 1522. An early marriage with Elizabeth Brooke, daughter of Lord Cobham, proved unhappy, for a letter from the Spanish ambassador Chapuys to Charles V. (Feb. 9, 1542) speaks of her having been repudiated by her

husband. As early as 1516 Wyat was server extraordinary to the king, and in 1524 he was at court as keeper of the king's jewels. He was one of the champions in the Christmas tournament of 1525. His father had been associated with Sir Thomas Boleyn as constable of Norwich Castle, and he had thus been early acquainted with Anne Boleyn. He appears to have been generally regarded as her lover. He was employed on missions to Francis I. (1526), to the papal court (1527), and from Rome was sent to Venice. From 1528 to 1530 he was acting as high marshal at Calais.

During the following years he was constantly employed in Henry's service, and was apparently high in his favour. He was, however, sent to the Tower in 1536, perhaps because it was desired that he should incriminate the queen. His father's correspondence with Cromwell does not suggest that his arrest had anything to do with the proceedings against Anne Boleyn, but the connection is assumed (*Letters and Papers of Henry VIII.* vol. x. No. 919) in the letters of John Hussey to Lord Lisle, deputy of Calais. Nicholas Harpsfield makes a circumstantial statement (*Pretended Divorce . . .* Camden Soc. p. 253) that Wyat had confessed his intimacy with Anne to Henry VIII. and warned him against marrying her; but this, in view of his continued favour, seems highly improbable. He was released after a month's imprisonment, and in the autumn of that year took part in the suppression of the Lincolnshire rising. In March 1537 he was knighted, and a month later was sent abroad as ambassador to Charles V. In 1538 he was joined by Edmund Bonner, then a simple priest, who wrote to Cromwell (2nd Sept. 1538) a long letter (Petyt MS. 47, Middle Temple; first printed in the *Gentleman's Magazine,* June 1850) in which he accused Wyat of disloyalty to the king's interests, and of many personal slights to himself. So long as Cromwell ruled no notice was taken of Bonner's allegations. He was recalled in April 1539, but later in the same year he was employed on another embassy to the emperor. After Cromwell's death Wyat's enemies renewed their attacks, and he was imprisoned (Jan. 17, 1541) in the Tower on the old charges, with the additional accusation of treasonable correspondence with Cardinal Reginald Pole. He was released at the intercession of the queen, Catherine Howard, on condition that he confessed his guilt and took back his wife, from whom he had been separated for fifteen years, on pain of death if he were thenceforth untrue to her (*see* Chapuys to Charles V., March 1541). He received a formal pardon on March 21, and received during the year substantial marks of the king's favour. In the summer of the next year he was sent to Falmouth to meet the ambassadors of the emperor. The heat brought on a fever to which he succumbed at Sherborne, Dorset, on Oct. 11. A Latin elegy on his death was written by his friend John Leland, "Naenia in mortem Thomae Viati equitis incomparabilis"; and Henry Howard, earl of Surrey, celebrated his memory in some well-known lines beginning "Wyat resteth here, that quick could never rest," and in two sonnets.

Wyat's work falls readily into two divisions: the sonnets, rondeaus, and lyric poems dealing with love; and the satires and the version of the penitential psalms. The love poems probably date from before his first imprisonment. A large number were published in 1557 in *Songes and Sonettes* (*Tottel's Miscellany*). Wyat's contributions number 96 out of a total of 310. These have been supplemented from mss. He was the pioneer of the sonnet in England. Wyat wrote in all thirty-one sonnets, ten of which are direct translations of Petrarch. The sentiment is strained and artificial. Wyat shows to greater advantage in his lyrical metres, in his epigrams and songs, especially in those written for music[1], where he is less hampered by the conventions of the Petrarchan tradition, to which his singularly robust and frank nature was ill-fitted. Wyat wrote three excellent satires—"On the mean and sure estate," dedicated to John Poins, "Of the Courtier's Life," to the same, and "How to use the court and himself." They are written in *terza rima* and in form and matter owe much to Luigi Alamanni. In the "Penitential Psalms" each is preceded by a prologue describing the circumstances under which the psalmist wrote, and the psalms themselves are very freely paraphrased, with much original matter from the author. They were published in 1549 by Thomas Raynald and John Harrington as *Certayne Psalmes . . . drawen into English meter by Sir Thomas Wyat Knyght.*

[1]One of the most musical of the pieces printed in his works, however, "The Lover complayneth the unkindnes of his Love," beginning "My lute, awake," is sometimes attributed to George Boleyn, Lord Rochford (*see* E. Bapst, *Deux Gentilshommes poètes de la cour de Henri VIII.*, p. 142).

None of Wyat's other poems were printed until fifteen years after his death, in *Songes and Sonettes.* There are editions of his *Works* by G. F. Nott (1816); of the *Songes and Sonnettes* by E. Arber (1870); and of the *Poems* (2 vols.) by A. K. Foxwell (1913). *See* A. K. Foxwell, *Study of Wyat's Poems* (1911). *See* also Brewer and Gardiner, *Letters and Papers of Henry VIII.* (especially from 1534 to 1542).

WYAT, SIR THOMAS (THE YOUNGER) (d. 1554), English conspirator, son of the preceding, was over 21 in 1543, but the date of his birth is uncertain. He is said to have accompanied his father on his mission to Spain, and to have been turned into an enemy of the Spaniards by the menaces of the Inquisition. In 1542 he inherited the family property of Allington castle and Boxley abbey on the death of his father.

In 1554 he joined with the conspirators who combined to prevent the marriage of Queen Mary with Philip, the prince of Spain. On January 22, 1554, he summoned a meeting of his friends at his castle of Allington, and the 25th was fixed for the rising. On the 26th Wyat occupied Rochester, and issued a proclamation to the county. Lord Abergavenny and Sir Robert Southwell, the sheriff of Kent, were deserted by their men, who either disbanded or went over to Wyat. A detachment of the London train-bands sent against him by Queen Mary, under the command of the duke of Norfolk, followed their example. The rising now seemed so formidable that a deputation was sent to Wyat by the queen and council to ask his terms. He insisted that the Tower should be surrendered to him, and the queen put under his charge. The insolence of these demands caused a reaction in London, where the reformers were strong and were at first in sympathy with him. When he reached Southwark on Feb. 3, he found London Bridge occupied in force, and was unable to penetrate into the city. He was driven from Southwark by the threats of Sir John Brydges (or Bruges), afterwards Lord Chandos, who was prepared to fire on the suburb with the guns of the Tower. Wyat now marched up the river to Kingston, where he crossed the Thames, and made his way to Ludgate with a part of his following. Some of his men were cut off. Others lost heart and deserted. His only hope was that a rising would take place, but the loyal forces kept order, and after attempting to force the gate Wyat surrendered.

He was brought to trial on March 15, and could make no defence. Execution was delayed, in the hope that in order to save his life he would compromise the queen's sister, the Princess Elizabeth. He was executed on April 11, and on the scaffold expressly cleared the princess of all complicity in the rising. His estates were afterwards partly restored to his son George, the father of the Sir Francis Wyat (d. 1644) who was governor of Virginia in 1621–26 and 1639–42.

See G. F. Nott, *Works of Surrey and of Sir Thomas Wyat* (1815); and Froude, *History of England.*

WYCHERLEY, WILLIAM (*c.* 1640–1716), English dramatist, was born about 1640 at Clive, near Shrewsbury, where for several generations his family had been settled on a moderate estate of about £600 a year. Like Vanbrugh, Wycherley spent his early years in France, whither, at the age of fifteen, he was sent to be educated in the very heart of the "precious" circle of Mme. de Montausier, on the banks of the Charente. This lady effected the first of his successive conversions from Protestantism to Catholicism. Later at Oxford, Bishop Barlow reclaimed him, and under James II. he returned to Catholicism once more. In fact, the deity he worshipped was the deity of the "polite world" of his time—gentility. Moreover, as a professional fine gentleman, at a period when, as the genial Major Pack says, "the amours of Britain would furnish as diverting memoirs, if well related, as those of France published by Rabutin, or those of Nero's court writ by Petronius," Wycherley was obliged to be a loose liver.

As a fellow-commoner of Queen's College, Oxford, Wycherley lived (according to Wood) in the provost's lodgings, being entered as "Philosophiae Studiosus" in July 1660. And he does not seem to have matriculated or to have taken a degree. He left Oxford and settled in the Inner Temple; but not, naturally, to engage seriously in the study of the law. Pleasure and the stage were alone open to him, and probably early in 1671 was produced, at the Theatre Royal, *Love in a Wood*. It was published the next year. With regard to this comedy Wycherley told Pope that he wrote it the year before he went to Oxford. But we need not believe him: the worst witness against a man is mostly himself. To pose as the wicked boy of genius has been the foolish ambition of many writers, but on inquiry it will generally be found that these inkhorn Lotharios are not nearly so wicked as they would have us believe. It is not so much that, as Macaulay insists, "the whole air and spirit of the piece belong to a period subsequent to that mentioned by Wycherley," but that "the whole air and spirit of the piece" belong to a man—an experienced and hardened young man of the world—and not to a boy who would fain pose as an experienced and hardened young man of the world. The real defence of Wycherley against his foolish impeachment of himself is this, that *Love in a Wood*, howsoever inferior in structure and in all the artistic economies to *The Country Wife* and *The Plain Dealer*, contains scenes which, not for moral hardness merely, but often for real dramatic ripeness, are almost the strongest to be found amongst his four plays. The play was dedicated to Charles II.'s mistress, the duchess of Cleveland, whose favours Wycherley forthwith enjoyed. His fortune as a dramatist was made. Voltaire (in his *Letters on the English Nation*) has a picturesque description of the duchess's visits to Wycherley's chambers in the Temple.

Whether Wycherley's experiences as a naval officer, which he alludes to in his lines "On a Sea Fight which the Author was in betwixt the English and the Dutch," occurred before or after the production of *Love in a Wood* is a point upon which opinions differ, but on the whole we are inclined to agree with Macaulay, against Leigh Hunt, that these experiences took place not only after the production of *Love in a Wood* but after the production of *The Gentleman Dancing Master*, in 1673. We also think, with Macaulay, that he went to sea simply because it was the "polite" thing to do so—simply because, as he says in the epilogue to *The Gentleman Dancing Master* "all gentlemen must pack to sea."

This second comedy was published in 1673, but was probably acted late in 1671. It is inferior to *Love in a Wood*. In *The Relapse* the artistic mistake of blending comedy and farce damages a splendid play, but leaves it a splendid play still. In *The Gentleman Dancing Master* this mingling of discordant elements destroys a play that would never in any circumstances have been strong—a play nevertheless which abounds in animal spirits, and is luminous here and there with true dramatic points.

It is, however, on his two last comedies—*The Country Wife* and *The Plain Dealer*—that must rest Wycherley's fame as a master of that comedy of repartee which, inaugurated by Etheredge, and afterwards brought to perfection by Congreve and Vanbrugh, supplanted the humoristic comedy of the Elizabethans. *The Country Wife*, produced in 1672 or 1673 and published in 1675, is so full of wit, ingenuity, animal spirits and conventional humour that, had it not been for its motive, it would probably have survived as long as the acted drama remained a literary form in England. So strong, indeed, is the hand that could draw such a character as Marjory Pinchwife (the undoubted original not only of Congreve's Miss Prue but of Vanbrugh's Hoyden), such a character as Sparkish (the undoubted original of Congreve's Tattle), such a character as Horner (the undoubted original of all those cool impudent rakes with whom our stage has since been familiar), that Wycherley is certainly entitled to a place alongside Congreve and Vanbrugh.

Scarcely inferior to *The Country Wife* is *The Plain Dealer*, produced probably early in 1674 and published three years later,—a play of which Voltaire said, "Je ne connais point de comédie chez les anciens ni chez les moderns où il y ait autant d'esprit." This comedy had an immense influence, as regards manipulation of dialogue, upon all subsequent English comedies of repartee, and he who wants to trace the ancestry of Tony Lumpkin and Mrs. Hardcastle has only to turn to Jerry Blackacre and his mother, while Manly (for whom Wycherley's early patron, the duke of Montausier, sat), though he is perhaps overdone, has dominated this kind of stage character ever since.

It was after the success of *The Plain Dealer* that the turning-point came in Wycherley's career. The great dream of all the men about town in Charles's time, as Wycherley's plays all show, was to marry a widow, young and handsome, a peer's daughter if possible—but in any event rich, and spend her money upon wine and women. While talking to a friend in a bookseller's shop at Tunbridge, Wycherley heard *The Plain Dealer* asked for by a lady who, in the person of the countess of Drogheda, answered all the requirements. An introduction ensued, then love-making, then marriage—a secret marriage, probably in 1680, for, fearing to lose the king's patronage and the income therefrom, Wycherley still thought it politic to pass as a bachelor. But the news reached the royal ear, and Wycherley lost the royal favour for ever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and *Love in a Wood* had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the countess followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died, however, in the year after her marriage and left him the whole of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid; and the result of his marrying the rich, beautiful and titled widow was that the poet was thrown into the Fleet prison. There he remained for seven years, being finally released by the liberality of James II.—a liberality which, incredible as it seems, is too well authenticated to be challenged. James had been so much gratified by seeing *The Plain Dealer* acted that, finding a parallel between Manly's "manliness" and his own, such as no spectator had before discovered, he paid off Wycherley's execution creditor and settled on him a pension of £200 a year. Other debts still troubled Wycherley, however, and he never was released from his embarrassments, not even after succeeding to a life estate in the family property. In coming to Wycherley's death, we come to the worst allegation that has ever been made against him as a man and as a gentleman. At the age of seventy-five he married a young girl, and is said to have done so in order to spite his nephew, the next in succession.

Wycherley wrote verses, and, when quite an old man, prepared them for the press by the aid of Alexander Pope, then not much more than a boy. But, notwithstanding all Pope's tinkering, they remain contemptible. Pope's published correspondence with the dramatist was probably edited by him with a view to giving an impression of his own precocity. The friendship between the two cooled, according to Pope's account, because Wycherley took offence at the numerous corrections on his verses. It seems more likely that Wycherley discovered that Pope, while still professing friendship and admiration, satirized his friend in the *Essay on Criticism*. Wycherley died on Jan. 1, 1716, and was buried in the vault of the church in Covent Garden.

Wycherley's complete works were edited by M. Summers in 4 vols. (Nonesuch Press, 1924). *See* C. Perromat, *William Wycherley, sa vie, son oeuvre* (1921). (T. W.-D.; X.)

WYCLIFFE (or WYCLIF), **JOHN** (*c.* 1320–1384), English reformer, was born, according to John Leland, at Ipreswel (evidently Hipswell), in Yorkshire[1]. The Wycliffes were connected

[1]The form of spelling of the name Wycliffe adopted in this article is that of the village Wycliffe-on-Tees, from which Leland says that he "drew his origin" (*Collectanea* ii. 329); it is also preferred by the editors of the Wycliffe Bible, by Milman and by Stubbs. "Wyclif" has the support of Shirley, of T. Arnold and of the Wyclif Society; while "Wiclif" is the popular form in Germany.

with Balliol College, Oxford, which had been founded by their neighbours, the Balliols of Barnard Castle; John Wycliffe went there, and some time after 1356 was elected master. Confusion with contemporaries makes it not easy to trace his Oxford life; it has been said that he was a fellow of Merton College in 1356. In 1361 he accepted the living of Fillingham in Lincolnshire. In the same year a "John de Wyclif of the diocese of York, M.A." was a suppliant to the Roman Curia for a provision to a prebend, canonry and dignity at York (*Cal. of Entries in the Papal Registries*, ed. Bliss, Petitions, i. 390). This was not granted, but Wycliffe received instead the prebend of Aust in the collegiate church of Westbury-on-Trym. In 1365 one "John de Wyclif" was appointed by Simon Islip, archbishop of Canterbury, to the wardenship of Canterbury Hall, which the archbishop founded for a mixed body of monks and secular clergy, and then filled exclusively with the latter. In 1367, his successor, Simon Langham, replaced the intruded seculars by monks. The displaced warden and fellows appealed to Rome, and in 1371 judgment was given against them. The question of the identity of the warden of Canterbury Hall with the reformer is still a matter of dispute. It may have been referred to by Wycliffe himself (*De ecclesia*, cap. xvi. pp. 370 *sq.*), and was assumed by the contemporary monk of St. Albans (*Chron. Angl.* "Rolls" ser. p. 115) and by Wycliffe's opponent William Woodford (*Fasc. Zizan.* p. 517), who found in Wycliffe's resentment at this treatment the motive for his attacks on the religious orders; it has likewise been assumed by a series of modern scholars, including Loserth (*Realencyklopädie*, 1908 ed., vol. xxi. p. 228, § 35), who only denies the deductions that Woodford drew from it. Dr. Rashdall, following Shirley, brings evidence to show that the Wycliffe of Canterbury Hall was the same person as the fellow of Merton, this being the strongest argument against the identification of the latter with the reformer.

Long before Wycliffe had become a power outside Oxford his fame was established in the university. He was acknowledged supreme in the philosophical disputations of the schools, and his lectures were crowded, but it was not until he was drawn into the arena of the politico-ecclesiastical conflicts of the day that Wycliffe became of world-importance. It has been assumed that this happened first in 1366, and that Wycliffe published his *Determinatio quaedam de dominio* supporting parliament in refusing the tribute demanded by Pope Urban V.; but Loserth has shown that this work must be assigned to a date some eight years later. Wycliffe, in fact, for some years to come had the reputation of a good "curialist." Had it been otherwise, the pope would scarcely have granted him (January 1373) a license to keep his Westbury prebend even after he should have obtained one at Lincoln (*Cal. Papal Letters*, ed. Bliss and Twemlow, iv. 193). Moreover, it is uniformly asserted that Wycliffe fell into heresy after his admission to the degree of doctor (*Fasc. Ziz.* p. 2), and the papal document above quoted shows that he had only just become a doctor of theology, that is in 1372.

But Wycliffe's tendencies may already have called attention to him in high places as a possibly useful instrument for the anti-papal policy of John of Gaunt and his party. On the 7th of April 1374, he was presented by the crown to the rectory of Lutterworth in Leicestershire, which he held until his death; and on the 26th of July he was nominated one of the royal envoys to Bruges to confer with the papal representatives on the long vexed question of "provisions" (*q.v.*). He may have been attached to this mission as theologian—a proof that he was not yet considered a *persona ingrata* at the Curia. His name stands second, next after that of the bishop of Bangor, and he was paid at the princely rate of twenty shillings a day. The commission was appointed because of repeated complaints from the Commons; but the king was interested in keeping up the papal system of provisions and reservations, and the negotiations were practically fruitless.

After his return Wycliffe lived chiefly at Lutterworth and Oxford, making prolonged visits to London, where his fame as a popular preacher was established. It is from this period that dates the development of his systematic attack on the established order in the church. It was not at first the dogmatic, but the political elements in the papal system that provoked his censure. The negotiations at Bruges had strengthened his sympathy with the anti-curial tendencies in English politics from Edward I.'s time onwards, and a final impulse was given by the attitude of the "Good Parliament" in 1376; in the autumn of that year he was reading his treatise on civil lordship (*De civili dominio*) to his students at Oxford. Of its propositions some, according to Loserth, were taken bodily from the 140 titles of the bill dealing with ecclesiastical abuses introduced in the parliament; but it may perhaps be that Wycliffe inspired the bill rather than the bill Wycliffe. For the first time he now publicly proclaimed the doctrine that righteousness is the sole indefeasible title to dominion and to property, that an unrighteous clergy has no such title, and that the decision as to whether or no the property of ecclesiastics should be taken away rests with the civil power.

If the position at which Wycliffe had now arrived was originally inspired, as Loserth asserts, by his sympathy with the legislation of Edward I., *i.e.*, by political rather than theological considerations, the necessity for giving to it a philosophical and religious basis led him to criticism of the doctrinal standpoint of the church. As a philosopher Wycliffe was no more than the last of the conspicuous Oxford scholastics, and his philosophy is important in so far as it determined his doctrine of *dominium*, and the direction in which his political and religious views were to develop. In the controversy between Realism and Nominalism he was on the side of the former, though his doctrine of universals showed the influence of Ockham and the nominalists. To Wycliffe the doctrine of arbitrary divine decrees was anathema. The will of God is his essential and eternal nature, by which all his acts are determined; God created all things in their primordial causes, as genera and species, or else in their material essences, *secundum rationes absconditas seminales* (*ibid.* p. 66). The world is therefore not merely one among an infinity of alternatives, but is the only possible world; it is, moreover, not in the nature of an eternal emanation from God, but was created at a given moment of time—to think otherwise would be to admit its absolute necessity, which would destroy free-will and merit. Since, however, all things came into being in this way, it follows that the creature can produce nothing save what God has already created. This leads to predestination and free-will. Wycliffe takes a middle position. God does not will sin, for He only wills that which has being, and sin is the negation of being; He necessitates men to perform actions which only become right or wrong through man's free agency. All human lordship is derived from the supreme overlordship of God and is inseparable from it, since whatever God gives is part of himself. But, in giving, God does not part with the lordship of the thing given; whatever lordship the creature may possess is held subject to due service to the supreme overlord. Thus, as in feudalism, lordship is distinguished from possession. Property is the result of sin; Christ and his apostles had none. The service by which lordship is held of God is righteousness and its works; it follows that the unrighteous forfeit their right to exercise it, and may be deprived of their possessions by competent authority.

The question follows as to what this authority is, and this Wycliffe sets out to answer in the *Determinatio quaedam de dominio* and the *De civili dominio*. Briefly, his argument is that the church has no concern with temporal matters at all, that for the clergy to hold property is sinful, and that it is lawful for statesmen (*politici*)—who are God's stewards in temporals—to take away the goods of such of the clergy as no longer render the service by which they hold them. That the church was actually in a condition to deserve spoliation he refused to affirm; but his theories fitted in too well with the notorious aims of the duke of Lancaster not to rouse the bitter hostility of the endowed clergy.

Hitherto Wycliffe had made no open attack on the doctrinal system of the church. Early in 1377, however, Archbishop Sudbury summoned him to appear before the bishop of London, and on Feb. 19 Wycliffe made his appearance at St. Paul's, accompanied by the duke of Lancaster, by Lord Percy, marshal of England, and by four doctors of the four mendicant orders. Before Wycliffe could open his mouth, the court was broken up by a rude brawl between his protectors and Bishop Courtenay,

the affair developing into a general riot.

Wycliffe had escaped for the time, but probably before this his enemies had set their case before the pope; and on the 22nd of May five bulls were issued by Gregory XI., condemning eighteen of Wycliffe's "conclusions." All the articles but one are taken from his *De civili dominio*. The bulls truly stated Wycliffe's intellectual lineage; he was following in the error of Marsilius of Padua; and the articles laid against him are concerned entirely with questions as to how far ecclesiastical censures could lawfully affect a man's civil position, and whether the church had a right to hold temporal endowments. The bulls were addressed to the archbishop of Canterbury and the bishop of London, the university of Oxford, and the king. The university was to send Wycliffe to the prelates, who were to examine the truth of the charges and to report to the pope, Wycliffe being meanwhile kept in confinement. The execution of the papal bulls was impeded by three separate causes—the king's death on the 21st of June; the tardy action of the bishops, who enjoined the university to make a report; and the unwillingness of the university to admit the pope's right to order the imprisonment of any man in England. The convocation of the university merely directed Wycliffe to keep within his lodgings at Black Hall for a time.

As soon as parliament met in the autumn of 1377, Wycliffe was consulted by it as to the lawfulness of prohibiting that treasure should pass out of the country in obedience to the pope's demand. Wycliffe's affirmative judgment is contained in a state paper still extant; and its tone is plain proof that his views on the main question of church and state had the support of the nation. He had laid before this same parliament his answer to the pope's bulls, with a defence of the soundness of his opinions. His university, moreover, confirmed his argument; his tenets, it said, were orthodox though their expression might admit of a wrong interpretation. Early in 1378 Wycliffe appeared at Lambeth Palace to clear himself before the prelates who had summoned him. A more cautiously worded defence was laid before the council; but its session was rudely interrupted, not only by a crowd of citizens, but also by a messenger from the princess of Wales enjoining them not to pass judgment against Wycliffe; and thus a second time he escaped. Meanwhile his "protestatio" was sent on to Rome, but before any further step could be taken Gregory XI. died.

In the autumn of this year Wycliffe was once more called upon to prove his loyalty to John of Gaunt, who had violated the sanctuary of Westminster by sending armed men to seize two squires who had taken refuge there. One of them was murdered, together with a servant of the church. The bishop of London excommunicated all concerned in the crime (except only the king, his mother and his uncle), and preached against the culprits at Paul's Cross. At the parliament held at Gloucester in October, in the presence of the legates of Pope Urban VI., Wycliffe read an apology for the duke's action, pleading that the men were killed in resisting legal arrest. The paper, which forms part of the *De ecclesia,* maintains the right of the civil power to invade the sanctuary to bring escaped prisoners to justice.

The schism in the papacy, owing to the election of Clement VII. in opposition to Urban VI., accentuated Wycliffe's hostility to the Holy See and its claims. He did not object to a visible head of the church so long as this head possessed the essential qualification of righteousness. It was later that Wycliffe definitely branded the pope, *qua* pope, as Antichrist. (*See* vol. ii. of the *Sermones*. Book iii. of his *Opus evangelicum* is entitled *De Antichristo*.) Wycliffe's criticism of the established order and of the accepted doctrines he now determined to carry into the streets. For this purpose he instituted "simple" priests to preach his doctrines throughout the country; and, secondly, he translated the Vulgate into English, with the aid of his friends Nicholas Hereford and John Purvey. (*See* BIBLE, ENGLISH.) This version of the Bible, and still more his numerous sermons and tracts, established Wycliffe's position as the founder of English prose writing.

Wycliffe had been on good terms with the friars, whose ideal of poverty appealed to him but he had come to recognize that all organized societies within the church were liable to the same corruption, while he objected fundamentally to a special standard of morality for the "religious." His itinerant preachers were meant to supplement the services of the church by religious instruction in the vernacular, and among them were men who held or had held respectable positions at Oxford. The common people were rejoiced by their plain and homely doctrine which dwelt chiefly on the simple "law" of the gospel, while they no doubt relished the denunciation of existing evils in the church. The feeling of disaffection against the rich and careless clergy, monks and friars was widespread but undefined. Wycliffe turned it into a definite channel.

In addition, Wycliffe was appealing to the world of learning in a series of Latin treatises, which followed each other in rapid succession, and collectively form his *summa theologiae*. J. Loserth, in his paper "Die Genesis von Wiclifs Summa Theologiae" (*Sitzungsber. der k. Akad. der Wissensch.*, Vienna, 1908, vol. 156) gives proofs that the *Summa* was written to provide weapons in the controversies of the time. During the years 1378 and 1379 Wycliffe produced his works on the truth of Holy Scripture, on the church, on the office of king, on the papal power. The *De officio regis* is practically a declaration of war against the papal monarchy, an anticipation of the theocratic conception of national kingship as established later by the Reformation. (See *De officio regis* ed. A. W. Pollard and Charles Sayle, from Vienna mss. 4514, 3933, Wyclif Soc. 1887—cap. vi. p. 119.) Wycliffe now passed from an assailant of the papal to an assailant of the sacerdotal power. In 1379 or 1380 Wycliffe began a formal public attack on what he calls the "new" doctrine in a set of theses on the Eucharist propounded at Oxford. (1381 is the date given in Shirley's edition of the *Fasciculi Zizaniorum*. F. D. Matthew, in the *Eng. Hist. Rev.* for April 1890, v. 328, proves that the date must have been 1379 or 1380.) There followed sermons, tracts, and, in 1381, his great treatise *De eucharistia*. Finally, at the close of his life, he summed up his doctrine in the *Trialogus*.

The language in which he denounced transubstantiation anticipated that of the Protestant reformers; it is a "blasphemous folly," philosophically it is nonsense, since it presupposes the possibility of an accident existing without its substance; it overthrows the very nature of a sacrament. Yet the consecrated bread and wine are the body and blood of Christ, for Christ himself says so (*Fasc. Zizan.* p. 115); we do not, however, corporeally touch and break the Lord's body, which is present only *sacramentaliter, spiritualiter et virtualiter*—as the soul is present in the body. The real presence is not denied; what Wycliffe "dares not affirm" is that the bread is after consecration "essentially, substantially, corporeally and identically" the body of Christ. His doctrine approximates to the Lutheran doctrine of consubstantiation, as distinguished from the Zwinglian teaching accepted in the xxviii. Article of Religion of the Church of England.

The theologians of the university were at once aroused. The chancellor, William Barton, sat with twelve doctors (six of whom were friars), and solemnly condemned the theses. Wycliffe appealed, not to the pope, but to the king. But the lay magnates, who were perfectly ready to help the church to attain to the ideal of apostolic poverty, shrank from the responsibility of supporting obscure propositions, which involved undoubted heresy and the pains of hell. John of Gaunt hastily sent a messenger enjoining the reformer to keep silence. The rift thus created between Wycliffe and his patrons in high places was widened by the Peasants' Revolt of 1381, the result of which was to draw the conservative elements in church and state together.

With the Peasants' Revolt it has been supposed that Wycliffe had something to do. One of its leaders, John Ball, when condemned, confessed that he learned his subversive doctrines from Wycliffe. We have, however, not only the repeated testimony of Knyghton that he was a "precursor" of Wycliffe, but also documentary evidence that he was excommunicated in 1366, long before Wycliffe exposed himself to ecclesiastical censure. Wycliffe's communistic views are theoretical and confined to his Latin scholastic writings. They could not reach the people directly. Possibly his followers translated them in their popular discourses, and thus fed the flame that burst forth in the rebellion.

In the spring after the Revolt his old enemy, William Courtenay, who had succeeded the murdered archbishop Sudbury as archbishop of Canterbury, resolved to stamp out Wycliffe's crowning heresy. He called a court of bishops, theologians and canonists at the Blackfriars' convent. This proceeding was met by a manifestation of university feeling on Wycliffe's side. The chancellor, Robert Rygge, though he had joined in the condemnation of the theses, stood by him, as did also both the proctors. The Council decided that out of 24 articles extracted from Wycliffe's works, ten were heretical and fourteen erroneous. The reply of the chancellor was to deny the archbishop's jurisdiction within the university, and to allow Philip Repington, disciple of Wycliffe, to preach before the university. The chancellor and proctors were now summoned to appear before the Blackfriars' court on the 12th of June. Though they were, with the majority of regent masters at Oxford, on the side of Wycliffe, the main question was for them one of philosophy rather than faith, and they made formal submission to the authority of the Church.

Wycliffe himself remained at large and unmolested. That his strength among the laity was undiminished is shown by the fact that an ordinance passed by the House of Lords alone, in May 1382, against the itinerant preachers was annulled on the petition of the Commons in the following autumn. The reformer, however, was growing old and now occupied himself in writing numerous tracts and two of his most important works. The *Trialogus* is a summing up of his arguments and conclusions on philosophy and doctrine. It was the most influential of all Wycliffe's works, and was the first to be printed (1525). All the only four known complete mss. of the work, preserved in the Imperial Library at Vienna, are of Hussite origin. The note of both the *Trialogus* and of the unfinished *Opus evangelicum*, Wycliffe's last work, is their insistence on the "sufficiency of Holy Scripture."

In 1382, or early in 1383, Wycliffe was seized with a paralytic stroke. On the 28th of December 1384, he had a final stroke, from the effects of which he died on the New Year's eve. He was buried at Lutterworth; but by a decree of the council of Constance, May 4, 1415, his remains were ordered to be dug up and burned, an order which was carried out, at the command of Pope Martin V., by Bishop Fleming in 1428.

A sober study of Wycliffe's life and works justifies a conviction of his complete sincerity and earnest striving after what he believed to be right. When he conceives the Church as consisting exclusively of the righteous, he may seem to have gone the whole length of the most radical reformers of the 16th century. And yet, powerful as was his influence in England, his doctrines in his own country were doomed to become for a century and a half the creed only of obscure sectaries. (*See* LOLLARDS.) It was otherwise in Bohemia, whither his works had been carried by the scholars who came to England in the train of Richard II.'s queen, Anne of Bohemia. Here his writings were eagerly read and multiplied, and here his disciple, John Huss (*q.v.*) raised Wycliffe's doctrine to the dignity of a national religion. Extracts from the *De ecclesia* and the *De potestate Papae* of the English reformer made up the greater part of the *De ecclesia* of Huss, a work for centuries ascribed solely to the Bohemian divine, and for which he was condemned and burnt. It was Wycliffe's *De sufficientia legis Christi* that Huss carried with him to convert the council of Constance; of the fiery discourses now included in the published edition of Wycliffe's *Sermones* many were likewise long attributed to Huss. Finally, it was from the *De eucharistia* that the Taborites derived their doctrine of the Lord's Supper, with the exception of the granting of the chalice to the laity. To Huss, Luther and other continental reformers owed much, and thus the spirit of the English reformer had its influence on the reformed churches of Europe.

BIBLIOGRAPHY.—The documentary materials for Wycliffe's biography are to be found in John Lewis's *Life and Sufferings of J. Wiclif* (new ed., Oxford, 1820), which contains a valuable appendix; Foxe's *Acts and Monuments*, vol. iii., ed. 1855, with app.; Forshall and Madden's preface to the Wycliffe Bible, p. vii. note, Oxford, 1851; W. W. Shirley's edition of the *Fasciculi Zizaniorum*, a collection of contemporary documents (1858); and H. T. Riley's notices in the appendices to the *Second* and *Fourth Reports* of the Historical Manuscripts Commission. The narrative of a monk of St. Albans published under the title of *Chronicon Angliae*, by Sir E. Maunde Thompson (1874), and in a modified version in Walsingham's *Historia Anglicana* (ed. H. T. Riley, 1863, 1864). Knyghton's chronology in *De eventibus Angliae* is faulty (ed. J. R. Lumby, 1889–95). There are valuable notices in the *Eulogium historiarum* (vol. iii., ed. F. S. Haydon, 1863), in the *Chronicle* of Adam of Usk (ed. E. M. Thompson, 1876), and in the continuations of Higden. The controversial works of Wodeford and Walden are important, but must be used with caution.

Of modern biographies that by G. V. Lechler (*Johann von Wiclif und die Vorgeschichte der Reformation*, 2 vols., Leipzig, 1873; partial Eng. trans., by P. Lorimer, 1878, 1881 and 1884) is by far the most comprehensive. Shirley's introduction to the *Fasciculi Zizaniorum*, and F. D. Matthew's to his edition of *English Works of Wyclif hitherto unprinted* (1880), as well as Creighton's *History of the Papacy*, vol. i., 1882, and Sir H. C. Maxwell Lyte's account in his *History of the University of Oxford* (1886), contain valuable criticism. *See* also Mr. R. L. Poole, (*Illustrations of the History of Mediaeval Thought*, 1884); J. Loserth (*Hus und Wiclif*, Prague, 1884; also Eng. trans.). G. M. Trevelyan, *England in the Age of Wycliffe* (London, 1899); Oman, *History of England 1377–1485* (London, 1906); W. W. Capes, "History of the English Church in the 14th and 15th Centuries," in *Hist. of the Eng. Church*, ed. Stephen and Hunt (London, 1900); J. Loserth's article "Wiclif," in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1908), xxi., pp. 225–227; H. B. Workman, *John Wyclif* (1926).

Wycliffe's works are enumerated in a *Catalogue* by Shirley (Oxford, 1865). Of his Latin works only two had been published previous to 1880, the *De officio pastorali*, ed. G. V. Lechler (Leipzig, 1863) and the *Trialogus*, ed. Lechler (Oxford, 1869). Under the auspices of the Wyclif Society the following have been published.—*Polemical Tracts*, ed. R. Buddensieg (2 vols., 1883); *De civili dominio*, vol. i. ed. R. L. Poole, vols. ii.–iv., ed. J. Loserth (1885–1905); *De compositione hominis*, ed. R. Beer (1884); *De Ecclesia*, ed. Loserth (1886); *Dialogus sive speculum ecclesiae militantis*, ed. A. W. Pollard (1886); *Sermones*, ed. Loserth, vols. i.–iv. (1887–90); *De officio regis*, ed. A. W. Pollard and C. Sayle (1887); *De apostasia*, ed. M. Dziewicki (1889); *De dominio divino*, ed R. L. Poole (1890); *Quaestiones. De ente praedicamentali*, ed. R. Beer (1891); *De eucharistia tractatus major*, ed. Loserth (1893); *De blasphemia*, ed. Dziewicki (1894); *Logica* (3 vols., ed. Dziewicki, 1895–99); *Opus evangelicum*, ed. Loserth (4 vols., 1898), parts iii. and iv. also bear the title *De Antichristo; De Simonia*, ed. Herzberg-Fränkel and Dziewicki (1898); *De veritatae sacrae scripturae*, ed. R. Buddensieg (3 vols., 1905); *Miscellanea philosophica*, ed. Dziewicki (2 vols., 1905) (vol. i. has an introduction on Wycliffe's philosophy); *De potestate papae*, ed. Loserth (1907).

For his works in English see *Select English Works*, ed. T. Arnold (3 vols., 1869–71), and *English Works hitherto unprinted*, ed. F. D. Matthew (1880). *The Wicket* (Nuremberg, 1546; reprinted at Oxford, 1828) is not included in either of these collections. (R. L. P.; X.)

WYCOMBE (officially CHEPPING WYCOMBE, also CHIPPING or HIGH WYCOMBE), a town and municipal borough in Buckinghamshire, England, 26½ m. W. by N. of London by the G.W. railway. Pop. (1921) 21,952.

The principal industry is the making of cane- and rush-seated chairs and furniture.

There are various British remains including an encampment in the neighbourhood of Chipping Wycombe, but the traces of a Roman settlement are more important. There was evidently an important Roman station here and traces of the fortifications and many other remains have been found. In Domesday the manor only is mentioned. The last charter, which replaced several earlier ones from 1225 onward was granted by Charles II. in 1663.

See John Parker, *History and Antiquities of Wycombe* (1878).

WYE, a river of England, famous for beautiful scenery. It rises on the eastern slope of Plynlimmon, close to the source of the Severn, the estuary of which it joins after a widely divergent course. Its length is 130 m. Running at first south-east it passes Rhayader and receives the Elan, in the basin of which are the Birmingham reservoirs. It then receives the Ithon (left) and then passes Builth and Hay. The river, which rose at 2,000 ft., has now reached a level of 250 ft., 55 m. from its source. As it enters Herefordshire it bends east to reach the city of Hereford. It soon receives the Lugg, which, augmented by the Arrow and the Frome, joins from the north. The course of the Wye now becomes sinuous; and the valley narrows nearly to Chepstow. It passes Monmouth, where it receives the Monnow on the right, and finally Chepstow, 2 m. above its junction with the Severn estuary. The river is navigable for small vessels for 15 m. up from the mouth on high tides. The average spring tide is 38 ft. at Chepstow,

and the average neap tide is 28½ ft. The scenery is finest between Rhayader and Hay in the upper part, and from Goodrich, below Ross, to Chepstow in the lower, the second being the portion which gives the Wye its fame.

The name of Wye belongs also to two smaller English rivers—a tributary of the Derbyshire Derwent and a tributary of the Thames, watering a valley of the Chilterns.

WYMAN, JEFFRIES (1814–1874), American scientist, born in Chelmsford, Mass., Aug. 11, 1814. He graduated at Harvard in 1833, and in 1837 also received his medical degree there. He began medical practice in Boston and became a demonstrator of anatomy at Harvard, but in 1843 he went to Europe for a short period of study at London and Paris. Upon his return he was for four years professor of anatomy and physiology at Hampton-Sidney College, Richmond, Va., and was then recalled to Harvard as Hersey professor in anatomy. He began the task of building a museum of comparative anatomy at Harvard, one of the first in the United States, and travelled widely in search of specimens, his trips ranging along the Atlantic coast from Labrador to Florida, and including expeditions to Europe, to Guiana, and, notably, up the La Plata, Uruguay and Parana rivers and across the pampas and Andes to Santiago, Chile. In 1866 he was made a trustee of the museum of archaeology and professor of archaeology and ethnology on the George Peabody foundation. His scientific papers embrace a wide range of studies, including human, comparative and microscopic anatomy, physiology, paleontology and ethnology. Especially notable were his papers on "Observations on the Crania" (*Proc. of Boston Soc. of Nat. Hist.*, 1868), on the nervous system of the bullfrog and the changes undergone during metamorphosis (*Smithsonian Institution Contributions*, 1852), the first account of the osteology of the gorilla (*Memoirs, Boston Soc. of Nat. Hist.*, 1847), and "Unusual Methods of Gestation in Certain Fishes" (*Silliman's Journal*). He died at Cambridge, Mass., Sept. 4, 1874.

There is a memoir and complete bibliography of his writings in the *Biographical Memoirs, Nat. Acad. of Science*, vol. 2 (1886). His colleague, Oliver Wendell Holmes, wrote a biographical sketch in the *Atlantic Monthly* (Nov. 1874).

WYMONDHAM (pronounced *Windham*), town in Norfolk, England, 10 m. S.W. of Norwich by L.N.E.R. Pop. (1921) 4,814. The church of St. Mary the Virgin on the outskirts of the town was attached to a Benedictine priory, founded in the 12th century as a cell of St. Albans abbey by William de Albini. In 1448 this foundation became an abbey. The nave is Norman with a massive triforium, surmounted by a Perpendicular clerestory and a beautiful wooden roof. The broad north aisle is Perpendicular, and has also a fine rood screen. At the west end there is a Perpendicular tower. In the centre of the town is a half-timbered market cross (1616), with an octagonal upper chamber.

WYNAAD, highland tract, south India, forming part of Malabar district, Madras. It consists of a table-land amid the west Ghats, 60 m. long by 30 m. broad, with an average elevation of 3,000 feet. A large amount of British capital was sunk during the decade 1876–86 in gold mines in the district. It had still earlier been a coffee-planting district, but more tea is now grown. Cardamoms are also produced in large quantities.

WYNDHAM, SIR CHARLES (1837–1919), English actor, was born in Liverpool on March 23, 1837, the son of a doctor. He was educated abroad, at King's college, London, and at the College of Surgeons and the Peter street anatomical school, Dublin. Early in 1862 he made a first appearance in London as an actor. In that year he went to America, volunteered during the Civil War and became brigade surgeon in the Federal army, resigning in 1864 to appear on the stage in New York with John Wilkes Booth. Returning to England, he played at Manchester and Dublin in various pieces. He reappeared in London in 1866 as Sir Arthur Lascelles in Morton's *All that Glitters is not Gold*, but his great success at that time was in F. C. Burnand's burlesque of *Black-eyed Susan*, as Hatchett, "with dance." This brought him to the St. James's theatre, where he played with Henry Irving in *Idalia*; then with Ellen Terry in Charles Reade's *Double Marriage*, and Tom Taylor's *Still Waters Run Deep*. He had a great success as Charles Surface, his best part for many years. In 1876 he took control of the Criterion theatre. Here he produced a long succession of plays, notably a number of old English comedies, and among modern plays, *The Liars*, *The Case of Rebellious Susan* and others by Henry Arthur Jones; his most famous part was in *David Garrick*. In 1899 he opened his new theatre, called Wyndham's. In 1902 he was knighted. From 1885 onwards his leading actress was Miss Mary Moore (Mrs. Albery), who became his partner in the proprietorship of the Criterion and Wyndham's theatres, and of his New theatre, opened in 1903; and her delightful acting in comedy made their long association memorable on the London stage. Wyndham died in London on Jan. 12, 1919.

WYNDHAM, GEORGE (1863–1913), British politician and man of letters, was born Aug. 29, 1863, the eldest son of Percy Scawen Wyndham, and grandson of the first Lord Leconfield. His mother was Madeline Caroline Frances Eden, daughter of Sir Guy Campbell, bart., and through her he was great-grandson of Lord Edward Fitzgerald, the Irish rebel. He was educated at Eton and Sandhurst, obtained a commission in the Coldstream Guards in 1883, and served through the Suakin campaign of 1885. He left the army in 1887, married Sibell Mary, daughter of the 9th Earl of Scarborough, widow of Earl Grosvenor. He became private secretary to A. J. Balfour, at the time Irish Secretary, and in 1889 entered Parliament as Conservative member for Dover, a seat which he retained till his death.

After serving, from 1898–1900, as financial secretary to the war office, he was appointed in 1900 chief secretary for Ireland. His early work in Ireland met with general approval. He developed enormously the Conservative policy of land purchase; and the act which he carried in 1903 for that end was the most comprehensive measure of the kind ever submitted to Parliament. He hoped to arrange a form of local government which should sufficiently meet Nationalist demands, and with this in view appointed in 1902 an eminent Anglo-Indian, Sir Antony (afterwards Lord) MacDonnell to the under-secretaryship. The Unionist party, both in Ireland and in England, became suspicious of the tendencies of his administration, and he was driven in 1905 to resignation. He never held office again, but was active in support of tariff reform and woman suffrage; he was a keen critic of Haldane's army reforms, and threw himself vigorously into the "Diehard" campaign against the Parliament Bill in 1911.

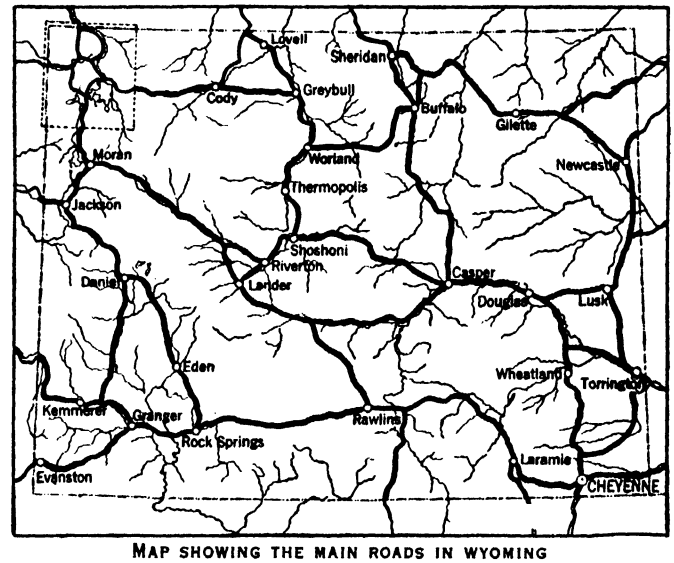
He was also a man of letters. Here his genius was stimulated by his friendship for W. E. Henley, who dedicated a book to "George Wyndham, soldier, courtier, scholar." His principal published work was an edition of *Shakespeare's Poems* (1898); but he wrote also on North's *Plutarch* and *Ronsard*. The Admirable Crichton of his day, handsome and debonair, he was keen alike on field sports and the arts, a working railway director and an efficient colonel of yeomanry, the pet of society and the recipient of honorary distinctions from several universities. On June 8, 1913, at the comparatively early age of 50, he died in Paris.

See his *Life and Letters*, ed. J. W. Mackail and Guy Wyndham (2 vols., 1925).

WYNDHAM, SIR WILLIAM, BART. (1687–1740), English politician, was the only son of Sir Edward Wyndham, Bart., and a grandson of William Wyndham (d. 1683) of Orchard Wyndham, Somerset, who was created a baronet in 1661. Educated at Eton and at Christ Church, Oxford, he entered parliament in 1710 and became secretary-at-war in the Tory ministry in 1712 and chancellor of the exchequer in 1713. He was closely associated with Lord Bolingbroke, and he was privy to the attempts made to bring about a Jacobite restoration on the death of Queen Anne; when these failed he was dismissed from office. In 1715 the failure of a Jacobite movement led to his imprisonment, but he was soon set at liberty. Under George I. Wyndham was the leader of the opposition in the House of Commons, fighting for his High Church and Tory principles against Sir Robert Walpole. He was in constant communication with the exiled Bolingbroke, and after 1723 the two were actively associated in abortive plans for the overthrow of Walpole. He died at Wells on June 17, 1740. Wyndham's first wife was Catherine, daughter of Charles Seymour, 6th duke of Somerset. By her he had two sons, Charles,

who became 2nd earl of Egremont in 1750, and Percy, who took the name of O'Brien and was created earl of Thomond in 1756.

The Wyndham Family.—Sir John Wyndham, a Norfolk man, was knighted after the battle of Stoke in 1487 and beheaded for high treason on May 2, 1502. He married Margaret, daughter of John Howard, duke of Norfolk, and his son Sir Thomas Wyndham (d. 1521), of Felbrigg, Norfolk, was vice-admiral of England under Henry VIII. By his first wife Sir Thomas was the father of Sir John Wyndham, who married Elizabeth, daughter of John Sydenham of Orchard, Somerset, and founded the Somerset branch of the family, and also of Sir Edmund Wyndham of Felbrigg, who was sheriff of Norfolk at the time of Robert Ket's rebellion. By his second wife Sir Thomas was the father of the seaman Thomas Wyndham (*c.* 1510–53), an account of whose voyage to Morocco in 1552 is printed in Hakluyt's *Voyages*.



The Wyndhams are also connected through a female line with the family of Wyndham-Quin, which holds the earldom of Dunraven. Valentine Richard Quin (1752–1824), of Adare, county Limerick, was created Baron Adare on the union with England in 1800, and earl of Dunraven and Mount-Earl in 1822. His son, the 2nd earl (1782–1850), married Caroline (d. 1870), daughter and heiress of Thomas Wyndham of Dunraven castle, Glamorganshire, and took the name of Wyndham-Quin. Their son, the 3rd earl (1812–71), who was created a peer of the United Kingdom as Baron Kenry in 1866, was a well-known man of science, especially interested in archaeology and in Celtic antiquities. His son, Windham Thomas Wyndham-Quin (1841–1926), the 4th earl, served in the Abyssinian campaign and the South African War. He was under-secretary for the Colonies in 1885–87, and was a great figure in Irish politics, as chairman of the Irish Land Conference (1902) and president of the Irish Reform Association; he was also prominent as a yachtsman, competing for the America's cup (*see* YACHTING) in 1893 and 1895. He died on June 14, 1926.

WYNTOUN, ANDREW OF (?1350–?1420), author of a long metrical history of Scotland, called the *Orygynale Cronykil of Scotland*, was a canon regular of St. Andrews, and prior of St. Serf's in Lochleven. He wrote the *Chronicle* at the request of his patron, Sir John of Wemyss, whose representative, Mr. Erskine Wemyss of Wemyss Castle, Fifeshire, possesses the oldest extant ms. of the work. The subject is the history of Scotland from the mythical period (hence the epithet "original") down to the accession of James I. in 1406. The earlier books are of no historical value, but the later have in all outstanding matters stood the test of comparison with contemporary records. The philological interest is great, for few works of this date, and no other of like magnitude, are extant in the vernacular.

The text is preserved in eight mss., of which three are in the British Museum, the Royal (17 D. xx.), the Cottonian (Nero D. xi.) and the Lansdowne (197); two in the Advocates' library, Edinburgh (19, 2, 3 and 19, 2, 4), one at Wemyss castle (*u.s.*); one in the university library at St Andrews, and one, formerly in the possession of the Boswells of Auchinleck, now the property of John Ferguson, Duns, Berwickshire. The first edition of the *Chronicle* (based on the Royal ms.) was published by David Macpherson in 1795; the second by David Laing, in the series of "Scottish Historians" (Edin., 1872). Both are superseded by the elaborate edition by Amours for the Scottish Text Society (1906).

WYOMING, popularly known as the "Equality" State because it was the pioneer in woman suffrage, is one of the central-western States of the United States of America, and is situated between 104° 3′ and 111° 3′ long. W. and 41° and 45° N. lat. It is bounded north by Montana, east by South Dakota and Nebraska, south by Colorado and Utah, and west by Utah, Idaho and Montana. Including Yellowstone park (area 3,114 sq.m.), Wyoming has an area of 97,548 sq.m. of which 366 sq.m. are water surface. Over Yellowstone park, however, the United States has exclusive jurisdiction and control. East and west the State has an extreme length of 367 m., and north and south an extreme breadth of 277 miles. In shape it is an exact rectangle. Its mean elevation is 6,700 ft. above sea-level and in this respect it is exceeded only by Colorado. The name "Wyoming," originally bestowed upon the Wyoming valley in Pennsylvania, is a corruption of a word of the Delaware Indians meaning "upon the great plain." It is not known who first applied it to the State.

Physical Features.—The great plains in Wyoming have an elevation of from 5,000 to 6,000 ft. over much of the State, and consist of flat or gently rolling country, barren of tree growth, but often covered with nutritious grasses, and possessing a soil rich in the mineral elements necessary for plant life which it produces abundantly when it receives sufficient moisture. Erosion buttes

MAP SHOWING THE MAIN ROADS IN WYOMING

and mesas occasionally rise as picturesque monuments above the general level of the plains, and in the vicinity of the mountains the plains strata, elsewhere nearly horizontal, are bent sharply upward and carved by erosion into "hogback" ridges. These features are well developed about the Big Horn mountains, an outlying range of the Rockies which boldly interrupts the continuity of the plains in north-central Wyoming.

Notwithstanding high elevations in both the northern and southern portions of the State, the low central portion makes a distinct break in the continuity of the northern and southern ranges of the Rockies, giving a broad relatively low pass through which went the Oregon and Overland trails in the early days and later the Union Pacific railway. In this central region the plains are interrupted by minor mountain groups, volcanic buttes and lava flows. In the north-east are outlying spurs of the Black hills, the Little Missouri buttes and the Devil's Tower, the latter a prominent erosion remnant of volcanic intrusion. The higher levels of the Big Horn range have been modified by local glaciation, giving glacial cirques, alpine peaks and many mountain lakes and waterfalls. Several small glaciers still remain about the shoulders of Cloud Peak (13,165 ft.), the highest summit in the range. The various ranges in the north-western part of the State form some of its most magnificent scenery. A vast portion of this has been set aside as Yellowstone National park, but areas in the Absarokas east of the park are also considered beautiful. Just south of the park, the Teton mountains rise abruptly from Jackson's Hole to elevations of 10,000 and 11,000 feet. They are an imposing landmark and were hailed by all emigrants of the Oregon Trail as a welcome sign that they were approaching Pacific waters. In the famous Wind River Range farther south-east are Gannett Peak (13,785 ft.), the highest point in the State, and Fremont Peak (13,720 ft.).

In addition to the hot springs of the Yellowstone region, mention should be made of large hot springs (about 135° F) at Thermopolis and Saratoga.

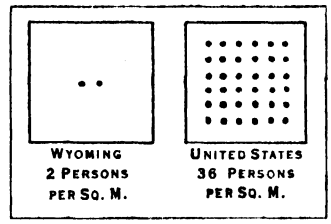
Drainage.—About two-thirds of the State is drained by branches of the Missouri river, the most important being the Yellowstone, Big Horn and Powder rivers flowing north and the Cheyenne and North Platte flowing east. The Green river, a branch of the Colorado drains the south-western part of the State. The Snake river, flowing into the Columbia, heads in the southern part of Yellowstone park and flows south-west through the beauti-

ful valley known as Jackson's Hole into Idaho. Along the western border the Bear river takes its course a short distance, draining ultimately into the Great basin. South-west of the centre of the State is an area with no outward drainage, the streams emptying into desert lakes.

Wild Life.—Wyoming still abounds in wild life and game animals, the game animals increasing according to the State game and fish commissioner, despite the fact that more non-resident game and fishing licenses were sold in 1924–25 for Wyoming than for any other State. The game census of 1926 estimates 4,900 moose, 44,720 wapiti ("elk"), 3,130 mountain sheep, 21,885 antelopes, 28,050 deer, 2,145 bears. About 8,000,000 fingerlings and fry were planted in 1926 in Wyoming waters by the fish hatcheries of the State.

Climate.—It is difficult to generalize about Wyoming's climate, since the varied and rugged topography makes corresponding local variations. Precipitation for the State averages 13·89 in. annually, but it varies from about 6 in. in the lower Big Horn basin, Sweetwater county and lower Wind river valley, the driest portions, to 35 in. in the mountains bordering on Yellowstone park. In the agricultural region of the south-eastern counties the average annual rainfall is 15·20 in. East of the continental divide about 70% of the precipitation occurs between April and September. The cool summer months of the mountain regions lower the average temperature of the State materially. The annual mean for the valleys is 46° F and for the mountains 36°. The average of 85 stations, well distributed over the State, gives a day average for July of 81° and a night average of 47°. Day temperature for January average 32° and night 7°. The portion of the State west of the divide has a lower average and longer winters than that east of the divide. The cold spells are not severe for their chilling effect is modified by the normally low humidity.

Government.—Wyoming is governed still by its first Constitution, adopted by the people in 1889, and made effective when the State entered the Union, July 10, 1890.



The legislature is composed of a senate and a house of representatives. Each county elects one senator for each 9,000 inhabitants or major portion thereof, and one representative for every 3,250 inhabitants or major portion thereof, though each county has a right to one senator and representative, regardless of its population. New apportionments are made after each Federal and State census, the State census occurring in every year that ends with a five. In 1926 there were 27 senators and 62 representatives. The regular sessions of the legislature meet in Cheyenne on the second Tuesday in January every odd-numbered year and may continue 40 days. The governor has the power to veto any bill, but if upon reconsideration it is repassed by a two-thirds majority in each house it becomes a law without the governor's signature. The governor may veto any item in the appropriations bill. Special laws are not to be passed where a general one may be made applicable.

The chief executive officer is the governor. There are only four other elective executive officers, the secretary of State, auditor, treasurer and superintendent of public instruction. These men not only direct their own departments but some, together with appointed officers, act on many executive boards, such as the State board of charities and reform, State land commission, State fiscal board, State board of pardons, State farm loan board, State board of supplies, State historical board, etc. An unusually large number of the executive officers are appointed by the governor and are responsible to him. Among them are a State examiner, a State engineer, two inspectors of coal mines, a State geologist, the attorney-general, four water superintendents for the four irrigation districts of the State, three live stock commissioners and three sheep commissioners, five members of the State highway commission, three members of the board of equalization, State land commissioner, five members of the State board of health, the members of the board of agriculture, the commissioner of law enforcement, and the commissioner of labour and statistics, etc.

The supreme court of Wyoming has three justices who are elected by the voters for a term of eight years. Two terms of supreme court are held annually, one in April and the other in October. A special term can be held when two justices so vote. There are eight district courts. A regular term is held yearly in each, and special terms may be called in any district by the presiding judge. Each of the eight district judges is elected by his district for a six-year term. The counties are also divided by the county commissioner into judicial districts for which the voters of the district elect a justice of the peace. Incorporated towns and cities have municipal courts and police justices.

Every citizen of the United States over 21 years of age who has lived in Wyoming one year and in the county where he is to vote 60 days and in the election district ten days, who can read the Constitution of the State, and who is not insane, an idiot or a person convicted of infamous crimes (unless restored to his civil rights) has the right of suffrage.

Population.—The population of Wyoming in 1870 was 9,118; in 1880, 20,789; in 1890, 60,705; in 1900, 92,531; in 1910, 145,565; in 1920, 194,402 and in 1925, according to a State census, 206,381. The 1925 census figures, taken by the assessors on their ordinary round, were regarded by State officials as low. Data based on election returns and the school census indicated about 225,000. The estimate of the U.S. census bureau for July 1927 was 241,000. The 1925 census showed an increase of 20,466 or more than 100%, in Natrona county, the increase being due to great activity in the Salt Creek and Teapot Dome oil districts. Increases were registered in but five other counties, the remainder showing a decrease. Natrona now leads all counties with a population almost double that of Laramie county, the next in rank.

DENSITY OF POPULATION, 1920, COMPARED WITH AVERAGE FOR THE UNITED STATES

The density of population was 0·9 per square mile in 1900, 1·5 in 1910 and 2·0 in 1920. This was lower than that of any other State except Nevada. Of the 1920 population 97·8% was white. According to the 1925 census there were then 991 Japanese, 969 negroes and 169 Chinese in the State. In 1926 the Indians numbered 1,899 (1,182 of them full blood), 947 belonging to the Arapahoe and 952 to the Shoshone tribes. Most of them were settled in Fremont county upon the site of the former Shoshone reservation (thrown open to settlement in 1906).

In 1920, 25,225 or 13·3% of the population was foreign born. Of these 5,193 were from the United Kingdom and Ireland; 3,629 from Scandinavian countries; 2,292 from Germany; 1,482 from Russia, while other countries were represented with less than 1,200 each. Of the 86·7% native born, 13·3% was born of foreign parentage, 8·8% of mixed parentage and 64·6% of native parentage. According to the 1925 census 59,655 were born within the State of Wyoming. In 1910 3·3% of the population was illiterate, in 1920 but 2·1%. Among native whites illiteracy amounted to 0·3% only, but among the foreign born it rose to 9·0%.

There were 57,341 urban and 137,054 rural inhabitants in 1920. The percentage of urban dwellers was 29·6 in 1910 and 29·5 in 1920. The population of the six leading cities for 1910, 1920 and 1925 was: Casper, 2,639, 11,447, 23,288; Cheyenne, 11,320, 13,829, 13,202; Laramie, 8,237, 6,301, 9,629; Sheridan, 8,408, 9,175, 8,436; Rock Springs, 5,778, 6,456, 6,875; Rawlins, 4,256, 3,969, 5,587.

Finance.—The assessed valuation of taxable property in Wyoming in 1919 was $375,239,158, and in 1926 $457,760,169, an increase of 22%. A great part of the increase was accounted for by the rise in value of corporate property from $97,021,145 to $154,246,212 in these years. The value of land and live stock, on the other hand, declined. On the 1926 valuation a total of $18,997,505 in taxes was levied, distributed as follows: general property tax for State purposes, $3,289,387; for county purposes, $5,181,166; for school purposes, $7,355,786; and, for municipal purposes, $3,171,854. The increase in direct taxation in the biennium 1925–26 over 1921–22 is $1,227,547. The State was responsible for 9·4% of the increase, the counties for 44·3% and the municipalities for 46·6%. A large increase in oil royalties, 50%

of which is distributed to the schools, made possible a decrease in direct taxation for that purpose.

Direct taxation contributed but $3,090,507 of the State's total income of $28,545,533 for the biennium 1925–26. The sales or rentals of land furnished $4,956,056, the interest from land funds $904,546, and royalties on the production of oil and other minerals $5,740,947. The remainder came from the receipts of various State departments and institutions. Total disbursements of the State for the same biennium amounted to $27,345,333. The State highway fund received $5,782,650, while $104,500 more was used for the highway bond tax fund. The State university received $733,246 for its general fund and $615,349 for its building fund. The general fund, used for administration expenses, received $2,637,410.

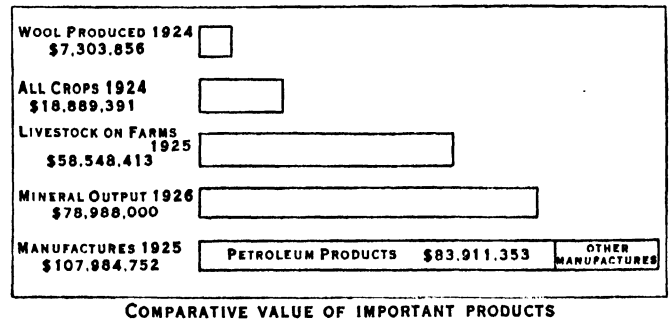
The bonded debt of Wyoming in Sept. 1926, was $1,919,000, all except $19,000 being highway bonds. Bonds to the value of $1,000,000 had been taken up and paid in the 1925–26 biennium.

The value of all tangible property in 1922 was $976,000,000 as compared with $356,000,000 in 1912. The *per caput* ownership amounted to $4,663. There were 96 banks (32 of them national banks) on June 30, 1925, with capital and surplus of $7,808,000, total resources and liabilities of $66,495,000 and savings deposits of $20,879,000.

Education.—The department of education, which administers the public school system of Wyoming, is composed of the superintendent of public instruction and six members, appointed by him, who serve for six years and without salary. To carry into effect their plans and decisions the department appoints, with the governor's approval, a commission of education upon which the actual work of travelling, inspection and correspondence falls.

The total school attendance in 1925–26 was 50,138 out of a school census population of 63,074. There were 13,310 pupils in 1,222 rural schools. A determined effort to improve these schools is being made by encouraging them to conform to certain standards set by the department of education. In 1926, 220 of the 1,200 were standardized as compared with 16 in 1920. Nearly half of the rural enrolment was brought to school in buses in 1926.

There were 78 accredited high schools in 1926. High school students numbered 9,664 as compared with 3,063 in 1916. Most of this increase has been made possible by the establishment of high schools in portions of the State hitherto unserved. Because of sparse population many large sections cannot afford a four-year course, so the junior high school movement is making much progress, and standards are being set by the department of education to which they must conform.



Wyoming holds the enviable position of securing a larger proportion of its school support from non-taxation sources than any other State in the Union. In 1925 this proportion amounted to 46·6%. Like many other Western States it received, upon its admission to the Union, a grant from the Federal Government of one-sixteenth of the land within its borders for school purposes. Income from the sale of this land is to be held in a permanent school fund, only the interest of which can be used, with any proceeds which may come from leasing the land. Royalties from oil, coal and other minerals on these lands also go into this fund; and in addition 5% of all receipts for Federal lands sold within Wyoming's borders. This permanent fund increased from $3,153,516 in 1920 to $14,503,648 in 1926, and its income available for use in the latter year was $836,746. When oil and other minerals are obtained from Federal lands within the State, the U.S. Government pays to Wyoming certain royalties on such minerals, 50% of which is distributed to the schools. It is especially the increasing royalty on oil which is making a decrease in the amount secured by direct taxation possible. Government royalties amounted to $1,479,488 in 1926. Of the amount secured for education through direct taxation $2,295,873 was derived from local district and poll taxes and $926,968 from county taxes.

School expenditures in 1925–26 totalled $8,397,353, of which $3,691,289 was for the salaries of 1,412 rural teachers, 913 elementary teachers in town schools and 520 high school teachers. The sum of $301,000 was spent for transportation of pupils on about 300 bus routes.

The University of Wyoming is in Laramie. In 1925–26 there were 1,185 students at the regular session and 1,500 at the several summer sessions. The budget for 1925–26 totalled $1,026,563, of which $524,929 was for operating expenses, and $309,703 for the university improvement fund. There is a $\frac{1}{8}$ mill tax for the regular State university fund, and a $\frac{1}{8}$ mill tax for the university building improvement fund. Most of the buildings are comparatively new. In 1923 a new library was completed and in 1926 a new engineering building. The library contains 58,000 volumes, exclusive of pamphlets. The "Rocky Mountain Herbarium," the largest and most representative collection of plants of the central Rocky region, is also to be found at the university.

Penal and Charitable Institutions.—The Wyoming State penitentiary is at Rawlins, and in 1926 had 256 inmates. A dairy and poultry farm, an excellent garden, and a shirt factory which earned $88,000 in the biennium 1924–26, furnish occupation for the prisoners and pay the major share of the expenses. The State hospital for the insane is at Evanston and, in the biennium 1924–26, it had an average of 360 patients in its wards constantly. This was 33 more than the previous biennium, and 77 more than in the biennium ending in 1922. A $100,000 building was erected in 1926 for the 70 female patients. The Soldiers and Sailors' Home with 28 inmates in 1926 is at Buffalo. There is a State training school for feeble-minded children at Lander with an enrolment of 187 in 1926. The Industrial Institute for delinquent boys is at Worland (1926 enrolment, 81), and that for girls is at Sheridan (1926 enrolment, 24). At Rock Springs there is a General State hospital providing medical care and surgical attention for the public, and in connection with which a nurses' training school is maintained. Big Horn hot springs and Saratoga hot springs are owned by the State and are free for public use. Appropriations were made and the contracts let in 1926 for the first building of a State tuberculosis sanitarium at Basin. All these institutions are under the supervision of the State board of charities and reform, composed of the governor, secretary of State, treasurer, auditor and State superintendent of public instruction. These officials also constitute the board of pardons. Besides the State institutions there are the Cathedral home for children at Laramie and the Wyoming children's home, private institutions which operate under annual permits from the State board to which they are responsible. The deaf and blind are cared for at State expense in schools of the neighbouring States.

Agriculture.—Of the 62,460,160 ac. land area of Wyoming 21,209,703 ac. were privately owned in 1926. Homesteads still unperfected totalled 4,778,289 ac. more. National forests included 8,505,740 acres. Government withdrawals of oil, coal and phosphate lands amounted to 5,041,631 acres. There were 19,849,762 ac. still unappropriated for any purpose, and, in addition, 3,559,258 ac. of school or granted lands remained unsold. Live stock and

COMPARATIVE VALUE OF IMPORTANT PRODUCTS

land values reached their peak in 1919; then agriculture suffered severe depression from which it had not wholly recovered in 1926. In 1919 there were 1,066,838 head of cattle valued at $42,376,220. By 1926 cattle had decreased 461,737 in number, or 45%, and $30,422,863 in value or 72%. Sheep in 1919 numbered 2,719,249 head and were valued at $22,406,925. In 1926 there were 1,982,965 head valued at $15,480,488. The sheep industry recovered somewhat in 1924 due to a sharp rise in wool prices, and since has been profitable enough to encourage steady expansion. In 1919 there were 12,321,421 ac. of taxable land valued at

$95,115,035. By 1926 the taxable land had increased 7,906,608 ac., but the value increased only $8,739,454. This meant that the average value per acre had dropped from $7.71 to $5.13. The State board of equalization gives the following average land values for 1926: irrigated cultivated land, $46.47; irrigated uncultivated land, $24.68; dry farmed, $9.31; grazing, $3.05. These values are slightly lower than those for 1925. Despite the increased acreage of taxable land the number of farms decreased from 15,748 in 1920 to 15,512 in 1925. What actually happened was that the average size of farms increased from 750 to 1,203 acres. Between 1921 and 1926 irrigated lands under cultivation increased from 482,262 ac. to 485,468 ac., showing that they were holding their own. Dry farm lands, however, decreased from 1,059,273 to 805,677, while grazing lands increased from 12,405,115 to 19,277,090 ac., showing that the extra acreage per farm was used for grazing purposes. The valuation of all farm property in 1926 was $240,396,373 and the average valuation per farm $15,497 as compared with $21,235 in 1920. Farm population decreased from 67,306 in 1920 to 61,181 in 1925.

Crop Production.—The total value of all crops in Wyoming, was, in 1924, $31,398,000; in 1925, $26,876,000; in 1926, $30,444,000. Hay is the leading crop, both in acreage and value, 1,054,000 ac. in 1926 yielding 1,698,000 tons valued at $14,433,000. There were 408,000 ac. of alfalfa, the leading variety of hay cultivated, producing 2.2 tons per acre. Wheat is second in value, 180,000 ac. in 1926 yielding 3,378,000 bu. valued at $3,614,000. Indian corn increased from 11,000 ac. in 1910 to 86,000 ac. in 1920 and 197,000 ac. in 1926. Its acreage in 1926 actually surpassed the wheat acreage but was below it in value, which was $2,837,000. Goshen, Laramie, Platte, Campbell and Crook, in order, were the leading corn-growing counties. Oats to the amount of 4,690,000 bu., valued at $2,110,000, were produced in 134,000 ac. in 1926. Potatoes valued at $1,820,000 were raised on 13,000 ac., the yield being 140 bu. per acre. The production of sugar beet increased from 250,000 tons in 1924 to 300,000 tons in 1925 and 382,000 tons in 1926. Their sugar content, 15.20% in 1926, is unusually high. Barley, rye and beans were grown in 1926 to a value of $500,000 to $800,000 each. About 50,000 bu. of apples also were produced, valued at $69,000.

Live Stock.—In 1926, 7,786 carloads of cattle, 4,931 carloads of sheep and 595 carloads of pigs were shipped from the State. The tendency to ship live stock east to the corn belts for fattening is decreasing, and more of the feeding is done at home. Such feeding is increasing with the development of western markets, more and more of Wyoming's live stock each year being shipped to the west. Wyoming has long ranked among the leading States in wool production, her output reaching 38,400,000 lb. in 1910. In 1920 and 1921 she held first place among the States, third in 1922, 1923 and 1924, second in 1925 and third in 1926, according to the preliminary estimate. The yield in 1925 was 21,362,000 lb., in 1926 it was estimated at 22,338,000 lb. Because of the cool nights Wyoming sheep have heavy fleeces, those in 1926 averaging 8.5 lb. as compared with 7.8 lb. for the United States as a whole.

Dairying.—Dairying is steadily increasing, the total value of dairy products marketed April, 1925, to April, 1926, being $4,645,431. Chickens in 1925 were valued at $602,737 and turkeys at $780,480. The turkeys especially have seen a phenomenal increase from 9,000 valued at $25,000 in 1925 to 181,474 valued at $943,664 in 1926. Bee colonies increased from about 24,700 in 1925 to 29,700 colonies in 1926. Honey yields per colony in Wyoming are very high, averaging 107 lb. in 1923 and 95 lb. in 1924 as compared with 39.1 lb. and 46.2 lb. for the United States as a whole in these years.

Mining.—Wyoming's most important mineral resources, coal, petroleum and phosphate, are of the bulky sort and their development was long retarded by inadequate transportation facilities. The value of all mineral products in 1909 was $10,572,188; in 1919, $41,928,788; in 1924, $75,494,166 and in 1925, $78,754,915. During these latter years mining rose to the leading place among Wyoming industries.

Foremost in value is petroleum. Capt. Bonneville reported oil springs near Lander as early as 1832. Oil from such springs was used by the early trappers as liniment, and by the overland emigrants for wagon grease. In 1883 and 1884 the first three wells were drilled near Lander, but lack of transportation facilities made it impossible to market the product on a paying basis. Not until production leaped from 187,000 bbl. in 1911 to 1,572,000 bbl. in 1912 did Wyoming become an important oil-producing State. From 1912 to 1916 the rate of increase was about 1,000,000 bbl. annually. By 1920 production amounted to 16,831,000 bbl.; by 1921 to 19,333,000 barrels. Due to intensive developments in the Salt Creek district production leaped again from 26,715,000 bbl. in 1922 to 44,785,000 bbl. in 1923. The 1924 production was 39,498,000 bbl.; in 1925, 29,173,000 bbl., and in 1926 24,558,000 barrels. The value of this output during the years 1923, 1924, 1925 and 1926 was respectively $48,900,000, $48,600,000, $51,467,000 and $49,300,000. Of the 1925 production 21,481,390 bbl. came from the Salt Creek district 40 m. north of Casper. Lost Soldier, Rock Creek, Grass Creek and Big Muddy, the next most important districts, were producing between 1,000,000 and 2,000,000 bbl. each. The construction of a pipe-line in 1924 from the Salt Creek and Teapot Dome fields across Nebraska and Kansas to Freeman, Mo., a distance of 700 m., enabled the petroleum from Wyoming to enter into competition with oil from the mid-continent fields. The development of its petroleum resources kept Wyoming in a fairly prosperous condition during the years immediately following the World War when depression was so general in other industries. Royalties contributed millions of dollars to the State treasury, thereby lessening the taxation burden throughout the State. Oil fields and oil towns furnished a good market for labour and for agricultural produce. In its petroleum output Wyoming in 1926 ranked fifth among the States. The U.S. geological survey estimates its petroleum resources to be 553,000,000 bbl. valued at $1,107,000,000. In addition, its oil shale deposits are estimated to contain 20,000,000,000 bbl. worth $40,000,000,000. This last reserve is only beginning to be developed, the first plant for the treatment of oil shale being erected in 1925. In addition to petroleum proper, 45,539,000,000 cu.ft. of natural gas valued at $4,149,000 was produced in 1925, and 32,777,000 gal. of natural gas gasolene valued at $3,227,000.

Next to petroleum, coal is the most important mineral in the State. Coal-bearing formations underlie about 60% of its area. The largest area known to contain workable coal lies east of the Big Horn mountains and extends from Douglas northward to the boundary, an area of 15,000 sq. miles. Coal mining, however, is carried on in every county of the State, the largest production at present being from the mines of the Union Pacific railway near Rock Springs. The coal is all of the bituminous or sub-bituminous variety. The U.S. geological survey estimates Wyoming to contain over 1,076,000,000,000 tons of coal valued at $107,000,000,000. This amounts to about one-seventh of the coal resources of the nation. The output of the coal-mines rose from 5,971,000 short tons in 1922 to 7,575,031 short tons in 1923. In 1924 production was 6,757,468 short tons; in 1926 it was 6,968,000 short tons. The value of the 1924 output was $18,327,000 and of the 1925 output $18,275,000.

The copper output, valued at $642,213 in 1916 and $553,605 in 1917, mostly from the Encampment district, was worth only $16,358 in 1923. Gold production also had then become almost negligible though there were signs of renewed activity in the Sweetwater district in 1925. In 1926 the Colorado Iron and Fuel company produced 548,376 tons of iron ore valued at $1,392,877, a revival of the mining of a mineral in which Wyoming is comparatively rich. In 1924 gypsum to the value of $190,344, building stone to the value of $354,000, sand and gravel worth $173,886, and clay products valued at $126,606 were also produced.

Forests and Lumber.—There are 11 national forests in Wyoming with a total area of 8,500,101 ac. and a timber stand estimated at 14,596,058 thousand board feet. These forests are all high up in the back country, rugged and remote. About 60% of the timber stand is lodge-pole pine, used mostly for railroad ties. The next most abundant varieties are the Englemann spruce and Alpine fir, which displace the lodge-pole pine at between 8,000 and 9,000 ft. above sea-level. In addition to these main types,

there are the Douglas fir and limber pine, both restricted in their distribution to favoured localities, the Douglas fir between the lodge-pole-spruce line, especially on moist north slopes, and the limber pine on exposed rocky sites rising toward the timber line, where it usually takes the frontier stand. The timber cut in 1919 was 25,876,000 board feet, in 1921, 40,494,000 board feet, in 1926, 41,049,000 board feet. There is very little cut except on the national forests where it is supervised by the forest rangers. The forests also pastured 125,000 head of cattle and horses, and 575,000 head of sheep for the farmers and ranchers living in the valleys below.

Manufactures.—Except for petroleum refining, manufactures are of little importance in Wyoming, most of them being local in character and dependent on local products for their raw material. In 1925 there were 224 establishments, employing 6,333 workers, paying $10,526,253 in wages, and producing products valued at $107,984,752, of which $31,911,403 was added by manufacture. Of the total value of products $83,911,353 was the output of 15 oil refineries employing 2,214 men. Railroad repair shops employed a slightly greater number of men, though the value of their products was but $7,312,069 because the value of their raw material was much less. There were three sugar beet factories producing products valued at $3,679,778. Lumber and timber products of 14 mills were worth $1,573,020, meat products of four packing plants, $1,284,226.

Transportation.—Wyoming was fortunate in being in the path of the Union Pacific, the first transcontinental railway, which crossed it in 1869. Branches, however, were slow in building, and they are still few, the aim of most railways being to reach Pacific coast connections rather than local development. This handicap has been offset somewhat by good roads and the use of motor vehicles. There were 1,992 m. of railway in the State in 1926, the Chicago, Burlington and Quincy system leading with 686 m., the Union Pacific following with 537 miles. The total valuation of the railroad mileage within the State was $86,672,691 in 1926. The 1925 payroll for railway employees amounted to $14,798,799.

Highways.—In 1926 there were 46,319 m. of highway in Wyoming, of which 7% or 3,136 m. belonged to the State highway system which touched 59 of the 73 incorporated towns in the State. Construction work on the State system was begun in 1917, and by 1927 48·5% of the State highway mileage had been completed to a gravel surface standard. The 1927 legislature made available sufficient revenue to complete the remaining 51·5% within the ensuing ten years. One-half of the highway fund comes from the Federal Government, the State matching the Federal appropriation with its own. The State highway income consists of 38% of the oil and mineral royalties, the fees for licences, and a tax of 3¢ a gallon on gasolene. There were 45,547 passenger automobiles and 5,733 motor trucks in 1926.

HISTORY

Wyoming contains land from all four of the principal annexations which made up the territory of the United States west of the Mississippi river. Except for a small portion in Carbon and Albany counties, the land east of the continental divide was acquired from France by the Louisiana Purchase of 1803. The remaining portion formed the northern tip of the Texas annexation in 1854. The north-western corner of the State, drained by the Snake river into the Columbia, formed a part of the old "Oregon Country," held jointly by the United States and Great Britain until the British relinquished their claims in the treaty of 1846. The portion of the State drained south-west into the Colorado river or into the Great Basin was secured by the Mexican cession of 1848.

Exploration.—There are legends of Spanish exploration of Wyoming, but so far they are unconfirmed by documentary evidence. Verendrye, a French explorer, coming overland from the Saskatchewan river, may also have reached the State's borders in 1743, but the vagueness of his journals makes it impossible to determine the fact with certainty. John Colter, a member of the Lewis and Clark expedition who left that body on their homeward trip and plunged back into the wilderness as a free trapper, is the first white man known definitely to have entered the State. Doubtless there were similar wanderers before him whose tales are forever lost. Colter trapped to the east and south of Yellowstone park, and finally, in 1807, crossed that wonderland itself and brought to the world the first news of its strange phenomena. Four years later an expedition of more than 50 men, commanded by Wilson Price Hunt and bound overland to the mouth of the Columbia to begin the American fur trade in that region, entered north-eastern Wyoming, proceeded south and west around the Big Horn mountains, up the Big Horn and Wind rivers, across the divide by Sherman pass, and on by the Snake river valley into Idaho. In 1812 several of the same party, led by Robert Stuart, returned over a more southern route, discovering, it seems almost certain, the famous South pass, through which the Oregon and California trails were later to pass, and exploring for the first time the valleys of the Sweetwater and Platte rivers.

Period of Trappers and Traders.—In the following years a number of free trappers and employees of the various St. Louis fur companies trapped in eastern Wyoming but not until the spring of 1824 was the continental divide again crossed, this time by Thomas Fitzpatrick, leading a detachment of William Henry Ashley's fur traders across to new grounds. Fitzpatrick is usually given the credit for the discovery of South pass, and was the first to make it known. After 1824 several hundred traders crossed it each year, the annual rendezvous of the Americans being held on the other side of the divide, either in the valley of the Green river or in Jackson's Hole. The rendezvous was a colourful frontier gathering of Indians, fur traders and company employees for the purpose of meeting the pack trains of the company and exchanging the furs for next year's supplies. Hundreds of tents and tepees would dot the river bottoms during the frontier's one great social event. In 1834 Ft. Laramie was built by the traders at the confluence of the Laramie and North Platte rivers in eastern Wyoming, and it served as a centre for the fur trade until 1849 when the U.S. Government purchased it to use as a military post for the protection of emigrants.

Overland Emigration through Wyoming began in 1842 when Fitzpatrick piloted the first train over the Oregon trail. Movements increased steadily during the next few years, and in 1847 they were swelled by the Mormon emigration which followed the Oregon trail over the pass and then branched south-west past Ft. Bridger, built by James Bridger on Black's Fork.

The first rush to California came in 1849, the "Forty-niners" following the Oregon trail through Wyoming, and branching south-west after they entered Idaho. The first stage-coach line, over this route, a monthly service to Salt Lake City, started in 1851. In 1858 a daily line from Atchison to San Francisco was travelling the trail. In 1860 the famous Pony Express was established. In 1861 the first telegraph line to the Pacific was constructed across Wyoming along this route.

Indian Hostilities.—In 1862, however, Shoshone and Sioux depredations were so constant that it became necessary to move the stage line to a southern route nearly parallel with the present Union Pacific railway. Government troops were detailed to protect the stage stations, emigrant trains and freighting trains. Indian hostilities increased in 1863, 1864 and 1865 and came to a climax in 1866, known as "the bloody year on the plains." That year Government troops were constantly on the move, and there were numerous engagements in which many soldiers were lost. In attempting to keep open the Bozeman road, a cut-off from Ft. Laramie to the gold mines of Montana, Col. Fetterman and his entire company of 80 men were surprised and massacred. War with the Sioux continued until peace was made in 1868 with their chief, Red Cloud.

Permanent Settlement.—The Union Pacific railway commenced to build across the State in 1867 and pushed rapidly forward. Cheyenne and Laramie were founded at this time. In order to protect and govern new settlements along the railway the Territory of Wyoming was organized in 1868, though territorial officials were not appointed until 1869. At the first territorial legislature, held in Cheyenne in Dec., 1869, women of Wyoming were given the right to vote at all elections. This right

was confirmed by an equal suffrage clause in the State Constitution drawn up in 1889. Wyoming was the pioneer State of the United States, and perhaps of the world, to grant woman suffrage. Gold discoveries in the South pass region in 1867 and 1868 brought additional settlers to the new territory. The first land office was opened in Cheyenne in 1870 and the first homestead entry completed in 1871.

Rise of Cattle Industry.—But Wyoming did not at first prove attractive to homesteaders except in the best valleys along the Union Pacific. Instead it was discovered that the bunch and buffalo grass of the plains made excellent feed for cattle. Not only did they fatten on it in the summer, but the thick ripe bunches, retaining all their nutritious food elements, penetrated the thin snows of the wind-swept plains, enabling the herds to live and thrive all winter without extra food or care. Also cattle could be grazed at a distance from the railroad and when ready for market transported themselves. Soon great herds were on the way north from the overstocked ranges of Texas, cowboys driving them up the "long trail" to the tune of:

> Whoopee ti yi yo, git along little dogies,
> For you know Wyoming will be your new home,

and other trail songs. By the late '70s the ranges of Wyoming were well stocked. Herds increased rapidly and almost without expense. Only a "home ranch" for headquarters was necessary, and the herds ranged far and wide on the public domain. Once or twice a year they were rounded up, the calves branded, and the steers for market cut out from the herd and started on the "drive." The cattle industry sprang suddenly into full bloom in Wyoming and declined almost as suddenly because the cattlemen overreached themselves. The ranges were so overstocked that there was no longer grass left for winter feeding. Thousands upon thousands of cattle perished during severe and long-continued storms of the winters of 1886, 1887 and 1888 so that many "cattle barons" were financially ruined while others were left with only a shadow of their former herds. Disease also broke out among the herds and brought down the market price to less than one-half what it had been.

Cattle War of 1892.—Finally railroads, long blocked by Indian troubles, now pushed forward again, breaking up the ranges, and bringing in the settlers. Stockmen were long bitter against these "nesters." True, stockmen did not own the range, but they had been there first, and most of them would have purchased their lands had not the homestead law forbidden them to do so. Besides, the stockmen felt the land was fit in many districts only for grazing. They were not only inhospitable to the settlers but in many instances took active measures to drive them out of the country. A movement of this sort was the famous Johnson county cattle war of 1892 when more than 50 armed men entered Johnson county in a body against the settlers and small cattle owners, some of whom they branded as "rustlers," while the settlers organized to resist them. Only two lives were sacrificed, owing to the intervention of troops from Ft. McKinney at a decisive moment. It was one of the last struggles of the industry to keep its prestige. After that many big owners were forced out of business, and the country divided up among men with smaller outfits, who took no chances, but cut the hay in the bottom lands for winter feed. Thus began that combination of farming and stock-raising which still prevails and seems best fitted for the State.

Rise of Sheep Raising.—With decline of cattle-raising, sheep-raising began to increase. The first large herds reached the State in the latter '80s. A long feud was also waged between the cattlemen and the sheepmen, for the sheepmen tried to force their way into ranges already occupied. Cattlemen claimed that cattle would not go where sheep had grazed, and that the sheep destroyed the range and polluted the water-holes. An imaginary "deadline" was drawn by the cattlemen beyond which sheep must not go. Herders violated this arbitrary law at their own peril, for the annals of Wyoming record many cases where camps were burned and herds and herders both killed. As the sheepmen grew stronger these persecutions ceased, and when it was found that sheep were fully as profitable as cattle, public opinion sided with the sheepmen. Since 1900 Wyoming has been, in a number of years, the leading wool-producing State of the Union.

BIBLIOGRAPHY.—The most important official State reports are the biennial ones of the treasurer, secretary of State, commissioner of public lands and farm loans, State geologist, board of equalization, department of education, board of charities and reform; the bulletins of the University of Wyoming; the yearly bulletin of the State department of agriculture entitled *Wyoming Agricultural Statistics;* and the bulletins of the State geologist, bulletin No. 17 being a *Bibliography and Index of Wyoming Geology 1823–1916.* Miscellaneous Circular No. 28 of the U.S. Dept. of Agriculture deals with the *National Forests of Wyoming* (1927). Hebard, *History and Government of Wyoming* (San Francisco, 1919); H. M. Chittenden, *History of the American Fur Trade* (1919); A. J. Mokler, *History of Natrona County* (Chicago, 1923); John Clay, *My Life on the Range* (Chicago, 1924); A. H. Dixon and C. O. Downing, *Civil Government of Wyoming* (Gillette, Wyo., 1926); Noel J. Breed, *The Early Developments of the Wyoming Country 1743–1853* (1928); and publications of the Wyoming State historical department.

WYOMING VALLEY, a valley on the north branch of the Susquehanna river, in Luzerne county, Pennsylvania, U.S.A. The valley, properly speaking, is about 3½m. wide and about 25m. long, but the term is sometimes used historically to include all of the territory in the north-east of the State once in dispute between Pennsylvania and Connecticut. In Connecticut the Susquehanna Land Company was formed in 1753 to colonize the valley, and the Delaware Land Company was formed in 1754 for the region immediately west of the Delaware river. The rights of the Six Nations to all this territory were purchased at Albany (N. Y.), by the Susquehanna Company in 1754, but the work of colonization was delayed by the Seven Years' war. A few colonists settled at Mill Creek in 1763, but were attacked on Oct. 15 and driven away by the Indians. The five original towns of Wilkes-Barré (*q.v.*), Kingston, (*q.v.*), Pittston (*q.v.*), Hanover and Plymouth were founded by the company early in 1769.

In the meantime the Six Nations (in 1768) had repudiated their sale of the region to the Susquehanna Company and had sold it to the Penns. Settlers from Pennsylvania had arrived and taken possession of the block-house and huts at Mill Creek in Jan. 1768. The conflict which followed between the Pennsylvania and the Connecticut settlers is known as the first Pennamite-Yankee War. Although defeated in the early stages of the conflict, the Yankees finally gained the ascendancy and terminated the war in the battle of "Rampart Rocks" on Dec. 25, 1775. The General Assembly of Connecticut, in Oct. 1776, gave the valley the status of a county (Westmoreland county).

As the War of Independence came to a close the old trouble with Pennsylvania was revived. A court of arbitration appointed by the Continental Congress met in Trenton (N.J.), in 1782, and on Dec. 30 gave a unanimous decision in favour of Pennsylvania. The refusal of the Pennsylvania Government to confirm the private land titles of the settlers, and the arbitrary conduct of her agent, Alexander Patterson, resulted in 1784 in the outbreak of the second Pennamite-Yankee War. Treachery and harsh treatment by the Pennsylvania officers created a strong public opinion in favour of the Yankees, and the Government was compelled to adopt a milder policy. Patterson was withdrawn, the disputed territory was erected into the new county of Luzerne (1785), the land titles were confirmed (1787), and Col. Timothy Pickering (*q.v.*) was commissioned to organize the new county and to effect a reconciliation. The trouble was again revived by the repeal in 1790 of the confirming act of 1787 and by a subsequent decision of the U.S. circuit court, unfavourable to the Yankees, in the case of *Van Horn* v. *Dorrance.* All of the claims were finally confirmed by a series of statutes passed in 1790, 1802 and 1807. Since 1808, mainly through the development of its coal mines (*see* PITTSTON, PA.), the valley has made remarkable progress both in wealth and in population.

For a thorough study of the early history of Wyoming Valley, *see* O. J. Harvey, *A History of Wilkes-Barré.*

WYON, THOMAS (1792–1817), English medallist, was born at Birmingham. He was apprenticed to his father, the chief engraver of the king's seals, and studied at the Royal Academy, London. He became probationary engraver to the Mint in 1811,

and engraved his medal commemorative of the peace, and his Manchester Pitt medal. In 1815 he was appointed chief engraver to the Mint. His younger brother, Benjamin Wyon (1802–1858), his nephews, Joseph Shepherd Wyon (1836–1873) and Alfred Benjamin Wyon (1837–1884), and his cousin, William Wyon (1795–1851), were also distinguished medallists.

WYRE FOREST, the remains of an ancient forest in south-eastern Shropshire and northwestern Worcestershire. It lies on high ground southwest of the Severn river and contains some fine scenery. It forms the southern portion of the Severn valley coal-fields. Wyre Forest station is on the G.W.R. three miles north-west of Bewdley.

WYSPIAŃSKI, STANISLAW (1869–1907), Polish painter and dramatist, was born in Cracow in 1869. His paintings reveal a genius for dramatic construction, but the loss of the use of his hand forced him to turn to writing. *Wesele* (The Wedding) is usually regarded as his greatest work and has a high place in Polish literature. The three tragedies *A Warsaw Song, Lelewel* and *November Night* constitute a vivid and powerful portrayal of the November revolution of 1838. In these plays and in *The Legion, Deliverance* and *The Acropolis* he gives voice to the national aspirations of his countrymen and concentrates on the causes of weakness in his nation which put off the hour of its delivery. *The Curse* and *The Judges* are concerned with the lot of the peasants, their ignorance and passions and the pathos of their lives. They adapt the form of the Greek tragedies, the people of the village forming the chorus which comments on the actions of the principal characters. *Boleslas the Bold, The Church on the Rock, King Casimir* are historical dramas. Wyspiański seems to have felt prophetically the approach of a stormy era of war and sacrifice which his people must prepare to meet. The World War greatly increased his influence and Polish drama of recent times has remained under his spell.

WYSS, JOHANN (1781–1830), Swiss author, was born on Mar. 13, 1781, at Bern, where in 1806 he became professor of philosophy and later chief librarian of the University. He was a collector of Swiss tales and folklore, writing *Idyllen und Erzählungen aus der Schweiz* (1815–22), and editing the 15 volume collection *Alpenrose* (1811–30). He is better remembered, however, as the author of *Der Schweizerische Robinson* (1812–13), first translated into English in 1820 as *The Swiss Family Robinson* and appearing in many editions since. He is also the author of the Swiss National hymn, "Rufst du, mein Vaterland?" He died at Bern on Mar. 31, 1830.

WYTHE, GEORGE (1726–1806), American jurist, was born in the county of Elizabeth City, Va., in 1726. He had little formal schooling but was well taught by his mother and was admitted to the Virginia bar in 1757. He was elected to the house of burgesses in 1758 and as such in 1764 was placed on a committee to prepare petitions to the King and both houses of Parliament against the threatened Stamp Act. Wythe drew up the petition to the House of Commons in such strong language that it required considerable modification before it could be sent. In 1775 he was sent to the Continental Congress where he remained to sign the Declaration of Independence. In 1776 he was appointed with Jefferson and Pendleton to make the laws of Virginia more appropriate for an independent State, an important work which required three years to complete. In the meantime he was an important member of the constitutional convention in Virginia. He was a member of the Federal constitutional convention in 1787, and, in the following year, of the Virginia convention which ratified it.

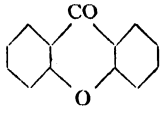
In 1777 Wythe was appointed a judge of the court of chancery, and in 1786 when the court was reorganized he was made sole chancellor of the State, which position he held until his death. He was one of the first judges to lay down the principle (*Comth.* v. *Catron,* 1782) that a court can annul a law deemed to conflict with the constitution, a doctrine which became of tremendous importance as applied by his pupil, John Marshall (*q.v.*). From 1779 to 1789 he also held a professorship of law at William and Mary College, one of the first such chairs in the United States, but his increasing duties as chancellor forced him to relinquish it. He continued a private school at Richmond afterward. Wythe's influence as a teacher probably constituted his most lasting service to the nation. Besides the great chief justice, Marshall, two presidents, Thomas Jefferson and James Monroe, were numbered among his pupils, and Henry Clay was for four years clerk of his court. Wythe died at Richmond, Va., on June 8, 1806. His *Decisions* were published in 1795 (2nd. ed. with memoir, 1852).

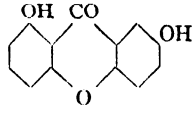
Thomas Jefferson prepared a sketch found in his *Writings* (Monticello ed., vol. i., 1904). *See* also L. S. Herrink, "George Wythe," in *John P. Branch Historical Papers,* vol. iii. (1912).

WYTTENBACH, DANIEL ALBERT (1746–1820), German-Swiss classical scholar, was born at Bern on Aug. 7, 1746. He studied Greek under Heyne at Göttingen, and dedicated his first work to Ruhnken, who wrote that he had not expected to find in Germany such knowledge of Greek and such critical powers. Heyne recommended him to Ruhnken and Valckenaer, and in 1770 he went to Leyden. He obtained a professorship in 1771, and began his *Bibliotheca Critica,* which continued to appear for about 30 years. He became professor of Greek at the Athenaeum at Amsterdam in 1785. He edited the *Moralia* of Plutarch for the Clarendon Press, the second portion of which underwent strange adventures during the war between Holland and Great Britain, and was eventually found at Hamburg. The book was finished in 1805. He went to Amsterdam in 1799 on Burmann's death and published his charming *Vita Ruhnkenii* (Leyden, 1799). During his last years he became nearly blind. His only important work was his edition of the *Phaedo,* and he died of apoplexy on Jan. 17, 1820.

Hemsterhuis, Valckenaer, Ruhnken and Wyttenbach, more than any others after Bentley, laid the foundations of modern Greek scholarship. The precise study of grammar, syntax and style, and the careful criticism of texts by the light of the best manuscript evidence, were upheld by these scholars in the Netherlands when they were almost entirely neglected elsewhere on the Continent, and were only pursued with partial success in England.

WYVERN, WIVERN or **WYVER,** the name of an heraldic monster, with the forepart of a winged dragon and the hind part of a serpent or lizard (*see* HERALDRY). The earlier spelling of the word was *wiver* or *wivere*; O.E. *wyvre;* O.Fr. *wivre,* mod. *givré.* It is a doublet of "viper," with an excrescent *n,* as in "bittern," M.E. *bitore.*





X In both the eastern and western Greek alphabets a form X or + occurred, but it had a different value in each. In the western it was used to represent the double sound *ks*, with which value it passed into Latin and came down to modern times. In the eastern or Ionic alphabet it had the value of the unvoiced velar aspirate (*kh*). We have insufficient evidence to determine the exact nature of the connection between the forms in both alphabets or the origin of either. It is possible that the western X with the value of modern X was descended from the same stem as Semitic ⌶ (*samech*), which is otherwise represented in the Greek alphabet only by its name transferred to another letter. It is, however, far from certain that this is so, and were it the case the value of the letter in the east would not be accounted for. Certain facts tend to show that the letter was regarded as one in spite of its difference of value in the two alphabets. In the Lydian alphabet a form + occurs, whose value cannot always be determined, though it appears in some cases to be that of *p*. The letter was probably in use in the Asianic alphabet from which the Greeks derived their own representing a sound that did not occur in Greek. (B. F. C. A.)

XANTHIC ACID (xanthogenic acid), an organic acid named from the Greek ξανθός, yellow, in allusion to the bright yellow colour of its copper salt. The salts of this acid, $C_2H_5O{\cdot}CS{\cdot}SH$, are formed by the action of carbon disulphide on the alcoholates, or on alcoholic solutions of the caustic alkalis. Ethyl xanthic acid, $C_2H_5O{\cdot}CS{\cdot}SH$, obtained by the action of dilute sulphuric acid on the potassium salt at 0° C, is a colourless oil which is very unstable, decomposing at 25° C into carbon disulphide and alcohol. The potassium salt crystallizes in yellow needles and is formed by shaking carbon disulphide with a solution of caustic potash in absolute alcohol. On the addition of cupric sulphate to its aqueous solution it yields a yellow precipitate of cuprous xanthate. Potassium xanthate is used in indigo printing and also as an antidote for phylloxera. Other alcoholic solutions yield similar xanthates, and cellulose xanthate serves in the production of viscose silk.

XANTHIPPE, the wife of Socrates (*q.v.*). Her name has become proverbial in the sense of a nagging, quarrelsome woman. Attempts have been made to show that she has been maligned, notably by E. Zeller ("Zur Ehrenrettung der Xanthippe," in his *Vorträge und Abhandlungen*, i., 1875).

XANTHONE, in organic chemistry, a compound containing a ring system (formula I.) similar to that present in many of the natural colouring matters. (*See* ANTHOCYANINS AND CHEMISTRY, ORGANIC: *Heterocyclic Division.*)

(I.)  (II.) 

It is dibenzo-γ-pyrone, $C_{13}H_8O_2$, and crystallises in needles which melt at 173–174° C, boil at 250° C and are volatile in steam. Its yellow solution in concentrated sulphuric acid has a blue fluorescence. Xanthone is prepared by dehydrating phenyl salicylate (salol) or 2:2′-dihydroxybenzophenone with concentrated sulphuric acid. Euxanthone (1:7-dihydroxyxanthone, formula II.) is the colour principle in Indian yellow obtained from the urine of cows fed on mango. In this dye the euxanthone is partly free and partly present as the calcium or magnesium salt of euxanthic acid (a combination of euxanthone and glycuronic acid) crystallising in yellow needles (m.p. 237° C). Euxanthone is prepared synthetically by condensing resorcinol with quinolcarboxylic acid.

Gentisein, a trihydroxyxanthone, of which the methyl ether (gentisin) is contained in the gentian root, dyes mordanted cotton in bright yellow shades and has been synthesised from phloroglucinol and quinolcarboxylic acid.

XANTHUS (mod. Günük), an ancient city of Lycia, on the river Xanthus (Eshen Chai) about 8 m. above its mouth. It was besieged by the Persian general Harpagus (546 B.C.), when the acropolis was burned and all the inhabitants perished (Herod. i. 176). The city was afterwards rebuilt; and in 42 B.C. it was besieged by the Romans under M. Junius Brutus. It was taken by storm and set on fire, and the inhabitants perished in the flames. The ruins lie on a plateau, high above the left bank of the river. The nearest port is Kalamaki, whence a tedious ride of three to four hours round the edge of the great marsh of the Eshen Chai brings the traveller to Xanthus. The whole plan of the city with its walls and gates can be discerned. The well-preserved theatre is remarkable for a break in the curve of its *auditorium*, which has been constructed so as not to interfere with a sarcophagus on a pedestal and with the "Harpy Monument" which still stands to its full height, robbed of the reliefs of its parapet (now in the British Museum). In front of the theatre stands the famous *stele* of Xanthus inscribed on all four sides in Lycian and Greek. Behind the theatre is a terrace on which probably the temple of either the Xanthian Apollo or Sarpedon stood. The best of the tombs—the "Payava Tomb," the "Nereid Monument," the "Ionic Monument" and the "Lion Tomb"—are in the British Museum, as the result of Sir Chas. Fellows's expedition; only their bases can be seen on the site. A fine triple gateway, much polygonal masonry, and the walls of the acropolis are the other objects of most interest.

See O. Benndorf and G. Niemann, *Reisen in Lykien und Karien* (1884). (D. G. H.)

XAVIER, FRANCISCO DE (1506–1552), Jesuit missionary and saint, commonly known in English as St. Francis Xavier and also called the "Apostle of the Indies." He was the youngest son of Juan de Jasso, privy councillor to Jean d'Albret, king of Navarre ,and his wife, Maria de Azpilcueta y Xavier, sole heiress of two noble Navarrese families. He was born at his mother's castle of Xavier or Xavero, at the foot of the Pyrenees and close to the little town of Sanguesa, on April 7, 1506, according to a family register, though his earlier biographers fix his birth in 1497. Following a Spanish custom of the time, which left the surname of either parent optional with children, he took his mother's name. In 1524 he went to the university of Paris, where he entered the College of St. Barbara, then the headquarters of the Spanish and Portuguese students, and in 1528 was appointed lecturer in Aristotelian philosophy at the Collège de Beauvais. In 1530 he took his degree as master of arts. He and the Savoyard Pierre Lefèvre, who shared his lodging, had already, in 1529, made the acquaintance of Ignatius of Loyola—like Xavier a native of the Spanish Basque country.

Ignatius succeeded, though in Xavier's case after some opposition, in gaining their sympathy for his missionary schemes (*see* LOYOLA, IGNATIUS OF); and they were among the company of seven persons, including Loyola himself, who took the original Jesuit vows on Aug. 15, 1534. They continued in Paris for two years longer; but on Nov. 15, 1536, they started for Italy, to concert with Ignatius plans for converting the Muslims of Palestine. In Jan. 1537 they arrived in Venice. As some months must elapse before they could sail for Palestine, Ignatius determined that the time should be spent partly in hospital work at Venice and later in the journey to Rome. Accordingly, Xavier devoted himself for nine weeks to the hospital for incurables, and then set out with eight companions for Rome, where Pope Paul III. sanctioned their enterprise. Returning to Venice, Xavier was ordained priest on Midsummer Day 1537; but the outbreak of war between Venice and Turkey put an end to the Palestine expedition, and the companions dispersed for a 12 month's home mission work in the Italian cities. Nicolas Bobadilla and Xavier

betook themselves first to Monselice and thence to Bologna, where they remained till summoned to Rome by Ignatius at the close of 1538.

Ignatius retained Xavier at Rome until 1541 as secretary to the Society of Jesus. (*See* JESUITS for the events of the period 1538–41.) Meanwhile John III., king of Portugal, had resolved on sending a mission to his Indian dominions, and had applied through his envoy, Pedro Mascarenhas, to the pope for six Jesuits. Ignatius could spare but two, and chose Bobadilla and a Portuguese named Simão Rodrigues for the purpose. Rodrigues set out at once for Lisbon to confer with the king, who ultimately decided to retain him in Portugal. Bobadilla, sent for to Rome, arrived there just before Mascarenhas was about to depart, but fell too ill to respond to the call made on him.

Mission in the East Indies.—Hereupon Ignatius, on March 15, 1540, told Xavier to leave Rome the next day with Mascarenhas, in order to join Rodrigues in the Indian mission. Xavier complied, merely waiting long enough to obtain the pope's benediction, and set out for Lisbon, where he was presented to the king, and soon won his entire confidence, attested notably by procuring for him from the pope four briefs, one of them appointing him papal nuncio in the Indies. On April 7, 1541, he sailed from Lisbon with Martim Alfonso de Sousa, governor designate of India, and lived amongst the common sailors, ministering to their religious and temporal needs, especially during an outbreak of scurvy. After five months' voyage the ship reached Mozambique, where the captain resolved to winter, and Xavier was prostrated with a severe attack of fever. When the voyage was resumed, the ship touched at Malindi and Sokotra, and reached Goa on May 6, 1542. Exhibiting his brief to D. João d'Albuquerque, bishop of Goa, he asked his permission to officiate in the diocese, and at once began walking through the streets ringing a small bell, and telling all to come, and send their children and servants, to the "Christian doctrine" or catechetical instruction in the principal church. He spent five months in Goa, and then turned his attention to the "Fishery Coast," where he had heard that the Paravas, a tribe engaged in the pearl fishery, had relapsed into heathenism after having professed Christianity. He laboured assiduously amongst them for 15 months, and at the end of 1543 returned to Goa.

At Travancore he is said to have founded no fewer than 45 Christian settlements. It is to be noted that his own letters contain, both at this time and later on, express disproof of that miraculous gift of tongues with which he was credited even in his lifetime, and which is attributed to him in the *Breviary* office for his festival. Not only was he obliged to employ interpreters, but he relates that in their absence he was compelled to use signs only.

He sent a missionary to the Isle of Manaar, and himself visited Ceylon and Mailapur (Meliapur), the traditional tomb of St. Thomas the apostle, which he reached in April 1544, remaining there four months. At Malacca, where he arrived on Sept. 25, 1545, he remained another four months, but had comparatively little success. While in Malacca he urged King John III. of Portugal to set up the Inquisition in Goa to repress Judaism, but the tribunal was not set up until 1560. After visiting Amboyna, the Moluccas and other isles of the Malay archipelago, he returned to Malacca in July 1547, and found three Jesuit recruits from Europe awaiting him. About this time an attack upon the city was made by the Achinese fleet, under the rajah of Pedir in Sumatra; and Xavier's early biographers relate a dramatic story of how he roused the governor to action. This story is open to grave suspicion, as, apart from the miracles recorded, there are wide discrepancies between the secular Portuguese histories and the narratives written or inspired by Jesuit chroniclers of the 17th century.

Voyage to Japan.—While in Malacca Xavier met one Yajiro, a Japanese exile (known to the biographies as Anger, Angero or Anjiro), who fired him with zeal for the conversion of Japan. But he first revisited India and then, returning to Malacca, took ship for Japan, accompanied by Yajiro, now known as Paul of the Holy Faith. They reached Kagoshima on Aug. 15, 1549, and remained in Japan until Nov. 20, 1551. (*See* JAPAN.) On board the "Santa Cruz," the vessel in which he returned from Japan to Malacca, Xavier discussed with Diogo Pereira, the captain, a project for a missionary journey to China. He devised the plan of persuading the viceroy of Portuguese India to despatch an embassy to China, in whose train he might enter, despite the law which then excluded foreigners from that empire. He reached Goa in Feb. 1552, and obtained from the viceroy consent to the plan of a Chinese embassy and to the nomination of Pereira as envoy. Xavier left India on April 25, 1552, for Malacca, intending there to meet Pereira and to re-embark on the "Santa Cruz."

Voyage to China.—The story of his detention by the governor (officially styled captain) of Malacca—a son of Vasco da Gama named Alvaro de Ataide or Athayde—is told with many picturesque details by F. M. Pinto and some of the Jesuit biographers, who have pilloried Ataide as actuated solely by malice and self-interest. Ataide appears to have objected not so much to the mission as to the rank assigned to Pereira, whom he regarded as unfit for the office of envoy. The right to send a ship to trade with China was one for which large sums were paid, and Pereira, as commander of the expedition, would enjoy commercial privileges which Ataide had, *ex officio*, the power to grant or withhold. It seems doubtful if the governor exceeded his legal right in refusing to allow Pereira to proceed; in this attitude he remained firm even when Xavier, if the Jesuit biographers may be trusted, exhibited the brief by which he held the rank of papal nuncio, and threatened Ataide with excommunication. (*See* R. S. Whiteway, *Rise of the Portuguese Power in India* [London, 1898], appendix A. The question is complicated by the fact that the *Sixth Decade* of Diogo do Couto, the best contemporary historian of these events, was suppressed by the censor in its original form, and the extant version was revised by an ecclesiastical editor.) On Xavier's personal liberty no restraint was placed. He embarked without Pereira on July 16, 1552. After a short stay at Singapore, whence he despatched several letters to India and Europe, the ship at the end of Aug. 1552 reached Chang-chuen-shan (St. John Island) off the coast of Kwang-tung, which served as port and rendezvous for Europeans, not then admitted to visit the Chinese mainland.

Xavier was seized with fever soon after his arrival, and was delayed by the failure of the interpreter he had engaged, as well as by the reluctance of the Portuguese to attempt the voyage to Canton for the purpose of landing him. He had arranged for his passage in a Chinese junk, when he was again attacked by fever, and died on Dec. 2nd, or, according to some authorities, Nov. 27, 1552. He was buried close to the cabin in which he had died, but his body was later transferred to Malacca, and thence to Goa, where it still lies in a magnificent shrine. (*See* J. N. da Fonseca, *An Historical and Archaeological Sketch of Goa*, Bombay, 1878.) He was beatified by Paul V. in 1619 and canonized by Gregory XV. in 1621.

Achievement.—In appearance Xavier was neither Spanish nor Basque. He had blue or grey eyes, and fair hair and beard, which turned white through the hardships he endured in Japan. That he was of short stature is proved by the length of the coffin in which his body is still preserved, less than 5 ft. 1 in. (Fonseca, *op. cit.* p. 296). Many miracles have been ascribed to him; an official list of these, said to have been attested by eye-witnesses, was drawn up by the auditors of the Rota when the processes for his canonization were formed, and is preserved in manuscript in the Vatican library.

The contention that Xavier should be regarded as the greatest of Christian missionaries since the 1st century A.D. rests upon more tangible evidence. His Jesuit biographers attribute to him the conversion of more than 700,000 persons in less than ten years; and though the figures are absurd, the work which Xavier accomplished was enormous. He inaugurated new missionary enterprises from Hormuz to Japan and the Malay archipelago, leaving an organized Christian community wherever he preached; he directed by correspondence the ecclesiastical policy of John III. and his viceroy in India; he established and controlled the Society of Jesus in the East. Himself an ascetic and a mystic, to whom things spiritual were more real than the visible world, he had the strong common sense which distinguished the other Spanish mystics, St. Theresa, Luis de Leon or Raimon Lull. This quality

is nowhere better exemplified than in his letters to Gaspar Baertz (Barzaeus), the Flemish Jesuit whom he sent to Hormuz, or in his suggestions for the establishment of a Portuguese staple in Japan. Supreme as an organizer, he seems also to have had a singularly attractive personality, which won him the friendship even of the pirates and bravos with whom he was forced to consort on his voyages.

Modern critics of his work note that he made no attempt to understand the oriental religions which he attacked, and censure him for invoking the aid of the Inquisition and sanctioning persecution of the Nestorians in Malabar. He strove, with a success disastrous to the Portuguese empire, to convert the Government in Goa into a proselytizing agency. Throughout his life he remained in close touch with Ignatius of Loyola, who is said to have selected Xavier as his own successor at the head of the Society of Jesus. Within a few weeks of Xavier's death, indeed, Ignatius sent letters recalling him to Europe with that end in view.

(K. G. J.)

BIBLIOGRAPHY.—Many of the authorities on which the biographies of Xavier have been based are untrustworthy, notably the *Peregrinaçam* of F. M. Pinto (*q.v.*). Xavier's extant letters, supplemented by a few other 16th century documents, outweigh all other evidence. A critical text of the letters, with notes, bibliography and a life in Spanish, will be found in *Monumenta Xaveriana ex Autographis vel ex Antiquioribus Exemplis collecta*, vol. i. (Madrid, 1899–1900), in *Monumenta Historica Societatis Jesu*. For translations, H. Coleridge, *The Life and Letters of Saint Francis Xavier* (2 vols., 1872) is useful. There are numerous old and uncritical biographies; best and earliest are O. Torsellino (Tursellinus) *De vita Francisci Xaverii, libri sex* (Antwerp, 1596); Eng. trans. T.F., *The Admirable Life of Saint Francis Xavier* (Paris, 1632) and João Lucena, *Historia da Vida do Padre Francisco de Xavier* (Lisbon, 1600). J. M. Cros, *St. François de Xavier, sa vie et ses lettres* (2 vols., Toulouse, 1900), embodies the results of long research. *See* K. G. Jayne, *Vasco da Gama and his Successors*, ch. xxv. to xxxii. (1910); Otis Carey, *A History of Christianity in Japan* (2 vols., 1909); E. A. Stewart, *Life of St. Francis Xavier* (1917); A. Bellessort, *Saint François Xavier* (1917); F. Apalategui, *Empresas y viajes apostolicás de San Francisco Xavier* (1920).

XENIA, a city of south-western Ohio, U.S.A., the county seat of Greene county; 16 m. S.E. of Dayton, near the Little Miami river, at an altitude of 910 feet. It is served by the Baltimore and Ohio, the Pennsylvania and electric railways and motorbus lines. Pop. (1920) 9,110 (22% negroes). It is the trade centre of a rich farming and stock-raising district; the seat of the Ohio Soldiers' and Sailors' Orphans' home; and an important manufacturing city, making rope, twine and cordage, boots and shoes, furniture and various other commodities. About 3 m. N.E. is Wilberforce University for Negroes (1856). Xenia was laid out in 1803, incorporated as a town in 1808 and as a city in 1870. It has a city-manager form of government.

XENOCRATES, OF CHALCEDON (396–314 B.C.), Greek philosopher and rector of the Academy from 339 to 314 B.C., removed to Athens in early youth. He became the pupil of the Socratic Aeschines, but presently joined himself to Plato, whom he attended to Sicily in 361. Upon his master's death (347 B.C.), in company with Aristotle he paid a visit to Hermias at Atarneus. In 339, Aristotle being then in Macedonia, Xenocrates succeeded Speusippus in the presidency of the school. On three occasions he was member of an Athenian legation, once to Philip, twice to Antipater. Soon after the death of Demosthenes in 322, resenting the Macedonian influence then dominant at Athens, Xenocrates declined the citizenship offered to him at the instance of Phocion, and, being unable to pay the tax levied upon resident aliens, was sold, or on the point of being sold, into slavery. He died in 314, and was succeeded by Polemon, whom he had reclaimed from a life of profligacy. Besides Polemon, the statesman Phocion, Chaeron, tyrant of Pellene, the Academic Crantor, the Stoic Zeno and Epicurus are alleged to have frequented his lectures.

Xenocrates's earnestness and strength of character won for him universal respect. Wanting in quickness of apprehension and in native grace, he made up for these deficiencies by a conscientious love of truth and an untiring industry. Less original than Speusippus, he adhered more closely to the letter of Platonic doctrine, and is accounted the typical representative of the Old Academy. With Plato Xenocrates postulated ideas or numbers to be the causes of nature's organic products, and derived these ideas or numbers from unity (which is active) and plurality (which is passive); but unlike Plato, he took for his principles arithmetical unity and plurality, and accordingly identified ideal numbers with arithmetical numbers. In thus reverting to the crudities of certain Pythagoreans, he laid himself open to the criticisms of Aristotle, who, in his *Metaphysics*, recognizing amongst contemporary Platonists three principal groups—(1) those who, like Plato, distinguished mathematical and ideal numbers; (2) those who, like Xenocrates, identified them; and (3) those who, like Speusippus, postulated mathematical numbers only—has much to say against the Xenocratean interpretation of the theory, and in particular points out that, if the ideas are numbers made up of arithmetical units, they not only cease to be principles, but also become subject to arithmetical operations. Xenocrates's theory of inorganic nature was substantially identical with the theory of the elements propounded in the *Timaeus*, 53 C *seq.* Nevertheless, holding that every dimension has a principle of its own, he rejected the derivation of the elemental solids—pyramid, octahedron, icosahedron and cube—from triangular surfaces, and in so far approximated to atomism. Moreover, to the tetrad of simple elements—viz., fire, air, water, earth—he added ether. His cosmology was also drawn almost entirely from the *Timaeus*.

Soul is a self-moving number, derived from the two fundamental principles, unity and plurality whence it obtains its powers of rest and motion. It is incorporeal, and may exist apart from body. The irrational soul, as well as the rational soul, is immortal. The universe, the heavenly bodies, man, animals, and presumably plants, are each of them endowed with a soul. Xenocrates identifies the universe and the heavenly bodies with the greater gods, and reserves a place between them and mortals for the lesser divinities. Xenocrates appears to have recognized three grades of cognition, each appropriated to a region of its own—viz., knowledge, opinion and sensation, having for their respective objects supra-celestials or ideas, celestials or stars, and infra-celestials or things. Of his logic we know only that with Plato he distinguished *τὸ καθ' αὑτό* and *τὸ πρός τι*, rejecting the Aristotelian list of ten categories as a superfluity.

Valuing philosophy chiefly for its influence upon conduct, Xenocrates bestowed especial attention upon ethics. He wrote much upon this subject; but the indications of doctrine which have survived are scanty. Things are goods, ills or neutrals. Goods are of three sorts—mental, bodily, external; but of all goods virtue is incomparably the greatest. Happiness consists in the possession of virtue, and consequently is independent of personal and extraneous advantages. The virtuous man is pure, not in act only, but also in heart. To the attainment of virtue the best help is philosophy; for the philosopher does of his own accord what others do under the compulsion of law. Speculative wisdom and practical wisdom are to be distinguished.

Xenocrates was not in any sense a great thinker. His metaphysic was a travesty rather than a reproduction of that of his master. His ethic had little which was distinctive. But his austere life and commanding personality made him an effective teacher, and his influence, kept alive by his pupils Polemon and Crates, ceased only when Arcesilaus, the founder of the so-called Second Academy, gave a new direction to the studies of the school.

Griechen* (Leipzig, 1875), ii. 1; F. W. A. Mullach, *Frag. Philo. Graecorum* (Paris, 1881), iii., and Überweg, *Grundriss der Gesch. der Philosophie*, Bd. I. (1926).

(H. JN.; X.)

XENON, a very rare gas occurring to the extent of one part in about 20 million parts of the atmosphere (*q.v.*). Xenon (symbol Xe, atomic number 54, atomic weight 130·2), was isolated in 1898 by Sir W. Ramsay and M. W. Travers who liquefied it at −109° C and solidified it at −140° C.

XENOPHANES of Colophon, the reputed founder of the Eleatic school of philosophy, is supposed to have been born in the third or fourth decade of the 6th century B.C. An exile from his Ionian home, he resided for a time in Sicily, at Zancle and at Catana, and afterwards established himself in southern Italy, at

Elea, a Phocaean colony founded in the 61st Olympiad (536–533). In one of the extant fragments he speaks of himself as having begun his wanderings 67 years before, when he was 25 years of age, so that he was not less than 92 when he died. His teaching found expression in poems, which he recited rhapsodically in the course of his travels. In the more considerable of the elegiac fragments which have survived, he ridicules the doctrine of the migration of souls (xviii.), asserts the claims of wisdom against the prevalent athleticism, which seemed to him to conduce neither to the good government of states nor to their material prosperity (xix.), reprobates the introduction of Lydian luxury into Colophon (xx.), and recommends the reasonable enjoyment of social pleasures (xxi.). Of the epic fragments, the more important are those in which he attacks the "anthropomorphic and anthropopathic polytheism" of his contemporaries. According to Aristotle, "the first of Eleatic unitarians was not careful to say whether the unity which he postulated was finite or infinite, but, contemplating the whole firmament, declared that the One is God." Whether Xenophanes was a monotheist, whose assertion of the unity of God *suggested* to Parmenides the doctrine of the unity of Being, or a pantheist, whose assertion of the unity of God was also a declaration of the unity of Being, so that he *anticipated* Parmenides is a question about which authorities differ.

Of Xenophanes's utterances about (1) God, (2) the world, (3) knowledge, the following survive: (1) "There is one God, greatest among gods and men, neither in shape nor in thought like unto mortals. . . . He is all sight, all mind, all ear (*i.e.*, not a composite organism). . . . Without an effort ruleth he all things by thought. . . . He abideth ever in the same place motionless, and it befitteth him not to wander hither and thither. . . . Yet men imagine gods to be born, and to have raiment and voice and body, like themselves. . . . Even so the gods of the Ethiopians are swarthy and flat-nosed, the gods of the Thracians are fair-haired and blue-eyed. . . . Even so Homer and Hesiod attributed to the gods all that is a shame and a reproach among men—theft, adultery, deceit and other lawless acts. . . . Even so oxen, lions and horses, if they had hands wherewith to grave images, would fashion gods after their own shapes and make them bodies like to their own. (2) From earth all things are and to earth all things return. . . . From earth and water come all of us. . . . The sea is the well whence water springeth. . . . Here at our feet is the end of the earth where it reacheth unto air, but, below, its foundations are without end. . . . The rainbow, which men call Iris, is a cloud that is purple and red and yellow. (3) No man hath certainly known, nor shall certainly know, that which he saith about the gods and about all things; for, be that which he saith ever so perfect, yet doth he not know it; all things are matters of opinion. . . . That which I say is opinion like unto truth. . . . The gods did not reveal all things to mortals in the beginning; long is the search ere man findeth that which is better."

There is very little secondary evidence to record. "The Eleatic school," says the Stranger in Plato's *Sophist*, 242 D, "beginning with Xenophanes, and even earlier, starts from the principle of the unity of all things." Aristotle, in a passage already cited, *Metaphysics*, A5, speaks of Xenophanes as the first of the Eleatic unitarians, adding that his monotheism was reached through the contemplation of the *οὐρανός*. Theophrastus (in Simplicius's *Ad Physica*, 5) sums up Xenophanes's teaching in the propositions, "The All is One and the One is God." Timon (in Sext. Empir. *Pyrrh.* i. 224), ignoring Xenophanes's theology, makes him resolve all things into one and the same unity. The demonstrations of the unity and the attributes of God, with which the treatise *De Melisso, Xenophane et Gorgia* (now no longer ascribed to Aristotle or Theophrastus) accredits Xenophanes, are plainly framed on the model of Eleatic proofs of the unity and the attributes of the Ent, and must therefore be set aside.

The wisdom of Xenophanes, like the wisdom of the Hebrew Preacher, showed itself, not in a theory of the universe, but in a sorrowful recognition of the nothingness of things and the futility of endeavour. His theism was a declaration not so much of the greatness of God as rather of the littleness of man. His cosmology was an assertion not so much of the immutability of the One as rather of the mutability of the Many. Like Socrates, he was not a philosopher, and did not pretend to be one; but, as the reasoned scepticism of Socrates cleared the way for the philosophy of Plato, so did Xenophanes's "abnormis sapientia" for the philosophy of Parmenides.

XENOPHON, Greek historian and philosophical essayist, the son of Gryllus, was born in Athens about 430 B.C. As the description of the Ionian campaign of Thrasyllus in 410 (*Hellenica*, i. 2) is clearly derived from Xenophon's own reminiscences, he must have taken part in this campaign, and cannot therefore have been less than 20 years of age at the time. He belonged to an equestrian family of the deme of Erchia. It may be inferred from passages in the *Hellenica* that he fought at Arginusae (406 B.C.), and that he was present at the return of Alcibiades (408 B.C.), the trial of the Generals and the overthrow of the Thirty. Early in life he came under the influence of Socrates, but an active career had more attraction for him. In 401 B.C., being invited by his friend Proxenus to join the expedition of the younger Cyrus against his brother, Artaxerxes II. of Persia, he at once accepted the offer. It held out the prospect of riches and honour, while he was little likely to find favour in democratic Athens, where the knights were regarded with suspicion as having supported the Thirty. At the suggestion of Socrates, Xenophon went to Delphi to consult the oracle; but his mind was already made up, and he at once proceeded to Sardis, the place of rendezvous. Of the expedition itself he has given a full and detailed account in his *Anabasis*, or the "Up-Country March." After the battle of Cunaxa (401 B.C.), in which Cyrus lost his life, the officers in command of the Greeks were treacherously murdered by the Persian satrap Tissaphernes, with whom they were negotiating an armistice with a view to a safe return. The army was now in the heart of an unknown country, more than a thousand miles from home and in the presence of a troublesome enemy. It was decided to march northwards up the Tigris valley and make for the shores of the Euxine, on which there were several Greek colonies. Xenophon became the leading spirit of the army; he was elected an officer, and he it was who mainly directed the retreat. Part of the way lay through the wilds of Kurdistan, where they had to encounter the harassing guerrilla attacks of savage mountain tribes, and part through the highlands of Armenia and Georgia. After a five months' march they reached Trapezus (Trebizond) on the Euxine (Feb. 400 B.C.). At Cotyora he aspired to found a new colony; but the idea, not being unanimously accepted, was abandoned, and ultimately Xenophon with his Greeks arrived at Chrysopolis (Scutari) on the Bosporus, opposite Byzantium. After a brief period of service under a Thracian chief, Seuthes, they were finally incorporated in a Lacedaemonian army which had crossed over into Asia to wage war against the Persian satraps Tissaphernes and Pharnabazus. Xenophon, who accompanied them, captured a wealthy Persian nobleman, with his family, near Pergamum, and the ransom paid for his recovery secured Xenophon a competency for life.

On his return to Greece Xenophon served under Agesilaus, king of Sparta, at that time the chief power in the Greek world. With his native Athens and its general policy and institutions he was not in sympathy. At Coroneia (394 B.C.) he fought with the Spartans against the Athenians and Thebans, for which his fellow-citizens decreed his banishment. The Spartans provided a home for him at Scillus in Elis, about two miles from Olympia; there he settled down to indulge his tastes for sport and literature. After Sparta's crushing defeat at Leuctra (371 B.C.), Xenophon was

driven from his home by the people of Elis. Meantime Sparta and Athens had become allies, and the Athenians repealed the decree which had condemned him to exile. There is, however, no evidence that he ever returned to his native city. According to Diogenes Laërtius, he made his home at Corinth. The year of his death is not known; all that can be said is that it was later than 355 B.C., the date of his work on the *Revenues of Athens*.

The *Anabasis* (composed at Scillus between 379 and 371 B.C.) is a work of singular interest, and is brightly and pleasantly written. Xenophon, like Caesar, tells the story in the third person. His description of places and of relative distances is very minute and painstaking. The researches of modern travellers attest his general accuracy. It is expressly stated by Plutarch and Diogenes Laërtius that the *Anabasis* was the work of Xenophon, and the evidence from style is conclusive. The allusion (*Hellenica*, iii. 1, 2) to Themistogenes of Syracuse as the author shows that Xenophon published it under an assumed name.

The *Cyropaedia*, a political and philosophical romance, which describes the boyhood and training of Cyrus, hardly answers to its name, being for the most part an account of the beginnings of the Persian empire and of the victorious career of Cyrus, its founder. The *Cyropaedia* contains, in fact, the author's own ideas of training and education, as derived conjointly from the teachings of Socrates and his favourite Spartan institutions. It was said to have been written in opposition to the *Republic* of Plato. A distinct moral purpose, to which literal truth is sacrificed, runs through the work. For instance, Cyrus is represented as dying peacefully in his bed, whereas, according to Herodotus, he fell in a campaign against the Massagetae.

The *Hellenica* written at Corinth, after 362 B.C., is the only contemporary account of the period covered by it (411–362 B.C.) that has come down to us. It consists of two distinct parts; books i. and ii., which are intended to form a continuation of the work of Thucydides, and bring the history down to the fall of the Thirty, and books iii.–vii., the *Hellenica* proper, which deal with the period from 401 to 362 B.C., and give the history of the Spartan and Theban hegemonies, down to the death of Epaminondas. There is, however, no ground for the view that these two parts were written and published as separate works. There is probably no justification for the charge of deliberate falsification. It must be admitted, however, that he had strong political prejudices, and that these prejudices have influenced his narrative. He was a partisan of the reactionary movement which triumphed after the fall of Athens; Sparta is his ideal, and Agesilaus his hero. Hardly less serious defects than his political bias are his omissions, his want of the sense of proportion and his failure to grasp the meaning of historical criticism. The most that can be said in his favour is that as a witness he is at once honest and well-informed. For this period of Greek history he is, at any rate, an indispensable witness.

The *Memorabilia*, or "Recollections of Socrates," in four books, was written to defend Socrates against the charges of impiety and corrupting the youth, repeated after his death by the sophist Polycrates. The work is not a literary masterpiece; it lacks coherence and unity, and the picture it gives of Socrates fails to do him justice. Still, as far as it goes, it no doubt faithfully describes the philosopher's manner of life and style of conversation. It was the moral and practical side of Socrates's teaching which most interested Xenophon; into his metaphysical speculations he seems to have made no attempt to enter: for these, indeed, he had neither taste nor genius. Moving within a limited range of ideas, he doubtless gives us "considerably less than the real Socrates, while Plato gives us something more." It is probable that the work in its present form is an abridgement.

Xenophon has left several minor works, some of which are very interesting and give an insight into the home life of the Greeks.

The *Oeconomics* (to some extent a continuation of the *Memorabilia*, and sometimes regarded as the fifth book of the same) deals with the management of the house and of the farm, and presents a pleasant and amusing picture of the Greek wife and of her home duties. There are some good practical remarks on matrimony and on the respective duties of husband and wife.

In the essays on horsemanship (*Hippikē*) and hunting (*Cynegeticus*), Xenophon deals with matters of which he had a thorough knowledge. In the first he gives rules how to choose a horse, and then tells how it is to be groomed and ridden and generally managed. The *Cynegeticus* deals chiefly with the hare, though the author speaks also of boar-hunting and describes the hounds, tells how they are to be bred and trained, and gives specimens of suitable names for them.

The *Hipparchicus* explains the duties of a cavalry officer. He dwells at some length on the moral qualities which go to the making of a good officer, and hints very plainly that there must be strict attention to religious duties.

The *Agesilaus* is a eulogy of the Spartan king, who had two special merits in Xenophon's eyes: he was a rigid disciplinarian, and he was particularly attentive to all religious observances. We have a summary of his virtues rather than a picture of the man himself.

The *Hiero* works out the line of thought indicated in the story of the Sword of Damocles. It is a protest against the notion that the "tyrant" is a man to be envied, as having more abundant means of happiness than a private person.

The *Symposium*, or "Banquet," to some extent the complement of the *Memorabilia*, is a brilliant little dialogue in which Socrates is the prominent figure. He is represented as "improving the occasion," which is that of a lively Athenian supper-party, at which there is much drinking, with flute-playing, and a dancing-girl from Syracuse, who amuses the guests with the feats of a professional conjurer. Socrates's table-talk runs through a variety of topics, and winds up with a philosophical disquisition on the superiority of true heavenly love to its earthly or sensual counterfeit.

There are also two short essays, attributed to him, on the political constitution of Sparta and Athens, written with a decided bias in favour of the former, which he praises without attempting to criticize. Sparta seems to have presented to Xenophon the best conceivable mixture of monarchy and aristocracy. The second is certainly not by Xenophon, but was probably written by a member of the oligarchical party at Athens shortly after the beginning of the Peloponnesian War.

In the essay on the *Revenues of Athens* (written in 355 B.C.) he offers suggestions for making Athens less dependent on tribute received from its allies. Above all, he would have Athens use its influence for the maintenance of peace in the Greek world and for the settlement of questions by diplomacy, the temple at Delphi being for this purpose an independent centre and supplying a divine sanction.

The *Apology*, Socrates's defence before his judges, in the general opinion of modern critics is not a genuine work of Xenophon, but belongs to a much later period.

The editions of Xenophon's works, both complete and of separate portions, are very numerous, especially of the *Anabasis;* only a selection can be given here. Editio princeps (1516, incomplete); E. C. Marchant (1900–1912, in the Clarendon Press *Scriptorum Classicorum Bibliotheca*). *Anabasis:* J. F. Macmichael (1883); C. W. Krüger and W. Pökel (1888); W. Gemoll (1899). *Cyropaedia:* G. M. Gorham (1870); L. Breitenbach (1875); A. Hug (1883); F. Hertlein and W. Nitsche (1886); H. A. Holden (1887–90). *Hellenica:* L. Breitenbach (1874–84); R. Büchsenschütz (1880–91); O. Keller (1890); G. E. Underhill, *Commentary on the Hellenica* (i.-vii., 1900). *Memorabilia:* A. R. Cluer (1880); R. Kühner (1882); L. Breitenbach (1889); J. Marshall (1890). *Oeconomicus:* H. A. Holden (1895); C. Graux and A. Jacob (1886). *Hiero:* H. A. Holden (1888). *Agesilaus:* R. W. Taylor (1880); O. Güthling (1888). *Resp. Lacedaem.:* G. Pierleoni (1905). *Resp. Atheniensium:* A. Kirchhoff (1874); E. Belot (1880); H. Müller and Strübing (1880); E. Kalinka (1913). *Cynegeticus:* G. Pierleoni (1902). *Hippikē:* Tommasini (1902). *Reditus Athen.:* A. Zurborg (1876). *Scripta Minora:* L. Dindorf (1888). There is a good English translation of the complete works by H. G. Dakyns (1890–94), and of the *Art of Horsemanship* by M. H. Morgan (U.S.A., 1890). Of general works bearing on the subject may be mentioned: G. Sauppe, *Lexilogus Xenophonteus* (1869); A. Croiset, *X., son caractère et son talent* (1873); I. Hartmann, *Analecta Xenophontea* (1887) and *Analecta Xenophontea Nova* (1889); C. Joël, *Der echte und der Xenophonteische Socrates* (1892); Lange, *X., sein Leben, seine Geistesart und seine Werke* (1900). *See* also GREECE: *Ancient History*, § "Authorities," and works quoted; J. B. Bury, *Ancient Greek Historians* (1909). Bibliographies in Engelmann-Preuss, *Bibliotheca Scriptorum Classicorum* (i., 1880) and in

C. Bursian's *Jahresbericht* (*c.*, 1900) by E. Richter. (E. M. Wa.)

XERXES (the Greek form of the Pers. *Khshayārshā;* Old Testament *Ahasverus, Akhashverosh—i.e.*, Ahasuerus [*q.v.*]—with wrong vocalization and substitution of *y* for *v*, instead of *Akhshavarsh;* in Aramaic inscriptions and papyri from Egypt the name is written *Khshai'arsh*), the name of two Persian kings of the Achaemenid dynasty.

1. Xerxes I., son of Darius I. and Atossa, the daughter of Cyrus the Great, and therefore appointed successor to his father in preference to his eldest half-brothers, who were born before Darius had become king (Herod. vii. 2 f.). After his accession in October 485 B.C. he suppressed the revolt in Egypt which had broken out in 486, appointed his brother Achaemenes as satrap and "brought Egypt under a much heavier yoke than it had been before" (Herod. vii. 7). His predecessors, especially Darius, had not been successful in their attempts to conciliate the ancient civilizations. This probably was the reason why Xerxes in 484 abolished the "kingdom of Babel" and took away the golden statue of Bel (Marduk, Merodach), the hands of which the legitimate king of Babel had to seize on the first day of each year, and killed the priest who tried to hinder him[1]. Therefore Xerxes does not bear the title of "King of Babel" in the Babylonian documents dated from his reign, but "King of Persia and Media," or simply "King of countries" (*i.e.*, of the world). This proceeding led to two rebellions, probably in 484 and 479; in the Babylonian documents occur the names of two ephemeral kings, Shamash-irbā and Tarziya, who belong to this time. One of these rebellions was suppressed by Megabyzus, son of Zopyrus, the satrap whom the Babylonians had slain[2].

Darius had left to his son the task of punishing the Greeks for their interference in the Ionian rebellion and the victory of Marathon. From 483 Xerxes prepared his expedition with great care: a channel was dug through the isthmus of the peninsula of Mount Athos; provisions were stored in the stations on the road through Thrace; two bridges were thrown across the Hellespont. Xerxes concluded an alliance with Carthage, and thus deprived Greece of the support of the powerful monarchs of Syracuse and Agrigentum. Many smaller Greek states, moreover, took the side of the Persians ("Medized"), especially Thessaly, Thebes and Argos. A large fleet and a numerous army were gathered. In the spring of 480 Xerxes set out from Sardis. At first Xerxes was victorious everywhere. The Greek fleet was beaten at Artemisium, Thermopylae stormed, Athens conquered, the Greeks driven back to their last line of defence at the Isthmus of Corinth and in the Bay of Salamis. But Xerxes was induced by the astute message of Themistocles (against the advice of Artemisia of Halicarnassus) to attack the Greek fleet under unfavourable conditions, instead of sending a part of his ships to the Peloponnesus and awaiting the dissolution of the Greek armament[3]. The battle of Salamis (Sept. 28, 480) decided the war. (*See* Salamis.) Having lost his communication by sea with Asia, Xerxes was forced to retire to Sardis; the army which he left in Greece under Mardonius was in 479 beaten at Plataea (*q.v.*). The defeat of the Persians at Mycale roused the Greek cities of Asia.

Of the later years of Xerxes little is known. He sent out Sataspes to attempt the circumnavigation of Africa (Herod. iv. 143), but the victory of the Greeks threw the empire into a state of languid torpor, from which it could not rise again. The king himself became involved in intrigues of the harem (*cf.* Herod. ix. 108 ff.—compare the late Jewish novel of *Esther*, in which a remembrance of the true character of the king is retained) and was much dependent upon courtiers and eunuchs. He left inscriptions at Persepolis, where he added a new palace to that of Darius, at Van in Armenia, and on Mount Elvend near Ecbatana; in these texts he merely copies the words of his father. In 465 he was murdered by his vizier Artabanus (*q.v.*) who raised Artaxerxes I. to the throne.

2. Xerxes II., son and successor of Artaxerxes I., was assassinated in 424 after a reign of forty-five days by his brother Secydianus or Sogdianus, who in his turn was murdered by Darius II. (*q.v.*).

See Ctesias, *Pers.* 44; Diod. xii., 64, 71, and the chronographers; neither of the two ephemeral kings is mentioned in the canon of Ptolemy nor in the dates of Babylonian contracts of this time.

The name Xerxes was also borne by a king of Armenia, killed about 212 B.C. by Antiochus the Great (Polyb. viii. 25; Johannes Antiochenus, p. 53; his name occurs on copper coins); and by a son of Mithradates the Great of Pontus (Appian, *Mithr.* 108, 117). (Ed. M.)

XINCA, a group of about 10,000 Indians living in southern Guatemala along the Rio de los Esclavos, including most of the departments of Santa Rosa and Jutiapa. They were first encountered by the Spaniards under Pedro de Alvarado in 1524 and were finally subdued two years later by Pedro Portocarrero. On account of their stubborn resistance many of them were branded and sold as slaves, whence the name of the river that cuts their territory. The Xinca may be the remnants of an ancient population which preceded the Maya and Nahua. The Maya regarded the Xinca as barbarians, a feeling very generally entertained in Guatemala to-day.

See D. G. Brinton, *On the Xinca Indians of Guatemala* (American Philosophical Society, *Proceedings*, Philadelphia, 1884); Walther Lehmann, *Zentral-Amerika*, 1 Teil, ii. Band (1920).

XIPHILINUS, JOANNES, epitomator of Dio Cassius, lived at Constantinople during the latter half of the 11th century A.D. He was a monk and the nephew of the patriarch of Constantinople of the same name. (Migne, *Patrologia Graeca*, cxx.) The epitome (ἐκλογαί) of Dio which was prepared by order of Michael Parapinaces (1071–78), comprises books 36–80, the period included being from the times of Pompey and Caesar down to Alexander Severus. Book 70 appears to have been missing in his copy, while in books 78 and 79 a mutilated original must have been used. Xiphilinus divided the work into sections, each containing the life of an emperor. He omitted the name of the consuls and hence sometimes falls into chronological errors. The epitome is valuable as preserving the chief incidents of the period for which the authority of Dio is wanting.

See J. Melber's Dio in Teubner series; C. Wachsmuth, *Einleitung in das Studium der alten Geschichte* (1895); W. Christ, *Geschichte der griechischen Literatur* (1898).

XOSA, a group of Bantu-speaking peoples occupying the eastern half of the Cape Colony. They comprise a large number of independent tribes, each governed by a chief assisted by councillors. Their subsistence is derived from a combination of cattle-keeping with agriculture. Socially they are organized into patrilineal exogamous clans. Marriage is polygamous and involves the payment of a bride-price; and both the sororate and the levirate are practised. Ancestor-worship is the main form of religious cult, and both magic and witchcraft play a strong part in the lives of the people.

See A. Kropf, *Das Volk der Xosa-Kaffern*, 1889.

X-RAYS, NATURE OF. X-rays, or Röntgen rays, is the name given to the radiations which, in the general spectrum of electromagnetic waves, occur after ultra-violet rays as we pass towards the shorter wave lengths. It is difficult to define the region exactly. As is well known the visible spectrum extends from the wave lengths of the extreme red (about 0·8μ) to the furthest violet (about 0·4μ), next follows the ultra-violet and then a region is reached where the absorption of the radiation by all kinds of matter becomes very great.

It is in the region of 1,000 Ångstrom units (or, to use other units, 0·1 μ, or 10^{-5} centimetre), that we may place the beginning of the X-rays, but we must remember that the radiations in the ultra-violet series of hydrogen are undoubtedly the terms of an X-ray series (the K series) of this gas. At the short wave length end we may regard the K rays of uranium, or more exactly the K

[1] Herod. i. 183, by Ctesias changed into a plundering of the tomb of Belitanas or Belus: *cf.* Aelian, *Var. Hist.* 13, 3; Aristobulus *ap.* Arrian vii. 17, 2, and Strabo xvi., p. 738.

[2] Ctesias, *Pers.* 22; his legendary history is transferred by Herodotus, iii. 150 ff., to the former rebellion against Darius.

[3] *See* G. B. Grundy, *Great Persian War* (1901), and in criticism W. W. Tarn, "The Fleet of Xerxes," in *Journal of Hellenic Studies* (1908), 202–234; also Macan's notes on Herod. iv.–vi. (1895), and authorities for Plataea, Salamis.

discontinuities of this element, as marking the limit of a region of radiations intimately connected with the electronic structure of the atom and from that point the gamma rays begin (*i.e.*, for wave-lengths less than $\frac{1}{10}$ of an Ångstrom unit). (*See* RADIATION.)

The quantum theory (*q.v.*) establishes a correspondence between each radiation of given wave-length and a certain number of volts, and when the radiations are excited by an electric discharge it is necessary that the potential of this discharge should be at least equal to this voltage. The visible and the ultra-violet radiations then correspond to just a few volts while the X-rays range from some hundred volts to more than a hundred thousand volts; to excite the gamma rays it would be necessary to employ a potential of several millions of volts.

In this wide interval are found rays the properties of which vary in a continuous manner as a function of the wave length. The Bragg-Peirce law which expresses the progressive and regular character of the absorption of a radiation in terms of the atomic number of the absorbing element appears to be valid throughout a region which extends at least from 10^{-2} Å to 10 Å, and probably much beyond in the short wave length direction.

Towards the end of the year 1895 Professor Röntgen, in his laboratory at Würzburg, in Bavaria, carried out experiments on the electric discharge through rarefied gases. The experiments of Crookes had at that time attracted a great deal of attention to this branch of physics. Röntgen had covered his discharge tube with black paper and placed a phosphorescent screen near it to see if a new radiation penetrated through the paper. Not only did the screen commence to fluoresce but also a new radiation was disclosed in a neighbouring room through a closed door. It is said that a foreign scientist visiting the German physicist some years later asked "what did you think then?" and he replied "I did not think, I experimented."

The history of the discovery of the X-rays by Röntgen is described under RÖNTGEN, WILHELM KONRAD VON.

The extraordinary penetrative qualities of X-rays were the object of the first researches, while the attempts to discover in them optical properties, analogous to those of the radiations of ordinary light, received a check, so much so that for a long time even their undulatory nature was in doubt. It was necessary to wait until the experiments of Laue, Friedrich and Knipping in 1912 to find, in the passage of X-rays through crystalline media, a remarkably fruitful method, which by demonstrating that the new radiations show, like light, the phenomena of interference and of diffraction, enabled the wave length to be determined and at the same time the different kinds to be separated. Between these two dates, 1895–1912, the study of Röntgen rays had made great advances, thanks especially to the work of Barkla on the secondary rays which they excite by falling on different bodies, and that of Whiddington on the excitation of X-rays by means of cathode rays of increasing velocities.

One of the first and most important results to which the study of X-rays led was the discovery that their passage through gases rendered the latter conductors of electricity. It was found later that this effect was in reality due to the ionisation which the fast moving electrons ejected from the atoms produce along their paths. The new radiations showed themselves capable of producing a considerable effect on photographic plates, a phenomenon also very probably due to a secondary action.

These two effects allow us to estimate the intensity of X-rays by measuring the ionisation current produced or the degree of blackening of photographic emulsions.

In addition, X-rays produce a certain number of chemical actions and the well-known phenomenon of luminescence in many substances. To-day barium platinocyanide and calcium tungstate are most commonly employed, either as fluorescent screens for visual observation, or as intensifiers to shorten photographic exposures.

All these remarkable properties have attracted keen attention; but what actually gives X-rays a place apart in the realm of Physics, is that by revealing simple general laws of very wide application in natural philosophy they yield us information concerning the interior parts of atoms, much better than do the other radiations.

It is the laws of X-rays which have most effectively helped to clarify the ideas of modern physicists on the structure of atoms. The study of Röntgen rays is so closely bound up with these conceptions that it is necessary to outline the latter at this point.

As a result of the theories of Sir Ernest Rutherford and Niels Bohr the atom of an element of atomic number N (that is to say in the Nth place in the natural order of the elements) is regarded as composed of a nucleus possessing a total positive charge equal to N times the elementary charge surrounded by a swarm of N electrons distributed in a certain manner around it. (*See* also ATOMS.) We understand, especially from the ideas of Bohr, that these electrons may be divided into several classes, characterised by the work which must be expended to extract from the atom an electron of a certain class. In conformity with the quantum theory we may define for each of these electronic levels a frequency ν_p related to the work W_p necessary to extract the electron from the atom by the relation—

$$\nu_p = \frac{W_p}{h}.$$

We denote by the letters K, L, M, etc., successive levels proceeding outwards from the nucleus. This being premised it is convenient to recall that the fundamental hypotheses of Bohr's theory are as follows:—

A spectral line is emitted by an atom when an electron passes from one level to another which is nearer the nucleus, *e.g.*, from the M to the K level, and this spectral line (which is emitted with an energy $h\nu$) possesses a frequency ν defined by—

$$\nu = \nu_K - \nu_M.$$

Conversely the transport of an electron from one level to another further from the nucleus, *e.g.*, from K to M, would correspond to the absorption of energy of a definite frequency; in the case of luminous radiation, this is called a resonance absorption; but as we shall see later, this process does not, in general, appear to be realised with X-rays.

When an electron is removed from one level it seems nearly always to be taken right out of the atom, which corresponds, in the case in which the first level is, for example, the L level, to a transport of an electron from this level to infinity with absorption of a wave of frequency ν_L which would be:—

$$\nu_L = \frac{W_L}{h}.$$

It is only by the absorption of energy of a frequency at least equal to ν_L that an electron of the L ring may be extracted from the atom. In passing through this frequency the incident radiation will suddenly become susceptible to a new mechanism of absorption and we ought to find a sudden rise in the curve of its absorption coefficient.

Bohr's theory enables us to predict the lines of a spectrum, when the various levels are stated. Among all these lines we may consider separately those which have the same final level, because their manifestation is conditioned by the same initial phenomenon: the existence of a vacant position in this level. Experiment shows that these lines actually have their origin in a uniform mechanism and form a natural group, a "series" of lines which will bear the name of the final level. If an exciting radiation, falling on a small portion of matter which contains a large number of atoms, is capable of ejecting an electron from the K ring of a number of them, it is natural to suppose that in some of the atoms, for example, the space will be filled up by an electron coming from the L ring with emission of the line α_K; the vacancy thus created on the L ring will be filled at the expense of the M ring with the emission of the line α_L. In other atoms it will be an electron from the M ring that will jump directly to the K ring emitting the line β_K and so on.

The emission of the series is, then, a statistical phenomenon resulting from events which occur in a large number of perturbed

atoms and the intensity of a line measures the probability of the particular combination of levels to which it corresponds.

Consider for an instant the higher terms of a series whose initial levels belong to the outer regions of the atom. They will have frequencies approaching the critical frequency of their final levels and their existence will depend on the real or virtual state of the outer initial levels. The series will thus be more numerous for the elements of high atomic weight, in which the levels occupied by electrons are themselves more numerous. External actions, chemical action, forces of cohesion, etc., which modify the surface levels, will likewise influence the higher terms of the series.

In fine it is by the lines close to the critical discontinuity that the influences of outside agents will be manifest. These lines may thus share with the lines of the luminous spectrum certain properties which will be absent in the lines arising from inner levels, the latter being practically independent of outside influences.

With the help of the preceding considerations we may describe in a summary and general way the properties of X-rays from the point of view of their emission and of their absorption by matter.

Emission.—For X-rays to be emitted there must be a vacant place among the electrons of the atomic layers, and this phenomenon occurs in the following cases:—

1. When the atom is ionised by collisions with other atoms or molecules, if these collisions are sufficiently intense. It is such collisions which give rise to the X-rays of very long wave-length in gaseous discharge tubes, and which also, by reason of the thermal agitation at very high temperatures, give rise to rays of shorter wave-length such as those which are met with in the hot stars.

2. When the atom has absorbed a primary radiation which has removed an electron by the action of the photoelectric effect (*see* below). The atom then returns to its normal state with emission of rays of greater wave length than those of the exciting radiation; this is the most general case of secondary radiation. On irradiating a body with X-rays of frequency greater than of its K absorption discontinuity it is caused to emit the complete series of its normal X-rays.

3. When the atom is ionised as a result of a collision with fast electrons, it is then necessary, as shown by the experiments of Duane and Hunt and of Webster, for the energy of the exciting electron to be greater than the quantum $h\nu$ of the discontinuity which characterises the level whence the atomic electrons are removed; it is this process which takes place in the X-ray tubes. A tube which has been evacuated, contains an anticathode of the element the rays of which it is desired to obtain. If the tube contains a little residual gas, electrons of the cathode stream strike the anticathode and by their collision cause the emission of X-rays; their number, however, is difficult to regulate and their speed ill-defined. A better result is obtained by employing a tube with an incandescent cathode of the Coolidge type. (*See* RÖNTGEN RAYS: *Applications.*) Such an incandescent filament serving as a cathode emits electrons of which the speed is a function of the applied voltage and the number a function of the temperature of the filament, *i.e.*, on the magnitude of the heating current. We thus have a known number of electrons of known energy.

The characteristic rays taken as a whole (*i.e.*, the K series, L series, M series, etc.) do not constitute the total radiation emitted from a target when it is subjected to the bombardment of a stream of electrons. There is, in addition, a continuous spectrum, more pronounced in the case of the elements of high atomic number, which is quite different in nature from the characteristic rays. The commencement of this spectrum, on the high frequency side, is abrupt and corresponds to the energy of the exciting cathode rays, as given by the quantum relation. That is to say, the highest frequency emitted, $h\nu_{max}$, is connected with the potential V applied to the tube by the formula

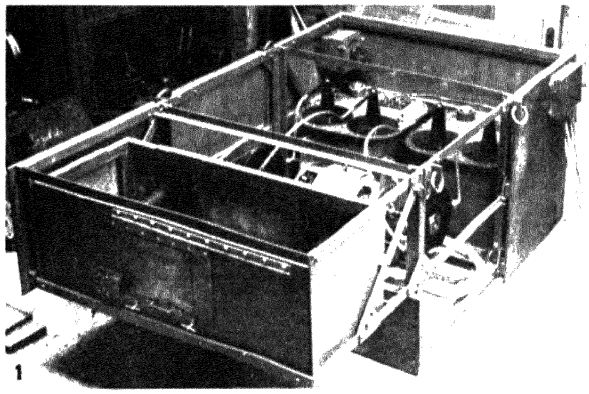
$$h\nu_{max} = eV$$

where e represents the electronic charge and h Planck's constant.

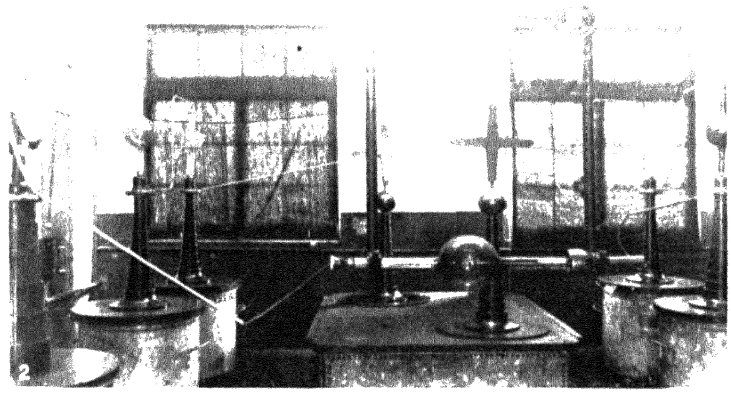
The examination of the distribution of the intensities as a function of the wave-length in the continuous spectrum shows that after this abrupt beginning, the intensity increases with increase of wave-length and passes through a pronounced maximum. There is a certain analogy with the well known curve which represents the emission of radiation by a black body; a fact which has not failed to attract attention. When the radiation is measured in various azimuths with respect to the exciting pencil of cathode rays, the position of the beginning of the spectrum remains invariable, but the intensity distribution is found to be modified. In accordance with theoretical predictions, the proportion of the high frequencies is much greater in the direction of the cathode rays.

The mechanism of the production of this continuous background still remains obscure. Attempts were made in the first place to find in it the radiation which the electromagnetic theory predicts in the case when an electron undergoes a change in its velocity but we have a very imperfect acquaintance with the laws of decrease of velocity of the fast electrons when they penetrate into matter. It is certain that the old classical theories are not sufficient and that it is necessary to introduce the idea of quanta. The recent experiments of Davisson and Germer, G. P. Thomson, etc., confirming the conceptions of the wave mechanics, have thrown new light on the behaviour of the electrons when they travel through an obstacle. In this way will be found perhaps a satisfactory explanation of the experimental data concerning the continuous spectral background of the Röntgen rays.

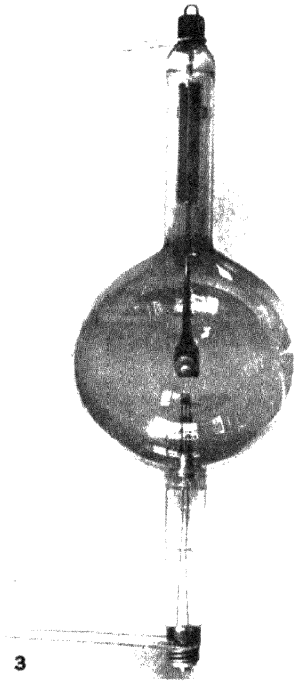
Absorption.—The best known property of X-rays, which has attracted wide attention to this type of radiation, is their ability to penetrate substances quite opaque to ordinary light, but it must not be thought that all X-rays are equally penetrating. Their absorption depends in a simple and general way on the wave-length of the rays and on the atomic number of the absorbing body; the higher the frequency of the rays and the lower the atomic number of the absorbing body, the greater will be the transparency. Certain rays are able to penetrate several centimetres of steel while others are stopped by a few millimetres of air.



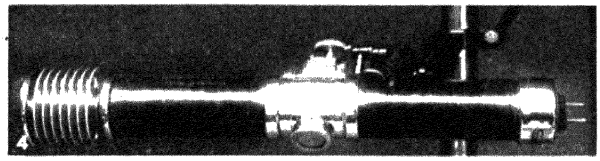
The study of the gradual diminution of intensity undergone by a beam of X-rays in passing through matter has shown that it depends on two different causes. On one hand the presence of atoms of matter in the path of the beam causes a scattering of a fraction of the latter in all directions in space; on the other hand, the same atoms are capable of absorbing quanta of the incident radiation while undergoing a more or less intense ionisation.



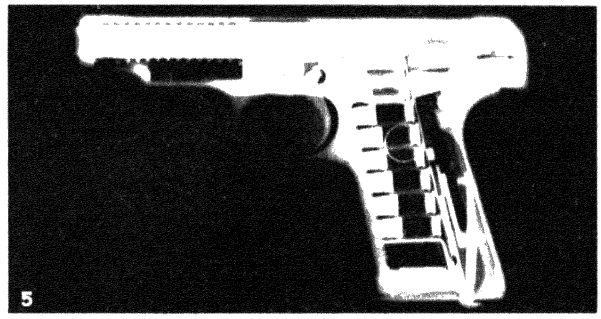
The first phenomenon has been called "scattering" and may be effected moreover in two very different ways, with which we shall have to deal later. The second phenomenon is that of absorption properly so called; let us recall first how we may represent it on the Rutherford-Bohr model. Several groups of electrons exist in the atom and to remove an electron of any group from the atom, a definite amount of energy must be supplied. When the atom is placed in a radiation of frequency ν, or when it is bombarded by quanta $h\nu$, the electrons whose energy of ejection is less than $h\nu$ may in certain favourable cases be ejected from the atom by the absorption of a quantum. Experiments have up to now always indicated that quanta of radiant energy are absorbed as a whole; if then a quantity of energy W_n is necessary to remove an electron of the nth class, the latter will leave the atom after an absorption of a quantum $h\nu > W_n$ and with kinetic energy



$$\tfrac{1}{2}mv^2 = h\nu - W_n.$$



This is Einstein's law of photoelectricity. After the departure of the electron, the atom remains in an abnormal ionised state; we know that it is then in a condition to emit one of the lines of the series characterised by the spectral term $\frac{W_n}{h}$.



The phenomenon of absorption can thus be viewed in two different aspects according as attention is directed to the diminished intensity of the resulting X-ray beam or to the modifications produced by it in the state of the matter irradiated. The first point of view, to which we will keep in the following paragraphs, corresponds to the study of the law of absorption; the second leads to an examination of the photoelectric effect itself, that is

X-RAY APPARATUS, AND SPECIMENS OF RESULTS OBTAINED

1. Self-contained and self-protecting 200,000 volt X-ray installation, as used for the routine examination of castings. 2. A 400,000 volt X-ray installation, showing transformer, in centre four valve rectifiers, and high power Coolidge tube. 3. Coolidge tube. 4. "Metalix" hot-cathode X-ray radiator, with heat-radiating fins at top. 7. Common photograph of butt weld, apparently sound. 8. Radiograph of the human teeth, revealing a metallic filling. 9. Radiograph illustrating hidden cracks in casting. 10. (Upper) Radiograph of poor butt weld. (Lower) Radiograph of good weld

to say the expulsion of electrons by the absorption of quanta of radiation, and is the subject of a later paragraph.

Let us consider solely the diminution in intensity of a beam of X-rays of wave length λ passing through an element of atomic number N; the intensity of the beam after having passed through a thickness x of the absorbing material, is related to the initial intensity by the relation

$$I_x = I_0 \epsilon^{-\tau x}.$$

The absorption is said to follow the exponential law. The quantity τ, *i.e.*, the coefficient of total absorption, is the sum of two other quantities σ and μ, the first of which expresses the effect of scattering and the second that of the true absorption. The scattering, and therefore the coefficient σ, varies but little with the atomic number, while on the other hand the absorption, and the coefficient μ increase rapidly with N. This difference in the variations of the two phenomena permits their contributions to the total diminution in intensity to be separated; in particular, for dense materials and X-rays of the more normal wave-lengths, scattering is practically negligible in comparison with absorption, thereby simplifying the study of the latter. It seems natural to introduce besides the coefficient μ of the exponential law, the coefficient μ/ρ of absorption per unit mass, where ρ denotes the density of the absorbing material, and the coefficient of atomic absorption μ_{at} related to the preceding by the atomic weight of the absorbing body and Avogadro's number.

In 1914 Bragg and Peirce showed that apart from the discontinuities, the quality μ/ρ approximately followed a law of the form

$$\frac{\mu}{\rho} = C\lambda^3 N^3.$$

The coefficient C assumes a new value at each discontinuity.

Numerous experimental researches have confirmed this result, but the values of the powers of λ and of N, though certainly in the neighbourhood of 3, have not yet been accurately established. If we consider the absorption per atom, the preceding law becomes

$$\mu_{at} = A\lambda^3 N^4.$$

Each time one of the critical values ν_n of the frequency is passed through, in the direction of increasing frequency, the coefficient A undergoes a sudden increase. It attains its maximum value when the quantum of the radiation is greater than the energy required to remove one of the K electrons from the absorbing atom. Richtmeyer found for fairly heavy elements the value

$$A_k = 2{\cdot}29 \times 10^{-2}$$

when λ is expressed in centimetres, while Windgardh found

$$2{\cdot}44 \times 10^{-2}.$$

Bragg's law gives the variation of the coefficient μ_{at} only between the discontinuities, but we can also represent the whole of the curve by a single mathematical formula. We may consider each one of the absorption mechanisms, which come successively into play as the frequency increases, as contributing a term in $\lambda^3 N^4$ to the value of μ_{at} and write

$$\mu_{at} = \Sigma a_n \lambda^3 N^4$$

the summation extending over all groups of electrons whose "extraction work" is less than the quantum of the incident radiation. The sum Σ thus increases by one term each time the frequency passes one of the critical values ν_n. It is evident that

$$A_K = a_K + a_{L_I} + a_{L_{II}} + a_{L_{III}} \cdots$$

$$A_{L_I} = a_{L_I} + a_{L_{II}} + a_{L_{III}} \cdots.$$

It is very instructive to consider the ratio of the values of μ_{at} on the two sides of a discontinuity; this is termed the "absorption jump." The K jump has been carefully studied, especially by Allen. According to him, its value for different elements is:

	Mo (42)	Ag (47)	Tu (74)	Pb (82)
$\delta_K =$	7·4	7·1	4·7	3·9

Other writers give, it is true, slightly different figures; for example, for silver, Stoner and Martin give $\delta_K = 6{\cdot}7$ and Richtmeyer $\delta_K = 6{\cdot}6$. One thing however is certain, the K jump diminishes as the atomic number increases. This shows that the Bragg-Peirce law cannot be rigorously true, at least so far as the factor N^4 is concerned; for if it were we should have:

$$\delta_K = \frac{A_K \lambda_K^3 N^4}{A_{L_I} \lambda_K^3 N^4} = \frac{A_K}{A_{L_I}} = \text{const.}$$

and this is contrary to experience.

L. de Broglie and A. H. Kramers have put forward interesting theories to predict the values of the absorption coefficients and jumps and, although we cannot regard their arguments as rigorous, have obtained results which are confirmed at least approximately by experiments.

When a continuous spectrum is analysed by means of crystal diffraction after having passed through an absorbing screen, absorption bands are found beginning abruptly and extending towards the high frequencies. The K band is single, the L band triple whilst the M and N bands exist in still greater numbers.

Bohr's simple scheme predicted one band for each series; Sommerfeld's theory, at least in its original form, predicted only two L bands; we shall not deal with the more complicated theories by means of which attempts have been made to explain the observed phenomena. (*See* the article on the spectroscopy of X-rays by M. Siegbahn.)

Photoelectric Effect.—The absorption of X-rays by the atoms of matter is accounted for by the removal of an electron which leaves the atom with kinetic energy $h\nu = W_n$, where ν is the frequency of the absorbed radiation, and W_n is the work required for the removal of the electron. It follows that if heterogeneous radiation falls on a body, each wave-length included in the spectrum of the incident beam will be able to excite all those levels whose "extraction work" is less than its own particular quantum. Further, the characteristic rays of the irradiated body will appear as a result of the return to their normal state of the excited atoms and these radiations will act in their turn on the material of the screen to produce in it the same phenomena. We ought therefore, to observe a large series of groups of electrons, each group of corpuscles having an energy which can be expressed by a relation of the form $h\nu_p - W_q$, in conformity with Einstein's expression.

Experiments have confirmed this point of view entirely; by irradiating secondary radiators with X-rays and analysing in a magnetic field the streams of electrons produced, actual corpuscular spectra are obtained, an electronic analogy as it were, of the X-ray spectra, which yield information both as to the incident radiations and the levels of the atoms irradiated.

The photoelectric effect of X-rays can also be demonstrated by the "Cloud method" of C. T. R. Wilson. In a gas through which a beam of X-ray passes, the sinuous paths of the electrons ejected from certain atoms can be seen and photographed. In this case the phenomenon is visible for a single atom and a large number of interesting observations can be made, such, for example, as an estimation of the initial directions of the velocities of the ejected electrons.

It is thus seen that the conductivity created in the gas by X-rays results from the pairs of ions separated by the photoelectrons along their trajectory and is not a direct effect of the incident rays. Observations of the details of the phenomenon have led to the discovery that the secondary X radiation is often absorbed by the emitting atom itself and photoelectrons emerge directly (Auger effect). Several phenomena moreover, seem definitely to indicate that the radiation has a greater tendency to be absorbed by the actual atom which has emitted it than by others, and it would be of great interest to know the laws of this internal absorption.

Wilson's method enables us equally well to determine the initial direction of the velocity of the ejected electrons and to make a

comparison, either with the direction of the incident beam, or with the state of the polarisation of the latter.

In spite of the difficulty of the measurements, the fact emerges from the experiments that the electron possesses a component of velocity in the direction of propagation of the rays, and that the magnitude of this component increases with the frequency as if a certain quantity of momentum passed from the wave to the corpuscle. It seems to be equally well established that the electrons have a tendency to emerge following the direction of the electric vector of the polarised wave.

The initial velocities do not however possess a unique direction but are distributed more or less closely about a mean value; the theories of Bubb, and of Auger and Perrin, especially the latter, are interesting attempts to explain the experimental results.

Diffraction of X-rays.—The analysis of light by means of optical gratings is accomplished by allowing it to fall on a series of fine lines engraved on glass or metal, the gratings consisting of from 50 to 1,000 lines per millimetre. For radiations of wave-length a thousand times shorter, such as X-rays, it would be necessary to employ lines correspondingly more closely drawn (that is, if it was desired to follow exactly the same method, for we shall see that the artifice of "grazing incidence" enables optical gratings to be used in the study of X-rays). It is for this reason that the natural gratings afforded by crystals with their regular alignments of molecules suggested themselves.

Crystals are in fact regarded as composed of piles of equidistant planes, in which the atoms, or molecules, are distributed in a regular manner and form the intersections of a lattice system. To take a simple case, for example potassium chloride, if we suppose that the atoms of chlorine and potassium are placed at the intersections of a cubic lattice each atom will act as a diffracting centre. The effect of the whole, due to the interferences of all the elementary waves issuing from each atom, can be easily calculated.

The German physicist, von Laue, and his collaborators, Friedrich and Knipping, first succeeded in 1912 in obtaining in this way the phenomena of crystal diffraction. Von Laue gave the theory of it and Sir William Bragg showed that the diffracted rays could be considered as reflected regularly at the different planes of the crystal lattice provided that their wave-length satisfied the relation:

$$n\lambda = 2d\sin\theta$$

where n is any integer, d the spacing between the lattice planes parallel to the plane considered, and θ the angle made by the incident ray with this plane.

It is thus seen that a heterogeneous beam of X-rays, on passing through a crystalline medium, will give a series of beams whose positions can easily be predicted beforehand, and which will furnish a diagram of spots on a photographic plate placed perpendicular to the incident beam. The arrangement of these spots reflects the symmetry of the crystal employed.

If, on the other hand, we imagine a single crystalline face and cause the angle of incidence θ to vary, we shall obtain reflected rays which will correspond to the different wave lengths present in the initial beam and will consequently furnish a true spectrum thereof.

We shall not deal further with this branch of spectroscopy which will form the subject of a special section (*see* below), but we must mention here the fundamental law discovered by Moseley in 1913 and which can be expressed as follows:

The X-ray spectra of all the elements are built up on a common model; the frequencies ν of their homologous lines, expressed as a function of the atomic number N of the elements, follow the law:

$$\sqrt{\nu} = aN - b.$$

It is well known how Bohr's theory accounts for this relation, one of the most important in physics, since it expresses the unity of structure of the different atoms by pointing to the gradual and regular change in their emission lines as one runs over the entire list of the elements. It will be noticed that Moseley's law is an expression of regular increase, and is not a periodic relation such as applies to the less fundamental properties of the elements of the Mendeleyev series. This distinction arises because the majority of the other properties of the elements, *e.g.*, chemical and physical, depend upon the outer electrons of the atom, while X-ray spectra, especially the highest frequency series of the heavy elements, are governed by the electrons nearest the nucleus.

It goes without saying that the Laue diagrams furnish a most valuable means of study in the investigation of crystal structures and in general, of the different regular arrangements in which atoms and molecules may exist in material media. In this way a new method of investigation has been made available for crystallographic study.

Employing the formula $n\lambda = 2d\sin\theta$ Sir William Bragg has evaluated d by making a simple assumption regarding the arrangement of the atoms at the intersections of the crystalline lattices in the very simple cubic crystals of KCl, NaCl, etc., and then using the molecular mass and the number of atoms in a gram molecule (Avogadro's number). The estimation of the frequencies by the method based on photoelectric effect and Einstein's equation and above all the production of X-ray spectra by means of ordinary optical gratings utilising grazing incidence, have definitely established the validity of the reasoning originally used to obtain the absolute value of d. We shall simply mention that d is $2{\cdot}814\times10^{-8}$ cm. for sodium chloride, and may increase to about 100×10^{-8} cm. for the distance between the regular stratifications presented by the layers of long chain fatty acids.

To obtain diffraction effects with X-rays it is not essential to employ crystals of large dimensions. Finely powdered crystals (and even micro-crystalline structures, such as those offered by metal sheets) give rise no longer to diagrams of spots, but to more or less clearly defined circles. Even homogeneous liquids furnish diffuse halos under certain conditions, the theory of which, still somewhat uncertain, introduces the mean distances between the molecules.

For the first approximation theories of the diffraction of X-rays by arrangements of atoms assume the latter to be stationary, though they are, of course, continually displaced by thermal agitation. It is not impossible to allow for this complication, and one is led to the conclusion that the temperature does not modify the position of the spots, but diminishes their intensity in relation to that of the adjacent continuous background. Experiment has confirmed these predictions at least quantitatively.

The intensity of crystalline diffraction, its distribution among the spectra of the different orders, the variation of the effects with the degree of perfection of the crystals and the study of the distribution of the electrons in the atoms by means of these data have all given rise to interesting researches which it is impossible to outline here, but which constitute a new chapter in physical chemistry.

Scattering of X-rays.—It is a general property of light to be re-emitted by the bodies on which it falls; the rays forming an incident pencil are re-distributed in space and until recently it was admitted, without question, that their wave-length underwent no modification.

The classical theory of the scattering of X-rays has been given by Sir Joseph Thomson. It led to a prediction of the distribution of the intensities of the scattered rays in different azimuths with relation to the incident beam and to their state of polarisation. To a first approximation these predictions have been verified by experiment, as Barkla in particular has shown.

Scattering by an atom is supposed to be due to the forced vibrations of the electrons of this atom. When the distance between these electrons is great in comparison with the wave-lengths, the total intensity scattered is the sum of the intensities due to each electron, but matters become complicated if the wave-length is comparable with the dimensions of the atoms. Debye thus explained the intense scattering of soft X-rays and showed how we pass gradually to Thomson's results for high frequencies.

The fundamental phenomena of diffraction of X-rays by crystalline media has been explained on the basis of the classical theory of scattering, and the latter has great success to its credit, but it is nevertheless certain that it is insufficient.

A. H. Compton has in fact discovered a very important phenomenon, that there are in reality two kinds of scattering[1], one which takes place without a sensible change of wave length and the other in which the scattered ray has a lower frequency than that of the incident ray. The increase of wave length is then a function of the angle of scattering θ following the formula $\lambda_\theta - \lambda_0 = 2\frac{h}{m_0 c}\sin^2\frac{\theta}{2}$ where h is Planck's constant, m_0 the mass of the electron and c the velocity of light it will be noted that $\lambda_\theta - \lambda_0$ is independent of λ.

Compton and Debye have given a very interesting quantitative theory of this phenomenon based on the fact that the energy of the incident quantum is divided into two parts, one represented by the scattered radiation and the other by kinetic energy communicated to the scattering electron. The conservation of energy and the conservation of momentum are assumed between the atoms of radiation and the scattering electron (it is known from Einstein's work that a quantum of radiation $h\nu$ possesses a quantity of momentum $\frac{h\nu}{c}$).

Experiment has confirmed this theory remarkably. In particular the existence of the recoil electrons having velocities in accordance with the predictions of Compton and Debye has been demonstrated by the cloud method of C. T. R. Wilson.

We have there one of the most striking examples of the success of the corpuscular theories of light; certain particulars are however still far from clear; the electrons always behave as though quite free (or firmly bound when the scattering takes place without change of wave-length) and many points concerning the fundamental mechanism of scattering still remain obscure.

We shall mention two further experiments which Wilson's method has rendered possible and which illustrate very well these phenomena of the propagation of light in quanta.

The first is due to C. T. R. Wilson: a beam of X-rays, while passing through an expansion chamber, falls on a copper "target," and we are then able to find on the same photographic plate the trajectory of a photoelectron ejected from the copper and a little further on in the gaseous mass that of another photoelectron ejected from an atom of the gas by the fluorescent X-rays of the copper due to the first phenomenon. We cannot more directly watch the transference of energy by discrete entities.

A second experiment has been carried out by Compton and Simon: a beam of X-rays experiences scattering by an atom of gas with change of wave-length and expulsion of a recoil electron whose trajectory is recorded in the form of a "fish track"; the tangent of the angle which the trajectory makes initially with the direction of the beam can be calculated. At the same time there is a chance that the scattered quantum may be absorbed in the vicinity and furnish a photoelectron; the origin of the trajectory of this photoelectron joined to the origin of the fish track will furnish the angle of scattering, so that all the geometrical elements necessary for the verification of the Compton-Debye theory can be obtained on the one plate. Experiment has shown, that to a first approximation at least the verification is satisfactory.

Physical Optics of X-rays.—For many years it seemed impossible to establish physical optics for X-rays, but Laue's discovery, establishing their diffraction, gave rise to a new view, which lead to a recognition for these radiations of an extension of the principal properties presented by luminous radiations.

Bragg's formula—

$$n\lambda = 2d\sin\theta$$

appeared, at the outset, quite rigorous, but the very precise experiments of Siegbahn and his collaborators showed that it was not so. Ewald pointed out that this divergence is explained by supposing a refraction of the waves in the crystalline medium with an index

$$\mu = 1 - \delta \quad \text{with} \quad d = \frac{Ne^2}{2\pi m \nu^2}$$

N being the number of electrons per unit volume and ν the frequency. This gives for the index of refraction a value just a few thousandths less than unity; in passing from air into the crystal an incident ray undergoes a perceptible refraction and in certain cases a total reflection.

A. H. Compton has proved experimentally the existence of this total reflection and Siegbahn has succeeded in obtaining an actual prismatic spectrum of X-rays. The index undergoes a sudden variation when an absorption discontinuity is passed through.

The phenomenon of total reflection with grazing incidence has been utilized by Compton and Doan and by Thibaud to obtain X-ray spectra using ordinary optical gratings (gratings having even no more than 200 lines to the millimetre can be used).

Several physicists, and in particular Haga, had originally tried to obtain diffraction of X-rays by means of a fine slit, but the rays employed were of too short a wave-length to produce a perceptible effect. Holweck using radiation of the order of 100 Ångstrom units succeeded in demonstrating diffraction by a slit and specular reflection on a metallic mirror.

The very small difference separating the index of refraction of X-rays from unity renders any attempt to apply the ordinary processes of polarisation by reflection very difficult and up till now, the phenomenon of double refraction has not been found. Theory indicates however, that scattering may furnish a method of obtaining linearly polarised radiation. Barkla first showed that a scattering body, composed of a light element, gives rise to a radiation which is practically free from secondary fluorescent radiation. On examining this radiation scattered in a direction at right angles to the incident beam, polarised rays ought to be obtained, but the polarisation thus obtained, while being perceptible, is very incomplete. Much better results are obtained, as was done by Mark and Szilard, by using crystal diffraction so that the diffracted ray makes a right angle with the incident radiation.

Conclusive Remarks.—X-rays certainly play an important part in stellar physics. It must not be forgotten in fact that at a given temperature the radiation in thermal equilibrium, or black body radiation, has a definite composition in which the very high frequency radiations are only present in any considerable quantity at very high temperatures. This condition is very probably realised in the hot stars in which the atoms are practically always in a state of intense ionisation such as is never found in terrestrial phenomena.

The discovery and study of X-rays has had an especially important influence on the development of Physics. It was the properties of conducting gases which led to the discovery of electrons and to that of the radioactive bodies; the diffraction of Röntgen rays by crystals has given new life to crystallography and the study of the whole of the fine structure of matter, at the same time that it enabled X-ray spectra to be obtained. The last through Moseley's law have rendered the unity of structure of the chemical elements indisputable and supplied to the Bohr atom its strongest support.

It is the high frequency of Röntgen rays which brings out more clearly the rôle of light quanta, renders Einstein's law on the photoelectric effect the more easily verified and which permitted the discovery of the Compton effect to be made. Röntgen rays afford ground particularly favourable to the birth of new ideas in the theories of radiation; ideas which will one day lead to the reunion in the same synthesis of the undulatory and corpuscular aspects of radiation. (DE BR.)

RÖNTGEN RAYS

Applications.—X-rays were discovered in the fall of 1895 by Prof. Wilhelm Konrad Röntgen, professor of physics in the University of Wurzburg, Bavaria. The discovery was the result of a somewhat extensive research concerning the passage of an electric current in an evacuated tube. This subject had received attention for many years and X-rays had unquestionably been produced, though not recognized, by very many investigators. Probably the first person actually so to produce X-rays was William Morgan in the year 1785.

The first recognition of the new rays occurred semi-accidentally: Röntgen happened to notice that when he passed an electric discharge through his tube some crystals of barium-platinocyanide

[1] It is known that Raman has quite recently found evidence of a change in wave-length in the case of scattering of ordinary light by liquids.

which were in the vicinity became brilliantly fluorescent, although the visible light from the tube was completely screened by black paper. He also found that various substances placed between the tube and a card on which barium-platinocyanide crystals were spread cast a shadow. Röntgen named these new rays, "for the sake of brevity," X-rays. The most striking attribute of the new rays was that they had the power of penetrating objects which were opaque to ordinary light and consequently their potential value in the realm of medicine was immediately recognized. In fact, some four days after the discovery was known in America, X-rays were successfully used to locate a bullet embedded in the calf of a patient's leg.

The tube with which Röntgen made his discovery bears very little resemblance to a modern X-ray tube; it was, in fact, the commonly used glass bulb called the Crookes tube, in which the cathode stream, instead of being directed on to a metal plate, now called the target, was directed from the cathode or negative electrode on to the glass wall of the tube and produced X-rays at the place of impact.

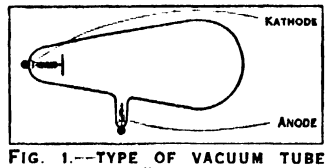

FIG. 1.—TYPE OF VACUUM TUBE WITH WHICH RÖNTGEN DISCOVERED X-RAYS

The earliest form of electrical generator to operate the vacuum X-ray tube was the induction coil, which in Röntgen's time was of a very primitive pattern. The discovery of X-rays, however, gave a great stimulus to the development of this piece of apparatus and comparatively soon afterwards mammoth induction coils were constructed having an electric potential of many thousands of volts and capable of giving electric sparks of 1 or even 2 ft. in length.

X-ray Tubes.—One of the earliest experimenters with X-rays, Sir Herbert Jackson, introduced the "focus" tube some two months after Röntgen's discovery. In this tube the cathode stream was "focussed" by means of a concave negative electrode on to a small area of a metal target which was mounted in the centre of the bulb. The actual focussing of the cathode stream, however, was not a new thing, as it had been demonstrated by Sir William Crookes some 20 years previously to show the heating effect of the cathode stream. The X-ray tube introduced by Sir Herbert Jackson has remained the standard type of tube for over 30 years, except that refinements and modifications have been added from time to time to legislate for ancillary developments. The early tubes depended for their operation upon the presence of a certain amount of residual gas, which became ionized and so provided the electrons constituting the cathode stream. Such tubes, known as gas tubes, are still in use and have many advantages.

To provide for the gradual absorption of the residual gas which takes place during operation various devices have been introduced from time to time whereby small fresh supplies of gas can be introduced into the bulb. A common form of such a regulator, as

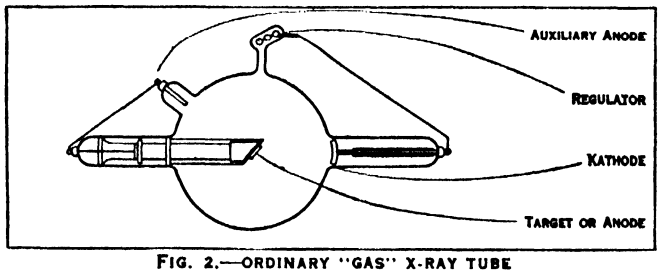

FIG. 2.—ORDINARY "GAS" X-RAY TUBE

it is called, consisted of a small piece of mica mounted in a small auxiliary tube and arranged so that the mica could be heated, the effect of which was to drive out a little air from between the layers of mica, which passed into the main bulb. In 1898 the self-regulating X-ray tube was introduced. Heated regulators were made automatic in operation by attaching wires to the regulator terminals, which could be placed quite near to the main terminals of the tube. As the gas in the X-ray tube becomes less its resistance to the passage of the current increases, and finally it arrives at a condition where it is easier for the discharge to jump from the main terminal to the regulator wire than to pass through the tube. The passage of the current through the regulating substance releases a little gas which passes into the main bulb, the resistance of which is lowered, and the discharge once more passes normally through the X-ray tube. In the early tubes platinum was generally used as the target because of its very high melting point.

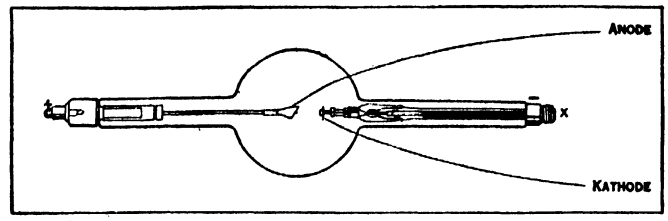

FIG. 3.—DIAGRAM OF THE STANDARD COOLIDGE X-RAY TUBE

In 1913 a new type of X-ray tube was introduced by Dr. W. D. Coolidge, of Schenectady, U.S.A. Its advent was the result of a considerable amount of work that had been done on thermionics by many investigators, notably Fleming and Richardson. The new tube is entirely independent of residual gas and depends upon the evaporation of electrons from an incandescent filament to form the cathode stream. The target of the Coolidge tube is of massive tungsten. The use of this highly desirable metal in the form of a massive target followed the valuable work done by Dr. W. D. Coolidge on the metallurgy and hot working of metallic tungsten.

Another form of hot cathode X-ray tube was invented about the same time by Lilienfeld in Germany, in which the electrons were produced in a reservoir and "boosted" by an auxiliary high tension circuit through a small hole communicating with the main portion of the tube, where they were taken in hand by the main high tension circuit and shot across to the target. By virtue of its extreme simplicity of operation, however, the Coolidge tube enjoys great popularity.

Still another type of hot cathode tube is the "Metalix," introduced by Philips of Holland; a novel feature of this tube is that it is cylindrical and narrow in shape and a large portion of the tube is made of metal. The X-rays emerge only from a comparatively small opening either at the end or in the centre. The tube is, therefore, self "protecting" and does not require the heavy and complicated tube boxes which safety of operation demands for other types of tube.

Hot cathode X-ray tubes operate at saturation voltage, and the penetrating power and X-ray intensity, which depend upon voltage and current, are adjustable and controllable independently; a state of affairs which it is impossible to realize in the older "gas" X-ray tubes.

Electrical Apparatus.—Although the induction coil is still used to provide the high tension electricity to operate X-ray tubes, it has largely been supplanted by the more consistent piece of apparatus known as the high tension transformer. The voltage delivered by such generators in common use for X-ray work may be anything from 60,000 to 250,000 volts. The normal voltage for medical and surgical radiography is about 100,000. X-rays for the treatment of disease, however, are required at 250,000 volts and even more.

The type of voltage normally yielded by a static high tension transformer is what is known as alternating; in other words, the current passes first in one direction and then in the other, the duration of each impulse being very small (there are about 100 such impulses per second in the usual type of X-ray transformer). Such an alternating supply is unsuitable for the generation of X-rays. The voltage impulses must all be in the same direction, consequently arrangements have to be made to suppress or reverse one set of impulses. The device generally employed for this purpose is a switch, the contacts of which revolve in harmony with the voltage impulses of the transformer as it is rotated by a motor run synchronously with the electrical pulsations. The electrical connections of this switch or commutator are so arranged that only current in one direction is allowed to pass through the X-ray tube. Another method of "rectification," as it is called, is by

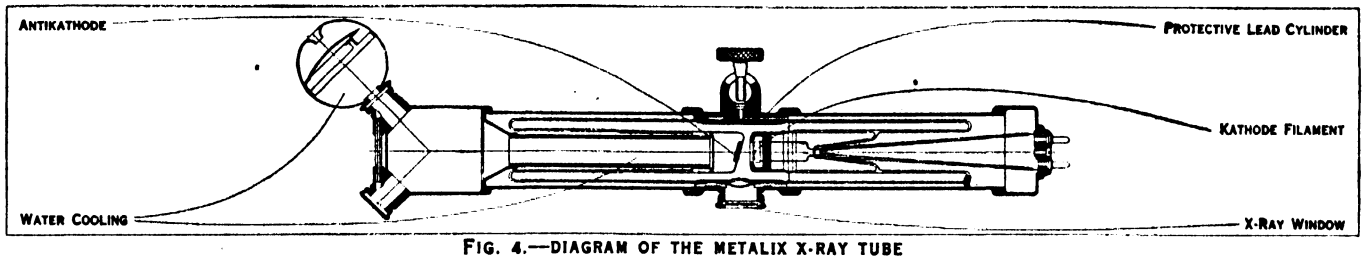

FIG. 4.—DIAGRAM OF THE METALIX X-RAY TUBE

means of large thermionic valves.

A transformer and rectifying device such as we have outlined produces what is known as a pulsating voltage. This is because each little voltage impulse grows in strength and dies away, and as it is only a portion at the maximum that is utilized in an X-ray

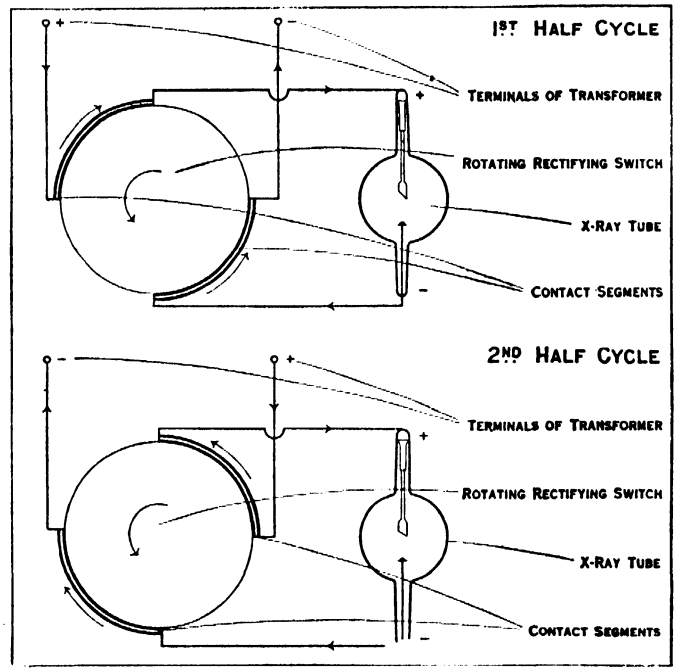

FIG. 5.—DIAGRAMS SHOWING THAT THE CURRENT IN THE X-RAY TUBE IS ALWAYS IN THE SAME DIRECTION EVEN THOUGH THE POLARITY AT THE TRANSFORMER TERMINALS IS CONTINUALLY CHANGING

tube it follows that each impulse of current is followed by an interval of no current. There is another type of X-ray transformer so arranged that certain electricity storers or condensers, as they are called, are connected in the circuit in such a way that they discharge a current during each of these intervals and so produce a constant or continuous voltage. The latter type of transformer is in fairly general use for the purpose of X-ray treatment and also for the radiography of metals.

DEVELOPMENTS

Nature and Properties.—X-rays have the power of penetrating materials which are opaque to ordinary light. This property was immediately appreciated by Röntgen. Another property, which in fact led to their discovery, is that they cause certain chemicals, for example barium-platinocyanide, to fluoresce; in other words, to emit visible light. This property is made use of in the familiar X-ray fluorescent screen, which is a piece of cardboard or other material covered with fine crystals of a suitable salt. Any object placed between the source of the X-rays and the screen throws a sharp shadow on the brilliantly glowing surface. X-rays affect a photographic plate in exactly the same way as does ordinary light, the only difference being that they act equally well whether the plate is wrapped or unwrapped. They have certain other chemical properties; for example, they cause iodine to be freed from a solution of iodoform in chloroform. They have also certain biological effects which are very imperfectly understood and form the subject of extensive research.

One of the most important properties possessed by X-rays is their power to change a non-conducting gas into an electrical conductor. It is known as the power of ionization. Like light, X-rays may be polarized and they may be diffracted by a crystal, the latter being a property of the greatest importance inasmuch as it forms the basis of the modern science of crystal analysis.

Early Applications.—The power of X-rays to penetrate opaque objects depends very largely upon the density of the material. It was very soon realized for example that flesh was more transparent to the rays than bone, and consequently it was possible to see the bones in the body. This fact was immediately recognized as being of the utmost importance and it was at once ordered by the German minister of war that the subject should be investigated from the point of view of its possible service to military surgery.

We said that the penetrability of a substance is governed by its density, but by April 1896 it had been determined that the X-ray absorbing power of a chemical element depended upon its atomic weight, which is a much more accurate statement.

During the first few weeks after Röntgen's discovery reports were received from all over the world recording the great value of the new rays. The extraction of a bullet from a patient's leg had been facilitated by their use even though it had moved some five inches from the entrance wound. In Paris the rays had been used to diagnose a diseased thigh bone and in Berlin to watch the growth of new bone following a fracture. The technique developed rapidly and by the end of Feb. 1896 the method was in comparatively general use. Twenty minutes was the average time of exposure required to obtain a radiograph of an arm in 1896. In 1928 the exposure necessary for this purpose is a small fraction of a second and the result is of course infinitely better. In May 1896 the first exclusive X-ray periodical appeared in England. It was called the *Archives of Skiagraphy*, and the first number recorded an X-ray cinematograph film 40 ft. long showing the movement of a frog's leg.

By 1897 systematic work was in progress on the biological effects of X-rays. This work had been stimulated by the early appearance of X-ray dermatitis or skin disease which had attacked various experimenters during the year 1896. It was very soon found that the action of the rays on physiological tissue was by no means consistent, some cells being stimulated by irradiation to rapid growth, others being killed and disintegrated. It was also observed that some cells exhibited much greater sensitiveness to the rays than others. These early experiments engendered the hope that X-rays would prove to be a powerful agent in the destruction of harmful bacteria in the human body—a hope that has, unfortunately, not been realized.

In 1897 Dr. Morton, of New York, obtained a remarkable radiograph of an entire and fully clothed adult body. The entire skeleton was shown and the total exposure was only 30 minutes. Noticeable among the very early medical applications of X-rays were their trial in the treatment of cancer and tuberculosis.

Although non-medical applications of X-rays are very largely a modern development, yet early in the history of the subject many such applications were suggested and even tried. One interesting application was suggested in the year 1899; it was called the "Izambard" process of printing by X-rays. A number of sheets of sensitized paper were to be piled up and the copy, which was to be prepared with an ink which was semi-opaque to X-rays, placed on the top, the whole mass was then to be radiographed. Experiments with the method showed that a block of paper some two inches in thickness could be successfully radiographed with-

out undue distortion. There are obvious disadvantages about the suggestion which caused it to be abandoned.

The radiography of metals was recognized as an important future use of X-rays as early as Feb. 1896, when Prof. A. W. Wright, of Yale university, radiographed a metallic weld and revealed a fracture which was not apparent to the eye. The very limited power of an X-ray tube prevented the development of this work for many years, but, as we shall see, it was to become hardly less important than the medical and surgical aspects. The examination of coal for impurities and ash was another early application which was to be revived some 30 years later in a more practical manner. (Kemp, *Colliery Guardian*, pp. 539-541, Feb. 29, 1924.) A short list of the various applications of X-rays which were actually tried during the time immediately following the discovery is of prophetic interest in view of our later and more systematized knowledge of the subject. They had been used to detect the adulteration of flour and sugar with sand and chalk, and in connection with the general subject of food adulteration the relative X-ray transparency of various foodstuffs was measured by Herr. W. Arnold in Germany. Other applications were:—

To detect pearls in pearl oysters;
To distinguish between real and artificial gems;
To discover the contents of postal parcels;
To recognize explosives and contraband in baggage;
To examine the insulation in electric cables.

USE IN MEDICINE

The extraordinary value of Röntgen's discovery has been nowhere more in evidence than in medicine. Although the biological effects of the rays are so little understood, it seems to be quite clear that physiological cells react to X-rays in different ways and certain organs in the body respond much more readily than others. X-rays are a most efficient cure for ringworm, yet the treatment must be exercised with great caution because of the sensitiveness of the hair follicles to the rays, the action of which may produce baldness. During the World War 1914–1918 this depilatory property was taken advantage of in a singularly ingenious manner. Tissue which was normally hair-bearing was first treated by X-rays, and it was then possible to use it for grafting in plastic surgery. Generally speaking, it has been found that X-rays in small doses tend to stimulate biological activity, while large doses tend to destroy such cells. It has been said that X-rays have a specially selective action on cancer cells and certainly their value in the treatment of cancer has been amply demonstrated. Some interesting investigations concerning the effect of X-rays on biological tissue have been published by Dr. W. Moppett, of Sydney, Australia (Moppett, *Australian Medical Journal*, vol. i. 15, April 11, 1925), who shows that the difference in the biological action of X-rays of slightly different wavelength is enormous.

The use of X-rays for the treatment of cancer and other tumours in the human body has raised a scientific question of great difficulty concerned with the accurate measurement of dosage. This is a matter of great complexity, as so many important factors are involved. Not only must the X-rays be known with great accuracy, both with regard to their quality (wave-length) and their quantity (intensity), but the intensity must be measured at the exact spot where the rays are intended to operate. A unit of X-ray intensity has been defined as that quantity of X-rays which would produce an ionization current of one electro-static unit in each cubic centimetre of air. Methods of measuring intensity have been various. Some methods seek to transform the energy of an X-ray beam into heat energy and measure it with delicate thermopiles; but the most precise method is to utilize the ionizing properties of the rays and to measure the ionization produced in a given quantity of gas. A rough-and-ready method which finds considerable favour with the medical profession, is to observe the change in colour produced in "pastilles" of barium-platinocyanide by the rays. The colour produced by any particular X-ray intensity is compared with a standard. The information so obtained, however, is not absolute but only relative. Another method of measuring X-ray intensity has been developed by Fürstenau, which depends upon the property possessed by X-rays of causing the element selenium to change its electrical resistance; but here again the results are only relative.

The use of X-rays as a curative agent has increased enormously since their value was first recognized in medicine, and their importance in this sphere is no longer second to their great value in medical and surgical diagnosis. In this branch they are not only used to examine bones and the coarser structures of the body, but the technique has so improved that the circulatory and respiratory systems are now investigated systematically by radiographical methods. By the administration of an opaque "meal" which usually consists of a barium salt in a palatable form, complicated processes of digestion may be studied by the physician as they proceed.

The question of localization of foreign bodies and foci of disease has received a considerable amount of attention and has developed into a high state of accuracy. The work was first carried out by the late Sir James Mackenzie Davidson, who developed ingenious geometric methods of localization. Stereoscopic X-ray pictures are also used in this connection and, when viewed in a suitable holder or stereoscope, afford a remarkably graphic method.

Another application of X-rays which is now in universal use is concerned with dentistry. By the development of small flexible apparatus and small X-ray tubes it has been possible so to commercialize these units that most dentists possess one as part of their ordinary equipment and the diagnosis of the condition of the roots of teeth has, by the help of X-rays, become a matter of absolute precision. Yet another practical biological application is to be found in veterinary practice, where X-rays have been shown to have considerable value. The Royal Army Veterinary Corps in England possess a specially designed installation which is in constant use.

MODERN INDUSTRIAL APPLICATIONS

The industrial applications of X-rays fall mainly into two divisions, the first being radiography or the photographic method. Under this heading we will also consider the visual examination by means of a fluorescent screen, which has obvious advantages over the photographic method in many instances. The second main division is concerned with the more difficult technique known as X-ray crystal analysis. We will consider these two spheres of usefulness in sequence.

In the first place it is in the science of engineering that X-rays have been shown to have the most important place. Engineering materials are constantly a source of weakness. Flaws and cracks in castings are always liable to occur and very often are only discovered when expensive machining has been done; they may then have to be scrapped and the work is wasted. If X-rays could be used to examine all castings immediately they would be universally employed, but unfortunately there is a limiting thickness of metal beyond which X-rays cannot penetrate. In the year 1928 this limiting thickness is about 5 in. of steel. Metal ingots and castings below this thickness are all capable of X-ray inspection although, owing to the complicated shape of many castings, their examination by X-rays is not always a practical thing. The illustrations give some idea of what a radiograph of a casting looks like. The white lines and patches indicate that in these places the metal departs from its normal homogeneity. (Plate I., fig. 9.) They represent flaws, either blowholes, inclusions, or cracks.

A certain number of patches or cracks may occur in a casting and still not be serious enough to entail its rejection. The actual significance of the X-ray picture in terms of mechanical strength is a matter for experience in interpretation. The positions and dimensions of metallic flaws may be calculated with great accuracy by stereoscopic methods. Interpretation is very quickly learnt by engineers and the radiograph becomes an infallible guide as to the soundness of material.

The faults to which castings are so liable demand continuous research in the actual process of casting various metals, and here again X-rays have become a most valuable adjunct to the conventional methods. The castings produced by a certain method

are radiographed and weak places noted, the technique is then suitably modified and the resulting castings again radiographed and so on. Among the castings and forgings that are at present radiographed on a service routine scale are those for gun carriages, aeroplane parts, locomotive parts, high pressure steam installations, and expensive steel cylinders, together with many others of specialized importance. The method is in general use in America and installations are in use for the same purpose in the factories and dockyards of the British Government.

Metallic welding affords another wide field of X-ray usefulness. All welding is liable to faults and even the best methods depend very largely upon the skill and care of the individual workman. There is no method save X-rays of testing a weld without destroying it. The illustrations show the sort of X-ray pictures yielded by good and bad welds. As a result of an extensive experience it is customary at Woolwich to estimate the mechanical strength of a weld by a mere examination of the radiograph.

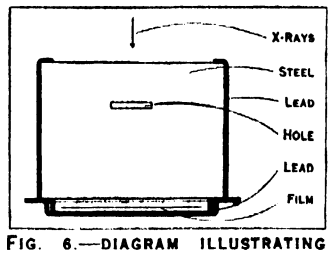

FIG. 6.—DIAGRAM ILLUSTRATING METHOD OF SCREENING TO ELIMINATE SCATTERED RADIATION

Another X-ray application has its main expression in the inspection of assembled articles, such as fuzes, where the finished product depends for its proper functioning on the completeness and correct assembly of its internal components. In such cases elaborate and expensive systems of inspection are often necessary. In many instances X-rays afford an accurate method of performing such a check. The inspection departments of the British Government have specially designed X-ray equipment for routine use in suitable cases.

Wooden structures, such as aeroplane spars, also offer a suitable field for X-ray application. Worm holes, resin pockets, and graining may be determined with great exactness.

A striking example of the value of X-rays was experienced in the World War, when strange ammunition of unknown content was radiographed before being cut up for examination, thereby avoiding all risk of accident.

In the course of a research on glued joints it was necessary to determine the disposition of the glue. By adding a small percentage of a heavy salt to the glue, thereby rendering it opaque to X-rays, the dispersion of the glue in the joint was shown with clearness in a radiograph. Motor tyres may be examined by X-rays to determine the position of the internal canvas or cords. Electric insulating materials, such as ebonite and built up paper materials, may be examined for the presence of impurities and electrically conducting particles. Abrasive wheels have been examined for cracks, and fireclay pots used in the manufacture of glass have been inspected for the presence of harmful metallic impurities. X-rays have also been used by Customs authorities to investigate the contents of sealed packages. Real pearls may be distinguished from imitation by X-rays because the real pearl emits a visible fluorescence under the action of the rays. Diamonds, which are very transparent to X-rays, may be distinguished from imitations, which as a rule are much more opaque. The use of X-rays to demonstrate the fit of shoes and boots is now a familiar sight in a boot shop. The exact measurement of the fit of screw threads is a matter that has given rise to a good deal of difficulty; X-rays are now being used for this purpose with remarkable success.

Dr. Heilbron, of Amsterdam, conducted some very remarkable and beautiful experiments with X-rays on pictures painted by old masters. The pigments of modern painters are in general much less opaque to X-rays than those used many years ago. Dr. Heilbron was able to produce X-ray evidence of extraordinary alterations having been made to some pictures. One picture examined by Dr. Heilbron was by Cornelis Engelbrechtsen, where the X-ray picture showed the figure of a vested priest which had been covered at a later date by the painted portrait of a woman. This hidden feature of the original painting had been undiscovered for 400 years. Another picture, a representation of the Madonna by Geertgen van St. Jans, was shown by the X-ray picture to have originally included an infant in the arms of the figure, which had subsequently been painted out. Many other pictures were examined with most interesting and striking results.

The development of X-ray apparatus has resulted in the production of small and portable equipments for various purposes, among which may be mentioned a set for the use of plumbers and builders to enable them to locate the position of wires and pipes in the walls and floors of buildings. The rays have also been used to detect metallic corrosion in slabs of ferro-concrete. From the examples that have been quoted it will be realized that it is difficult to imagine an industry where X-rays will not ultimately prove of service. Such unlikely specimens as chocolates, golf balls, and even elephants have been subjected to the process with useful results. The biological properties of X-rays have been pressed into industrial service in that they have been used to sterilize tobacco and cigars, and experiments have been carried out to discover whether they could be usefully employed to destroy certain harmful larvae in packing cases required for transhipment of sensitive materials.

The second main sphere of industrial X-rays depends upon the fact that, when suitable technique is employed, the constituent atoms and molecules which form a crystal reflect X-rays in a perfectly definite and regular manner, producing what is known as an X-ray spectrogram.

Different materials, when suitably excited, produce different and characteristic X-rays, consequently X-rays may be used as a method of chemical analysis. The method affords a very reliable qualitative test, and considerable work has been done in developing it as a more practical system of quantitative analysis. In certain cases X-ray chemical analysis has advantages over the conventional method, for example in certain mixed salts it is impossible by ordinary chemical methods to say how the tiny crystals of the mixture are made up. Each element, however, yields its own characteristic X-ray wave-lengths under suitable stimulus, and therefore accurate information as to the constitution of a chemical mixture may be obtained by an examination of what is called an emission spectrogram. Impurities in materials may also be detected by the same technique.

It was due to the fact that each element emits characteristic X-rays that the missing element of atomic No. 72 was discovered in 1923 by Coster and Hevesy of Copenhagen[1] and called by them Hafnium, out of compliment to the place of its discovery (Hafnia was the old name for Copenhagen). Scientific considerations led these investigators to examine the X-ray spectra yielded by certain minerals, and in the course of their investigations they discovered spectrum lines of the frequency known to be characteristic of the missing element. (*See* HAFNIUM.)

Practical applications of X-ray spectroscopy should be mentioned; but it is to be borne in mind that this aspect of the work was of much later development than radiography and involves a much more specialized knowledge, therefore it is practised chiefly in physical laboratories. Although many of the results have the greatest value in industry, yet the method, by reason of its specialized character, has not the same general use as radiography.

All substances of a crystalline nature are suitable specimens for X-ray spectroscopic investigation, for example the investigation of the minute structure of cellulose by X-rays has had the greatest value in the textile and explosive industries.

In metallurgy this particular use of X-rays has achieved universal recognition as a method of investigating the structure of metals in a way that is quite impossible by any other agency. By reason of the limiting value of the wave-lengths of visible light, there is a degree of smallness beyond which no microscope will ever be of value; X-ray spectroscopy, on the other hand, enables crystal structure to be studied with great accuracy. The effect of heat treatment of steels is a subject in which X-rays have considerable contributory value. The change in crystal structure in metals consequent upon mechanical treatment, such as rolling, may be shown by the differences produced in the resulting X-ray

[1] *Nature*, vol. iii. p. 79 (Jan. 1923).

spectrogram. The study of strain in metals is greatly facilitated by the use of X-ray spectroscopy, inasmuch as any condition resulting in the alteration of atomic structure may show itself in properly prepared X-ray spectrograms. The method has also been of assistance to the metallurgist in his study of metallic alloy systems.

Interesting work has been done on the examination of pivots by X-rays. By reason of their structure many materials have

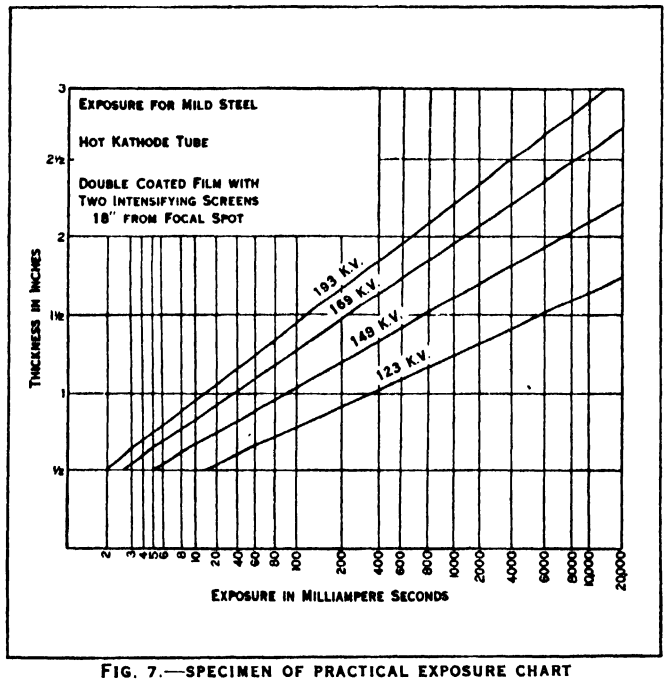

FIG. 7.—SPECIMEN OF PRACTICAL EXPOSURE CHART

much greater strength on one or two points on their surface than on others. The diamond, for example, may function perfectly as a pivot if the right spot is chosen to bear the strain. This particular spot depends upon the direction in which the constituent carbon particles are arranged. The regularity of arrangement that characterizes the diamond results in the formation of certain cleavage planes (or planes of maximum weakness), and a study of the arrangement of the carbon atoms in any particular diamond by X-rays will enable the experimenter to select that particular spot, with regard to these planes, most able to withstand wear. Explosives may be subjected to this special method of analysis in order to study the effect of atomic arrangement on their explosive properties, and their general sensitivity and stability; and also to detect impurities which may manifest themselves in the course of preparation or storage.

RADIOGRAPHIC TECHNIQUE

It is well to remember that radiography is the production of a shadow picture. The shadows exist in the picture because X-rays are absorbed to different degrees by different media. If we were to radiograph a perfectly homogeneous piece of muscle or steel we should obtain a photographic plate quite uniformly blackened because the X-ray absorption would be quite uniform. The absorption of X-rays by any material depends, firstly, upon the material itself—in general the higher its atomic weight the more absorbent it is—and, secondly, upon the penetrating power or wave-length of the X-rays. The latter condition depends, generally speaking, on the voltage which is applied to the terminals of the X-ray tube. Thus, remembering the first condition, lead is more absorbent than iron, iron more than aluminium, and aluminium more than organic substances such as flesh. At the same time, if we use an X-ray tube having a tungsten target the X-rays will be more penetrating when generated by 200,000 volts than at 100,000 volts, and so on. If a beam of X-rays of suitable penetrating power is passed through an object of varying thickness or varying composition the emerging rays (which affect the photographic plate) will have different intensities corresponding to the variations in the object, and the result will be a mixture of shadows of varying degrees of intensity. For example, a hidden cavity in a piece of metal means that the total thickness of the material is less at that particular place, and the X-ray absorption will also be less; therefore we shall obtain more intense X-rays in that area, resulting in a darker patch on the negative. If, instead of a photographic plate, we are using a fluorescent screen, we shall see a brighter patch on the screen corresponding to the more intense radiation.

Unfortunately, of the energy represented by the X-rays that fall on the photographic film only a very small fraction (less than 1%) has any photographic effect, the remainder simply passes through the emulsion without affecting it. The photographic effect, however, may be increased by the use of suitable intensifying screens that absorb more of the rays and in consequence emit actinic rays which reinforce the photographic image.

When an object is radiographed only a part of the incident radiation emerges, a large amount is absorbed and, as we say, scattered by the object itself. Not only is the radiation scattered inside the object but also at all its surfaces; and if this general scatter, which may be likened to a fog, reaches the photographic film its effect will be to produce photographic fogging and so destroy much of the valuable detail of the picture. One of the most important points, therefore, in radiographic technique is, first, to suppress all the X-rays coming from the tube except those which pass directly through the specimen to the photographic film and, secondly, to arrange that those rays which are scattered by the surfaces of the specimen itself shall be prevented as far as possible reaching the photographic emulsion.

The first condition is usually realized by enclosing the X-ray tube in a box made of a highly absorbent material; by reason of its high atomic weight, combined with its comparative cheapness, metallic lead is usually adopted for this purpose. The box is fitted with an adjustable aperture or diaphragm to control the size of the emergent X-ray beam.

There are many methods of realizing the second condition and the choice is governed by the character, shape, and size of the object to be radiographed. For medium sized objects it is often convenient to protect all the surfaces by sheet or powdered lead, and to protect the film in the same way. The diagram will illustrate the general method employed. When the object has very irregular edges it may be convenient to use a wax impregnated with lead or other heavy element. Another method is to immerse the specimen in a liquid having about the same coefficient of absorption as the specimen. In order to obtain good radiographs it is very necessary to centre the focal spot of the X-ray

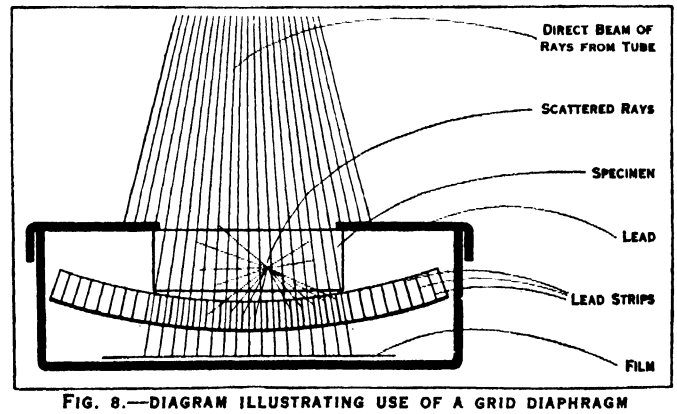

FIG. 8.—DIAGRAM ILLUSTRATING USE OF A GRID DIAPHRAGM

tube target over the middle or most important part of the object. The rays must fall nearly perpendicularly on the film, as obliquity of the rays will result in distortion and consequent loss of detail in the image.

The question of the correct exposure conditions is one of the most troublesome factors in successful radiography and calls for a great deal of experience, for it is not easy to reduce it to any general or simple rule which will fit all cases. The quantity of X-rays obtained from a tube is measured by the number of milliampéres of current passing through the tube, and exposure

is usually expressed in terms of the product of milliampéres and time, as milliampére seconds. Both the intensity and the quality of the X-rays govern exposure, and the latter also depends, therefore, upon the voltage impressed on the X-ray tube. If we wish to obtain a radiograph of a substance easily penetrable by X-rays, such as an arm, we should use a voltage of say 70,000 volts; but, on the other hand, if we wished to radiograph a thick mass of steel we should have to employ a voltage from 200,000 volts upwards. The diagram shows a typical exposure chart which has been worked out under practical conditions for mild steel.

Something has been said about the difficulty of overcoming the bad effect of scattered X-rays on a radiograph when such scattering occurs at the surfaces and edges of the specimen, and also in the surrounding medium, but the scattering which occurs *inside* the specimen has also a most deleterious effect. Much of this scattering is lost by absorption in the specimen but a great deal of it will emerge and affect the photographic emulsion, and as by its very nature it has no definite direction it will cast no definite shadow but it will merely produce a general fog. The manner in which technique seeks to overcome this difficulty is by the use of what is known as a grid. This piece of apparatus has many different forms but the principle involved is always the same. By the interposition of suitably disposed absorbing surfaces between the specimen and the film, the radiation which has not a suitably defined direction is absorbed and so prevented reaching the photographic emulsion. The diagram illustrates the general method of arrangement and shows the effect of the absorbing strips. It is obvious that the use of such a grid will result in an image of the strips appearing in the photographs as a series of lines. Although in some cases this may not detract from the value of the radiograph, yet in others it may be very undesirable. In the majority of such grids provision is made to overcome this difficulty by arranging for the system of absorbing surfaces or grids to travel across the film during the exposure at a uniform speed and in a direction at right angles to the length of the grids. Thus each part of the film is covered in turn for the same time by each grid so that no shadow results. The use of these grid diaphragms for all radiography, both medical and industrial, has become universal practice and the consequent improvement in general results is very striking.

X-ray Protection.—With the increasing application of X-rays to problems of industry the question of protection of the operator has become even more important than hitherto. X-rays are known to have serious effects upon the health of those who are exposed to their action. Fortunately it is possible, by careful design of plant, entirely to eliminate this risk. In most countries expert committees have been appointed whose business it is to lay down regulations governing the type and amount of protection that shall be used for any particular design of X-ray installation, and prospective users will be well advised to employ an expert consultant to design and certify the safety of installations required for all special purposes. The presence of high tension electric wires produce certain chemical effects in the atmosphere of the room in which they are installed. This necessitates somewhat elaborate ventilation systems to provide for a complete and frequent change of the atmosphere. Here again the expert should be consulted. If X-ray apparatus is carefully designed and the rules for its operation scrupulously adhered to, there need be no anxiety concerning the dangers of the rays. The lamentable loss of health and even of life that has been recorded among X-ray operators is, to a certain extent, due to the fact that the technique was new and in course of development, and it was quite impossible then to foresee many of the injurious effects that have now become well known. *See* RADIOTHERAPY; RADIOLOGY; X-RAY TREATMENT. X-RAYS AND CRYSTAL STRUCTURE. The idea of a regular, underlying structure has always been at the back of scientific studies of crystals. It is suggested by their very appearance, and it becomes almost a necessity to explain the regularities of the laws of the arrangements of the external faces and the physical properties of the crystals. Christian Huyghens, in the 17th century, first put forward the idea that a crystal was essentially a regular piling of atoms or molecules similar on a minute scale to a pile of shot or to the blocks of the Great Pyramid. It was not until the beginning of the 19th century, however, that the Abbé Haüy gave it a firm mathematical footing. (*See* CRYSTALLOGRAPHY.)

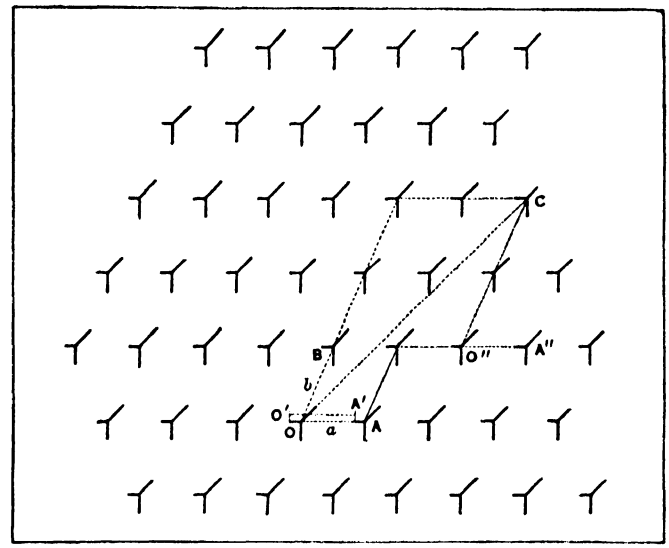

FIG. 1A

PART I. THE ANALYSIS OF STRUCTURE

The idea implicit in Haüy's work was that crystals consist of a regular ordering of exactly similar molecules in three dimensions.

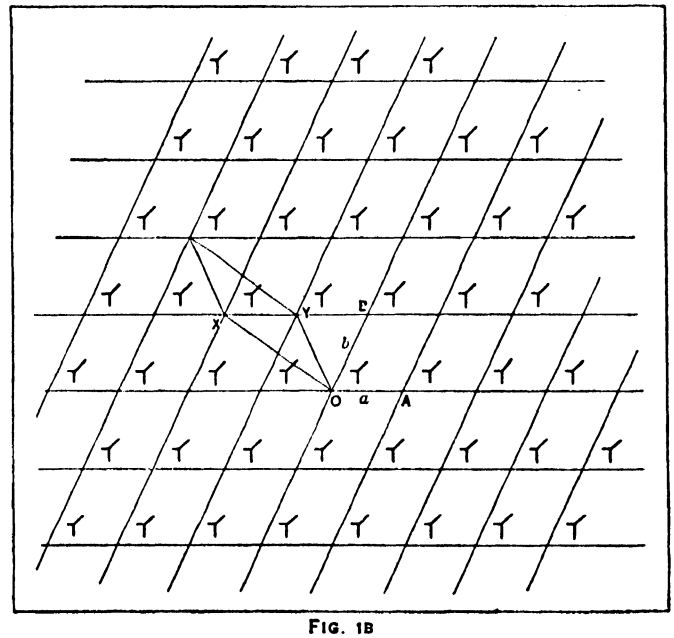

FIG. 1B

This is easiest to understand from its two dimensional analogue. In fig. 1A a set of similarly oriented identical patterns is shown, repeated supposedly indefinitely. A certain movement O–A takes me from a point O of one pattern to a corresponding point A in

another. Now an exactly similar movement O'A' would take me from any point of the pattern to the corresponding point or from any point in any pattern O'' to a corresponding point on another A''. Similarly, the different movement O–B may be seen to have the same property. They are the so-called translations of the crystal. Now we can easily see that any translation O–C can be made up of a succession of translations O–A and O–B, so that O–A and O–B may be taken as the primitive translations or the axes *a b* of the crystal. All the points derived in this way make up the

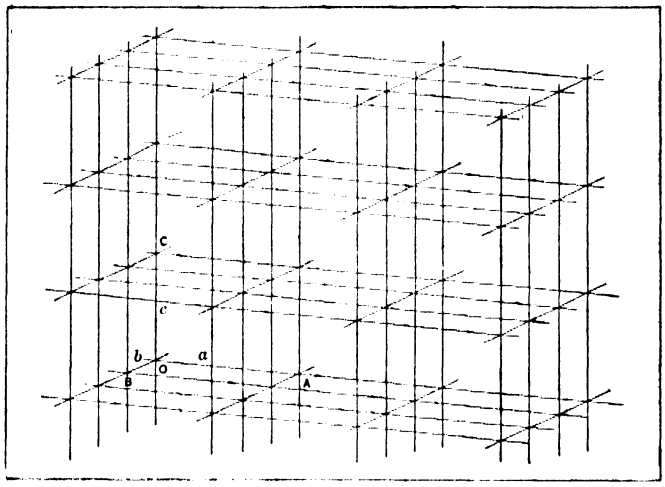

FIG. 2

lattice and by drawing lines parallel to the axes (fig. 1B) we define the cell of the crystal, the contents of all cells being identical. Of course, we might have chosen another set of axes, OX, OY instead, but the lattice is completely determined in either case by the lengths of the axes and the angle between them, and the whole crystal by the lattice and by the co-ordinates of each point in a single cell, referred to its axes as units. To extend this to three dimensions, we simply have to take another axis *c*, not in the plane of *a–b*, and the cells become parallelopipeds, extending in space in all directions. (*See* fig. 2.)

Symmetry.—Now there are other ways than translations in

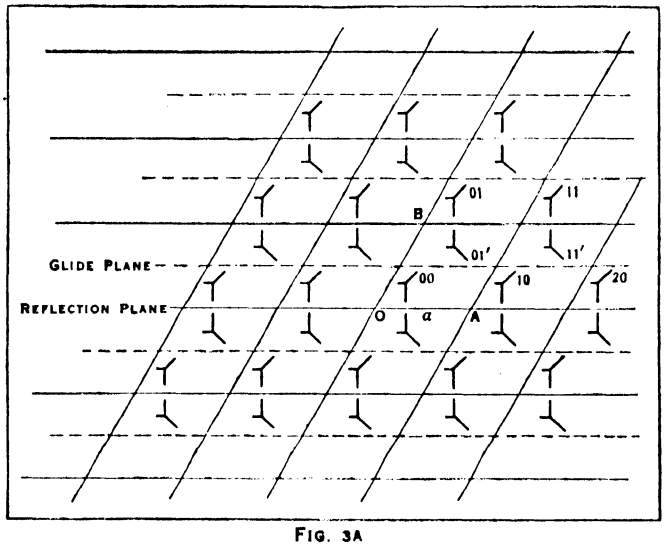

FIG. 3A

which identical patterns may appear. For instance, in fig. 3A each pattern is accompanied by its reflection in the plane O–A, imagined perpendicular to the plane of the paper; or in fig. 3B, by the two other patterns made by turning it about a three-fold axis through O. In fig. 3C we see both of these together. It is only necessary to specify the positions of one of the asymmetric patterns in the cell, and the nature of the symmetry to define the crystal as completely as before. The elements of symmetry permitted in space lattices are essentially those of crystallography, that is, two, three, four and six-fold axes, centres of symmetry, reflection planes and axes of the second sort. (*See* CRYSTALLOGRAPHY.) But there is the important condition that all axes must be translations and all planes lattice planes, and in addition, there are glide planes and screw axes. In fig. 3A we have the two rows of patterns (marked $\begin{smallmatrix}01' & 11'\\ 00 & 10 & 20\end{smallmatrix}$), each of which can be seen to be a reflection of the other in a plane, but which has also been moved on a half translation of the cell. This is called a glide plane re-

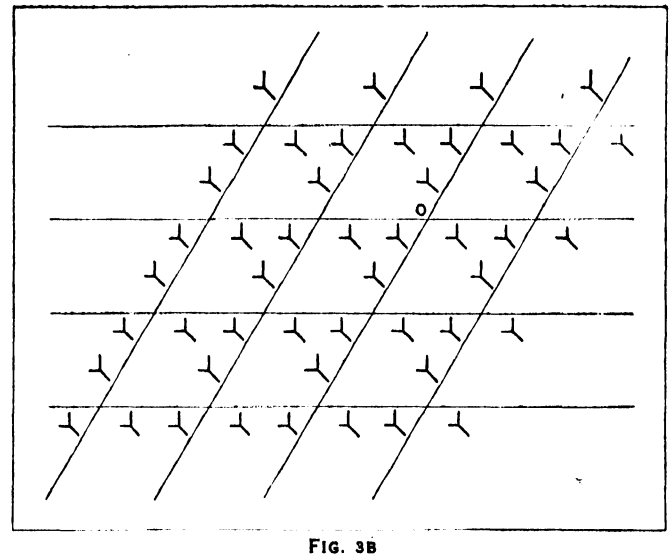

FIG. 3B

flection. An ordinary axis of symmetry is a pure rotation, but screw axes move the pattern a fraction ($\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{3}$ or $\frac{1}{6}$) of the lattice translation, parallel to the axis in each operation, so that at the end of a complete turn the pattern has moved through one translation, *e.g.*, three-fold screw axes perpendicular to the paper are shown in fig. 19. Screw axes may be right or left handed. In nature they are familiar as phyllotaxy, the arrangement of leaves on a stem.

The considerations of symmetry give us an ultimate method of classifying any regular arrangement of patterns in space. First we can divide the lattices into the fourteen types of Bravais

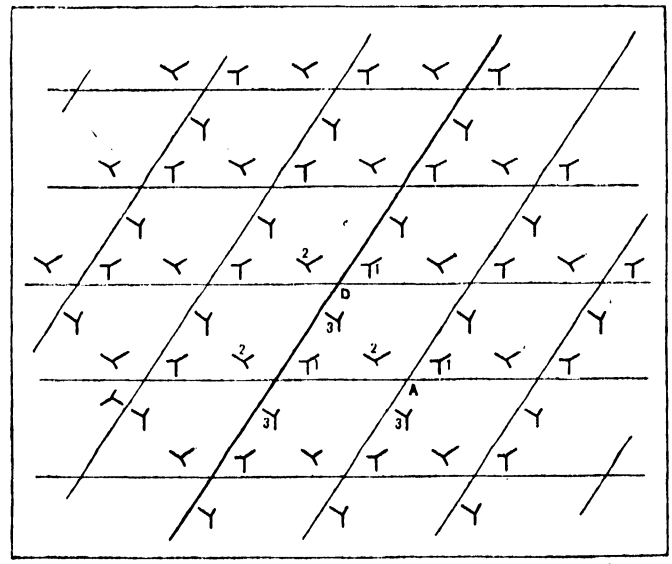

FIG. 3C

(1811–1863). (See Figure 4.) The seven systems of symmetry, cubic, tetragonal, hexagonal, rhombohedral, orthorhombic, monoclinic and triclinic, give rise to the simple lattices (i.) Γ_r, (iv.) Γ_t, (vi.) Γ_h, (vii.) Γ_{rh}, (viii.) Γ_o, (xii.) Γ_m, (xiv.) Γ_{tr}. But besides these there exist a number of face centred lattices [where the primitive translation is not from corner to corner of a rectangular face but to its midpoint]; one face centred (ix.) Γ_o', (xiii.) Γ_m' or all face centred (iii.) Γ_r'', (xi.) Γ_o'''. Lastly, there are the three

body centred lattices [where the primitive translation is to the centre of a rectangular parallelopiped rather than to its opposite corner]; (ii.) Γ_r', (v.) Γ_t', (x.) Γ_o''.

Next, we can divide the symmetry further, according to the nature of the axes and planes and the presence or absence of centres of symmetry into the thirty-two crystal classes. (*See* CRYSTALLOGRAPHY.) But the existence of glide planes and screw

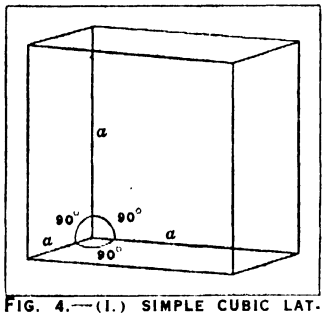

FIG. 4.—(I.) SIMPLE CUBIC LATTICE Γ_{rS} EQUAL AXES OF LENGTH ("a" AT RIGHT ANGLES)

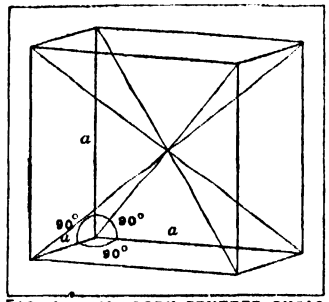

FIG. 4.—(II.) BODY CENTRED CUBIC LATTICE Γ_r (EQUIVALENT POINT IN CENTRE OF CUBE)

axes permits of still further divisions inside each class and for each variety of lattice possible in that class. If these two are specified, the complete inner symmetry or space group of the crystal is given. The determination of the two hundred and thirty possible space groups was begun by Sonchke (1842–1897) and finished by Schoenflies, Fedorow and Barlow at the beginning of the present century.

But though the geometrical frame-work for the complete description of crystal structure had thus been worked out, there remained no way of applying it, for it was impossible to determine either the nature of the lattice, the existence of screw axes and glide planes or even the size of the cell, much less the positions of the atoms in it. Yet the labour of the mathematicians was not wasted. Soon after they were concluded, a controversy was waging as to the nature of X-rays. Some maintained they were corpuscular and others that they were waves analogous to light. However, no one had then succeeded in diffracting them with a grating. (*See* LIGHT.) This seemed to show that if they were waves, their wave lengths must be much less than that of visible light, 10^{-5} cm. Now early in 1912 it occurred to von Laue, then a young physicist at Munich, who was in touch with the Crystallographic School at Groth, that the lattices of crystals, of which the little that was known indicated a periodicity of 10^{-8} cm., were of the right order to act as a grating for X-rays, and if they were waves to diffract them in definite directions. Friedrich and Knipping carried out the experiment of passing a narrow beam of X-rays through a crystal with a photographic plate behind it.

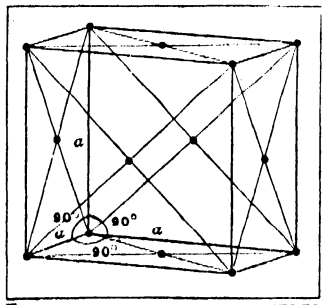

FIG. 4.—(III.) FACE CENTRED CUBIC LATTICE Γ_r'' (EQUIVALENT POINT AT CENTRES OF CUBE FACES)

The experiment was strikingly successful. The plate was covered with a regular pattern of spots, which was what von Laue had predicted. This experiment gave the key both to the nature of X-rays and the structure of crystals.

The Braggs' First Crystal Analyses.—The new discovery aroused immediate interest. In England it was taken up by Sir William Bragg and his son, W. L. Bragg, who in the same year determined the first crystal structures, those of rock salt and zinc-blende, and at the same time developed a method of analysis which was to be the basis of all further work. The way in which they accomplished the double task of determining the wave lengths of X-rays and the structure of crystals is told in their classic book, "X-rays and Crystal Structure." Here we will simplify it by assuming from the start that we can produce X-rays of single wave length λ (most easily from the fluorescent radiation of metals such as iron, copper, molybdenum and rhodium).

Bragg's Law.—The action of X-rays on crystals is best dealt with as selective reflection from crystal planes. If a set of planes be drawn through corresponding points in a crystal (*see* fig. 5A), not necessarily in any relation to the superficial faces, these will be a constant interval apart. This is the spacing of the plane d_{hkl}; ([hkl] are the Millerian indices, that is, the reciprocals of the fractional intercepts on the axes. *See* CRYSTALLOGRAPHY). If a train of waves falls on such a set of planes p (*see* fig. 6) at a glancing angle θ, each plane will reflect a small part of the wave

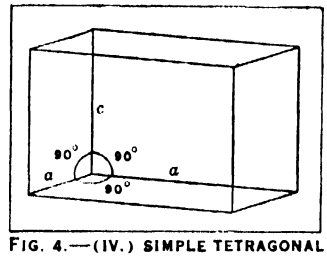

FIG. 4.—(IV.) SIMPLE TETRAGONAL LATTICE Γ_t (TWO EQUAL AXES "A" AND "C" ALL AT RIGHT ANGLES)

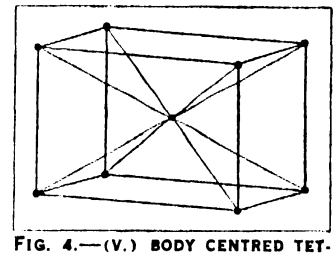

FIG. 4.—(V.) BODY CENTRED TETRAGONAL LATTICE Γ_t (EQUIVALENT POINT IN THE CENTRE OF CELL)

train regularly and let the rest through to the next plane. Now, in general, the reflected wave trains from successive planes will be out of phase with each other, will interfere and no reflection will result. (*See* LIGHT: *Interference.*) But if the path distance of the wave passing from plane to plane is a multiple of the wave length λ, all the reflected waves will be in phase and the train as a whole will be reflected by the crystal. This occurs when and only when

$$\sin\theta = n\lambda/2d.$$

This is the fundamental relation of crystal analysis known as "Bragg's Law." The integer n is the so-called order of the reflection. Thus the same plane will reflect at angles $\theta_1, \theta_2 \ldots \theta_n$, where $\sin\theta_1 = \frac{\lambda}{2d}$ $\sin\theta_2 = \frac{2\lambda}{2d} \ldots \sin\theta_n = \frac{n\lambda}{2d}$ for the same wave length. The higher the order or the smaller the spacing, the larger the angle of reflection. No plane whose spacing is less than half the wave length reflects at all. It is only necessary to measure θ, the angle at which X-rays of known wave lengths are reflected by a crystal, to know the spacing of its lattice planes.

But X-rays are able to give much more information than this. Consider a crystal with two scattering points in the cell of scattering powers A and B. (*See* Figure 5B.) Wave trains scattered

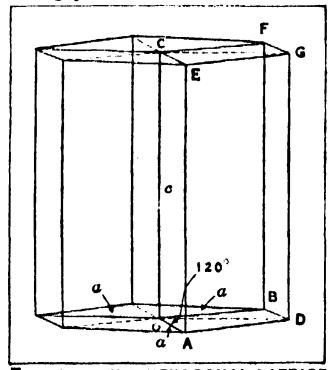

FIG. 4.—(VI.) HEXAGONAL LATTICE Γ_h (THREE CELLS SHOWN TO ILLUSTRATE THE HEXAGONAL SYMMETRY)

from the A and B plane are now out of phase and necessarily interfere. If the B planes are xd from the A's, the resulting intensity of the nth order of reflection will be proportional to $(A+B\ \cos 2\pi nx)^2+B^2\ \sin^2 2\pi nx$. If, for instance, B was half way between two A's, $x=\frac{1}{2}$, this would become $(A+B)^2$ for the even orders and $(A-B)^2$ for the odd. The even orders would be strong and the odd weak, and these would vanish if A and B were equal, and the plane in this case being said to be halved. A crystal with more scattering points gives rise to a more complicated expression but it should be clear that the intensity of reflection is both an indication and a check on the positions of the scattering centres inside the cell.

The chief experimental methods are therefore devised for a double purpose. Firstly, to find the glancing angles for the X-rays reflected by the different planes of the crystal, and secondly, to measure the intensity of the X-rays reflected. There are four chief experimental methods.

In the Bragg ionisation spectrometer (*see* fig. 7) the X-rays from the tube inside the lead box pass through the two slits

A and B, which limit them to a narrow beam, and meet the crystal C mounted to rotate about a vertical axis. The reflected beam is received in an ionisation chamber I, in which there is an absorbing gas such as methylene iodide, producing ions which charge the electroscope E. The crystal and chamber are moved to record each reflection and their angular position gives the glancing angle, while the ionisation current is a measure of the intensity. The Bragg spectrometer undoubtedly provides the most thorough method, but it is slow in action and suitable only for large crystals, so that methods depending on the photographic action of X-rays have also been developed.

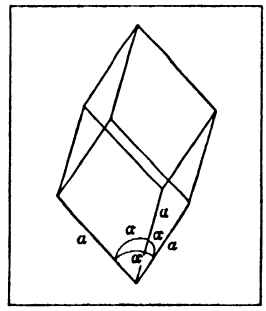

FIG. 4.—(VII.) RHOMBOHEDRAL LATTICE Γ_h
Three equal axes (a) marking an angle (d) with each other

The Rotation Method.—For the rotation originally due to de Broglie, an apparatus similar to fig. 8 is used. The X-rays from a tube not shown pass through the fine barrel aperture A and fall on the crystal C, which is rotated uniformly on the spindle S, driven by the motor M. As each crystal plane comes into a reflecting position, the reflected ray registers on the photographic plate P, producing a pattern such as shown in fig. 9. Each plane reflects four times per revolution, giving the photograph a symmetrical appearance. From the position of the spot on the plate, the spacings or the indices of the planes can be calculated. An important property of the rotation method is that if the crystal is rotated about a translation a of the lattice, all the reflected rays lie on a set of cones of angles ϕ_n where $\sin\phi = \frac{n\lambda}{a}$ these cones intersect the plate in hyperbolae called layer lines (*see* fig. 9) and their distance apart is the best measure of the true axes of the crystal. It can be seen from the photograph that the spots are of very different intensities. These are usually estimated by eye, as strong, medium, weak, etc., so that the method is definitely inferior in this respect to the ionisation spectrometer.

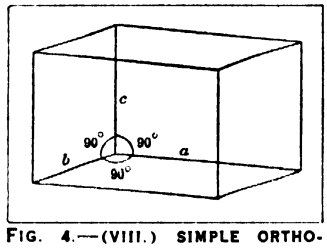

FIG. 4.—(VIII.) SIMPLE ORTHORHOMBIC LATTICE Γ_o
Three unequal axes a, b, c, at right angles

The Powder Method.—In the powder method, due to Debye and to Hull and Scherrer, a crystalline powder is used instead of a single crystal, depending on the fact that among so many grains some will be in the exact position to reflect. Consequently from the central beam diverge a set of cones each corresponding to the reflection from a single plane and forming circular rings on a plate (*see* fig. 12a) or so-called Debye curves on a film bent round a cylinder (*see* fig. 12b). Unfortunately, many planes often have the same or nearly the same spacings, which causes them to be confused and limits the method to simple crystals. However, as it is the only method for substances which cannot be obtained as single crystals, it is very useful, particularly for metals.

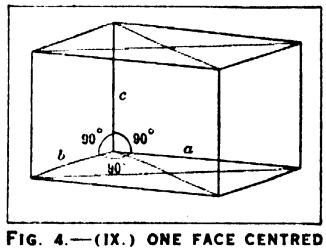

FIG. 4.—(IX.) ONE FACE CENTRED ORTHORHOMBIC LATTICE Γ' AS (VIII.) BUT WITH AN EQUIVALENT POINT AT THE CENTRE OF ONE PAIR OF FACES

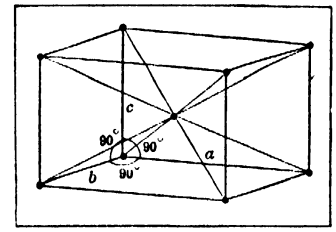
The Laue method depends on a different principle from the first three. Here the crystal is kept fixed, and a beam of white X-rays, that is with wave lengths ranging from between ·25 to ·5 A. (Ångström units = 10^{-8} cm.), is passed through it, usualy parallel to a crystallographic axis. The apparatus used is the same as before (*see* fig. 8). For a great number of planes there will always be some wave length which is right for reflection and a spot is formed, the position of which depends only on the angular position of the reflecting plane. Thus the Laue method gives no information as to spacing. But, as can be seen from the photographs (*see* fig. 11a and b) it gives an excellent picture of the symmetry of the crystal and also of the relative intensities of a great number of reflecting planes.

Plainly, though any one of these methods but the last could be and has been used alone for crystal analysis, it is much better to use all to amplify and check each other's results. In this way we arrive at the experimental data for crystal analysis; *the spacings and intensities of the X-ray reflections of a number of planes of known indices.*



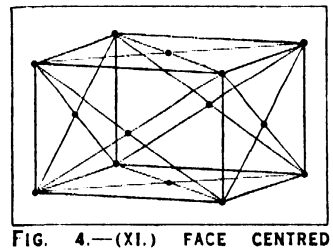


FIG. 4.—(X.) BODY CENTRED ORTHORHOMBIC LATTICE Γ_o'' AS VIII. BUT WITH AN EQUIVALENT POINT IN CENTRE OF CELL

Stages in Structure Analysis.—With these data the actual analysis divides into two parts. It is carried out schematically as follows:

1. *Determination of Cell Size.* The lengths of the three axes, a, b, c, are found from rotation photographs or from the spacing of planes given by the formula

$$d_{hkl} = \frac{1}{\sqrt{\left(\frac{h^2}{a^2} + \frac{k^2}{b^2} + \frac{l^2}{c^2}\right)}}$$

for orthogonal crystals. For monoclinic and triclinic crystals it is more complicated and here the angles between the axes are usually obtained from the external crystal form. It is easiest to use the pinacoid spacings (100) (010) (001), which give the axes directly, but these may be halved, so for the true cell, one general plane (hkl) at least must be taken.

FIG. 4.—(XI.) FACE CENTRED ORTHORHOMBIC LATTICE Γ_o''' AS (VIII.) BUT WITH EQUIVALENT POINTS IN CENTRES OF ALL SIX FACES

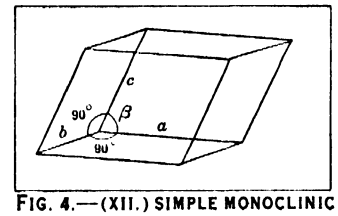

FIG. 4.—(XII.) SIMPLE MONOCLINIC LATTICE Γ_m
Two axes d and c making an angle B with each other and one axis b perpendicular to both of them

2. *Determination of the number of molecules per cell.* If D is the density of the crystal, and V its volume in cu.A. ($V = abc$ for an orthogonal cell), then the cell will contain Z molecules of molecular weight M, where $Z \times M \times 1{\cdot}66D \times V$. $1{\cdot}66 \times 10^{-24}$ being the weight of an atom.

3. *Determination of the Lattice Type.* This is done by means of the halvings of planes of the type (hkl). In simple lattices there are no inner regularities and all kinds of planes appear, whereas in centred lattices, certain planes are inter-spaced identically so that they do not reflect in odd orders and are said to be halved. A halving when h+k is odd will, for instance, indicate a c face-centred lattice Γ_o' (*see* fig. 4 [xiii]).

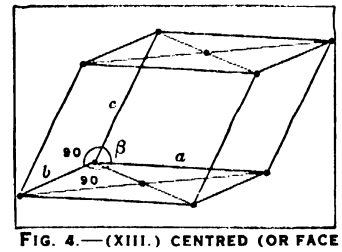

FIG. 4.—(XIII.) CENTRED (OR FACE CENTRED) MONOCLINIC LATTICE Γ_m' (EQUIVALENT POINTS IN THE CENTRES OF [A, B] FACES)

4. *Determination of Space Group.* It is first necessary to know the crystal class. This must be done by the methods of ordinary crystallography. Laue photographs are useful in detecting axes, but unfortunately, X-ray methods cannot distinguish directly between crystals with or without a centre of symmetry. Next, screw axes and glide planes can be detected, for the former cause all orders of the plane normal to it to disappear except that corresponding to a multiple of the screw translation, *e.g.*, in quartz, owing to the trigonal screw axis, perpendicular to the c plane, only

the third, sixth, ninth, etc., orders of this plane reflect. Glide planes, on the other hand, halve whole sets of planes of the type (hko), where $h+k$ is odd. Space groups are usually found by the use of tables, of which those of Astbury and Yardley and Wyckoff are most used. They are denoted by a complex symbol, such as D^4_{6h}, where D_{6h} stands for the symmetry class and $_4$ is the ordinal number in a space group table, usually that of Schoenflies.

Once the space group is known and the number of molecules per cell, the symmetry of the individual molecule follows, which is in general lower than that of the crystal. Further, the conditions of symmetry fix the positions of the atoms within certain limits. If we designate the co-ordinates of the atom, referred to the axes $a\ b\ c$ as $u\ v\ w$, the so-called parameters of the atom, then the symmetry conditions may fix the values of $u\ v\ w$ within certain limits. If there are very few atoms of a particular kind in the cell, $u\ v\ w$ may become 0 0 0 or 1/2 1/2 1/2, that is, the atom must be at a corner or in the centre of a cell. Or two parameters may be fixed, 0 0 v, fixing the atom anywhere on the c axis; or $o\ v\ w$, fixing it anywhere in the a plane. However, it is only in the simplest cases that the symmetry positions fix all the atomic positions. Usually, a set of independent parameters are left undetermined, which may be only one, as in graphite, or twenty or more as in a silicate. The difficulty of fixing parameters leads to many crystals being left at this stage, but though it is indirect, the fixing of parameters by means of intensity considerations is far the most interesting part of crystal analysis.

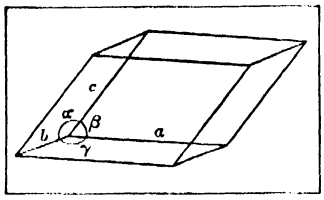

FIG. 4.—(XIV.) TRICLINIC LATTICE Γ_{1r}
Three unequal axis a, b, c, inclined at angles d, b, y to each other

The method consists in assuming certain values for the parameters and calculating from these the theoretical intensity of reflections from a set of planes. These are compared with the observed intensities, and the process repeated by trial and error, until the theoretical and observed intensities agree within the errors of the experiment. In many ways this method resembles the solution of a cross-word puzzle. The cell and space group provide the square and the pattern, the atoms the letters and the intensities the clues.

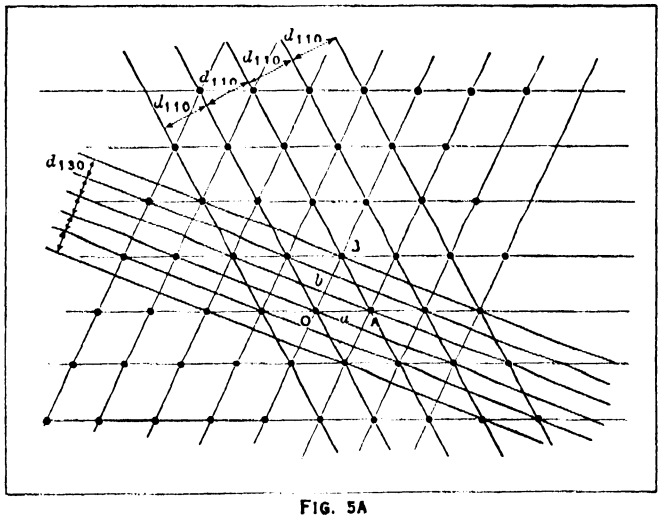

FIG. 5A

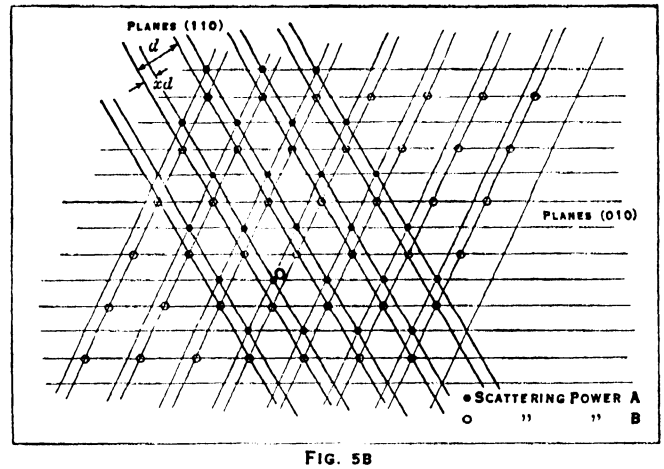
Atomic Structure Factors.—The amplitude of the reflection from the plane (hkl) of a crystal which has n atoms per cell with the parameters $u_1\ v_1\ w_1$, $u_2\ v_2\ w_2$, ... $u_n\ v_n'\ w_n$ is given by

$$C_{(\theta)} \sum_{1 \ldots n} F_{(r\theta)}\, e^{2\pi i(hu_r+kv_r+lw_r)}.$$

$C\theta$ is the J. J. Thomson formula for the scattering from a single electron, which depends only on the angle of scattering θ. F_1, F_2, ... F_n are the so-called structure factors of the different atoms. If the atoms scattered as a point, $F_r = Z_r$ the total number of electrons in the atom. Actually, the electrons are diffused in space, so that their scattered radiations interfere, making F fall off very rapidly with the angle θ, particularly for light atoms. Structure factor curves giving $F\theta$ can be found experimentally for each kind of atom or calculated from the wave mechanics distribution of electricity in the atom, as has been done by Pauling and Hartree. The exponential terms simply allow for the phase difference of the different atomic centres for the reflection of the plane (hkl). The observed intensity, before comparison with the calculated, must itself be corrected for absorption of the X-rays in the crystal, which is complicated by the fact that the very reflections of the X-rays increase the absorption differently for each plane. Corrections must also be made for temperature effects, as the atoms in a crystal vibrate more at higher temperatures, which reduces the reflection intensity.



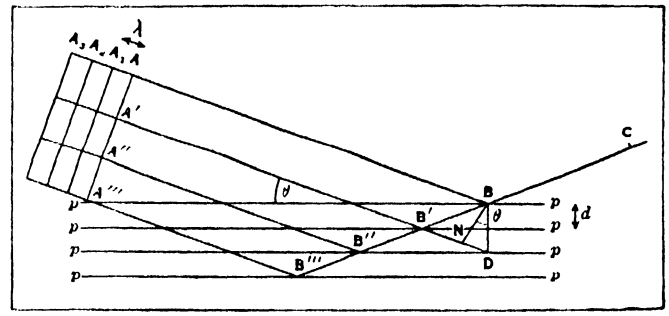


FIG. 5B

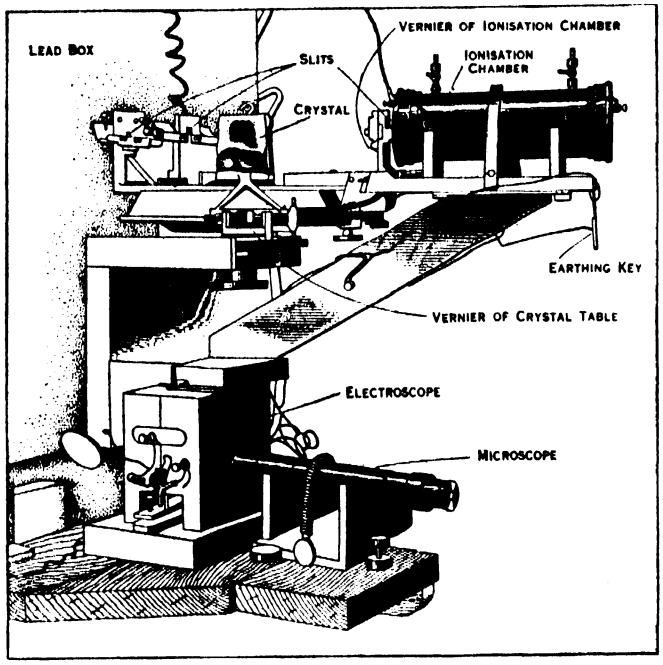
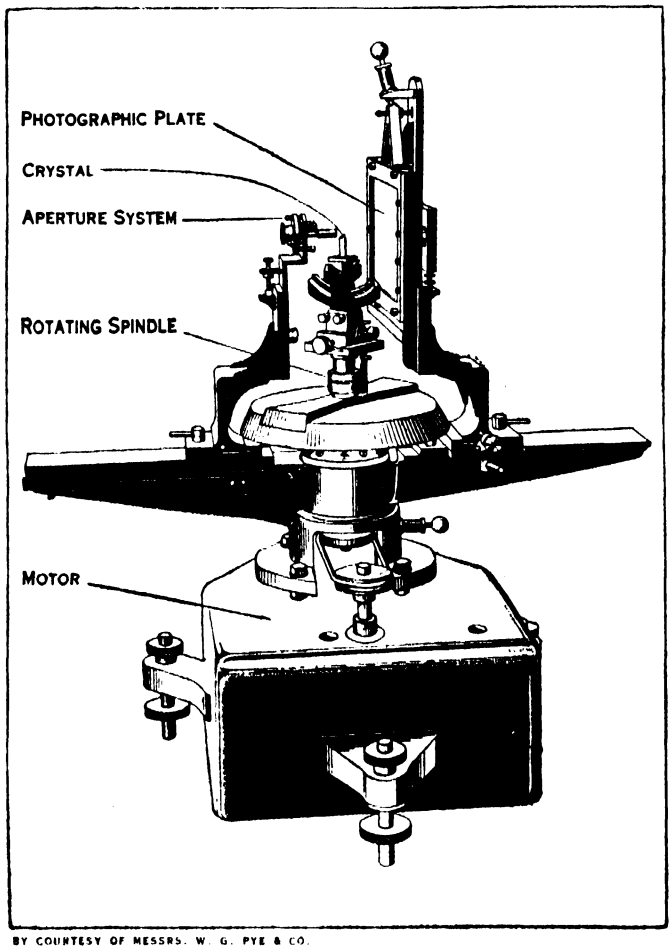


The calculation and comparison of intensities is a lengthy but straight-forward process, but the assigning of parameters is like solving a geometrical problem and always depends, in part, on intuition. Gradually, however, as more and more structures are being worked out, probable arrangements of atoms can be seen more easily, particularly by the use of the ideas of atomic diameters and co-ordination numbers (*see* Part II.). It was by the use of these that Pauling and West successfully and independently predicted the structure of topaz $Al_2S{\cdot}O_4F_2$. But however the parameters are obtained, good intensity agreement absolutely confirms the structure as correct because the slightest change of atomic position causes such changes in intensity distribution between the different reflections as to wholly upset the agreement.

FROM BRAGG, "X-RAYS AND CRYSTAL STRUCTURE" (G. BELL & SONS)

FIG. 6



This completes our account of the methods of crystal analysis as far as the positions of the atoms are concerned. Unfortunately, to illustrate it with even a single example, would exceed the length of this article, and the reader must be content with the results of the analysis given in Part II. Strictly, however, merely to know the position of the centres of the atoms in a crystal, is only the beginning of a real knowledge of their structure. A complete knowledge must also include a quantitative account of the forces by which the crystal is held in equilibrium and of the dynamics of the crystal when it is acted on by mechanical or electrical

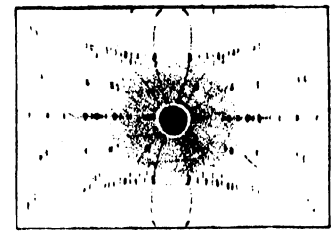
fields. Such an account should give all the mechanical and physical properties of the crystal in terms of its structure. This part of

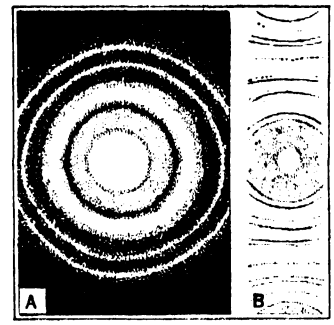


BY COURTESY OF MESSRS. W. G. PYE & CO.

FIG. 8.—APPARATUS FOR ROTATION AND LAUE PHOTOGRAPHS ETC.: (A) APERTURE SYSTEM, (C) CRYSTAL, (P) PHOTOGRAPHIC PLATE, (S) ROTATING SPINDLE

crystal analysis is only beginning, but already the work of Born, Lande, Leonard Jones Joffe and several others has accounted quantitatively for the mechanical properties of simple ionic crystals, particularly of the rock salt type.

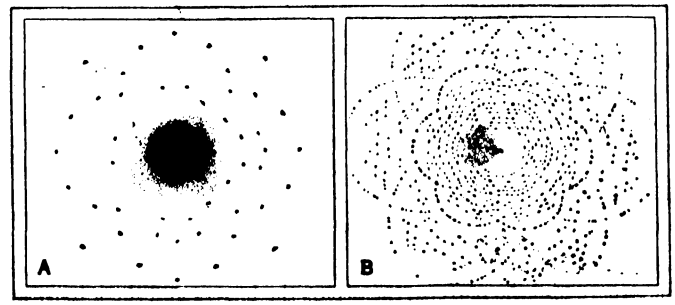
PART II. THE STRUCTURES OF CRYSTALS



Crystal Chemistry.—By the methods outlined above, the structures of an ever increasing number of crystals have been worked out every year (1926 for instance, produced over three hundred papers on the subject) yet the field is so immense and the difficulties of analysis so considerable, that we can still only deal satisfactorily with the simpler types of crystal structure. Already, however, owing to the work of Sir William and W. L. Bragg, of Fajans, Wasatsjerna, Pauling and above all, V. M. Goldschmidt, we can put forward a theory of the mode of crystal construction which can be used to predict unknown structures and structures and properties of new substances.

BY COURTESY OF J. M. ROBERTSON

FIG. 9.—ROTATION PHOTOGRAPH



To understand the essence of this theory of crystal chemistry, we must start not from the crystal but from the atom. The most convenient form in which to represent the atom for this purpose is by Schrodinger's wave mechanics. Here each atom is pictured as a nucleus of positive electricity, surrounded by shells of diffuse negative electricity, growing denser towards the centre. Each cell corresponds to a set of Bohr orbits with the same chief quantum number in the classical quantum mechanics. These electron cells serve in the first place to give the atom a finite size (*see* fig. 12). This does not mean that the atom is a rigid sphere of definite radius. The wave mechanics atom must be considered as having a definite degree of compressibility and deformability. The chemical and crystallographic properties of an atom depend partly on the size but more on the character of its outer shell of electrons.

FROM BRAGG, "X-RAY AND CRYSTAL STRUCTURE" (G. BELL & SONS)

FIG. 10.—(A) SPECTRUM OF ALUMINIUM CRYSTAL TO POWDERED FORM, (B) SPECTRUM OF GOLD

Certain arrangements of electrons (2, 8, 18, 32 for chief quantum numbers 1, 2, 3, 4) have their inner quantum numbers so balanced that they are in a condition of minimum energy and so are physically stable and without external electric fields. These arrangements occur in the inner shells of most elements (but not in the iron, palladium, platinum or rare earth groups) but only the

FROM BRAGG, "AN INTRODUCTION TO CRYSTAL STRUCTURE" (G. BELL & SONS)

FIG. 11.—LAUE PHOTOGRAPH OF: (A) ROCK SALT, (B) BERYL

elements of the inert gas group have stable outer shells. The other elements tend to fall into two groups. Those with one, two, or rarely up to four or five electrons more than the next lower stable grouping are the metals. They all tend to ionize, that is, to lose these spare electrons and assume a more stable configuration, acquiring a positive charge as a result; thus a sodium atom with eleven electrons loses one readily to become a singly charged sodium ion Na^+, with ten electrons in the configuration of the rare gas neon. The non-metallic type of atom is, on the other hand,

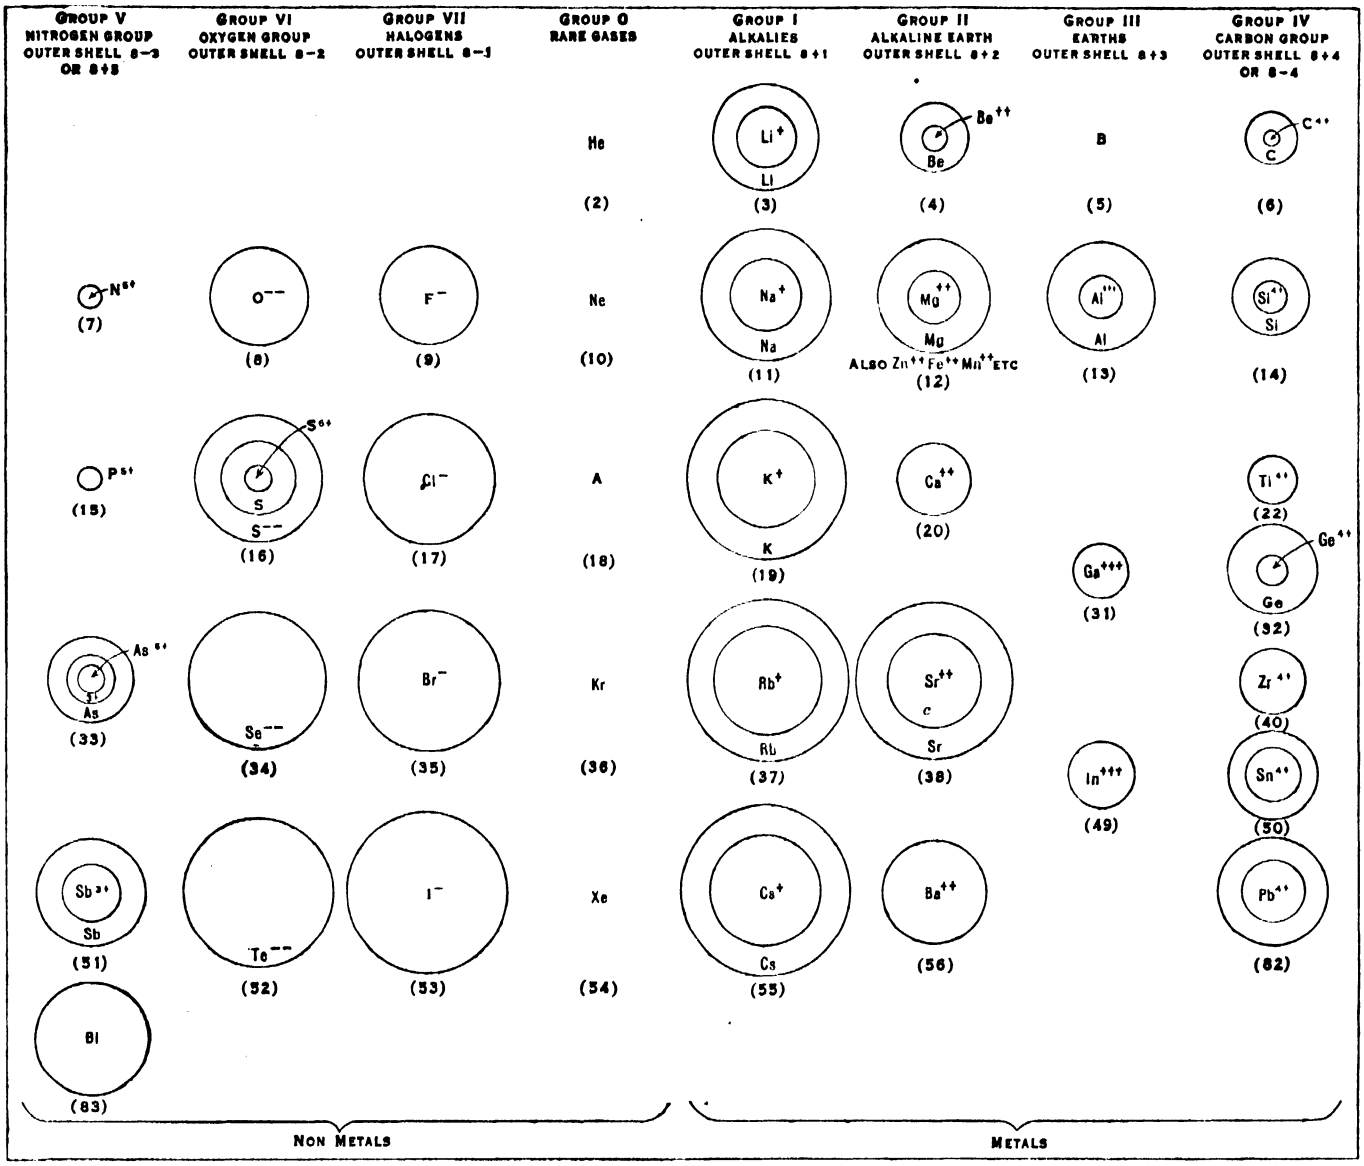


FIG. 12.—APPROXIMATE ABSOLUTE SIZES OF ATOMS AND IONS, INNER CIRCLES IN METALS AND OUTER IN NON-METALS SHOW THE IONIC STATE; NUMBERS IN () ARE ATOMIC NUMBERS (SCALE 50,000,000:1)

one, two or three electrons short of the number required to form the next stable configuration and tends to take up extra electrons to complete the shell, acquiring a negative charge in the process.

Isolated atoms and ions only exist at temperatures and pressures such as we find in stars and vacuum tubes. Under normal conditions they are always found combined. We know four such types of combination. These are called the heteropolar or ionic, the homopolar, the molecular and the metallic.

Two ions such as Na^+ and Cl^- will attract each other with a force $\frac{e^2}{r^2}$ where r is the distance between them, and there will be an equilibrium when this force balances the repulsive force existing between their outer shells at close quarters. It is this repulsive force that gives the atoms their finite size. It is also electrical in origin but much more complex and expressible in such terms as $-\frac{c}{r^9}$. In the presence, however, of more Na^+ and Cl^- ions, it is easy to see that $\overset{+\ -}{NaCl}$ will become

$$\begin{matrix} +\ - \\ NaCl \\ -\ + \\ ClNa \end{matrix} \quad \text{and then} \quad \begin{matrix} +\ -\ + \\ NaClNa \\ -\ +\ - \\ ClNaCl \\ +\ -\ + \\ NaClNa \end{matrix}$$

and so on in three dimensions, each positive ion being surrounded by as many negative ions as possible and building up a crystal of rock salt (*see* fig. 13). Ions are of very different sizes (*see* fig. 12) and when a small, highly charged positive ion such as Be^{++} is close to a large, diffuse ion S^{--}, it not only attracts it but distorts its structure, attracting the electron shell and repelling the nucleus. This is called polarisation. Polarisation is particularly effective when the negative ion is unsymmetrically surrounded by positives, as in layer lattices (*see* fig. 29). A polarised heteropolar attraction can in this way build up a complex ion, such as $(Mg^{++}O_4^{--})^{6-}$.

Homopolar Combinations.—In homopolar combination, two or more atoms with incomplete electron shells make up for their lack of stability by sharing electrons, thus achieving a completeness of outer shell for the combination which cannot exist for the individual. The simplest case is hydrogen. Individual hydrogen atoms, each with its one electron, are highly reactive because a one quantum shell is complete with two electrons, as in helium. Consequently two hydrogen atoms H combine to form the stable hydrogen molecule H_2, which spectrally and in many other ways resembles helium. In a similar way, by the sharing of a balanced pair of electrons, are formed the diatomic molecules F_2, O_2, N_2 of the non-metallic elements. An atom can share electrons with more than one other atom. Oxygen sharing electrons with two hydrogens forms the unsymmetrical water molecule $\overset{H}{\diagdown}\!\!O\!\!\overset{H}{\diagup}$ or carbon and two oxygens to form the symmetrical carbon diox-

ide O-C-O. The process, which can be extended indefinitely to form more and more complicated molecules, particularly those of organic chemistry (where the carbon atom possessing four two-electron bonds [co-valencies in modern chemical terms] which

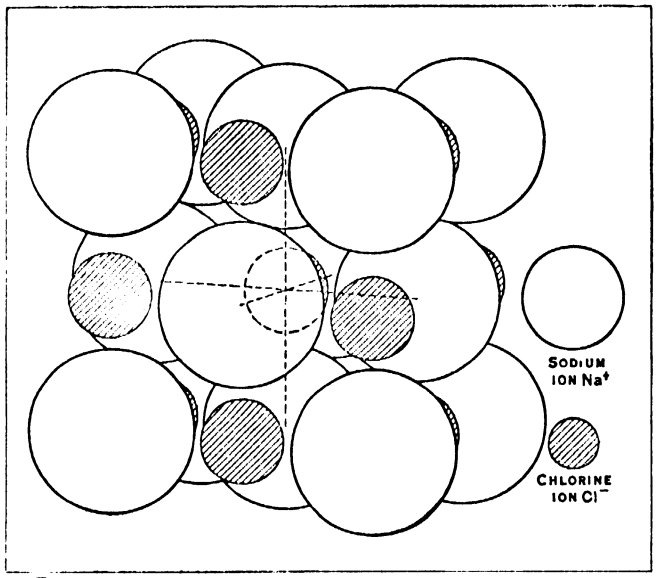

FIG. 13.—SODIUM CHLORIDE STRUCTURE (SCALE 70,000,000:1)

bring its outer shell from four to eight electrons) enables long chains of atoms to be formed as in the paraffins, or rings as in benzene derivatives. This reaches its ultimate limit when the linking is extended indefinitely in all directions and results, not in forming a molecule, but a crystal such as diamond (*see* fig. 23), which may

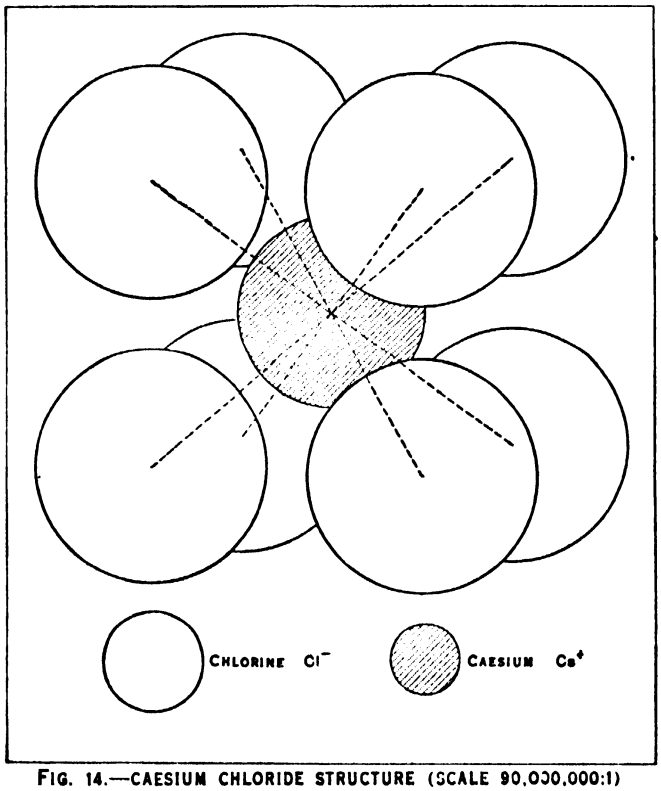

FIG. 14.—CAESIUM CHLORIDE STRUCTURE (SCALE 90,000,000:1)

be considered as one solid molecule. But homopolar bonds can also build up complex ions, such as the ammonium ion NH_4^+ with its ten electrons, which has the same relation to the neutral molecule CH_4 as the sodium ion Na^+ has to neon; or the series of negative ions ClO_4, SO_4, PO_4 and SiO_4.

Molecular Combination.—Between electrically neutral atoms and molecules which have also completed outer shells, there still exists a type of residual attraction which may be called molecular. In the simplest case of an inert gas atom, this residual attraction is only effective at very close distances and consequently, except at the lowest temperatures, the substance remains a gas. But at such temperatures it solidifies in a state of equilibrium between the attractive and repulsive forces, both probably due to distortions in the electronic structure. Very similar is the attraction

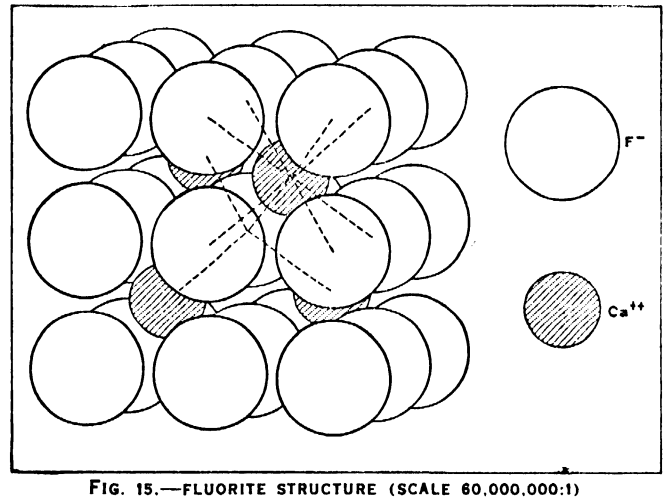

FIG. 15.—FLUORITE STRUCTURE (SCALE 60,000,000:1)

between non-polar molecules such as O_2 which also tend to have low melting points, but when a molecule is polar, that is, acts as an electric dipole or multipole, these poles attract others of opposite sign, with forces approaching those of ionic crystals.

Metallic Combination.—Metallic combination occurs when all the atoms tend easily to lose electrons. The positive ions thus formed cohere together, held by the electron gas, produced from the discarded electrons now no longer bound to particular atoms.

It is from such knowledge of the units of crystal structure, that is, atoms, simple and complex ions and molecules, and of the kind of forces holding them together, that we can see the physico-chemical meanings of the crystal structures which are found by the quite independent means of X-rays. But the process is two-sided. At the same time we learn from the structure much of the chemical and physical properties of atoms inaccessible by other methods.

Crystallised substances, that is to say, all solids with the exception of the glasses, may be divided into four main classes: the

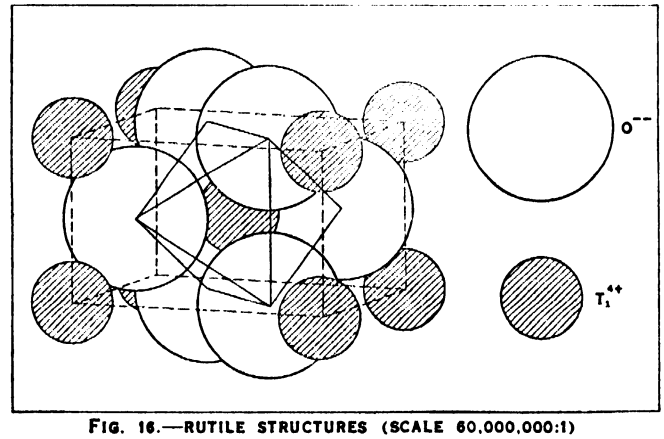

FIG. 16.—RUTILE STRUCTURES (SCALE 60,000,000:1)

ionic, the adamantine, the molecular and the metallic; and three prominent intermediate classes: the silicates, the layer lattices and the metalloids. The leading properties of these classes are shown in Table I.

Ionic crystals have been more studied than any of the other classes because the simple Coulomb electrical forces holding them together lead to simpler structures, of which it is sometimes possible to give a quantitative explanation. The first law of formation for ionic crystals was stated by Goldschmidt as follows:

Crystal type	Crystal units	Type of binding	Characteristic properties				Typical Crystals
			Optical	Electrical	Thermal	Mechanical	
Ionic	Simple and complex ions	Electrical attraction between ions of opposite signs	Transparent absorption invisible. Colour (if present) is due to atoms	Moderate insulators in high fields conduct by transfer of ions	Fairly high melting point ionization occurs in liquid and vapour	Hardness increasing with higher ionisation Tendency to fracture by cleavage	NaCl fig. (13) CaF_2 (15) $CaCO_3$ (21) K_2SO_4 $(NH_4)_2PtCl_6$ (20)
Silicate	O^{--} or F^- ions Sc^{4+} or Be^{2+} or Al^{3+} and other positive ions	Weak to moderate polarisation	In short infra red due to complex ions In long infra red due to crystal lattice Refractivity due to positive ions	When polarisation is slight they dissolve with ionisation in ionising solvents (water) when stronger are insoluble	Very high melting points, glasses formed on cooling of melt	Very hard with tendency to cleave or fracture conchoidally	Olivine Mg_2SiO_4 (22) Cyanite Al_2SiO_5 Garnet $R''_3\,R'''_2Si_3O_{12}$ Spinel Al_2MgO_4 Corundum Al_2O_3
Adamantine	Atoms of the fourth group and groups on either side of it	Homopolar bonds throughout or strongly polarized ionic binding	Transparent with high refractivity or opaque metalloidal	Diamond is a perfect insulator. The others conduct metalloidally Very insoluble	Very high melting points with tendency to vapourise except in more metalloidal	Very hard Hardness less for metalloidal types	Diamond C (23) Zinc Blende ZnS Wurtzite ZnS (24) Carborundum CSi
Molecular	Inert gas atoms Non polar and polarmolecules	Van der Waal's forces or residual electric fields between molecularpoles	Transparent optical properties due to molecules and similar to gas and liquid phases	Insulators except when very polar; soluble in non-ionizing (molecular) solvents except when polar	Melting point very low with neutral atoms, rises with heavier molecules and polar molecules	Very soft, hardness increasing with polarity of molecules. Deformation plastic	Argon A (31) CO_2 (25) Ice H_2O (18) Paraffins C_nH_{2n+2} (26) Calomel Hg_2Cl_2 (27)
Layer	Strongly polarising and easily polarised ions	In layers. Homopolar or polarised ionic Between layers Molecular	As Adamantine	Various. Similar both to molecular and adamantine	Various. Similar both to molecular and adamantine	Cleaving readily in layers which are soft and flexible	Graphite C (28) CdI_2 (29)
Metallic	Positive ions and electron gas	Electrical attraction between positive ions and electron gas?	Opaque (due to free electrons) with selective reflection in infra red	Conductors conductivity inversely proportional to no. of free electrons Soluble in acids where H^+ ions absorb free electrons	Moderate to very high melting points. Long liquid interval	Moderate hardness increased by alloying. Elastic but yield by glide plane slipping when overstressed	Copper, Iron (31) Iron, Sodium (32) Zinc (33)
Metalloidal	Metal atoms and atoms of the sulphur and arsenic type	Mixture of homopolar ionic and metallic binding	Opaque metallic or transparent with high refractivity and colour	Medium to bad conductors Soluble only with decomposition	Tendency to vaporise or decompose at high temperatures	Moderately hard to soft. Properties a mixture of those of other types	Nickel Arsenide NiAs Fahlerz R''_2SbS_3 Pyrites FeS_2 (34)

"The crystal structure of a substance is determined by the size and polarisation properties of its components, which may be atoms, ions or atomic groups."

Size of an ion is, after its charge, its most important property. It varies very greatly for different ions. In fig. 12, the size of a number of ions and atoms which illustrates their dependence on atomic number and charge, it can be seen that the size of a positive ion in the same group increases with the atomic number, while in the same series for positive ions, it decreases markedly with increasing charge, which acts by tightening the whole structure. But in negative ions, the increased size due to the repulsion of the extra electrons is counteracted by the greater fields they find themselves in, and consequently doubly charged negative ions are never greater than and sometimes smaller than singly charged. The way in which the increased charge tightens the structure is shown by the fact that KCl, where both ions have eighteen electrons, the interatomic distance is 3·14 A; whereas in CaS, also with eighteen electrons each, but quadruple electrostatic force, the corresponding distance has shrunk to 2·84 A.

The way in which atomic diameter influences structure can be seen from the simplest ionic structure of the type AX, with equal numbers of ions of opposite signs. The simplest of these is the structure of rock salt (*see* fig. 13), where sodium and chlorine ions occupy alternate corners of a cubic lattice. The co-ordination number is 6:6, that is, each sodium has six chlorine neighbours and vice versa. Actually, the chlorine ions are so large compared to the sodium that they form an octahedron that encloses it almost completely. Simple geometry shows that this can only be the case if R_A (radius of positive ion) : R_X (radius of negative ion) $<$ ·73. This relation holds for all halides of the alkaline metals with the exception of the chloride, bromide and iodide of caesium where the ratios RR are ·91, ·84 and ·75 respectively. Now these last three are the only alkaline halides which do not belong to the sodium chloride type but to the caesium type. (*See* fig. 14.) Here the co-ordination number is 8:8 and there is, so to speak, more room for the larger caesium ion inside the cube of chlorine ions. Where $R_A:R_X$ is very small, the factor of polarisation comes in, and the structure ceases to be ionic and becomes adamantine or molecular.

If we pass to the next simpler series, AX_2, a similar situation occurs. Where $R_A:R_X$ is greater than ·73, the structure is of the fluorite type. (*See* fig. 15.) Here the co-ordination number is 8:4, the calcium ions being surrounded by a cube of eight fluorine ions, just as the caesium by the chlorines. A great number of compounds belong to this type, which includes the chlorides of the alkaline earths and the oxides of zirconium, thorium and uranium. If $R_A:R_X$ lies between ·73 and ·41, a structure is formed

analogous to rock salt. This is the rutile structure. (*See* fig. 16.) Here the co-ordination number 6:3 cannot be satisfied in the cubic system and the octahedron of oxygen ions is placed on its

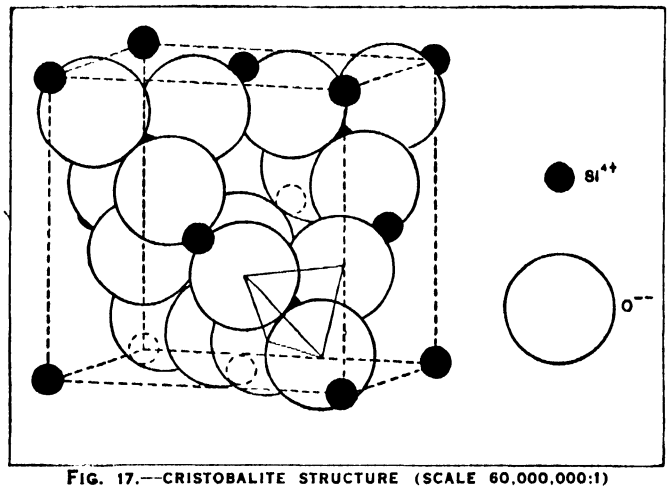

FIG. 17.—CRISTOBALITE STRUCTURE (SCALE 60,000,000:1)

side in a tetragonal structure. The two other forms of TiO_2, anatase and brookite, are also built with the same co-ordination but with the octahedra distorted and differently placed. A great number of substances belong to the rutile structure. The fluorides

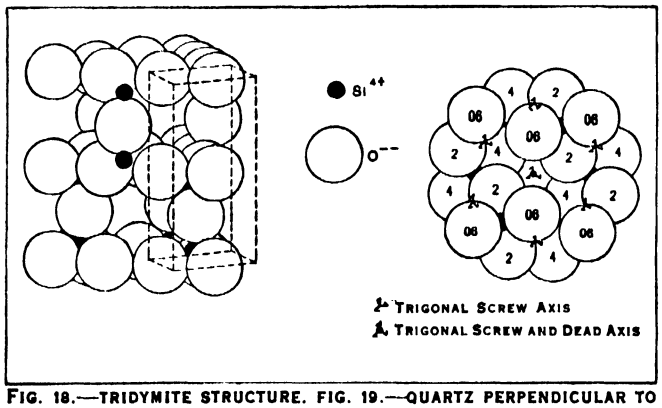

FIG. 18.—TRIDYMITE STRUCTURE. FIG. 19.—QUARTZ PERPENDICULAR TO TRIGONAL: THE NUMBERS 0246 FOR THE O'' ATOMS AND 135 FOR THE Si⁴. ATOMS REFER TO DEPTHS BELOW PLANE OF PAPER (SCALE 30,000,000:1)

of Mg., Mn., Co., Fe., Ni., Zn. and the dioxides of Mn., Mo., Sn., W. and Pb., as well as several others.

When $R_A:R_X$ lies between ·41 and ·22, the co-ordination number is 4:2, which is approaching an adamantine structure. This is the

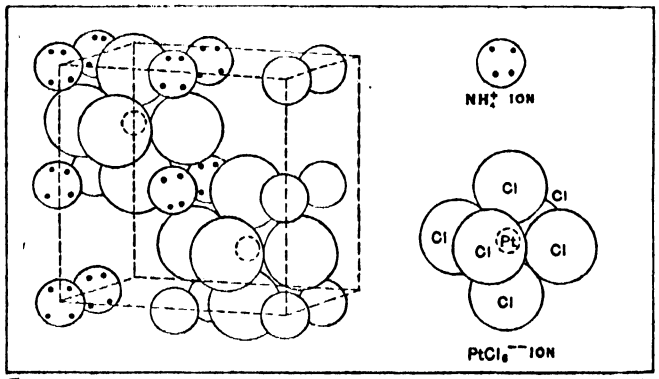

FIG. 20.—AMMONIUM HEXACHLOROPLATINATE STRUCTURE (SCALE 30,000,000:1)

case for the different forms of silica, SiO, Cristobalite, Tridymite and Quartz. These are shown in figs. 17, 18 and 19. Though apparently different, these structures have the essential point in common that they are built from silicon ions completely surrounded by four oxygens in a tetrahedron. Each oxygen is shared between two tetrahedra and the different forms of structure are merely due to different arrangements of these tetrahedra. Thus the polymorphism of silica is not due to any change in the molecule.

So far we have dealt only with crystals with simple ions, but those with complex ions are essentially similar. When the ion is

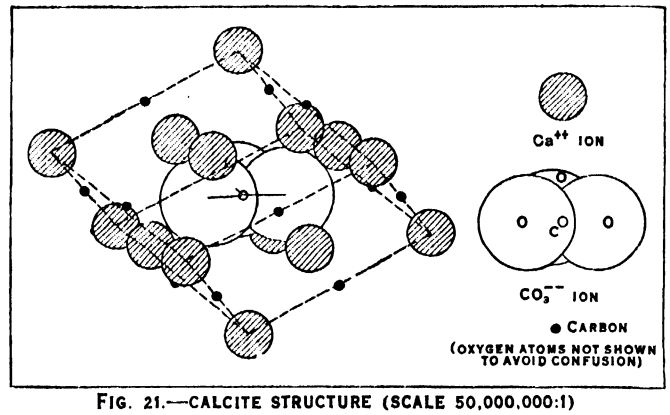

FIG. 21.—CALCITE STRUCTURE (SCALE 50,000,000:1)

approximately spherical, as is ammonium NH_4, or highly symmetrical as $Ni(NH_3)_6^{++}$,$PtCl_6$—it can take its place in a crystal exactly like a simple ion of the same size. Ammonium, NH_4, is practically indistinguishable in its compounds from Rb. Such

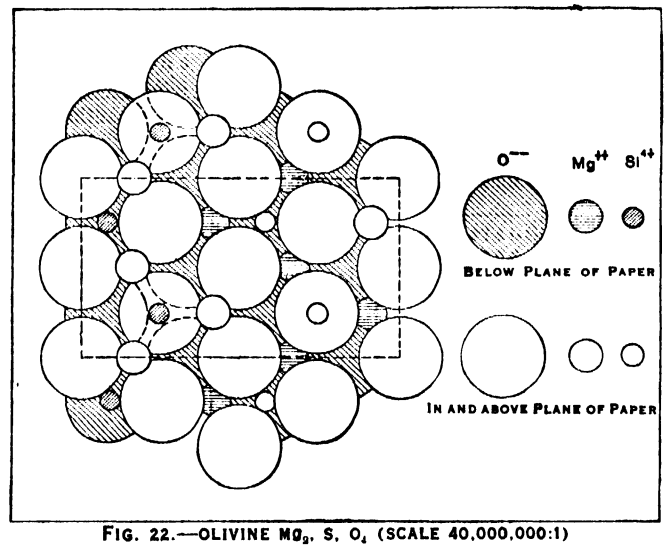

FIG. 22.—OLIVINE $Mg_2.\ S.\ O_4$ (SCALE 40,000,000:1)

a compound as $(NH_4)_2$ $(PtCl_6)$ (*see* fig. 20) is, except for its larger size, essentially the same as fluorite. When the compound ion is not nearly spherical, loss of symmetry results. In the case of calcite (*see* fig. 21), for instance, the ions are arranged very much as in rock salt, but owing to the flatness of the CO_3^{--} ion, one trigonal axis is shortened, leading to a rhombohedral crystal. A number of crystals, such as $FeCO_3$ and $NaNO_3$, belong to the calcite class. With ions of the type BX_4, such as BF_4^-, ClO_4^-, SO_4^{--}, PO_4^{---}, the structures are of even lower symmetry, though in all of these the tetrahedronal arrangement of oxygen atoms is maintained.

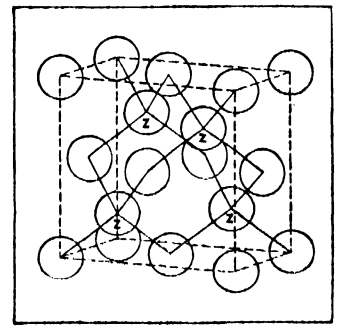

FIG. 23.—DIAMOND STRUCTURE; IF ATOMS MARKED Z ARE REPLACED BY ZINC AND THE REMAINING BY SULPHUR, ZINCBLENDE STRUCTURE IS GIVEN (SCALE 50,000,000:1)

There are a great number of ionic crystals which are neither of the simple ionic or complex ionic types, which may be grouped together as a silicate type, though not all contain silicon. The structure of the silicates are complex but, as W. L. Bragg has shown, they consist essentially of oxygen ions in a close-packed arrangement, either cubic or hexagonal. (*See* figs. 31 and 33.)

These ions are held together by strongly charged metallic ions, which occupy the spaces between them. In the tetrahedral spaces are found the smallest and most highly charged ions Si^{4+} Be^{++}. In the octahedral spaces larger ions with smaller charges, such as Ti^{4+}, Al^{3+}, Mg^{++}, Fe^{++}. Still larger ions, such as $Ca^{++}Na^{+}$or K^{+}, introduce distortions into the structure. The symmetry of the

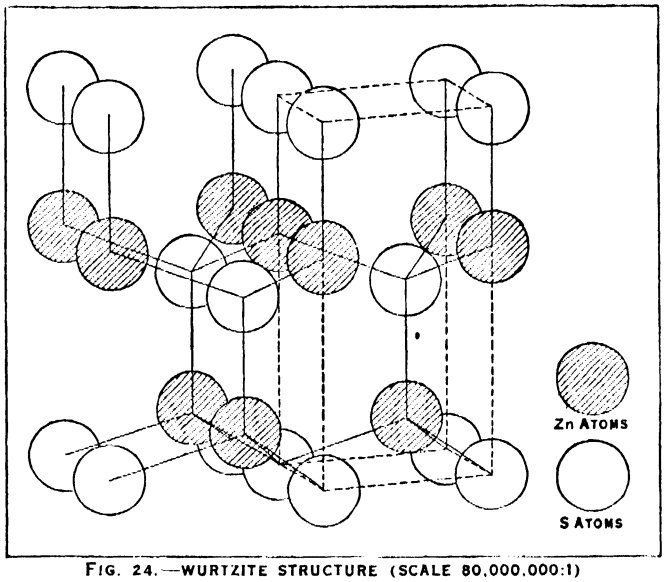

FIG. 24.—WURTZITE STRUCTURE (SCALE 80,000,000:1)

silicates adjusts itself to fit these ions with the minimum distortion, which leads to large and complicated cells, generally of low symmetry. One of the simplest of these olivine Mg_2SiO_4 is shown in fig. 22. Other silicates of known structure include cyanite $Al_2S_1O_5$, phenacite $Be_2S_1O_4$, beryl $Be_3Al_2Si_6O_{18}$ and the garnets

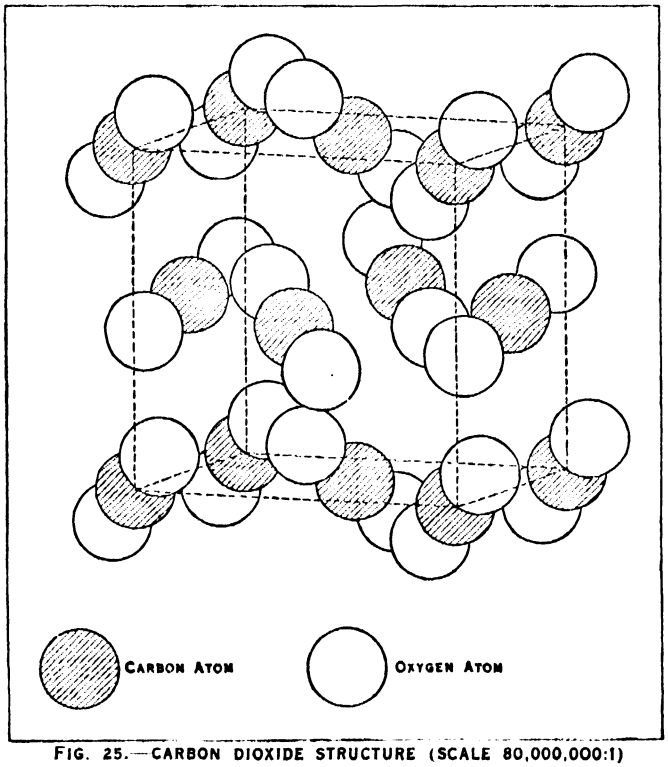

FIG. 25.—CARBON DIOXIDE STRUCTURE (SCALE 80,000,000:1)

$R_3''R_2'''$ Si_3O_{12}. Two non-silicate types are also built from close-packed oxygens, the corundum type Al_2O_3, including haematite Fe_2O_3, NgT_1O_3, and the spinel type Al_2MgO_4, including magnetite Fe_2FeO_4 and Ag_2MoO_4.

In adamantine crystals the forces binding the whole crystal together are homopolar, so it may be considered that they are single molecules. The typical adamantine crystal is the diamond. (*See* fig. 23.) Here each carbon is joined to four others (co-ordination 4:4) by a homopolar electron sharing bond in a tetrahedral fashion, alternate tetrahedra pointing in opposite directions. If we replace alternate carbon atoms with zinc and sulphur, we arrive at the zinc blende structure, which is typical for adamantine compounds. Such compounds are chiefly found in the fourth group of the periodic table and in compounds between elements of the neighbouring groups on either side. For instance, we have

Compound	GaGe	GaAs	ZnSe	CuBr	
Atomic Number	32 32	31 33	30 34	29 35	
Interatomic dist.	2·43	2·435	2·45	2·46	A

all with diamond structure. It should be noticed that here, unlike the case of KCl and CaS, there is little change in interatomic distance. Another 4:4 is represented by Wurtzite (*see* fig. 24), the other form of zinc sulphite. The relations and the distances of neighbouring atoms are the same in both cases, but in Wurtzite, the symmetry is hexagonal instead of cubic. The three forms of carborundum represent a compound diamond-Wurtzite structure with a very large cell.

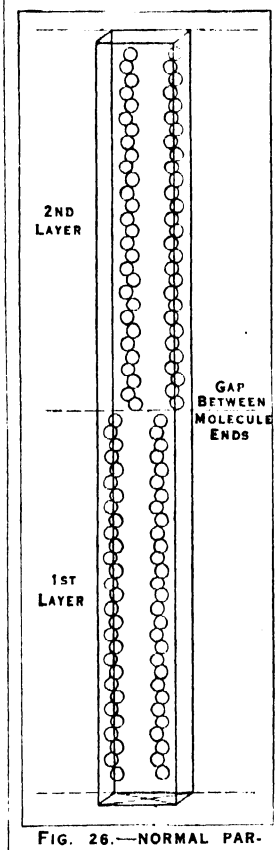

FIG. 26.—NORMAL PARAFFIN STRUCTURE (SCALE 14,000,000:1)

In molecular crystals, the units of structure are neutral atoms or molecules, and as the forces are so much weaker, the determining factor is the shape of the molecules. The most ideally simple cases are the crystals of the inert gases, which are cubic close-packed. (*See* fig. 30.) The similar structures are found for symmetrical molecules such as CH_4, SnI_4 and more or less distorted for molecules N_2, O_2, I_2, NH_3 or CO_2 (*see* fig. 25), none of which are strongly polar. Another simple case is when the molecules are long, straight structures, such as those of the paraffins. (Fig. 26). Here they lie together like bundles of sticks, forming loosely connected layers. A study of compounds with benzene rings, benzene, naphthalene, hexamethylbenzene, shows that this ring of carbon atoms has a real existence and is probably plane, while studies of structures with quadruply substituted carbon atoms as penterithretol or tetraphenyl methane shows that the carbon bonds are arranged almost tetrahedrally.

If a molecule possesses unbalanced electrical poles, these arrange themselves in the crystal so as to neutralize each other as much as possible, either by polymerising or forming pseudionic crystals; thus ice formed from the strongly polar $_{+}H\overset{\ddot{-}}{\underset{H_{+}}{O}}$ has tridymite structure (*see* fig. 18), in which each oxygen is surrounded by four hydrogens, or calomel $\overset{-}{Cl}\overset{|}{Hg}\overset{+}{Hg}\overset{-}{Cl}$ (*see* fig. 27), in which the mercury atoms are surrounded by chlorines.

A small but very interesting class are the layer crystals, in which the forces binding the atom extend only in two dimensions, forming large sheets which are held together by weaker molecular forces. The typical layer lattice is that of graphite. (*See* fig. 28.) Here the sheets are hexagons of carbon atoms, bound together in 3:3 co-ordination, 1·42 A, while the layers bound molecularly are 3·4 A. Another example is cadmium iodide. Here the polarisation of the large iodide ions prevents the normal ionic fluoride structure. To this type belong the hydroxides $Ca(OH)_2$ $Mg(OH)_2$ and the sulphides ZrS_2, SnS_2.

Metallic crystals differ from the previous classes by the presence of free electrons, the attraction between which and the positive ions gives the structure its stability. The basis of the structure

of pure metals and alloys is one of close packing, but the radii of atoms in metals are much greater than those of the corresponding ions in ionic crystals. (*See* fig. 12.) The pure metals have very simple structures: face centred cubic for Cu, Al, Fe_γ (*see* fig. 30); Body centred cubic for Na, Fe_2, Fe_8 (*see* fig. 31) and close packed hexagonal cubic for Mg, Zn, W (*see* fig. 32). Several metals have phases with different structure. Iron, for instance, between the temperatures 1100° and 1425°, has a face centred cubic structure. Both above and below this temperature, its structure is body centred. Manganese has two forms with very complicated cubic structures, and tin, at low temperatures (grey tin) is like diamond, while at ordinary temperatures (white tin) it has a distorted diamond structure.

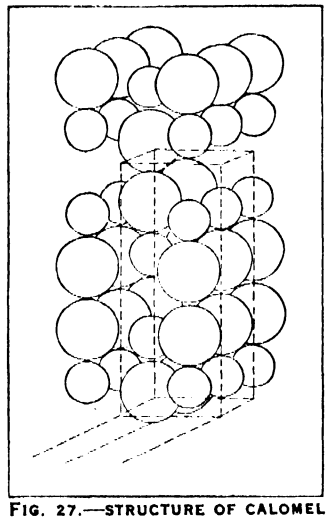

FIG. 27.—STRUCTURE OF CALOMEL $Hg^{=}$ C_{l_2} (SEE FIG. 1) (SCALE 30,000,000:1)

Our knowledge of the real constitution of alloys is immensely furthered by X-rays. They are essentially of two types, solid solutions and compounds. In solid solutions, the atoms of one metal are replaced by another, distributed by chance throughout its structure. This is shown by an X-ray pattern similar to the pure metal but with a different size of cell. In inter-metallic compounds on the other hand, the atoms of the different metals have definite positions similar to those in ionic compounds, such as CuZn, but usually more complicated, with a tendency to large cells of high symmetry. δ Bronze $Cu_{31}Sn_8$, for instance, has a cell of side 17·9 A. and 416 atoms. The laws of combination in metallic compounds are quite different from those of ordinary chemistry, but seem to depend on electron numbers.

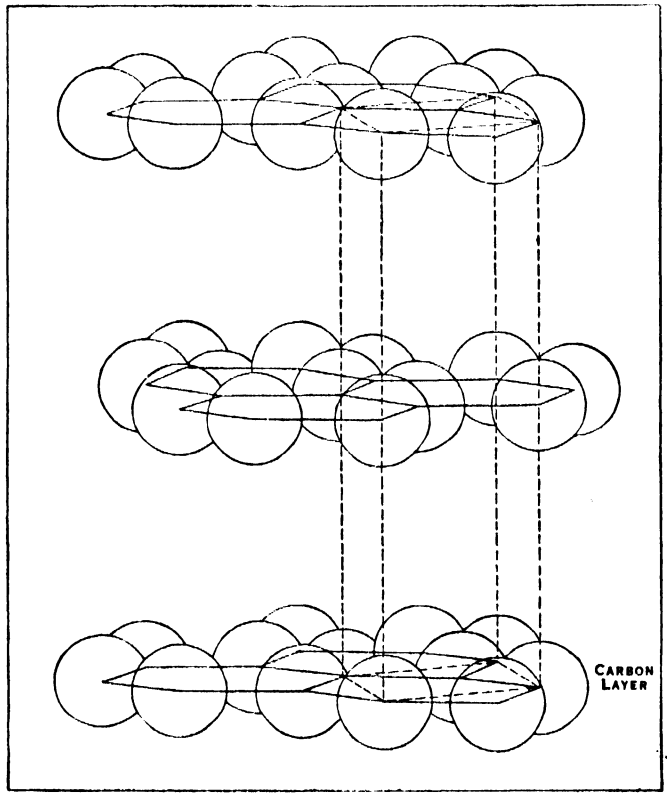

FIG. 28.—GRAPHITE STRUCTURE (SCALE 120,000,000:1)

There are a number of substances which show resemblances to both metallic, adamantine and ionic crystals. They may be roughly classed together as metalloidal. These include the semi-metals Se, Te, As, Sb, Bi and a great number of simple and complex arsinides, antimonides, sulphides, selenides, etc. They resemble the metals in having free or loosely bound electrons, which makes them in a lesser degree opaque and conducting, and also by the complexity and indefinite composition of many compounds such as the fahlerz group, which contain Cu, Ag, Hg, Pb, FE, AS, Sb+S, in varying proportions. The structures, however, are much less close-packed and resemble adamantine structures. Some, however, are more like ionic structures. Typical are pyrites (*see* fig. 33), which is a rock salt structure with Fe^{++} in the place of Na^+ and the complex ion S_2^{--} in that of Cl^-. Another is the nickel arsenide structure, a hexagonal structure with 6:6 co-ordination, to which belong very many substances, such as FeSe, CoSb.

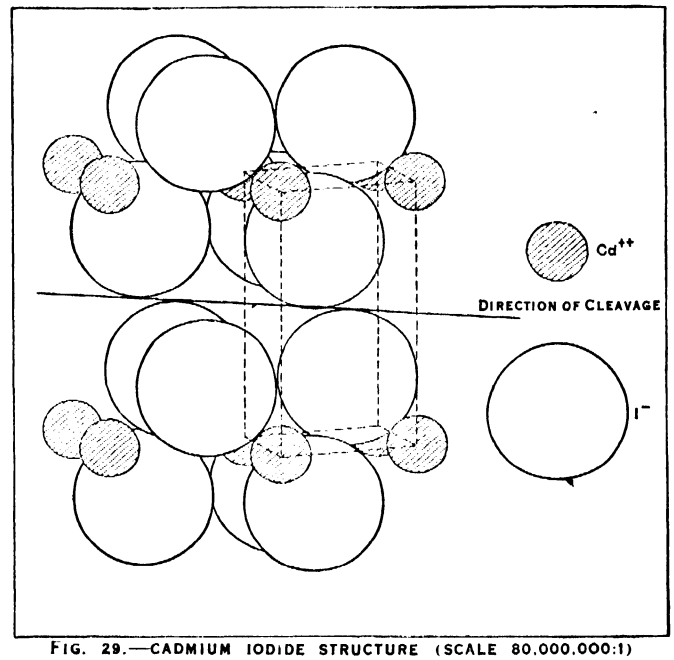

FIG. 29.—CADMIUM IODIDE STRUCTURE (SCALE 80,000,000:1)

This completes the systematic account of the structures of crystals, but X-rays have proved useful, not only in determining the positions of atoms in crystals but of the arrangement of minute crystals in materials. It is possible by means of X-rays to find the position of the crystal axes of crystals far too small to be seen microscopically and to study their arrangement in relation to the properties of the material. This has been done in both textiles and ceramics, but most effectively in metals.

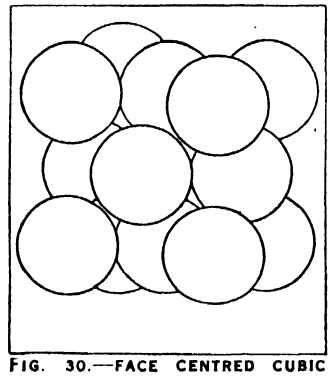

FIG. 30.—FACE CENTRED CUBIC STRUCTURE OF γ IRON AND COPPER AND ARGON (SCALE 60,000,000:1)

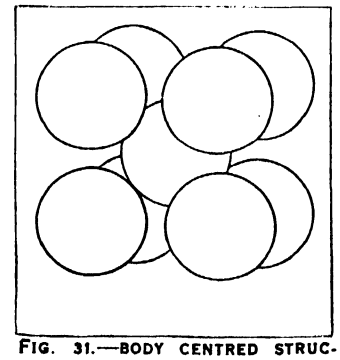

FIG. 31.—BODY CENTRED STRUCTURE OF L IRON (OR SODIUM) (SCALE 60,000,000:1)

Apart from their hardness, the chief mechanical property of metals is that of neither fracturing nor cleaving when overstressed, but deforming by the slipping of atoms along the glide planes, with consequent increase in hardness. This enables metals to be successfully worked, rolled, drawn, etc. Pure metals form

glide planes very easily, but the presence of another metal in solid solution interferes with the regularity of the lattice and makes gliding much more difficult, thus increasing hardness. The effect of alloying is greater, the more highly charged the alloying ion. Carbon has more effect, for instance, on iron than the same amount of cobalt. A piece of metal when cast has its small crystals of which it is composed oriented at random towards each other. On rolling or drawing, the crystals are not only elongated but they tend to take up positions with some crystallographic axis in the direction of the rolling. This is shown on a Debye diagram by the splitting up of the uniform rings into patches indicative of these preferred directions. On heating a rolled or a drawn metal, it recrystallises and the random orientation of the particles is restored. But at the same time, the hardness is lost. The explanation of these processes of hardening and annealing is being energetically sought, largely by X-ray methods, and already this has led to important technical results. It is clear that the practical importance of X-ray analysis has only begun to be felt and will, in time, prove to be of immense significance.

X-RAY TREATMENT (*see* RADIOLOGY; RADIOTHERAPY). The X-rays are used extensively in medical treatment. They are valuable in many forms of skin disease, particularly those of a chronic character. They have a favourable influence upon enlargements of the lymphatic glands, of the spleen and of the thyroid gland. They give useful palliative effects in certain forms of malignant disease, and some permanent cures of cancerous conditions have been obtained by their use. In rodent ulcer, which presents features allied to cancer, there is no doubt of the efficacy of X-ray treatment for bringing about a complete cure in the majority of cases, provided that the disease has not advanced too deeply into the tissues.

The idea of using X-rays in the treatment of disease arose from recognition of the injurious effects which followed prolonged application of the rays for diagnostic purposes. Many early workers with X-rays noted the production of an inflammation of the skin, or a falling out of the hair over parts which had been subjected to X-rays, and Leopold Freund, of Vienna, has stated that his first attempts to utilize X-rays in treatment were made in 1896 to cure a hairy mole and were prompted by what he had read of such occurrences. A definite action of the rays upon the skin having been observed, their employment in the treatment of skin diseases followed as a natural corollary. Amongst the earliest investigators of the possible therapeutic effects of X-rays the names of Schiff, Freund, Kienböck, Holtzknecht, Sjögren and Stenbeck may be mentioned. In Great Britain C. R. C. Lyster, Sir Malcolm Morris, E. Dore and J. H. Sequeira were amongst the earliest investigators.

Therapeutic Dosage.—For operating successfully with an agent capable of producing decidedly harmful effects when given in large doses it is necessary to have a method of measurement, and the need for this quickly became apparent when X-rays were used for treatment. The results of X-ray photography had already shown that the tubes employed were capable of emitting radiations of varying powers of penetration, and that the tubes were by no means constant in this respect; and the question whether highly penetrating rays or rays of feeble penetration were to be preferred for therapeutic use became the subject of much discussion. It is now recognized that the choice depends upon the object of the treatment. So too the problem of measuring the quantity of rays emitted by a tube during a given time began to call for a solution. In 1901 Benoist designed an apparatus by which the quality of the rays emitted by a tube at any moment could be determined, and in 1902 Holtzknecht brought out the first quantitative device, a chromo-radiometer, which enabled the dose administered to a patient to be observed, and recorded for future guidance. Holtzknecht also drew up a scale of units by means of which the indications of his apparatus could be interpreted. The units of Holtzknecht are still used to express the dosage of X-rays, though his apparatus has been superseded. Holtzknecht's method of measurement consisted in observing the change of colour in certain pastilles when exposed to X-rays, and his apparatus consisted of a scale of tints, and a number of pastilles of a yellow tint which acquired a green colour during exposure. The composition of these was kept a secret, but analysis revealed in them the presence of potassium sulphate combined with celluloid or gelatine. The pastilles were laid upon the surface under treatment, and their change of colour was compared at intervals with the scale of standard tints.

Quantitative Measurement.—It was next thought that under suitable conditions the measurement of the current passing through the X-ray tube might serve as a guide to the quantity of X-rays emitted by the tube, but, although this is the case to a certain extent, the method of quantity measurement employed almost universally in X-ray treatment was that devised by Sabouraud and Noiré, and used with signal success by them in an enormous number of cases of ringworm, in which disease measurement of dose is of the most critical importance, for the following reason. The cure of ringworm by X-rays requires that all the hair of the affected region shall be caused to fall out, but, nevertheless, it is necessary for obvious reasons that the hair should grow again after the disease has disappeared. Now if the dose of X-rays be insufficient the hair does not come out and no cure results, while if the dose be too great the hair comes out but does not grow again; and the margin of safety is quite a narrow

one. The method of Sabouraud and Noiré which proved itself reliable for such critical measurements of dosage as are required for ringworm treatment, has to-day the universal acceptance of all X-ray workers for other forms of superficial X-ray treatment, although the use of their pastilles has certain disadvantages, notably that they react ill to highly penetrating or "hard" rays.

Sabouraud's pastilles consist of small disks of platino-cyanide of barium. This chemical compound has a bright yellow-green colour when freshly prepared, and changes through gradations of yellow to a brown colour when exposed to X-rays. The pastilles are supplied in a book with which a permanent tint of colour is supplied, to indicate the colour change in the pastille which corresponds with a quantity of X-rays equal to the maximum dose which the healthy skin will stand without inflammatory consequences. This is often spoken of as a "pastille dose." As the amount of irradiation needed to produce the change of colour is considerable, the salt is fixed, during the treatment, at a point halfway between the source of the rays and the skin surface under treatment. During an exposure the chemical salt, in the form of a small disk of the material on cardboard, is adjusted in the required position by means of a pastille holder, and it is examined at intervals during the course of the exposure, until it has reached the required tint. When in the holder the pastille must be protected from light, and should have a piece of metal as a backing.

In X-ray treatment some protection of the surrounding healthy parts is usually necessary. With this object various methods of shielding were devised, either covering the patient by impermeable materials, or enclosing the tube in an impermeable box with suitable windows for the passage of the pencil of rays which is to fall upon the part under treatment.

Effect on Tissues.—The effect of the rays on healthy tissues is in the main a destructive one, but some of the cells of the tissues are more sensitive to the rays than are others; and this permits of a selective effect being obtained, with the destruction of some cells and not of the whole tissue. Young cells, and actively growing cells, are the most susceptible, and for this reason it is possible to influence the glands of the skin and the papillae of the hairs with a dose which will not destroy the skin itself. The art of successful working with X-rays is based upon a careful adjustment of the dose so as to secure a selective destruction of the morbid elements, and to avoid wholesale damage to the part treated. The effects of excessive doses of X-rays is to produce an inflammation which may result in painful sores which obstinately refuse to heal for many weeks or months. In the case of "soft" rays a quantity up to double that of the usual maximum or pastille dose may be employed in urgent cases without risk of any serious inflammation. In the treatment of ringworm the exact pastille dose must not be exceeded or the fall of the hair is likely to be followed by permanent baldness.

The distance of the skin surface from the centre of the tube must be known, and the pastille arranged in place accordingly. Fifteen centimetres is a usual distance, and at this distance a tube working with a current of a milliampere should give the full therapeutic dose or "pastille dose" in about 15 minutes. In general X-ray treatment it is quite usual at the present time to proceed by the method of full doses at rather long intervals. From the experience obtained by Sabouraud in numerous cases of ringworm it has been found that a full dose must not be repeated until a month has elapsed.

Treatment of Abnormal Growths.—A great amount of work has been done with X-rays for the treatment of cancer, but it is now recognized that the X-rays do not cure a cancer, although they are of value for the relief of pain. Diminution of size in cancerous growths has frequently been observed, and in some instances sarcomatous tumours have completely disappeared under X-ray treatment. Sooner or later, however, the cancer or sarcoma returned either in the original site or elsewhere, and the patient died of the disease. How far the use of intensely hard X-rays produced by currents of some 150 KV, as in the Erlangen method of treating cancer, will prove effective, is doubtful.

X-ray treatment is of service for the treatment of enlarged "strumous" glands in the neck. When these glands are in the early stages, and there has not been any softening or breaking down of the gland tissue, the application of X-rays, a few times repeated in moderate doses, will determine the subsidence of the enlargement and may effect a complete cure.

In the massive glandular enlargements of lymphadenoma a great reduction of the tumours can be brought about by heavy doses of X-rays, but the results are to give a symptomatic rather than a real cure, for fresh glandular growths take place internally, and the usual course of the disease is not fundamentally modified.

So too in leukemia, the symptom of excessive abundance of white cells in the circulating blood can be surprisingly altered for the better by X-rays, but generally without real cure of the underlying condition. The effect appears to be due to a direct destructive action upon the leucocytes of the blood.

The use of X-rays in fibroid tumours of the uterus has been advocated, particularly in France and in Germany. The action of the rays seems to be in part due to their influence upon the activity of the ovaries and in part to a direct effect upon the growing fibroids themselves, causing decrease of activity, relief of symptoms and reduction of the tumours. Not all varieties of fibroid are suitable for this kind of treatment. (H. L. J.)

XYLENE, the name given to certain hydrocarbons, the dimethylbenzenes, of which three forms exist with the same formula, $C_6H_4(CH_3)_2$ (*see* ISOMERISM); they occur in the light oil fraction of the coal tar distillate, but cannot be separated by fractional distillation owing to the closeness of their boiling points. The mixture can be separated by shaking with sulphuric acid, whereupon the ortho- and meta- compounds are sulphonated, the para- compound remaining unattached. The ortho and meta acids may be separated by crystallization of their salts or sulphonamides. The principal constituent of the light oil is *meta*-xylene, which is successively nitrated and reduced to commercial *m*-xylidine, (4-amino-1:3-xylene). From *para*-xylene a similar base, *p*-xylidine (2-amino-1:4-xylene), is prepared. Both xylidines are employed in colour making. *Keta*-xylene is also used in making artificial musk which is trinitro-*tert*.-butyl-*m*-xylene. (*See* PERFUMES.) Ortho-xylene is obtained from ortho-bromotoluene, methyl iodide and sodium as a colourless mobile liquid boiling at 142°, melting at −28°, and having a specific gravity of 0·8932 at 0°. Meta- or iso-xylene, the most important isomeride, has been obtained from Borneo petroleum (*see* TOLUENE), or by distilling with lime mesitylenic acid, $C_6H_3(CH_3)_2CO_2H$, an oxidation product of mesitylene, $C_6H_3(CH_3)_3$. Meta-xylene boils at 139°, melts at −54°, and has a specific gravity of 0·8812. Para-xylene obtained when camphor is distilled with zinc chloride, is best prepared from *para*-bromotoluene or dibromobenzene, methyl iodide and sodium.

The three xylenes are oxidized by nitric acid to the corresponding coluinc acids. Further oxidation leads to ortho-, meta (iso)-, and para (tere)-phthalic acids. (*See* PHTHALIC ACID.)

XYLOPHONE, a small instrument of percussion, of definite sonority, sometimes used in the orchestra to mark the rhythm.

XYSTUS, Greek term for the covered portico of a gymnasium.

X Y Z CORRESPONDENCE, the letters which when made public in 1798 nearly involved France and the United States in war. By orders of the French Directory fully a thousand U. S. vessels had been stopped on the high seas for examination. President Adams sent three commissioners, C. Pinckney, Marshall and Gerry, to France to negotiate a treaty which would do away with this annoyance. The commissioners were met in France by three agents who demanded a large sum of money before the Directory would receive the commission and also notified the commission that France would expect a loan from the United States if satisfaction of any other kind was to be given. The commissioners upon rejecting these overtures were ordered out of France. Their report was published at once in the United States and in it the French agents were labeled X, Y and Z, from which the correspondence took its name. The United States increased its army and navy, and hostilities were actually begun, when Talleyrand disavowed any connection with the agents and agreed to receive any minister the United States might send.

Y The 25th letter of the modern alphabet dates only from Roman days in its present position. The Latin alphabet as adapted from the Chalcidic and Etruscan ended with **X**. The two final letters **Y** and **Z** were introduced after the conquest of Greece for use in Greek words transliterated and borrowed. **Y** was the form taken by the letter *upsilon* in the Ionic alphabet, which by the time of the Roman conquest had become generally used in Greece. The letter in the western or Chalcidic alphabet was in the form **V** in which form it had passed into Latin with the vocalic value of *u* and the consonantal value of modern English *w*. In the Greek κοινή based upon Attic the letter **Y** had the value of French *u* or German *ü*. This sound was unknown in the Latin language, and if pronounced in borrowed Greek words passed quickly into that of *i*.

In Old English and Middle English the letter was frequently used in place of *i*, e.g., in words such as *cyng*. In modern English its value is identical with that of *i* both long and short, its most frequent use being perhaps as final in the adverbial termination (e.g., *widely, strongly*). In addition it represents a palatal spirant most frequently when initial (*e.g.*, in words such as *yacht, yoke, young*). (B. F. C. A.)

YABLONOI or **YABLONOVOI** ("Apple Mountains"), known to the Mongols as *Dynze-Daban*, a range of the eastern part of Asiatic Russia. The range is really the eastern slope of a narrow north-north-east extension of the Malkan horst, which rises from eruptive rocks near Kiakhta. The Ingoda river flows along the foot of the range, which is 5–6,000 ft. above sea-level, the highest point being Mount Sokhondo, near the Mongolian frontier. The descent of the Yablonoi to the trough of the Ingoda is 800 to 1,000 ft. and the slope is mainly rocky débris, with scattered patches of forest. The scarp cuts across the Archaean rocks, which strike to the east-north-east; all the horsts and ridges lying to the east of the Yablonoi are thus cut through by the Ingoda-Shilka valley, their waters flowing across the grain of the country in their course towards the Khingan range. The Yablonoi slope is part of the watershed between the Arctic-flowing and the Pacific-flowing streams and it also forms the boundary between the Siberian and the Daurian flora. The trans-Baikal railway crosses the range at 3,137 ft. above sea-level.

YA-CHOW-FU, a city near the western borders of Szechwan, China in 30° N., 103° E. Population about 30,000. It is situated on the banks of the river Ya where tea is grown. The city is walled and is about 2 m. in circumference. It is first mentioned during the Chow dynasty (1122–255 B.C.).

YACHT, a light and comparatively small vessel, propelled by means other than oars. The term is now limited to vessels used for pleasure, or for racing purposes. For sailing yachts *see* YACHTING. Since 1840 power yachts have been increasingly used, especially as long distance cruising became a favourite pastime of the rich. The earliest power yachts were paddle boats, but the paddle was in time abandoned entirely in favour of the screw. For many years steam auxiliaries were the fashion. As a rule they were built with such a small beam that some canvas was necessary for steadying purposes. Of these cruiser yachts perhaps the highest development was reached in the "Valhalla," a ship rigged auxiliary with triple expansion engines of 1,490 tons Thames Measurement, built in 1892. The purely steam yacht developed steadily and during the last decade of the nineteenth century there was a boom in such construction, particularly for owners in the United States. Conspicuous among the big yachts built during this period were the "Valiant" of 1893, 2,184 tons, the "Lysistrata" of 1900, 2,082 tons, and the "Mayflower," 1,844 tons which was for a time the official yacht of the President of the United States.

The internal combustion engine was used for pleasure purposes at sea from the early days of the 20th century, almost as soon as it became practical on land, but to begin with it was in small craft only. For some years before the war the size of yachts propelled by petrol engines, either as full power or as an auxiliary, was increasing steadily and when war broke out the first Diesel-engined yachts were under construction.

After the war the full-powered motor yacht of considerable tonnage, with either Diesel or semi-Diesel machinery, established itself in popular favour in the place of the steam yacht, very few of the latter type having been built of recent years.

The "Nourmahal" of 2,001 tons, the "Savarona" of 1,833, and the "Warrior" of 1,245 tons are typical of the big modern motor yachts, while engines have been installed for auxiliary purposes in yachts of every size, from the 1,195-ton "Flying Cloud" built for the Duke of Westminster to small cruisers of three and four tons. The new cruiser yacht without auxiliary power is, in fact, now the exception and it has even been found necessary to draw up rules forming racing classes of auxiliaries.

YACHTING, the sport of racing in yachts and also the pastime of cruising for pleasure in sailing, steam, or motor vessels. Yacht racing dates from the beginning of the 19th century; for, although there were sailing yachts long before, they were but few, and belonged exclusively to princes and other illustrious personages. During the reign of Elizabeth a pleasure ship was built (1588) at Cowes (Isle of Wight), so that the association of that place with the sport goes back a very long time. In 1660 Charles II. was presented by the Dutch with a yacht named the "Mary," until which time the word "yacht" was unknown in England. He was fond of sailing, for he designed a yacht of 25 tons called the "Jamie," built at Lambeth in 1662, as well as several others later on. In that year the "Jamie" was matched for £100 against a small Dutch yacht, under the duke of York, from Greenwich to Gravesend and back, and beat her, the king steering part of the time—apparently the first record of a yacht match and of an amateur helmsman.

The first authentic record of a sailing club is in 1720, when the Cork Harbour Water Club, now known as the Royal Cork Yacht Club, was established in Ireland, but the yachts were small. Maitland, in his *History of London* (1739) mentions sailing and rowing on the Thames as among the amusements then indulged in; and Strutt, in his *Sports and Pastimes* (1801), says that the Cumberland Society, gave yearly a silver cup to be sailed for near London. The boats usually started from Blackfriars bridge, went up the Thames to Putney, and returned to Vauxhall, being no doubt, mere sailing boats and not yachts or decked vessels. From the middle to the end of the 18th century yachting developed very slowly: although matches were sailed at Cowes as far back as 1780, very few yachts of any size, say 35 tons, existed in 1800 there or elsewhere. In 1812 the Royal Yacht Squadron was established by 50 yacht owners at Cowes and was called the Yacht Club, altered to the Royal Yacht Club in 1820.

EARLY TYPES OF YACHT

Early English Yachts.—Among the earliest of which there is any record were the "Pearl," 95 tons, built by Sainty at Wyvenhoe near Colchester in 1820, for the marquess of Anglesey, and the "Arrow," 84 tons, originally 61 ft. 9½ in. long and 18 ft. 5¼ in. beam, built by Joseph Weld in 1822, which for many years remained a racing yacht, having been rebuilt and altered several times. The Thames soon followed the example of the Solent and established the Royal Thames yacht club in 1823, the Clyde founding the Royal Northern yacht club in 1824, and Plymouth the Royal Western in 1827. In this year the Royal Yacht Squadron passed a resolution disqualifying any member who should apply steam to his yacht. In 1830 one of the largest cutters ever constructed was launched, viz., the "Alarm," built by Inman at Lymington for Joseph Weld of Lulworth Castle, from the lines of

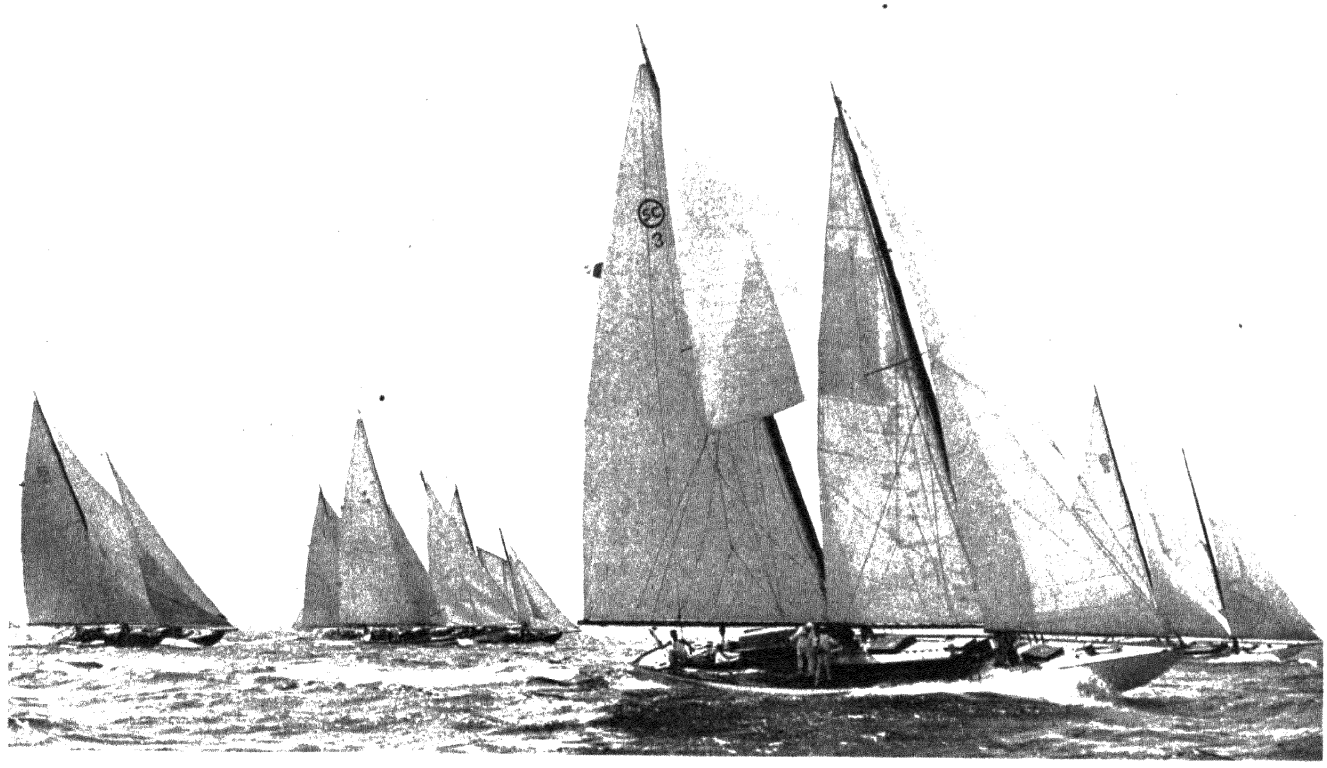
a famous smuggler captured off the Isle of Wight. She was 82 ft. on the load-line by 24 ft. beam, and was reckoned of 193 tons, old measurement, in which length, breadth and half-breadth (supposed to represent depth) were the factors for computation. Some yachtsmen at this time preferred still larger vessels and owned square-topsail schooners and brigs like the man-o'-war brigs of the day, such as the "Waterwitch," 381 tons, built by White of Cowes, in 1832, for Lord Belfast, and the "Brilliant," barque, 493 tons, belonging to J. Holland Ackers, who invented a scale of time allowance for competitive sailing. In 1834 the first royal cup was given by William IV. to the Royal Yacht Squadron. In 1836 the Royal Eastern yacht club was founded at Granton near Edinburgh; in 1838 the Royal St. George's at Kingstown and the Royal London; in 1843 the Royal Southern at Southampton and the Royal Harwich; in 1844 the Royal Mersey at Liverpool and the Royal Victoria at Ryde. The number of vessels kept pace with the clubs—the 50 yachts of 1812 increasing nearly tenfold before the middle of the century.

First Alteration in Type.—In 1848, after J. Scott Russell had repeatedly drawn attention to the unwisdom of constructing sailing vessels on the "cod's head and mackerel tail" plan, and had enunciated his wave-line theory, Mare built at Blackwall an entirely new type of vessel, with a long hollow bow and a short after-body of considerable fulness. This was the iron cutter "Mosquito," of 59 ft. 2 in. water-line, 15 ft. 3 in. beam, and measuring 50 tons. Prejudice against the new type of yacht being as strong as against the introduction of steam, there were no vessels built like the "Mosquito," with the exception of the "Volante," 59 tons, by Harvey of Wyvenhoe, until the eyes of English yachtsmen were opened by the Americans three years later. About this period yacht racing had been gradually coming into favour in the United States. (*See* below.) John C. Stevens, who played a leading part in the development of boats for pleasure sailing and racing in the United States, commissioned George Steers of New York, builder of the crack pilot schooners, to construct a racing schooner to visit England in the year of the great exhibition, and the result was the "America" of 170 tons. She crossed the Atlantic in the summer of 1851, but failed to compete for the Queen's cup at Cowes in August, although the club for that occasion threw the prize open to all the world, as her owner declined to concede the usual time allowance for difference of size. The members of the Yacht Squadron, not wishing to risk the reproach of denying the visitor a fair race, decided that their match for a cup given by the club, to be sailed round the Isle of Wight later in the same month, should be without any time allowance. The "America" entered and competed against 15 other vessels. The three most dangerous competitors being put out through accidents, the "America" passed the winning-post 18 minutes ahead of the 47-ton cutter "Aurora," and won the cup; but, even if the time allowance had not been waived, the American schooner yacht would still have won by fully a couple of minutes. The prize was given to the New York Yacht Club and constituted a challenge cup, called "the America's cup," for the yachts of all nations, by the deed of gift of the owners of the winner. (*See* below for a complete account of these races.)

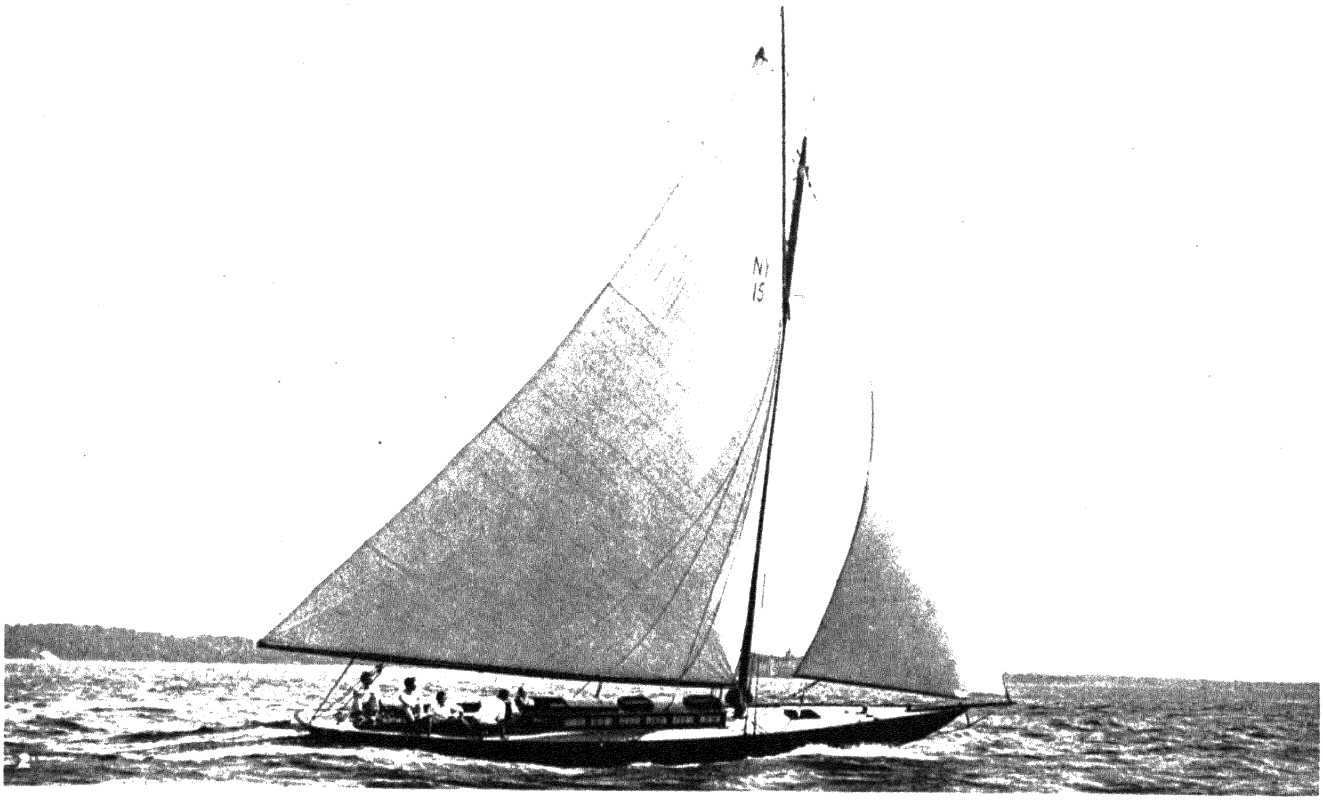
The First Great Era of Yacht Racing.—Between 1870 and 1880 there were some very notable additions to the racing fleet, including the schooners "Gwendolin," "Cetonia," "Corinne," "Miranda" and "Waterwitch"; the large cutters "Kriemhilda," "Vol au Vent," "Formosa," "Samoena" and "Vanduara," a cutter built of steel; the 40-tonners "Foxhound," "Bloodhound," "Myosotis" and "Norman"; the 20-tonners "Vanessa" (Hatcher's masterpiece), "Quickstep," "Enriqueta," "Louise" and "Freda"; and the yawls "Florinda," "Corisande," "Jullanar" and "Latona." The "Jullanar" may be noted as a specially clever design. Built in 1874 from the ideas of Bental, an agricultural implement maker of Maldon, Essex, she had no dead wood forward or aft, and possessed many improvements in design which were embodied and developed by the more scientific naval architects, G. L. Watson, William Fife, Jr., and others in later years. Lead, the use of which commenced in 1846, was entirely used for ballast after 1870 and placed on the keel outside.

No fewer than 400 matches took place in 1876, as against 63 matches in 1856, with classes for schooners and yawls, for large cutters, for 40-tonners, 20-tonners and 10-tonners. The Yacht-Racing Association, established in 1875, drew up a simple code of laws for the regulation of yacht races, which was accepted by the yacht clubs generally. The association adopted the rule for ascertaining the size or tonnage of yachts which had been for many years in force, known as the Thames rule; but in 1879 they altered the plan of reckoning length from that taken on deck to that taken at the load water-line, and two years later they adopted an entirely new system of calculation.

The Plank-on-edge.—These changes led to a decline in yacht-racing, the new measurement exercising a prejudicial effect on the sport, as it enabled vessels of extreme length, depth and narrowness, kept upright by enormous masses of lead on the outside of the keel, to compete on equal terms with vessels of greater width and less depth, in other words, smaller yachts carrying an inferior area of sail. The new type was known as the "lead mine" or plank-on-edge type.



Dixon Kemp in 1887 induced British yachtsmen to abandon the system of measuring yachts by tonnage and to adopt a new system of rating them by water-line length and sail area. The new system contained no taxes or penalties upon beam or depth nor upon "over all" length. The only factors measured were the water-line and the area of the sails. All the old tonnage rules taxed the length and the breadth. This change of the system measurement crushed the plank-on-edge type completely.



Revival of Yacht-racing Under Length and Sail Area Rule.—Yachtsmen were greatly pleased with the broader and lighter types of yachts that designers began to turn out under the length and sail area rule. They were more comfortable and drier in a seaway than the old vessels. The first large cutters built with considerable beam were "Yarana" and "Petronilla" in 1888, and in 1889 the first of Lord Dunraven's Valkyries was a vessel that was much admired. Then in 1890 "Iverna," a handsome clipper-bowed cutter owned by Mr. Jameson, came out and raced against "Thistle."

The Second Great Era in Yachting.—The seasons following 1892 are identified with the big cutter racing. The revival under the length and sail area rule had so far extended to "Iverna," "Tarana," "Petronilla," and "Valkyrie I." being built in the first class, but then there had been a pause of some years during which large numbers of 40-raters, 20-raters and the Solent classes had been built. Just when the critics were declaring that in the future no yachtsmen would build a class racer larger than a 40-rater (60 ft. L.W.L. with 4,000 sq.ft. of sail), the prince of Wales (afterwards Edward VII.) gave an order for the cutter "Britannia," while Lord Dunraven built "Valkyrie II.," A. D. Clarke "Satanita" and Peter Donaldson "Calluna"; and in this same season (1893), an American yachtsman took the Herreshoff yacht "Navahoe" over the Atlantic. Yacht designing and building now became a science demanding the highest tax upon the skill and ingenuity of the naval architect. The cutter "Valkyrie II." visited the United States in 1893, but Lord Dunraven's vessel was beaten by the "Vigilant." Curiously enough, when the crack Herreshoff cutters "Navahoe" and "Vigilant" visited the British Isles they were severely beaten by the British yachts. During the years that followed the "Britannia" held a wonderful record.

Some other famous racing yachts which were built under the length and sail area rule were "Ailsa" (1895), "Isolde," "Caress," "Audrey," "Niagara," and the "Norman."

It was evident that a skimming-dish of "Britannia's" or "Isolde's" rating would have no cabin accommodation or head room, and that the evolution of such type would be as bad for the sport as the development of the old plank-on-edge had been in 1885. It seemed strange that whilst the old tonnage rule had evolved the plank-on-edge ten years previously, the sail area measurement now evolved a plank-on-side, balanced by a fin. The fact was that designers had solved the problem. The rule measured only the length and the area of canvas. Taking the length of the vessel on the water-line as constant, then the vessel with the smallest possible weight could be driven with less sail at the same

NEW YORK YACHT CLUB CLASS BOATS

1. Start of the Seawanhaka schooners at the Larchmont regatta in 1928. Designed by Cox and Stevens, 16 of these boats were turned out at the same time in 1925, principally for racing on Long Island Sound. They are 56'6" overall, 38' waterline and 12' beam. 2. The "Banzai," a 30' class boat of the New York Yacht Club designed by N. G. Herrishoff and representative of a famous class of one design boats built in America 25 years ago. All of original 10 boats of this class still afloat

FAMOUS AMERICAN YACHTS

1. The 88′ schooner yacht "Advance" with staysail rig. One of the most successful types turned out, designed by Burgess, Swasey and Paine, now owned by Marion Eppley
2. The "Malabar 9," designed and owned by John G. Alden. Typical of large fleet of small ocean cruising schooners
3. New York Yacht Club 40′ class boat hard on the wind. A type designed by Herrishoff
4. The "Resolute," last American Cup Defender, in a fresh breeze. Starboard rail awash
5. "Prestige," a class M. sloop turning to winward. Owned by Harold S. Vanderbilt
6. Speedy little class R. Sloop with sheets down. Popular type of yacht
7. The "Frieda," American six metre class of boat of the type designed by Clinton H. Crane
8. Star class yacht in brisk going. Largest one design class ever promoted, over 600 built and raced in various parts of the world

speed as vessels with greater weight and greater sail. This solution of the problem was not apparent to designers from 1880 to 1885, because of the difficulty of obtaining stability. From 1880 to 1885 stability was obtained by means of very heavy keels. In 1895 the stability was obtained by means of a light piece of lead placed at the bottom of a deep steel fin.

The First Linear Rating Rule.—To endeavour to check the tendency to build skimming-dishes the Yacht-Racing Association introduced in 1896 a new system of measurement which was proposed by R. E. Froude. The novelty of the system consisted of a tax upon the skin girth of the yacht, whereby a vessel with hollow midship section was penalized by her girth being measured round the skin surface. Froude's first system of rating began on Jan. 1, 1896, and ended at the close of the year 1900. The measurement of the yacht was obtained by the following formula:—

$$\frac{\text{Length L.W.L.} + \text{beam} + \frac{3}{2}\text{ skin girth} + \frac{1}{2}\sqrt{(\text{sail area})}}{2} = \text{linear rating.}$$

This rule partially failed in its object. It was hoped that the skin-surface measurement would prevent the fin-bulb type being successful, but Froude and his colleagues had under-estimated the possible developments of exaggerated pram bows, immense scow-shaped shoulders and stern-lines, all of which could be introduced into the skimming-dish type with great success. So, notwithstanding the small premium on displacement this rule contained, the dishes could still beat the full-bodied yachts.

The Second Linear Rating Rule.—This rule, also suggested by Froude, was introduced on Jan. 1, 1901. The Y.R.A. agreed to fix this rule for a period of seven years. The object of the rule was to ensure a big-bodied vessel. The formula was:—

$$\frac{\text{Length} + \text{breadth} + \frac{3}{2}\text{ girth} + 4\bar{d} + \frac{1}{2}\sqrt{(\text{sail area})}}{2\cdot1} = \text{linear rating.}$$

Now the novelty of this rule was the new tax $\bar{d}$. This $\bar{d}$ represents the difference in feet between the measurement of the girth of the yacht's hull taken round the skin surface and the girth at the same place measured with a string pulled taut. This measurement is taken $\frac{6}{10}$ the distance from the fore end of the water-line. It is easy to see that in a full-bodied yacht $\bar{d}$ = a small unit, whilst in a hollow-bodied yacht $\bar{d}$ = a larger unit. Four times $\bar{d}$ being taken, it followed that hollow-bodied yachts were heavily penalized. This ingenious $\bar{d}$ measurement was evolved by Alfred Benzon, a Danish scientist and yachtsman.

Class Racing, Handicapping and Cruiser Racing.—Yacht racing may be subdivided under these three heads. Yacht racing by rating measurement or tonnage, when either the first yacht to finish is the winner, or the yacht saving her time by a fixed scale of time allowance in proportion to the rating of the vessel and the length of the course, is called class racing, and it obviously tends to encourage the fastest possible vessel under the current rating rule to be produced. It has always been regarded as the highest form of the sport. It is naturally, however, the most expensive form, because only the most up-to-date and perfectly equipped vessels can keep in the first flight.

From time to time, chiefly from about the years 1884 and 1885 onwards, handicaps framed according to merits have been fashionable amongst yachtsmen. They were originally devised to afford amusement and sport to out-classed racers and cruisers. Owing to the expense of class racing, handicap racing thrived greatly during the period of the first and second girth rules. During these periods, too, the third style of yacht racing came into vogue, namely, cruiser racing; either very fast cruisers were built specially for the purpose of handicap racing, or a number of yachts of exactly similar design were built specially to the owner's orders for the purpose of racing in a class together. The fast handicap cruisers had the great advantage over class racers from 1896 up to 1906, inasmuch as they were much more strongly built. "Valdora" (107 tons), "Brynhild" (160 tons), "Leander," "Namara," "Rosamond," "Merrymaid" and many others were yachts of the former type.

Yachts Built Under the Second Linear Rating Rule.—Few large vessels were built expressly for racing under this rule; indeed the Fife 65-footer "Zinita" (1904) was the only light-scantling yacht of any importance. However, two very handsome first-class vessels were constructed to the rule: "White Heather I." by Fife in 1904, and "Nyria" by Nicholson in 1906; they were some 12 ft. shorter than the great cutters of "Britannia's" year and altogether smaller, having less beam and draught and some 1,700 sq.ft. less sail area. The growing dissatisfaction of yacht-owners at the extreme light scantling of modern racing yachts was strongly demonstrated by the fact that both "White Heather I." and "Nyria" were specially ordered to be of heavy scantling, and they were classed A1 at Lloyd's. They were therefore of the semi-cruiser type. "Nyria," however, was the extreme type of a yacht of her period in shape, although heavy in construction.

The First International Rules Introduced.—In April 1904 B. Heckstall Smith drew the attention of German, French and British yachtsmen to the fact that the yacht measurement rules (then different in the various countries) were generally due to terminate about the end of 1907, and suggested that many advantages would accrue if an international rule could be agreed upon. The Yacht-Racing Association agreed to take the matter up, and at two international conferences, held in London in January and June 1906, an international rule of yacht measurement and rating was unanimously agreed to by all the nations of Europe. America alone refused to attend the conference. R. E. Froude, a nephew of the historian, struck the keynote of the object of the conference by a statement that the ideal yacht should be a vessel combining "habitability with speed." Old plank-on-edge types under the tonnage rules were habitable but slow. Skimming-dishes attained the maximum speed, but were uninhabitable. A good form was attained in 1901 with "Magdalen," but since that year the bane of light construction had become harmful to yachting. Hence the conference aimed at a rule which would produce a yacht combining habitability with speed. They adopted a form of linear rating comprising certain penalties upon hollow midship section (*i.e.*, Benzon's $\bar{d}$ tax) and also upon full pram bows. The following was adopted as the rule by which all racing yachts in Europe were rated:—

$$\frac{\text{L.} + \text{B} + \frac{1}{4}\text{G} + 3\bar{d} + \frac{1}{4}\sqrt{\text{S}} - \text{F}}{2} = \text{rating in linear units, } i.e.\text{, either feet or metres.}$$

Where L = length in linear units.
" B = extreme beam in linear units.
" G = girth in linear units.
" $\bar{d}$ = girth difference in linear units.
" S = sail area in square units.
" F = freeboard in linear units.

The length L for the formula was the length on the water-line, with the addition (1) of the difference between the girth, covering-board to covering-board, at the bow water-line ending, and twice the freeboard at that point, and (2) one-fifth of the difference between the girth, covering-board to covering-board, at the stern water-line ending, and twice the freeboard at that point. The additions (1) and (2) penalize the full overhangs and the bow overhang in particular. The girth, G, was the chain girth measured at that part of the yacht at which the measurement is greatest, less twice the freeboard at the same station, but there were certain provisions allowing the measurement of girth generally to be taken 0·55 from the bow end of the water-line. The girth difference, $\bar{d}$ in the formula, was the difference between the chain girth, measured as above described, from covering-board to covering-board, and the skin girth between the same points, measured along the actual outline of the cross-section.

For racing the yachts were divided into 11 classes. Class A for schooners and yawls only, above 23 metres (75·4 ft.) of rating, with a time allowance of four seconds per metre per mile. All the yachts in this class were classed A1 at Lloyd's. In racing, yawls sailed at their actual rating and schooners at 12% less than their actual rating. The other classes were ten separate classes for single masted vessels only in which there was no time allowance whatever.

Racing Yachts All Built to Fixed Scantlings.—Under the international rule the old trouble of ultra-light scantling in

racing yachts was completely abolished, for all yachts were obliged to be built under the survey and classed with one of the classification societies—Lloyd's Register of British and Foreign Shipping, Norsk Veritas, Germanischer Lloyd, or Bureau Veritas; and yachts of the international cutter classes so built were classed R, denoting that their scantlings are as required for their respective rating classes. The international rule for measurement and classification fixing the scantlings was introduced on Jan. 1, 1908; England, Germany, France, Norway, Sweden, Denmark, Austria-Hungary, Belgium, Holland, Italy, Spain, Finland, Russia and the Argentine Republic agreed to adopt it until Dec. 31, 1917. England adopted the new system a year before it formally became international.

The new rule produced the type of yacht desired—a vessel combining habitability with speed. Amongst the handsomest examples were the German emperor's schooner "Meteor" (1909), and the schooner "Germania" (1908), 400 tons or 31½ metres measurement, Class A, both built by Krupp's at Kiel. German designed, German built and German rigged and manned, they demonstrated the wonderful strides made by Germany in yachting. A few years before there were not a dozen smart yachts in Germany, and, indeed, the Kaiserlicher Yacht Club at Kiel was only founded in 1887. The "Germania" holds the record over the old "Queen's course" at Cowes, having in 1908 sailed it a quarter of an hour faster than any other vessel. Her time over the distance of about 47 to 48 nautical miles was 3 hours 35 min. 11 sec., or at the rate of 13·1 knots. In 1910 Herreshoff built in America a wonderful racing schooner of A class for the international rules called the "Westward," and in the races this clipper sailed at Cowes she proved the most weatherly schooner ever built.

The success of the international rule was remarkable. The following is a list of the racing yachts built under it in all countries from its foundation in 1907 to the outbreak of war in 1914.

Class in metres	Length in feet	Number of yachts built
23	75·4	3
19	62·3	6
15	49·2	19
12	39·4	35
10	32·8	54
9	29·5	25
8	26·2	174
7	23·0	86
6	19·7	328
5	16·4	41
Total	..	771

This total does not include the big schooners of Class A, such as "Meteor IV.," "Meteor V.," "Germania," "Waterwitch," "Westward" and "Margherita," enormous vessels of 400 tons, and a number of small yachts built in Scandinavia and neutral countries early in the war, from 1915 to 1917, when the first international rule came to an end. There were thus upwards of 800 yachts built to this rule for international racing.

Much of the finest racing in the whole history of yachting took place from 1908 until 1914. The International Yacht Racing Union was established under the chairmanship of the British Yacht Racing Association and consisted of all the European nations and the Argentine Republic. British yacht building was flourishing, German yachting was at its zenith under the Kaiser. International regattas on a big scale were held at Spithead in 1911, at Kiel in 1912, at Le Havre in 1913, and in the Oslo fjord in 1914. America was attracted to European yachting, and in 1910 an American racing schooner came to Europe, the "Westward," 323 tons, designed and built by Herreshoff. She started in 11 races and won them all. Sir Thomas Lipton's 23-metre cutter "Shamrock" remained the best British cutter during these seasons.

The End of the First International Rule.—The yachting season of 1912 was notable for the appearance of a new 15-metre yacht, the "Istria," designed on novel lines by C. Nicholson for Sir Charles Allom, and the first of a series of yachts by the same clever designer which quickly began to defeat the purpose of the international racing rule. In 1912 and 1913 his great schooner "Margherita" and the cutters "Istria," "Pamela," "Paula III." and others were of most undesirable type, but so efficient as racers that they outsailed the yachts of all other designers.

The Second International Rule.—*The Present Rules 1920–28.*—On the eve of Cowes week, 1914, the war put an end to all yacht racing. The pastime was only revived in 1919–20, after much difficulty, by the Yacht Racing Association. At the end of the war the Scandinavian nations purchased nearly all the best British racing yachts. The cost of building new yachts was prohibitive and the high wages of sailors raised the running expenses to nearly treble the pre-war rate. At the instance of the Y.R.A. the International Yacht Racing Union was reformed and a new rating rule was adopted in 1920. It was essential, in framing the second or present international rule, (1) to keep in view Froude's ideals of combining "habitability and speed" in the new racing yachts, and (2) to keep in view the economy of labour in working the yachts, *i.e.*, to reduce the area of canvas utilized to propel the hull. The object was to try to produce a habitable vessel of say 20 to 25 tons displacement, which, instead of requiring enormous sails to drive the hull, and which would thus need a crew of say eight men to work her, to produce a racing yacht with a hull that could be driven with one-third less canvas and a crew of only four men. The international conferences of 1919, 1924 and 1926 framed two separate rules, one for yachts up to 12-metres and another for yachts above 12-metres. These are as follows:—

Part I. For classes of 6-, 8-, 10- and 12-metres:

$$\frac{L+\frac{1}{4}G+2d+\sqrt{S}-F}{2\cdot5} = \text{rating.}$$

Part II. For yachts above 12-metres:

$$\frac{L+\sqrt{S}-F}{2\cdot3} = \text{rating.}$$

L = the "sailing length" being the length L.W.L. (length on waterline) with certain additions, including measurements of the length of the overhangs at the bow and stern, and also the fullness or girth of the said overhangs.

G = the chain girth.

d = the difference between the skin and chain girths, but not taken round the bottom of the keel.

S = the sail area.

F = the freeboard.

A limit in each rule was placed upon draught of water and height of masts or sail plans.

By far the most important innovation, however, in both rules was a limit upon the displacement of the yacht in proportion to her length. For many years there had been a "limit" or "penalty" upon the displacement of yachts in America. In 1919–20 the International Yacht Racing Union of Europe adopted the American limit upon displacement. Under sec. 8 it is explained how, in the year 1895, the lack of displacement of the skimming dish fin and bulb raters killed the original English length and sail area rule, there being, of course, no limit upon the *minimum* displacement then permitted. These new international rules are, in effect, nothing more nor less than length and sail area rules *plus* the all-important addition of a limit upon the minimum displacement. This is an actual fact, because L and S are the predominant factors of the rules, and the G, d and F amount to a very trifling percentage of the total. Now the minimum limit placed upon displacement in both Parts I. and II. of the present international rule is:

$$\text{Displacement in tons shall not be less than } \frac{(0\cdot2\ \text{L.W.L. in ft.} + 0\cdot5\ \text{ft.})^3}{35}$$

It will be found this gives a minimum weight or displacement of about 3¼ tons to a 6-metre yacht of about 22 ft.; a weight of about 21 to a 12-metre yacht of 42 ft. and about 107 tons to a 23-metre yacht of 75 feet.

All the yachts below 12 metres have to be classed for scantlings R at Lloyd's and all those above 12 metres A1 at Lloyd's.

The Bermudian Rig.—A direct outcome of the new inter-

national rule has been the evolution of the Bermudian rig (*q.v.*).

The Development of Yachting Since the War.—Owing to the increased cost of the sport, the progress of yachting from 1919 until the present time has been gradual. For a few years class racing for new yachts under the international rule has been chiefly confined to the smaller classes of 12 metres and under. A 6-metre yacht built in 1914 cost about £500, and in 1928 she cost about £1,100. The 75-foot or 23-metre "White Heather" and "Shamrock," built in 1907 and 1908, cost about £9,000 or £9,500. The new 23-metre yachts "Astra" and "Cambria," built in 1928, cost between £24,000 and £25,000. It is, therefore, not a matter for surprise that yachtsmen now cruise and race in yachts of smaller tonnage than in former times. Notwithstanding the cost of building, an enormous number of racing yachts have been built to the second international rule from 1920 to 1928, as is shown by the following table:

Class in metres	Length in feet	Number of yachts built
23	75	3
12	39·3	24
10	32·8	20
8	26·2	60
6	19·7	200
Total	..	307

These yachts have been built in Great Britain, Scandinavia, America, France, Italy, Belgium, Holland and Spain. The British 23-metres (built in 1928) are the "Astra," built by Nicholson for Sir Mortimer Singer, and the "Cambria," by Fife, for Sir William Berry. The most famous 12-metres have been the "Vanity," built by Fife for J. R. Payne, and the "Norisca," built by Johan Anker at Oslo.

Great contests for the British-American Cup were sailed in the years 1921–22, –23 and –24 between "teams" of British and American 6-metre yachts. Each country was represented by four selected yachts to form its team. Two contests were sailed in America and two in Britain, and the British won the rubber after many exciting and close races. William Fife the Scottish designer showed his superiority with "Polly," "Reg," "Betty" and "Zenith," and Frederick Stephen, another eminent Scottish yachtsman, designed and built his own yacht, "Coila III.," and competed with great success in these sporting races. Under the second international rule, however, no individual country has carried off the palm. Norway, Sweden and America have shared the honours with Britain. For the first time in the history of yachting it appears that yacht designers are unable to make certain of defeating an old yacht, under the rules, with a new vessel.

The King's Yacht "Britannia."—Encouragement has been given to the pastime of yacht racing since the war by the King's taking the lead in the sport in British waters and re-fitting the old cutter "Britannia" for racing. This yacht, designed by G. L. Watson, and built in the year 1893 has a hull form very similar to that fostered and developed by the new rating rules of 1920. The chief difference between the "Britannia's" hull form and that of modern yachts being that the latter have greater freeboard, and are consequently able to develop higher speed when pressed by fresh wind. The form of modern yachts is also somewhat more elongated and more easily driven in light winds. Nevertheless, with the aid of a small handicap allowance in her favour, the "Britannia" has been raced with much success from 1920 to 1928. She is of larger tonnage than "Astra," "Cambria," "Shamrock," "White Heather," "Lulworth" or "Nyria," and she has been re-rigged with stronger and more substantial gear than most of her newer opponents. Consequently, although not so fast for her size, she has often won many races on her merits in the heavy weather which occurs during the summer round the British coast. The King has personally won many famous races with "Britannia" against the modern yachts, in what is known by sailors as "Britannia's weather." The "Britannia" has thus had two distinct careers. First, from 1893 to 1897, and second, from 1920. No other vessel in the world has won so many prizes or sailed so many races. The following is her complete record:

Year	Number of starts	Number of first prizes	Number of other prizes	Total
1893	43	24	9	33
1894	48	36	2	38
1895	50	38	2	40
1896	58	14	10	24
1897	20	10	2	12
1913 and 1914	22	12	0	12

The Speed of Sailing Yachts.—It may be said that the speed of sailing yachts of normal dimensions varies according to the square root of their length. In judging the speed of modern yachts a comparison thereof is usually made through the "rating measurement." A yacht of 20-metres or 65·6 rating length, in a strong wind can maintain a maximum speed of about 12 knots. The time allowance in seconds per mile between yachts of different "sizes," "ratings" or "lengths," is usually found by the formula:

$$\frac{2{,}160}{Vr} - \frac{2{,}160}{VR}$$

where R is the rating length of the large yacht and r that of the smaller yacht.

It is interesting to recall some old records of speed over courses inside the Isle of Wight.

Date	Yacht	Distance	Time	Remarks
1858	The Arrow	45 miles	4 h. 19 m.	Cutter } Same
1872	The Arrow	50 ,,	4 h. 40 m.	Cutter } vessel.
1872	Kriemhilda	50 ,,	4 h. 37 m.	Cutter.
1883	Marjorie	50 ,,	4 h. 26 m.	Cutter.
1883	Samoena	50 ,,	4 h. 15 m.	Cutter.
1885	Lorna	50 ,,	4 h. 14 m.	Yawl.
1885	Irex	50 ,,	4 h. 7 m.	Cutter.
1870	Egeria	50 ,,	4 h. 27 m.	Schooner.

1908	Germania	47 ,,	3 h. 35 m.	German schooner.

The First Contest for the America's Cup.—The international trophy was originally a cup given by the Royal Yacht Squadron at Cowes, Isle of Wight, on Aug. 22, 1851, for a race open to all yachts, with no time allowance of any kind, the course being "round the Isle of Wight, inside the No Man's buoy and Sand Head buoy and outside the Nab." Fifteen vessels took up their stations off Cowes and started from moorings. In the table following are the names of the competitors.

Yacht	Rig	Tons	Owner
Beatrice	Schooner	161	Sir W. P. Carew.
Volante	Cutter	48	Mr. J. L. Craigie.
Arrow	Cutter	81	Mr. T. Chamberlayne.
Wyvern	Schooner	205	The duke of Marlborough.
Ione	Schooner	75	Mr. A. Hill.
Constance	Schooner	218	The marquis of Conyngham.
Gipsy Queen	Schooner	160	Sir H. B. Hoghton.
Alarm	Cutter	193	Mr. J. Weld.
Mona	Cutter	82	Lord Alfred Paget.
America	Schooner	170	Messrs. Stevens.
Brilliant	3-masted schooner	392	Mr. G. H. Ackers.
Bacchante	Cutter	80	Mr. B. H. Jones.
Freak	Cutter	60	Mr. W. Curling.
Eclipse	Cutter	50	Mr. H. S. Fearon.
Aurora	Cutter	84	Mr. T. Le Marchant.

The fleet started at 10 o'clock. Abreast of Ventnor the American schooner was a mile ahead of "Aurora," which was the last British craft to keep her in sight in a thick haze that blew up from the south-west late in the afternoon At the Needles the wind dropped until it was very light, and the "America" was then some 6 m. ahead of "Aurora," the time being about 6 P.M. The finish was:—

America (winner)	8.37 P.M.	Aug. 22
Aurora	8.58 P.M.	Aug. 22
Bacchante	9.30 P.M.	Aug. 22
Eclipse	9.45 P.M.	Aug. 22
Brilliant	1.20 A.M.	Aug. 23

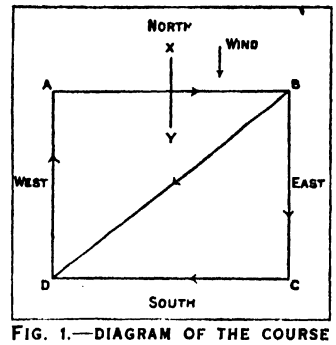
The "America" was built at New York by the firm of George and James R. Steers for the special purpose of competing with British yachts. The principal dimensions of the "America" were: tonnage 171; length over all 94 ft.; on the keel 82 ft.; beam 22 ft. 6 in.; foremast 79 ft. 6 in.; mainmast 81 ft. (with a rake of $2\frac{1}{8}$ in. to the foot in each mast); hollow bowsprit 17 ft. out board only; foregaff 24 ft.; maingaff 28 ft.; mainboom 56 ft. She was ballasted with pig-iron; 21 tons of the iron were permanently built into the vessel and the rest stowed inside. Below deck she was comfortably fitted for the living accommodation of the owner, guests and crew, and a cockpit on deck was a feature that few English yachts of the period possessed.

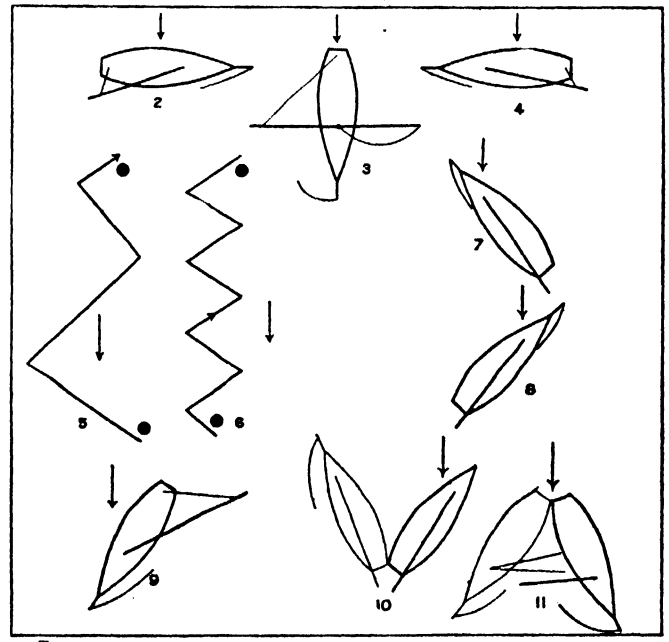
The cup won at Cowes by the "America," although not originally intended as a challenge cup, was afterwards given to the New York Yacht club by the owner of the "America" as a challenge trophy and named the "America's cup." In 1887 the sole surviving owner of the cup, George L. S. Schuyler, attached to the trophy a deed of gift which sets forth the conditions under which all races for the cup must take place. In brief the conditions are: (1) That the races must be between one yacht built in the country of the challenging club and one yacht built in the country of the club holding the cup. (2) That the size of the yachts, if of one mast, must be not less than 65 ft. L.W.L. and not more than 90 ft. L.W.L. If of two-masted rig not less than 80 ft. L.W.L. and not more than 115 ft. L.W.L. (3) The challenging club must give ten months' notice of the race, and accompanying the challenge must be sent the name, rig and the following dimensions: length L.W.L.; beam and draught of water of the challenging vessel (which dimensions shall not be exceeded), and as soon as possible a custom-house registry of the vessel. (4) The vessel must proceed under sail on her own bottom to the place where the contest is to take place. For results of subsequent contests *see* table, p. 870.

HOW A YACHT IS SAILED

The method and principle upon which a yacht race is sailed may be described in a way easily understood by any landsman. The course is usually a triangle or a square. Suppose the starting and finishing line is between the two mark boats XY (fig. 1); and suppose the start to be in an easterly direction. Suppose also the direction of the wind to be north. Then the course would be from the starting line round the marks or buoys placed at B, C, D, A, and back to finish across the line XY. The start of a yacht race is at a fixed hour, say 11 A.M. Two signal guns are fired, one at 10.55 to prepare, and the other at 11 A.M. to start. During the five minutes interval between the guns, the yachts may sail about anywhere they like, "jockeying," so as to try to get into the best position as the second gun fires. The object of the steersman is to sail his yacht across the line XY at full speed immediately after the starting gun has fired.

The first leg of the course is easterly, from the line XY to the point B. This is sailing at right-angles to the wind and is called "reaching." The yacht sailing from XY to B is said to be "reaching on the port tack" because the wind is blowing upon her "port" or left hand side. When reaching, the sails are trimmed as in fig. 2. The next course is from B to C. This is dead before the wind and is called "running." When the wind is dead aft, or nearly so, and the yacht is running before it, the balloon sail called the spinnaker is set. The spinnaker must be taken in before the yacht gets to C. When running, the sheets are eased right off as in fig. 3. The third course is from C to D, this is again reaching, as from A to B, but the yacht is now "reaching on the starboard tack" because the wind is blowing upon her "starboard" or right hand side (fig. 4).





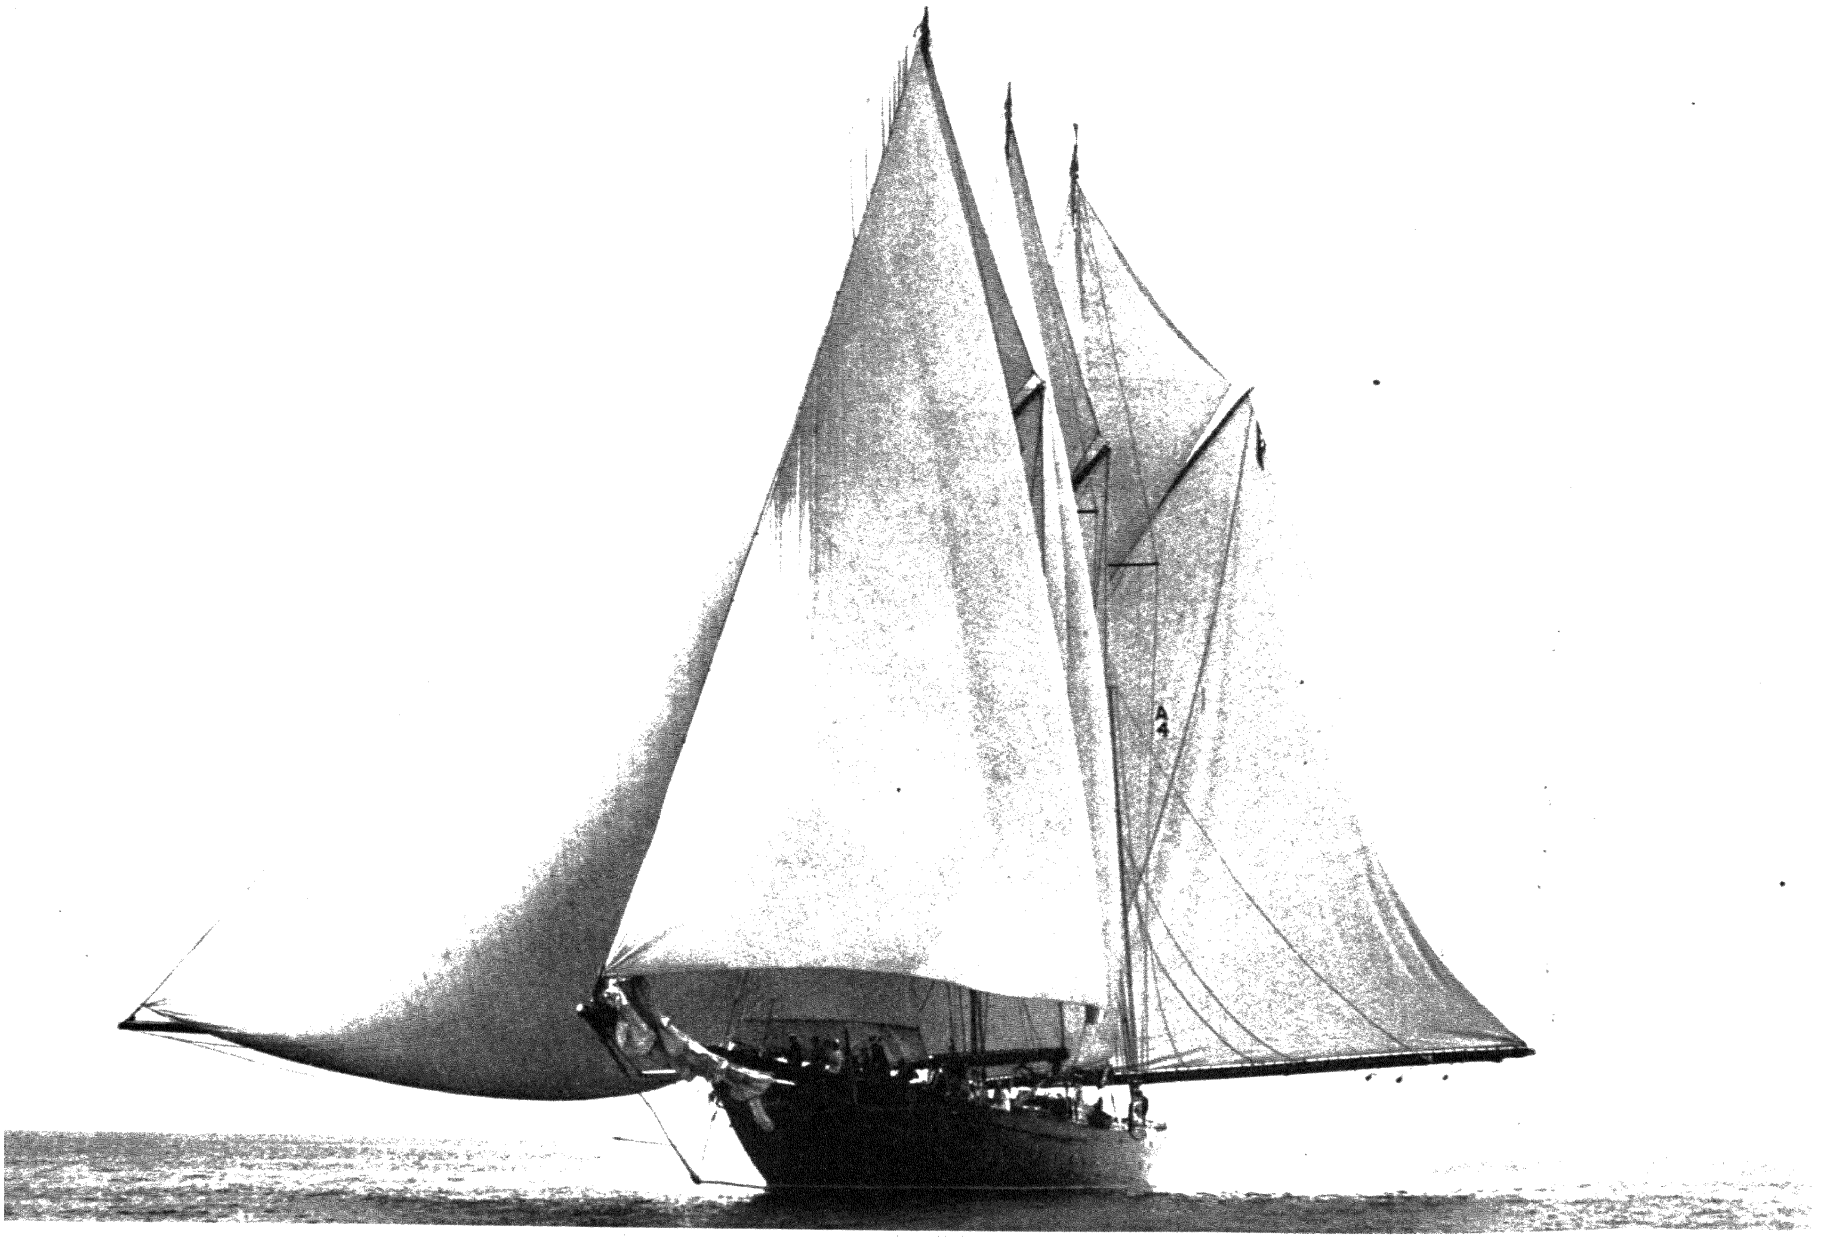


FIG. 1.—DIAGRAM OF THE COURSE OF A YACHT RACE

The yacht having reached to D, now has to sail from D to A. This is absolutely dead against the direction of the wind. The yacht cannot sail dead against the wind but only at an angle of rather less than 45° from it. The yacht, therefore, has to "tack to windward," or "turn to windward," making a zig-zag course. She may either make long tacks (fig. 5), or short tacks (fig. 6), whichever method will take her quickest from D to A. This turning to windward is the greatest test of the yacht's ability, and also of the ability of the helmsman. Much more distance and time may be gained or lost during the zig-zag than at any other period of the race. When sailing to windward the sheets are hauled very close. In fig. 7 the yacht is close hauled on the starboard tack, and in fig. 8 she is close hauled on the port tack. Having arrived at A, the course is next a reach on the port tack, with the wind on the left side, from A to the finishing line XY. As the bowsprit of the winning yacht crosses the finishing line, her winning gun is fired. A gun is usually fired for the first three yachts in a race. If the course had been a triangular course from the start to BD, A and back to the finish, then the leg of the course BD would have been at

FIGS. 2–11.—DIAGRAMS SHOWING HOW A YACHT RACE IS SAILED
2. Reaching on Port tack. 3. Running. 4. Reaching on Starboard tack. 5 & 6. Course tacking to windward. 7. Starboard. 8. Port tack. 9. "A Quartering Wind." 10. Tacking. 11. Gybing

an angle "between running and reaching." To sail off the wind from B to D in this manner is called "a free reach" or "a quartering wind," or to sail with "wind on the quarter." This is the fastest point of sailing, appreciably faster than running with spinnaker before the wind. With a quartering wind the sheets are trimmed as in fig. 9. A yacht is said to "tack" when she changes her course from port tack to starboard tack, or vice versa, when sailing towards the wind. Similarly, she is said to "gybe" when she changes her course from port tack to starboard tack, or vice versa, when sailing "off" or away from the wind. The boom in "tacking" and

2. A schoone. yacht close hauled on the wind off Cowes, Isle of Wight, yachting centre of the south coast of England

"gybing" passes from one side to the other, as in figs. 10 and 11. Yachts are not allowed to collide during the five minutes interval between the guns before the start or during the race. Those overtaking must keep out of the way of those which are being overtaken. Those with the wind on their left (port) side must keep out of the way of those with the wind on their right (starboard) side. When, also, two vessels find themselves converging, the yacht which is to windward must keep clear. When rounding or passing marks at the corners of the course or other obstructions, the outside yachts must give the inside yachts room, and no yacht must hit or touch any of the marks or buoys marking the course. The length of the course varies with the size of the competing yachts. Large yachts sail twice round a course of 20 m.—a distance of 40 miles. Small craft may sail a course of 6 or 8 miles.

THE UNITED STATES

Early History.—Organized yachting and yacht-racing in America began about 1840 with the formation of the first yacht or boat clubs for the promotion of pleasure-boating and the racing of yachts for sport. While a number of boats had been built in the United States and used solely for pleasure-sailing previous to that date, and hence could be classed as yachts, they were few in number, and in type they were more or less similar to the commercial or fishing craft of the same size in the locality in which they were to be used. The country, at that time, was too new and the people along the seaboard too busy in developing the trade and commerce of the newly formed States, and in opening up the land, to allow either the leisure or the means for the development of pleasure-boating.

Yachts had been used in both Great Britain and Holland since the 17th century, and in the history of the Dutch Colony of New Amsterdam, which later became the English Colony of New York, there is mention of a yacht, or boat built for pleasure-boating, named the "Onrust" (Restless), which is claimed to be the first decked vessel built in America. She was about 44 ft. in length and followed the characteristics and proportions of the Dutch boats used in Holland. It is probable that this craft was used also for commercial purposes when not used for pleasure sailing. While the "Onrust" was spoken of as a yacht, there is no authentic data relating to other yachts, or to the sport of racing boats, before the beginning of the 19th century. Except for the "Onrust," the earliest mention of a boat used exclusively for pleasure in New York waters was of a 20-ft. sail-boat owned by John C. Stevens, named the "Diver," and built some time prior to 1809. The name of Stevens is one intimately connected with the development of yachting in America for many years. In 1816 this same John C. Stevens built a perigua named the "Trouble." She was 56 ft. long, with a flat bottom, round bilge and two masts, each carrying a single sail. Some four years later he built a catamaran, or double-hulled boat, called the "Double Trouble," of which little is known except that she was not a success.

On the New England coast, where the population was largely seafaring, there was built in 1801, for Captain George Crowninshield, a wealthy shipowner and merchant, a large sloop of 22 tons called the "Jefferson," which her owner used largely as a yacht until the War of 1812, when she was fitted out as a privateer and took several prizes. Later she was sold into the fisheries. Following this venture, Crowninshield had built in 1816 a vessel called "Cleopatra's Barge," intended solely for pleasure-cruising, and so luxuriously fitted and furnished as to entitle her to rank as a yacht even according to present standards. The builder of this boat was Retire Becket, a well-known ship-builder of Salem, Mass. In her, Crowninshield made a pleasure-voyage to the Mediterranean and back in 1816–17, probably the first American yacht to go abroad. "Cleopatra's Barge" was 83 ft. long on the water, 23 ft. breadth of beam, and her tonnage was 191 tons.

It was in New York harbour, however, that most of the early yachting was done, and the first comprehensive attempt made to develop boats for pleasure-sailing and for racing. In this development the Stevens family, of which John C. Stevens was one of four brothers, played a leading part. Inheriting a love of the sea and mechanical tastes, they did much experimenting, and built successively larger yachts, following the "Diver" and the "Trouble." From 1830–40, sailing and racing boats for pleasure became common among men of means, and a good sized, though mixed, fleet of boats was to be found in New York waters.

Organized Yachting.—It was not until yacht clubs were organized, bringing together those who were interested in the sport, that yachting and racing began to develop along lines that tended to make it a popular pastime, or that yacht design began to show much improvement. As early as 1811 the Knickerbocker Boat Club of New York was formed, but it died the following year. After several other clubs, both in New York and Boston, had been formed and had died, the New York Yacht Club was organized on July 30, 1844, aboard John C. Stevens' new schooner-yacht "Gimcrack," anchored off the Battery. Among its original members were most of the leading yachtsmen of New York, and it was the first club that survived. To-day it is, in point of age and prestige, the foremost yacht club in America, and much of the development of yachting can be traced to the influence of the club itself, or its members. Five years later the Southern Yacht Club, of New Orleans, was organized, followed in 1854 by the North Carolina Yacht Club, and in 1857 by the Brooklyn Yacht Club, but for 20 years the New York Yacht Club was representative of American yachting and was the forerunner of the many yacht clubs that sprang up after the Civil War (1861–65) in all parts of the country wherever there was pleasure-sailing, until in 1928 there were over 450 organized yacht clubs in the United States and Canada.

Development of Design.—At the time of the formation of the New York Yacht Club, and for many years thereafter, the designing of yachts was not pursued as a science. Most of the yachts were turned out by local builders, working by "rule-of-thumb," each builder having his own particular fad or fancy for some particular type or model, these models being influenced largely by the environment and water conditions. With the shoal waters of the Atlantic coast, American yachtsmen as a whole preferred broad, shoal centreboard craft, with great initial stability, which enabled them to carry a large spread of sail without a great amount of ballast. These boats were very fast in smooth water. The centreboard was an adaptation of the leeboards of Holland, but was lowered through the keel instead of over the side. The first boat fitted with this sliding keel was constructed by Captain Schank, at Boston, in 1774. Later he continued his experiments in England and finally devised a successful centreboard in 1778. However, in 1811, the first patent for a centreboard was granted in the United States to three brothers, Jacocks, Henry and Joshua Swain, of Cape May, N.J., and as this device came into rapid use in the shoal waters of the Jersey coast, it may be looked upon as an American innovation.

On New York waters, therefore, under the stimulus of the New York Yacht Club, a large fleet of light draft centreboard yachts soon made its appearance, the boats being modelled by such noted builders as J. B. Van Deusen and "Pat" McGiehan, or such well-known boat sailors as Phil and Joe Ellsworth, or the Van Buskirks. These men had practical experience, but little technical knowledge of designing, and little real development was made during this period, it being an easier matter to rely on beam for stability and great sail area for speed, rather than on refinement of design. In New England, also, the centreboarder was becoming the popular type when speed was the consideration. All of the yachts of the period were then built on the accepted theory of full bow and fine, easy run, or the "cod's head and mackerel tail" principle, and

¶Throat halyard rendered on winch drum—withdrew.

design had not progressed as far as it had in England. Even the very large yachts were centreboarders, and in 1845 John C. Stevens built the "Maria," a sloop 92 ft. in length, which, after her second season, proved very fast and was one of the most famous as well as one of the fastest yachts in the country for many years.

So in 1850 the full bow of the "Maria" was cut away and the yacht was lengthened to 116 ft. over all, and given a sharp bow and hollow water lines forward. This increased her speed in smooth water. Associated with John C. Stevens at this time, was a young ship builder and modeller of New York, George Steers, who with Mr. Stevens modelled the schooner "Gimcrack" and helped in the changes in the "Maria." Stevens and Steers worked so much together that at this time it is impossible to dissociate their work. In 1849 Steers modelled and built the pilot boat "Mary Taylor" in which he discarded the "cod's head and mackerel tail" principle and used the fine entrance and long bow with the midship section farther aft. The "Mary Taylor" was most successful, beating all the fast pilot boats of her day. She brought fame to George Steers, and her form was quickly imitated by other builders.

During the winter of 1850–1851, George Steers modelled for a syndicate of six American yachtsmen, headed by John C. Stevens, and all members of the New York Yacht Club, a schooner of about 170 tons to go to England in the summer of 1851 and race there at the suggestion of some British merchants, the occasion for the proposal being a world's fair that was to be held in London that year. This yacht, built under the supervision of Steers at the yard of William H. Brown, in New York, and named the "America," proved to be the most famous yacht ever built. For the result of this experiment, *see* above.

In 1857 the surviving members of the "America" syndicate executed a deed of gift for the cup won by this yacht at Cowes, and known up to then as the Hundred Guinea Cup, and turned the cup over to the New York Yacht Club, to be held as a perpetual challenge cup for friendly competition between foreign countries. Thus the cup became known as the America's Cup (*q.v.*), and has become the most coveted yachting trophy in the world, emblematic of supremacy in speed under sail. Up to 1928 13 matches had been sailed for this "Blue ribbon of the sea," all of them resulting

in victories for the defenders, and up to this time the cup still remained in the custody of the New York Yacht Club. All of the challenges have come from Great Britain or Canada, and the results of all these races are given in the table on page 870.

In 1876, the advocates of the shoal-draft boat were given a rude jolt when the new 140-ft. centreboard schooner "Mohawk," built for Commodore W. T. Garner, of the New York Yacht Club, was capsized off Staten Island, drowning her owner and several guests. She was lying at anchor with her sails up and sheets made fast when she was struck by a squall, heeled down on her beam ends, where she filled and sank.

A few years after the "Mohawk" disaster Cary Smith turned out the sloop "Mischief," called a "compromise sloop," a centreboard boat, but deeper than the "skimming dishes," with more shape, and relying not alone on beam for stability. "Mischief," 67 ft. long, successfully defended the America's Cup in 1881 against the Canadian centreboard challenger "Atalanta." That same year there arrived in New York from Scotland a little cutter that was to exert a powerful influence on the future of yacht design in America, and that strengthened the growing band of yachting enthusiasts who were looking for something better in design than the wide, shoal centreboarders. This was the "Madge," designed by George L. Watson, a young British designer, and owned by James Coats, of Paisley, who had recently lived in America. "Madge" was a typical British cutter, 46 ft. long over all, 38½ ft. on the water, and only 7 ft. 9 in. beam. She was shipped to New York. That first summer she won nearly all her races against the crack centreboarders, most of them being won without calling on her time allowance. The success of the "Madge" put centreboard advocates on the defensive.

The discussion was still acute when the next challenge for the America's Cup was received, in 1885, from the British yacht "Genesta," a typical narrow cutter. There was much difference of opinion in America as to what type to build to meet the challenger; but a group of Boston yachtsmen, less committed to shoal draft than those around New York, went to a young Boston naval architect, Edward Burgess, and commissioned him to design a large sloop to defend the cup. Burgess was familiar with the cutter type, recognized its good points, and also knew the centreboard boats as they had developed around Cape Cod. Discarding all tradition, he decided to strike out in a radical way and design a yacht that to him appeared best suited to the conditions to be met, and combining the best points of the cutter with the wider beam and shoaler hull of the centreboard sloops. The result was the "compromise cutter," "Puritan," 81 ft. long on the water. On this length "Puritan" had a beam of 22½ ft., draft of 8 ft. 8 in., and a centreboard. She had the plumb stem of the cutter and was deep enough to get a beautifully modelled underbody. "Puritan" proved most successful, beating the shoal-draft defender built in New York handily and defeating the cutter "Genesta," the challenger.

These victories made Burgess the most successful designer in America, and the type originated by him grew rapidly in popularity and soon became the recognized American type. "Puritan" was followed in the next two years by the "Mayflower" and the "Volunteer," both by Burgess and each a successful defender of the America's Cup. Unfortunately, Burgess died in 1891, at the height of his career, and while still a comparatively young man.

The year that Burgess died, Nathaniel G. Herreshoff, of Bristol, R.I., had turned out a yacht that focussed the attention of American yachtsmen on the boat-building plant at Bristol, owned by him and his brother, John B. Herreshoff, and that was destined again to revolutionize yacht design and to bring fame to American yachts and to the Herreshoff family, which had been building boats on Narragansett bay since Civil War days. This yacht was "Gloriana." The new yacht was a masterpiece of designing and building and was very successful from the first. She was followed the next year by "Wasp," from the same designer, and embodying the same general principles.

When the next challenge for the America's Cup (1893) was received from the Royal Yacht Squadron, Herreshoff designed the successful defender, the sloop "Vigilant," 85 ft. on the water. While practically a keel boat, she carried a centreboard, which worked through a slot in the lead keel. Since the "Vigilant," N. G. Herreshoff has designed all of the defenders for the America's Cup up to and including the last race in 1920, when the "Resolute" successfully defended, and Herreshoff became the foremost yacht designer in America, for either large or small yachts.

The Scow Type and the Seawanhaka Cup.—On certain waters of Canada, notably the St. Lawrence river, and on the lakes of Minnesota and Wisconsin, where conditions are not suited to keel boats, the Universal Rule is not used, and in these localities the scow type has been developed to a very high state. These boats are extremely flat, drawing but a few inches, have two bilge boards instead of one centreboard, double rudders, and are sailed without ballast. On a reach they are exceedingly fast, and it is claimed that the larger boats sometimes attain a speed as high as 17 m. per hour in a strong breeze and smooth sea. They are usually sailed in 28-ft., 32-ft. and 38-ft. classes.

The contests for the Seawanhaka Cup between 1895 and 1912 did much for the development of the scow type. This famous trophy was put up by the Seawanhaka-Corinthian Yacht Club, of Oyster Bay, in 1895, for international competition between small yachts. The first race was sailed that year against an English challenger, "Spruce III.," a "half-rater." The following year the cup was won by the Royal St. Lawrence Yacht Club of Canada, with an extreme scow named the "Glencairn." There followed a long series of races between Canada and the United States.

Recent Development of Yacht Design.—During the World War there was very little yacht building in America, and no marked development in design. But following the readjustment period there was a marked increase in interest in all forms of yachting, and larger fleets were to be seen at the principal regattas than previously. In this development the small yacht predominated, due somewhat to the greatly increased cost of running large sailing craft, and to the fact that yacht racing was making a strong appeal to those who wanted to handle their own craft. Therefore, the smaller racing classes were promoted, principally the 31-rating (Class P), 25-rating (Class Q) and 20-rating (Class R) classes, and numerous one-design classes.

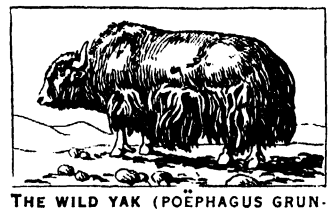
One-Design Classes.—As early as the late '90s several racing classes in which the boats of each class were identical in design were formed, and proved popular, both because the boats were, theoretically, of equal speed, and because there was considerable economy in building many boats exactly alike at one time. Some of the earlier of these one-design classes were the Newport 30-ft. class of fin-keel sloops, and the 70-ft. class of large sloops, both designed by Herreshoff. There followed, then, a great demand for such classes of yachts of one-design. Among the important one-design racing classes developed in the first quarter of the 20th century are the following:

Class	Load water line	Designer
	Feet	
Bar Harbor 31-footers	31	Herreshoff
New York Yacht Club 30-ft. class	30	"
New York Yacht Club 50-ft. class	50	"
New York Yacht Club 40-ft. class	40	"
Larchmont O class	38	Wm. Gardner
Seawanhaka Schooner class	38	Cox & Stevens
Class S One-design	20½	Herreshoff
Victory class	21	Wm. Gardner
Interclub class	19	C. D. Mower
Star class (over 400 boats have been built to this class)	16	Wm. Gardner
Indian Harbor Arrow class	21	John G. Alden
12-metre class	43	Burgess & Morgan
10-metre class	36	"
8-metre class	30	"
And many smaller classes under 20 ft. water line length		

The North American Yacht Racing Union.—Legislation affecting yacht racing, the rules under which yachts were raced, and measurement rules, up to about 1900, had been in the hands of individual yacht clubs, or local yacht racing organizations composed of a number of clubs in the same locality. There was thus

great lack of uniformity in different sections of the country. At the time of the agitation for a new measurement rule to supersede the "length-and-sail-area" rule, the New York Yacht Club took the lead and called a conference of yachting organizations of the Atlantic coast and the Great Lakes to find out what was wanted and to bring about uniformity by getting the other sections to adopt the new rule (the Universal Rule) that was then being formulated. This was a step forward, but the conference was not permanent in character, and there was no real governing body on yachting affairs in America. To remedy this situation, there was formed in 1925 a union of most of the local yacht racing associations, and a number of prominent yacht clubs, the guiding spirits in the matter being Clifford D. Mallory and Commodore W. A. W. Stewart, of the Seawanhaka-Corinthian Yacht Club. This organization, called the North American Yacht Racing Union, was the first permanent legislative and governing body of national scope in America, and through it both the racing and measurement rules have been standardized, and an appeal body for its members formed. In 1927 delegates from this union met with delegates of the International Yacht Racing Union, in London, to bring about closer co-operation internationally in yachting affairs.

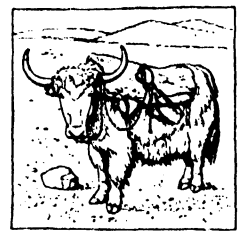
Cruising Yachts.—The development of cruising yachts in America has followed in a general way the development of the racing type. While no measurement rule had to be considered in their design, it was natural that in hull design the boats should take the same characteristics as the racing craft, especially as they were sailed on more or less protected waters, or along the coast where harbours were frequent. However, shortly after the World War, several designers, notably John G. Alden and William H. Hand, Jr., developed a type of small seaworthy yacht for cruising, embodying many of the characteristics of the New England fishing schooners. These boats were good offshore cruisers, and they quickly became popular, and were soon taking part successfully in long distance and ocean races, such as the one from New London to Bermuda, while several boats of this design, from 50 to 55 ft. long over all, made the Atlantic passage with safety and comfort. In size, they ranged from 40 to 125 ft. over all length, and a large fleet was built between 1920–28.



Ocean Racing.—Long distance racing along the coast, and ocean races between yachts, have been more popular among American yachtsmen than among those of the European yachting nations. The first transatlantic race was sailed in 1866, between three American schooners, in the month of December, one of them being a centreboarder, and the others keel yachts. These schooners were the "Henrietta," "Fleetwing" and "Vesta," the first winning in the fast time of 13 days 21 hours and 45 minutes. There was another Atlantic race in 1871 between the American schooner "Dauntless" and the British schooner "Cambria," and in 1887 the "Dauntless" and the new schooner "Coronet" raced from Sandy Hook to Roche's Point, Ireland, in March. The greatest ocean race ever sailed was in 1905, when 11 large yachts raced from Sandy Hook to Land's End, England, two being British yachts, one a German, and the rest American. It was won by the American three-masted schooner "Atlantic" in 12 days 4 hours and 1 minute, for the course of 3,013 miles, still the record in 1928.

About 1905 ocean racing in small yachts was inaugurated by the late Thomas Fleming Day to demonstrate that small boats, properly designed, built and handled, could keep the sea with safety. He inaugurated the race from New York to Bermuda, and later, one to Havana for power craft. After the war the Bermuda Race was revived and is now sailed every two years. For larger yachts there are two challenge cups for ocean racing, held by the New York Yacht Club, for which many historic contests have been sailed. These are the Cape May and the Brenton Reef cups for competition over ocean courses between Newport, R.I., and Cape May, N.J. On the Pacific coast the principal ocean race, for which a permanent cup has been put up, is one from the California coast to Honolulu, Hawaiian Islands, a distance of about 2,200 miles. This is sailed every two years. In 1928 a transatlantic race from New York to Spain was sailed, nine schooner yachts starting and seven finishing. The winners were the "Elena" and the "Nina," the latter being only 59 ft. long over all.

It is in the development of the sailing yacht that American yachtsmen are most interested and towards which they have devoted most of their energy and effort. (H. L. St.)



YAHGAN, an Indian tribe, now almost extinct, who occupy the south coast of Tierra del Fuego and the adjacent islands southward to Cape Horn. Hence they are the southernmost people in the world. That they have lived in the same region for many centuries is attested by great middens which cover their camping places. Yahgan life before the European settlement was extremely simple. In spite of the cold climate their chief garment was a single seal or other skin, which they wore on the windward shoulder. Their houses were usually small domed affairs of saplings covered with bark and grass or seal-skins. Their canoes, peculiar for their high pointed ends and a fireplace amidships, were constructed of the bark from a beech tree. Their manufactures included baskets of several weaves, harpoons, spears, shell necklaces and simple tools. Their diet embraced shellfish, seal, whale, various birds, a few berries and several kinds of fungi. The Yahgan had no organized tribal life or recognized leaders. Each family, often including several wives, was a law unto itself, wandering at will and rarely camping in one place for more than a few days. At times, groups of relatives would assemble to perform elaborate initiation ceremonies for both the boys and the girls, who were forced to undergo various privations, to have their courage tested by masked apparitions, and to learn the tribal lore. It has been asserted that the Yahgan have no religion. However, they believe in evil spirits, who must be propitiated by their medicine men, and they also reverence a supreme God. Their mythology is surprisingly rich.

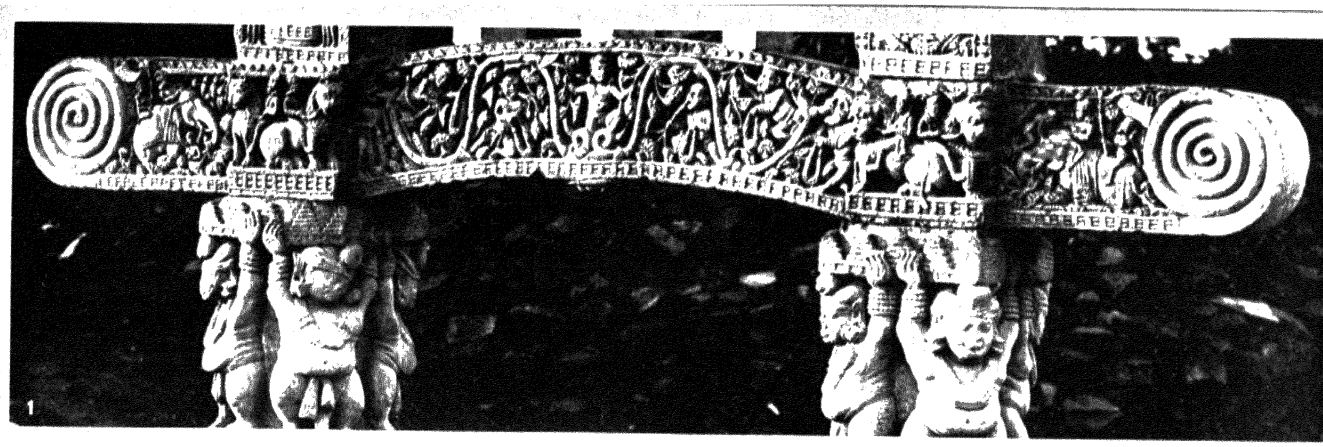
THE WILD YAK (POËPHAGUS GRUNNIENS)



YAK, the wild (and domesticated) ox of the Tibetan plateau; a species allied to the bison group. The yak, *Poëphagus grunniens,* is one of the largest of oxen, characterized by the growth of long shaggy hair on the flanks and under parts of the body and the well-known bushy tail. The wild species is black in colour. Domestic yaks are often black and white, and small-sized breeds exist. The magnificent half-tamed animals kept by the natives of the elevated Rupsu plateau, south of the Indus, afford the only means of transport by this route between Ladak and India. But even these are inferior to the wild yak, which stands nearly 6ft. at the shoulder and is confined to the arid plateau of Tibet.

DOMESTICATED YAK (POËPHAGUS GRUNNIENS)

YAKIMA (yăk'ĭmą), a city of south-central Washington, U.S.A., on the Yakima river, at an altitude of 1,075 ft.; the county seat of Yakima county. It is on Federal highways 97 and 410; has a municipal airport of 80 ac.; and is served by the Northern Pacific and the Union Pacific railways, and by electric inter-urban and motor-coach lines. Pop. (1920), 18,539 (87% native white); 1928 local estimate over 26,000. Yakima is the metropolis of a productive region of diversified agriculture, formerly a sagebrush desert, which owes its prosperity largely to reclamation by the Federal Government which will have brought 475,000 ac. under irrigation with the completion of undertakings in hand in 1928. Apples and other fruits are leading crops, but potatoes, green vegetables, live stock, grain, hay and dairy products are also important. The farm products shipped out of the valley in 1927 amounted to 42,248 carloads, valued at $41,666,500. The district has cold-storage facilities from which to load 9,500 cars, and the manufacturing industries of the

STATUES OF YAKṢAS OR INDIAN DEITIES

1. Yaksas, or deities, spouting lotus rhizome and flowers, and as Atlantes (Sāñcī 1st cent. B.C.). 2. Yakṣī, or dryad, under a tree (1st cent. A.D.—Museum of Fine Arts, Boston). 3. Chāndi Yakṣī (2nd cent. B.C.—Indian Museum, Calcutta). 4. Gangita Yakṣa (2nd cent. B.C.—Indian Museum, Calcutta). 5. Yakṣas Atlantes forming capital of column supporting arch of gate (Sāñcī 50 B.C.). 6. Yakṣa spouting lotus rhizome and flowers (from Bharhut 2nd cent. B.C.—Indian Museum, Calcutta). 7. Assamukhī Yakṣī (Bodhgaya 100 B.C.). 8. Kubera Yakṣa (1st–2nd cent. A.D.—Archaeological Museum, Mathurā). 9. Yakṣī carrying food and water (1st–2nd cent. A.D.—Archaeological Museum, Mathurā). 10. Yakṣa under tree (1st–2nd cent. A.D.—Archaeological Museum, Mathurā)

city (including large lumber mills and canneries) produce about 90 different commodities and have an annual output valued at $13,000,000. Bank clearings in 1927 totalled $77,903,887. The State Fair is held at Yakima annually in September. Five miles south of the city is the Yakima Indian Reservation, and the eastern entrance to Rainier National Park is 50 m. N.W. The city was incorporated in 1886 under the name of North Yakima. In 1900 the population was 3,154, and this increased to 14,082 by 1910. "North" was dropped from the name in 1917.

YAKṢAS. The Sanskrit designation *Yakṣa*, of uncertain derivation, is applied upon occasion to practically every Indian deity, and even to the Buddha, in an honorific sense. Later, in sectarian and especially in Buddhist literature, the Yakṣas are represented in the interests of edification either as devoted assistants and defenders of the faith, or as inferior beings of an ogre type. More generally we may say that Yakṣas are supernatural beings, deities of varying rank, who have once been men, and will be reborn again on earth. Generally speaking benevolent, they are closely connected with vegetation, human fertility and wealth; they are essentially tree spirits, others being more like gnomes; they possess magic powers, especially that of concealment.

The cult of Yakṣas seems to have been at one time the dominant aspect of popular religion in India; it may be described as an early form of devotional Hinduism, perhaps going back to a period in history contemporary with the Vedas. In the Atharva Veda and in certain Upaniṣads the Brahman itself is called "a great Yakṣa," and the indwelling spirit in Man a "self-like Yakṣa." The individual Yakṣas are for the most part local and tutelary deities; the Śākyas, for example, worshipped the Yakṣa Śākyavardhana. "He who prospers the Śākyas." Other Yakṣas are the guardian angels (*ārakkhadevatā*) of individuals. Others called Guhyakas are earth spirits who function as the bearers of vehicles and as supporters of buildings, like Atlantids. The chief of the Yakṣas is Kubera or Vaiśramaṇa, who is mentioned already in the Atharva Veda, and is best known as the great king who is regent of the north, where are his heaven, palaces and groves. He is essentially a god of wealth; his chief symbols are a lotus and a conch represented as fountains of money; as a tree-spirit he is associated with the banyan (*see* Plate, fig. 8). Another great Yakṣa is his generalissimo, Maṇibhadra. A group of 28 Yakṣa kings is mentioned in more than one place, but the total number of Yakṣas mentioned in the literature is very large. Many have come to be regarded as local manifestations of higher Brahmanical deities, especially Śiva. Kāmadeva, the god of love, belongs appropriately to the Yakṣa class; his symbol, the *makara* (mythical crocodile), represents the waters, or rather an essence in the waters, identical with the sap of trees, the water of life (*amṛta*).

YAKUB KHAN (1849–1923), ex-amir of Afghanistan, son of the amir Shere Ali, was born in 1849. He showed great ability at an early age, and was made governor of Herat by his father, but broke into open rebellion against him in 1870, and was imprisoned in 1874 in Kabul. However, when Shere Ali in 1878 fled before the British, he handed over the government to Yakub, who, on his father's death in the following February, was proclaimed amir, and signed a treaty of peace with the British at Gandamak. He agreed to receive a British resident, and was in turn to receive a subsidy and support against foreign attack. But in September of the same year his revolted troops attacked the British residency, and the resident, Sir Louis Cavagnari, and his staff and suite were cut to pieces. This outrage was instantly avenged, for in October Earl (then Sir Frederick) Roberts with a large force defeated the Afghans on the 6th and took possession of Kabul on the 12th. Yakub Khan thereupon abdicated, took refuge in the British camp, and was sent to India on Dec. 13. He died at Dehra in the United Provinces on Nov. 15, 1923.

YAKUTSK, an A.S.S.R. of Asiatic Russia formed in 1922, stretching from the Siberian area on the west to the Far Eastern area on the east, and from the Arctic ocean on the north to about lat. 54° N., where it is again bordered by the Far Eastern area. It covers about 4,000,000 sq.km. and is therefore almost equal in size to European Russia, but its total population in 1926 was roughly 278,800.

The region is the least explored in Russia, and has a tragic history of disaster overtaking many scientists whose efforts to investigate this inhospitable region have given us what information is available. A geological expedition sent out to the Aldan watershed by the Soviet Government in 1926 nearly perished of starvation and records that the price of salt was 4 grammes of gold for 400 grammes of salt and that meat cost 30 to 40 grammes of gold per kg. In 1927 the National Academy of Science organised a further expedition which proposes to remain for five years' investigation of various districts in Yakutsk.

Physical Features.—Much of Yakutsk is occupied by the basin of the Lena (*q.v.*). The Lena forms the eastern marginal river to that ancient block along the edge of which the Yenisei (*q.v.*) flows in the west. It flows in a true valley of erosion of very great age and is not confined by mountains except near its mouth, where the Khara-ulakh range, a spur of the folded mountains of the Verkhoyansk arc, rises on its right bank and deflects its course, while subsidiary fold lines affect the lower courses of the Olenek and the Anabar to the west. To the north lies a broad tundra belt sloping to the Arctic, from which rise four domes of basic eruptive rock.

Climate.—The soils of the republic are not favourable to cultivation; a broad belt south of the Arctic consists of dry clayey, stony tundra soil, merging southwards into forest tundra soil and then into the ash coloured alkali forest soils of the south, while there are belts of silty bog soils on the mountains. Along the banks of the Lena and Olekma, are strips and patches of fertile alluvial soils. The climate is severe and extreme, and Verkhoyansk (67° 50′ N., 133° 50′ E.) has the greatest annual range of temperature in the world; its average January temperature is −59° F, absolute minimum −90° F, average July temperature 60° F, absolute maximum 93° F. The fact that this cold pole lies so far east shows that the Atlantic has much more moderating influence than the Pacific, the latter being shut off by mountains, and also having strong prevailing off-shore winds. The change of temperature between the seasons is sudden and there is a drop of 40° F between October and November. At Yakutsk in lat. 62° 1′ N., winter is still extremely long and severe. The average January temperature is −46° F and the river is frozen from Nov. 12 to June 10 in most years.

Occupations.—The Skoptsi, an exiled religious sect, settled in Yakutsk in the '60s of the 19th century and introduced agriculture in the neighbourhood of Olekminsk and Yakutsk. The clean, well-built Skoptsi villages are in striking contrast to the dirty Yakutsk settlements. Barley occupies 53%, spring rye 27% and wheat 11% of the grain harvest. Potatoes, turnips and cabbages thrive and cultivation is slowly spreading in the alluvial patches of the Lena and Aldan, though the disturbed post-1917 conditions have temporarily checked progress. The limit of cultivation here extends to 63·5° N. and during 1898–1917 the sown area was trebled, many of the Yakuts sowing patches of grain.

Meadowland is important, and 725,000 tons of hay were raised in 1925–26. Cattle and horse breeding is successful as far north as Yakutsk; both horses and cattle are short, long-haired and very hardy. The milk yield is small, but of good quality. There are no sheep or pigs. Cattle-breeding would be much improved by better attention to winter quarters and food: the animals are crowded in insanitary huts, and plague often spreads.

North of this agricultural region is the region of the nomad reindeer breeders, relying entirely on their herds, while in some regions there is no reindeer-breeding and the natives rely on fish.

Ivory.—An important product is mammoth ivory, of which 25 tons were exported in the year 1926. The mammoth (*Elephas primigenius*) existed in comparatively recent times in great numbers in the polar region of Siberia and entire carcasses, with

flesh, skin, fur and congealed blood in the veins have been found in the region. Mammoth ivory is mentioned by Pliny and its existence was known to the Russians in 1582.

Mines.—Gold is the main product of the republic, realising about 8,000,000 roubles in 1925–26. It has been known to the Russians since the mid-19th century, when it was worked in the Olekma mines, now abandoned. The Aldan mines, re-opened in 1923, produced about 280,000 oz. of gold that was registered in 1925–26 and much contraband was probably also raised. The gold here is easily worked, being on or near the surface, but there are great difficulties of transport and the miners are often unable to procure the necessities of life. In 1914 a fresh source at Nyukhinsk was discovered and is now being successfully exploited.

Iron ore is worked in an entirely primitive way and smelted by the Yakuts to make hunting knives. They were capable smiths long before the coming of the Russians. Coal of recent origin and poor quality extends over a belt of 1,200 m. north and south of Yakutsk, but is little used. There is an area of curative mud on the Lena river with a high percentage of iron and aluminium, and a health resort is planned. Sulphur springs exist in many places, especially near Parsheva, and jasper and carneol are found below Zhigansk, where there is iron, coal and platinum. Spars, amber, graphite, gypsum, crystal and emerald are reported, but unworked.

Population.—The Yakuts are a Turkic branch of the Ural-Altaic stock and their language closely resembles that of the Turks. A Yakut grammar by Boethlingk was published in 1851. They are thick set, brachycephalic, with dark eyes and hair, narrow foreheads, broad noses and long narrow eyes.

The Yakuts form 85% of the population, and the Russians, mainly in the Aldan mining region and in Yakutsk, form 11%. There are also Chinese and Koreans in the mining district. Half the population of the republic live in or near Yakutsk. In former times *brodyagi* or escaped convicts were a great terror in the district, and there has been much intermixture with Russian exiles, convicts and traders.

The Tungus are another branch of the Ural-Altaic group, as are the Lamuts. The Yukaghir are a Palaeo-Siberian tribe, mainly found now between the Kolyma and Indigirka rivers and occupied in hunting and fishing. They are very short, with yellow or brown complexion, dark eyes and hair, and scanty beards. They are fast dying out, especially since the advance westwards of the Chukchee has lessened the number of wild reindeer. The latter tribe is spreading westward from the Far Eastern Area (*q.v.*).

YAKUTSK, a town of Asiatic Russia, the administrative centre of the Yakutsk A.S.S.R., situated 2 m. from the river Lena, here 9 to 11 m. wide, on its left bank, in 62° 5′ N., 129° 4′ E. Pop. (1926) 10,513. The alluvial soil on which it is built is frozen all the year round, but thaws to a depth of 3 or 4 ft. in summer, when the streets become quagmires. Many mud huts exist, though there are some brick houses, and the schools, churches and official buildings are of brick; some wooden houses are built on high platforms as a protection against the June floods, when the ice breaks on the river, which remains open till November. Winter sledge tracks radiate from the town to the Sea of Okhotsk, Vilyuisk, the Kolyma and to Irkutsk (1,165 m.). There are no good roads. There is telegraphic communication, but it frequently breaks down, especially in spring and autumn, when the roads are impassable and repair of the lines is impossible. Efforts are being made to establish air communication with the town and so lessen its isolation. Between the town and the Aldan are meadow lands with sandy sub-soil and scattered clumps of birch, willow and spruce. The fort was founded in 1632, and the town later became a centre for the trade in furs, mammoth ivory, reindeer hides and cattle. The policy of education in the vernacular is being encouraged.

YALE UNIVERSITY, the third oldest institution of higher education in the United States, situated at New Haven, Conn. In 1700 the needs of New England in the way of higher education were supplied by Harvard college, at Cambridge. Massachusetts Bay Colony was naturally the chief patron of Harvard, but Connecticut bore her full share in support of the enterprise. The two commonwealths, however, diverged to some extent in their theological and political development and there arose the desire for a separate college in Connecticut. The first distinct traces of this scheme appear in the early summer of 1701, in the neighbourhood of New Haven. The Rev. James Pierpont (Harvard, 1681), minister of the New Haven church, was the chief promoter of the new enterprise.

WREXHAM TOWER, MEMORIAL QUADRANGLE, AT YALE UNIVERSITY, DESIGNED ON THE LINES OF WREXHAM CHURCH IN WALES, WHERE ELIHU YALE, FIRST DONOR TO THE COLLEGE, IS BURIED

The General Court of the Colony met at New Haven on Oct. 9, 1701, and a charter was granted (probably on Oct. 16) "for the founding, suitably endowing and ordering a Collegiate School within his Majesty's Colony of Connecticut." The founders chose the Rev. Abraham Pierson of their number as rector of the Collegiate school and it was at his parsonage in Killingworth that the first scholar sought admission in March 1702.

The school continued at Killingworth, with the annual commencements at Saybrook, until the death of Rector Pierson on March 5, 1707. From 1707 to 1716, although the commencement exercises were held annually at Saybrook, the students resided in the several towns where their tutors were established. It was not until a gift of nearly 1,000 volumes of great value was secured by Jeremiah Dummer, the agent for Connecticut at London, that a building for the school became necessary. After much argument it was decided to establish the institution at New Haven. A cargo of gifts for the Collegiate school, from Elihu Yale, former governor of Ft. St. George, Madras, India, and a native of Boston, including, beside books, East India goods which were sold in Boston for £562. 12s., led the trustees to use the name Yale college at the commencement of 1718, the first to be held in the completed college building.

Although the Collegiate school had been founded independent of church control, strong influence was exerted early in its history to bring it under ecclesiastical domination. In 1722, when the rector, Timothy Cutler, was dismissed because of a leaning toward Episcopacy, the college required that every officer must publicly accept the confession of faith adopted at the Synod (1708), and that stern Calvinistic faith became the officially adopted creed and was strictly taught to its scholars. Although President Clap

secured the passage in 1745 of a new charter which legalized the name "Yale College" and in general provided a more explicit and liberal statement of powers and privileges conferred in 1701 and 1723, the organization of a College Church in 1757 provoked much criticism and revived the struggle to bring the college under the control of the legislature. President Clap made a convincing defence of the independent rights of the corporation but the assembly refused to pass the usual grant to the college in 1755.

The charter drawn up by President Clap is still in force. In 1792 the governor and lieutenant governor of the State and six senior State senators were made *ex officio* members of the corporation. In 1872 the six senators were replaced by six graduates, chosen by the alumni. The act authorizing the name Yale university was passed in 1887.

The curriculum of the college changed but little before the administration of Timothy Dwight the Elder (1795–1817), who expanded the usefulness of the college by the organization of professional schools. Benjamin Silliman, Sr. (1779–1864), was appointed to the first chair in chemistry, mineralogy and geology in the United States in 1802. In 1810 a medical department was established, and the theological and law departments were organized in 1822 and 1824.

Under the administration of Theodore Dwight Woolsey (1846–71) graduate courses were organized in 1846 and the Graduate school (under the title Department of Philosophy and the Arts) was established the following year. The degree of Doctor of Philosophy was first conferred in the United States by Yale in 1861. In 1847 also courses in applied chemistry were offered and in 1852 instruction in engineering. Two years later these courses were distinguished as a separate section with the title "Yale Scientific School," which was changed in 1863 to "Sheffield Scientific School" in appreciation of the assistance of Mr. Joseph E. Sheffield, of New Haven, who endowed the school in 1860 and subsequently increased his original gifts by frequent donations. In 1863 the Connecticut legislature gave to the scientific school a grant for promotion of scientific education, so that, until revocation of this act in 1892, this school was also the State college of agriculture and applied arts. The School of Fine Arts, established through the generosity of Augustus R. Street, was opened to students in 1869, the first of its kind to come within the scope of any university. The elective system of instruction was substituted for the fixed curriculum in 1876 and in the same year the degree of Master of Arts was first given; a graduate course in law also was established, offering the first advanced course in America or England leading to the degree of Doctor of Civil Law.

During the presidency (1886–99) of Timothy Dwight, grandson of the former President Dwight, the institution more than doubled in resources, faculty and student enrolment. The School of Music was established in 1894, and its work augmented through the patronage of Joseph Battell, Albert Arnold Sprague and his daughter, Mrs. Elizabeth Sprague Coolidge.

An outstanding feature of the administration of Arthur Twining Hadley (1899–1921) was the development of the university idea co-ordinating the various schools and departments. The School of Forestry, the oldest forest school in continuous operation in the United States, was founded in 1900, as the result of the gifts of James W. Pinchot and his family.

The establishment, through the gift of Edward L. Harkness, of a department of drama in the School of the Fine Arts, and of a School of Nursing by gifts from the Rockefeller Foundation and the development of facilities for an Institute of Human Relations, indicate the latest additions to the opportunities offered by Yale.

The present (1929) board of trustees, called the Yale corporation, consists of the president of the university, James Rowland Angell, the governor and lieutenant governor of Connecticut, ten fellows known as the successors of the original trustees, and six graduates elected for six-year terms. The corporation has five administrative officers, the president, provost, secretary, treasurer and associate treasurer and controller. The general administration of each school of the university is in the hands of a dean and a board of permanent officers, subject to the approval of the corporation. The university council, made up of the university's administrative officers, the deans, elected representatives of the divisions and other officers, helps to co-ordinate the work of the different schools and departments and considers educational problems of the university. The teaching in the university is divided among 35 departments of study which serve the various schools. All members of these departments who are of professorial grade are grouped in four divisions: language, literature and the arts; history and the social sciences; mathematics and the natural sciences; and engineering courses of study in candidacy for degrees in course are offered in ten schools which confer in all 25 degrees and two certificates.

The course of study in Yale College is designed to provide for substantial mastery of some one field of humanistic study together with an intelligent acquaintance with allied subjects. The Sheffield Scientific school provides for concentration in the principal fields of science and engineering, besides offering many electives. The school of the Fine Arts offers four professional courses, architecture, drama, painting and sculpture, in which lectures are combined with technical practice. The School of Music admits those who intend to become musicians by profession, or to enter the field of musical criticism and literature of music. The curriculum of 28 months (the equivalent of three college years) in the School of Nursing is divided into pre-clinical (four months) and clinical (two years) periods. Women are admitted to the Graduate school, School of Medicine, School of Law and School of Music, and to the courses in drama, painting and sculpture in the School of the Fine Arts.

The University library, including departmental collections, had a total (1928) of 1,902,512 volumes and pamphlets. Besides the gifts in the early years of the college, particular mention should be made of the Aldis collection of American *belles lettres*, the Elizabethan Club library of Shakespeare quartos and folios, the Henry R. Wagner collection of British and Irish economic and historical tracts, the Parker collection of books on Napoleon and the Ezra Stiles manuscript diaries and itineraries. Other important collections are the Penniman library of education, the William A. Speck collection of classical German literature, the Albert S. Wheeler Roman law library, the Lowell Mason music library, the Frederick S. Dickson collection of Fielding's works, the Scandinavian library of Count Riant, the Curtius and Seymour libraries of classical literature, the Robert von Mohl library of political science, the Edward M. House collection of historical papers and the J. Sumner Smith Russian library. Among its rare volumes the library has a copy of the Gutenberg 42 line Bible.

The collections of the School of the Fine Arts include the Jarves gallery of Italian art, numbering 120 primitives (13th to 17th centuries); the Trumbull gallery of historical portraits and other works, numbering 102 pictures; the Alden collection of Belgian Renaissance woodwork; and the Achelis collection of Dürer and Rembrandt prints. The university also owns a valuable collection of Greek and Italian vases. The Peabody museum of natural history was given by George Peabody in 1866.

The Yale university press was founded in 1908 for the publication of works having permanent interest and value. Since 1926 the Yale university press has published the *Yale Review* (1892), a national quarterly owned by the university. The university also publishes the *American Journal of Science* (1818), the oldest scientific publication in the United States, founded by Prof. Benjamin Silliman. The publications which are under the direction of students are the *Yale Law Journal*, *Yale Literary Magazine* (founded in 1836), the first undergraduate publication in the country, the *Yale Daily News* (1878), the oldest daily, the *Yale Record*, a humorous monthly, and the *Yale Scientific Magazine*.

In 1929 there were 680 officers and instructors and 508 assistants in instruction and administration. The students registered as candidates for degrees numbered 5,025; of this total 3,189 were undergraduates and 1,836 students in the graduate and professional schools. There were also 718 students who were not enrolled as candidates for degrees or certificates.

The buildings number 77. Connecticut hall (1752), a four-storey brick building with gambrel roof, long known as South Middle college, is the only building remaining from the 18th

century. The university funds on June 30, 1928, amounted to $58,024,459.36 ($21,181,302.17 in 1918), exclusive of land and buildings valued at $50,000,000, and of funds and property amounting to $2,712,013.78 held by the Sheffield trustees. The total income in 1927–28 was $5,960,665.25.

The alumni advisory board, representing the alumni groups through duly elected members, serves to secure careful discussion of university interests. In 1926 there were 23,752 living degree holders and 8,964 non-graduates, the majority from the North Atlantic division, but other sections of the country are well represented, as well as foreign countries. The division according to occupations shows a preponderance in the fields of education, medicine, ministry, engineering, banking, industry and commerce.

YALU, BATTLE OF THE. This was the opening battle on land of the RUSSO-JAPANESE WAR, and is described under that heading. Fought on May 1, 1904, by Gen. Kuroki's I. Army, advancing from Korea, the Japanese success was a valuable moral tonic and created a profound impression in Europe.

YAM, a term usually applied to the tubers of various species of *Dioscorea* of the monocotyledonous family Dioscoreaceae. These are plants with thick tubers (generally a development of the base of the stem), from which protrude long, slender, annual climbing stems, bearing alternate or opposite, entire or lobed leaves and unisexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish, bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the male flowers, and surmounting a three-celled, three-winged ovary in the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds. The species are natives of the warmer regions of both hemispheres.

D. sativa and *D. alata* are the species most widely diffused in tropical and subtropical countries. *D. aculeata,* grown in India, Cochin China and the South Sea islands, is one of the best varieties. *D. Batatas,* the Chinese yam, or Chinese potato, is hardy in Great Britain, but the great depth to which its enormous tubers descend renders its cultivation unprofitable. It has deeply penetrating, thick, club-shaped, fleshy roots, full of starch (about 13% of the fresh weight) which when cooked acquire a mild taste like that of a potato; they grow 3 ft. or upwards in length, and sometimes weigh more than 1½ lb. The plant grows freely in deep sandy soil, moderately enriched. The tubers of *D. alata* sometimes weigh 100 lb. Most of the yams contain an acrid principle, which is dissipated in cooking.

The only European species is *D. pyrenaica,* a native of the Pyrenees, a remarkable instance of a species growing at a long distance from all its congeners. In North America there is a single native species, *D. villosa,* called wild yam-root or colic-root. This is found from Rhode Island to Ontario and Minnesota and southward to Florida and Texas, but is of slight economic value. True yams must not be confounded with the sweet potato, *Ipomoea Batatas.* The common black bryony (*Tamius communis*) of hedges in England is closely allied to the yams of the tropics, and has a similar root-stock, which is reputed to be poisonous.

For the history of the yam, and its cultivation and uses in India, *see* G. Watt, *Dictionary of the Economic Products of India,* iii. (1890).

YAMA, in Vedic Hindu mythology the twin of his sister Yamī, and with her the first human pair. Yama is king of the dead, and later, their judge. The word is Sanskrit for "twin."

YAMAGATA, ARITOMO, PRINCE (1838–1922), Japanese field-marshal, was born in Choshu. He began life as an ordinary *samurai* and rose steadily in reputation and rank, being created a count in 1884, a marquess in 1895 (after the war with China) and a prince in 1907 (after the war with Russia). He twice held the post of premier, and was the leader of Japanese conservatism, being a staunch opponent of party cabinets. He died at Odawara on Feb. 1, 1922.

YAMAMOTO, TATSUO, BARON (1856–), Japanese statesman, was born in Oita-ken, and educated at Keio. After some time in a business career he entered in 1890 the Bank of Japan of which he was appointed director and then governor (1898–1903). In 1910 he became governor of Hypothec Bank of Japan. He was made minister of finance in 1911–1912, minister of agriculture and commerce in 1913–1914, and again in 1918–1922. At that time he belonged to the Seiyukai Party, but in 1924 he seceded and established a new party, Seiyuhonto, with Tokonami, as leader, becoming himself the adviser to the party. When the Kenseikwai and the Seiyuhonto parties united to form the Minseito, in 1927, he became the adviser to the new party. He was made the crown member of the house of peers in 1903, and created baron in 1920.

YAMBOL, a town of Bulgaria, on the river Tunja, 49 m. W. of Burgas by rail, and an important corn growing centre. Pop. (1926) 23,134. In the town are the remains of old fortifications, and the ruins of a fine mosque. Yambol is first mentioned in the 11th century, when it was known by the Byzantines as Hyampolis.

YAMETHIN, a town and district in the Mandalay division of Burma. The town has a station on the railway 275 m. N. of Rangoon on the main line to Mandalay. It is an important centre of trade with the Shan States. The district lies between the Shan States and the Meiktila, Magwe and Toungoo districts and comprises the Sittang valley in the centre, the Pegu Yomas on the west and the forested Shan hills on the east. Area, 4,176 sq.m.; pop. (1921) 323,189, showing an increase of 16,810 in the decade. The staple crop is rice, which is irrigated from tanks and canals. Millets and oil-seeds are grown in the north, where drought has more than once caused distress. Besides the chief town, Pyinmana and Pyawbwè, both also on the railway, carry on an active trade with the Shan States. Pyinmana has a forest school, and from Pyinmana a branch railway now crosses the forested Pegu Yomas to the Magwe district.

YANCEY, WILLIAM LOWNDES (1814–1863), American political leader, son of Benjamin Cudworth Yancey, lawyer of South Carolina, was born in Warren county, Ga., on Aug. 10, 1814. He attended Williams college for one year, studied law at Greenville, S.C., and was admitted to the bar. He was elected in 1841 to the State house of representatives, became State senator in 1843 and in 1844 was elected to the national House of Representatives to fill a vacancy, being re-elected in 1845. In 1846 he resigned his seat, and devoted himself to the resistance of anti-slavery aggression. In 1848 he secured the adoption by the State Democratic convention of the so-called "Alabama Platform," declaring that it was the duty of Congress not only to allow slavery in all the territories but to protect it, that a territorial legislature could not exclude it, and that the Democratic Party should not support for president or vice president a candidate not openly opposed to the exclusion of slavery from the Territories. When the Democratic convention in Baltimore refused to incorporate his ideas into the platform, Yancey with one colleague left the convention. He opposed the Compromise of 1850, and went so far as openly to advocate secession. In 1858 he advocated the appointment of committees of safety, the formation of a league of united southerners, and the repeal of the laws making the African slave-trade piracy. He attended the Charleston convention of the Democratic Party in April 1860, and again demanded the adoption of his ideas. Defeated, he again left the hall, followed by the delegates of Alabama, Mississippi, Louisiana, South Carolina, Florida, Texas and two of the three delegates from Delaware. On the next day the Georgia and a majority of the Arkansas delegation withdrew.

In the Baltimore convention of the seceders he advocated the nomination of John C. Breckinridge, and made a tour of the country on his behalf. When the South seceded, he delivered the address of welcome to Jefferson Davis on his arrival at Montgomery, but declined a place in President Davis's cabinet. On March 31, 1861, he sailed for Europe as the head of a commis-

sion sent to secure recognition of the Confederate Government, but returned in 1862 to take a seat in the Confederate senate. On account of his failing health, he left Richmond early in 1863, and on July 27 died at his home near Montgomery.

Du Bose, "Yancey: A Study," *Gulf States Hist. Mag.*, vol. i., pp. 239–252, 311–324 (Montgomery, Ala., 1903); and G. Petrie, "What Will Be the Final Estimate of Yancey," *Alabama Hist. Soc., Reprint* No. 14 (1904).

YANG-CHOW-FU, a city in the province of Kiangsu, China, formed of the two distinct cities of Kiang-tu and Kanch-'uan. Population about 100,000. The walls are between 3 and 4 m. in circumference. It was the ancient capital of the Yang Kingdom. It possesses an early historical connection with foreigners for Marco Polo ruled over it for three years by appointment from Kublai Khan (?1282–85). It is a cultural and literary centre rather than an industrial or commercial city.

YANGTZE KIANG (Yahng-ts-Ke-ahng), the principal commercial river of the country. This river, the length of which is estimated at some 3,000 miles, is known as the Yangtze by Europeans throughout its course, but among the Chinese this term indicates only the last three or four hundred miles where it flows through a region known in ancient times as "Yang." The ordinary official name for the whole river is Ch'ang Kiang or Ta Chiang, meaning the "long river" or the "great river." Popularly in the upper reaches every section has its local name. As it enters China it is known as the Kinsha Kiang (river of Golden Sand) and farther down as the Pai-shui Kiang; in Szechwan after its junction with the Min it is for some distance called the Min-kiang.

The beginnings of the river are somewhat indefinite but may be located in the high and difficult country between Tibet, Sin-kiang and Kuku-nor. The river flows in a south-easterly direction not far removed from some of the headwaters of the Hwang-ho. Proceeding south-eastward the Yangtze follows one of those narrow longitudinal valleys separated from one another by lofty ridges that mark the bending southward of the eastern extensions of the Himalayan folds against the older core of south-east China. At Batang in this section of the course the river is 8,540 ft. above sea-level. Its entrance into China proper is marked by bends in its course as it bursts through lines of weakness in the sides of the corridor valleys. The river then begins a long south-west to north-east course through the Red Basin of Szechwan. As the Yangtze cuts across the longitudinal valleys it receives many tributaries (flowing in parallel valleys) all naturally on the left hand bank. At Wa-Wu in Szechwan the height of the river is 1,900 ft. above sea-level, a fall of about 8 ft. per mile from Batang. Through the Red Basin of Szechwan the Yangtze flows at first with fairly low banks but towards the east it becomes deeply encased and the rapids are many and dangerous. This is due to the fact that Szechwan is tilted down against the up-thrust of the fault-line of the west and thus the river cuts with ease through its western half but gets through on the east by means of deep gorges. (*See* SZE-CHUEN.) At Chung-king, where the Kialing enters on the left, the river is only 630 ft. above sea-level. After receiving the Wu-kiang on the right the river enters deep gorges and emerges at I'chang (130 ft. above sea-level.) In its subsequent course the river skirts the north side of the old land-block of south-east China. Here the physical features are mostly set north-north-east to south-south-west or west-north-west to east-south-east. The Yangtze follows these directions alternately in successive sections. Below I'chang it is in the Hupeh basin, the Han flows in from the north-west and the basin focuses on Hankow (*q.v.*).

From I'chang to the sea, a distance of 1,000 miles, the fall of the river is exceedingly small, being as far as Hankow at the rate of 2½ inches and from Hankow to the mouth at the rate of little more than 1 inch per mile. The last 200 miles of the Yangtze course are practically a dead level.

The drainage area in Szechuan and below is about 650,000 sq.m., of which more than four-fifths lie above Hankow. The period of low water is from December to March. Melting snows in Tibet together with the summer monsoon cause an annual rise in the river of from 70 to 90 ft. at Chungking and from 40 to 50 ft. at Hankow. The mean volume of water discharged into the sea is estimated at 770,000 cu.ft. per second and the quantity of sediment at the mouth at 6,428 million cu.ft. per annum.

The Yangtze forms a commercial highway of first class importance. Except in winter-low-water, vessels of between 5,000–6,000 tons can reach Hankow. Sandbanks between Hankow and I'chang make navigation more difficult and above I'chang the gorges add to the dangers. But on the whole the Yangtze as a highway is the collecting and distributing centre of half the commerce of all China. Various "agreements" between China, Britain and other powers from 1898 have given Britain political influence over most of the Yangtze basin.

The great towns and centres of trade on the banks of the river are Chin-kiang at the junction with the Grand Canal; Nanking; An-king; Hankow and Wu Chang, I'chang, King-chow; Kwei-chow; Chung-king, and Sui fu.

YANKEE. The term means properly a citizen of New England, but by extension, chiefly by Europeans, it is often used to indicate any native of the United States. The origin of the word is uncertain, but according to a common statement the Massachusetts Indians are reported to have given the name, *Yenkees,* or *Yenghees,* to the English colonists, the term being a corruption of the word English; or as some think, a corruption of the French word, *anglais,* in which case the word must have originated in Canada, as the early Canadian Indians were the only ones in contact with the French. The British soldiers seem to have used it as a term of reproach for the New Englanders about 1775, who afterwards took up the word and used it in reference to themselves. During the Civil War the Southerners used it in a derisive sense to indicate inhabitants of the Northern States.

YANKTON, a city of South Dakota, U.S.A., on the high bank of the Missouri river, near the mouth of the James, 1,200 ft. above sea-level, and 60 m. from the S.E. corner of the State; the county seat of Yankton county. It is on Federal highway 81 and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, and the Great Northern railways, and by motor-coach lines to many points. Pop. (1925 State census) 5,507. In 1780 Pierre Durien reached the Indian village then occupying the site of Yankton, and married into the tribe. He guided the Lewis and Clark expedition from Saint Louis to Yankton, and in 1811 his son accompanied the Astoria expedition up the river and on to the Coast. In 1858 a permanent trading post was established here. The city was laid out in 1859, chartered in 1869, and in 1910 adopted a commission form of government. From 1861 to 1882 it was the capital of the Territory of Dakota.

YAOS or **AJAWA,** a Bantu-Negroid people of east-central Africa, whose home is the country around the upper reaches of the Rovuma river, and the north of Portuguese East Africa. They have spread into the territory south of Lake Nyasa and throughout the Shiré districts. They are the tallest and strongest of the natives in the Mozambique country. They were formerly slave-traders, but were reduced to submission by the English in 1896.

See Miss A. Werner, *The Natives of British Central Africa* (1906); Sir H. H. Johnston, *British Central Africa* (1897); H. L. Duff, *Nyasaland under the Foreign Office* (1903).

YAP. This island of the Caroline group, formerly owned by Germany, is situated in the Pacific ocean, south of Japan and east of the Philippines, and north of the equator, in lat. 9·35 N., long., 138·15 E. It has an estimated population of 7,155, almost entirely of Malay origin.

The importance of Yap arises from its cable connections, since it is a station on the direct line from the United States to the Dutch East Indies via Guam, while another cable runs from Yap to Shanghai. On May 7, 1919, Japan was given a mandate over the islands north of the equator previously owned by Germany, including Yap. The United States Government protested, and asked for a reopening of the subject on the ground that at the Peace Conference it had reserved the right to object to exclusive control of the cable landings by Japan and taken the position

that the island should be internationalized for cable purposes. Further, it was contended, the United States, not having ratified the Treaty of Versailles, was not bound by it. The supreme council of the Allies expressed its inability to reopen the matter. The controversy was finally disposed of at the Washington conference, Dec. 12, 1921, by an agreement between the two Powers, wherein the United States recognized the Japanese mandate and Japan agreed that the United States should have free access to the island on a footing of entire equality with Japan or any other nation in respect to the Yap-Guam cable and any other cables which might be laid by the United States or its nationals, and also similar rights and privileges in regard to radio-telegraphic service. The United States was also granted free entry and exit for persons and property. The United States Senate ratified the convention embodying this agreement March 1, 1922. (*See* WASHINGTON CONFERENCE.)

YAPOK: *see* WATER-OPOSSUM.

YA'QŪBĪ [Aḥmad ibn abī Ya'qūb ibn Ja'far ibn Wahb ibn Wāḍiḥ] (9th century), Arab historian and geographer, was a great-grandson of Wāḍiḥ, the freedman of the caliph Manṣūr. Until 873 he lived in Armenia and Khurasan; then he travelled in India, Egypt and the Maghrib, where he died in 891. His history is divided into two parts. In the first he gives a comprehensive account of the pre-Mohammedan and non-Mohammedan peoples, especially of their religion and literature. For the time of the patriarchs his source is now seen to be the Syriac work published by C. Bezold as *Die Schatzhöhle*. In his account of India he is the first to give an account of the stories of Kalila and Dimna, and of Sindibad (Sinbad). When treating of Greece he gives many extracts from the philosophers (*cf.* M. Klamroth in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, vols. xl. and xli.). The second part contains Mohammedan history up to 872, and is neither extreme nor unfair, although he inherited Shi'ite leanings from his great-grandfather.

Edition by T. Houtsma (2 vols., Leiden, 1883). Ya'qūbī's geography, the *Kitāb ul-Buldān*, contains a description of the Maghrib, with a full account of the larger cities and much topographical and political information (ed. M. de Goeje, Leiden, 1892). (G. W. T.)

YAQUI, the best known and sturdiest Indian tribe of Sonora, Mexico. Their language, generally called Cahita by older authors, belongs to the Piman division of the Uto-Aztecan family. The Yaqui were, and in part remain, settled agriculturists, but offered a stubborn resistance to the first Spanish invaders. They gradually came under mission influence, but in the 19th century Mexican encroachments on their lands and water rights led to a series of uprisings which were quelled with difficulty only to flare up anew, and since the final subjugation of the Apache, left the Yaqui the one unsubdued and feared tribe in North America. They pass as the best labourers in Sonora, and several thousand have recently settled in Arizona. They number about 30,000.

YĀQŪT or YAKUT (Yāqūt ibn 'Abdallah ur-Rūmī) (1179–1229), Arab geographer and biographer, was born in Greece of Greek parentage, but in his boyhood became the slave of a merchant of Hamah (Hamath), who trained him for commercial travelling and sent him two or three times to Kish in the Persian Gulf. After his master's death he became a bookseller, and he travelled in Persia, Syria, Egypt and visited Merv, Balkh, Mosul and Aleppo. About 1222 he settled in Mosul and worked on his geography, the first draft of which was ready in 1224. After a journey to Alexandria in 1227 he went to Aleppo, where he died in 1229. In his large geography, the *Mu'jam ul-Buldān* (ed. F. Wüstenfeld, 6 vols., Leipzig, 1866–73), the places mentioned in the literature or the stories of the Arabs are given in alphabetical order, with the correct vocalization of the names, an indication whether they are Arabic or foreign and their locality. A sketch of their history and of their monuments follows.

The parts of this work relating to Persia have been extracted and translated by Barbier de Meynard under the title *Dictionnaire géographique, historique et littéraire de la Perse* (1871). Yāqūt wrote a dictionary of geographical homonyms, the *Mushtarik* (ed. F. Wüstenfeld Göttingen, 1846). Yāqūt also wrote an important dictionary of learned men, the *Mu'jam ul-Udabā'*. Vol i. has been edited by D. S. Margoliouth, *Irshād al-Arib Il ā Ma'rifat al Adīb* (London, 1908).

YARKAND (Chinese name SOCHE FU), the largest town in one of the two chief oases of the Tarim basin in the dominion of Sinkiang, 38° 25′ N. and 77° 16′ E., 3,900 ft. above sea-level. The oasis lies along several rivers of the south-west part of the Tarim basin and, as these streams come from the glaciers of high Pamir, they are strong and give a good water supply. The Kashgar oasis lies to the north-west and the Khotan oasis (across a desert belt) to the south-east. In the Yarkand oasis irrigation is highly developed and the soil at the foot of the mountains is largely fertile loess on which wheat, barley, rice, beans, and oil plants are grown, while there are also many fruit orchards. Among the mountains there is good pasture and large herds of camels, yaks, goats, sheep and cattle are kept. Cotton and silk (mulberry) are cultivated to some extent.

Marco Polo visited Yarkand between 1271 and 1275 and Goes went there in 1603. Schlagintweit passed through Yarkand a few days before he was killed at Kashgar in 1857.

The town is surrounded by a great earth wall with towers of Chinese type and has mosques and madrasas (colleges) of great fame though less well known than those of Bukhara and Samarkand. Estimates of the population, all some years old, vary from 50,000 to 100,000, probably according to the extent to which suburbs have been reckoned with the city. There are several smaller towns in the Yarkand oasis: Tashkurgan on the Pamirs, Yangi-hissar, Posgam, Kargalyk, at the bifurcation of ways to Khotan and Ladakh, Sanju, Tagarchi, Kartchum, Besh-taryk and Guma. The city is a centre of caravan trade along routes from Cadakh, Khotan, Kansu and Trans-Caspian regions, as well as India and Russia generally. Horses, cotton, skins and leather and leather goods, carpets, silk, etc., are dealt in, and carpets as well as woven stuffs in silk, cotton and wool are made.

YARMOUTH, a seaport town and port of entry, Yarmouth county, Nova Scotia, Canada, on the Dominion Atlantic and Canadian National railways, 218 m. from Halifax. Pop. (1921) 7,073. Steamers run to Boston, Mass., and to St. John, N.B., and Halifax. Fish and lumber are exported.

YARMOUTH, a port at the western extremity of the Isle of Wight, England, on the Solent, where the estuary of the Yar debouches. Pop. (1921) 893. Steamers connect it with the S.R. at Lymington on the mainland. It appears in the Domesday Survey of 1086 under the name of Ermud.

YARMOUTH (GREAT YARMOUTH), a municipal, county and parliamentary borough, watering-place, and seaport of Norfolk, England (with a small portion in Suffolk), 121 m. N.E. from London by the L.N.E.R., served also by the M. and G.N.R. Pop. (1921) 60,700.

Yarmouth (*Magna Gernemutha*), which lies near the site of the Roman camp of Garianonum, is believed to have been the landing-place of Cerdic in the 5th century. Not long afterwards, the convenience of its situation having attracted many fishermen from the Cinque Ports, a permanent settlement was made, and the town numbered 70 burgesses before the Conquest. Henry I. placed it under the rule of a reeve. The charter of King John (1208), which gave his burgesses of Yarmouth general liberties according to the customs of Oxford, a gild merchant and weekly hustings, was amplified by several later charters asserting the rights of the borough. In 1552 Elizabeth granted a charter of admiralty jurisdiction, afterwards confirmed and extended by James I. In 1668 Charles II. incorporated Little Yarmouth in the borough by a charter which with one brief exception remained in force till 1703, when Anne replaced the two bailiffs by a mayor, reducing the aldermen and common councilmen to 18 and 36. Yarmouth returned two members to parliament from 1300 to 1868, when it was disfranchised until 1885. The borough now returns one member. The herring trade, which has always been the main industry of Yarmouth, used to be carried on at an annual fair between Michaelmas and Martinmas.

Yarmouth lies on a long and narrow peninsula of sand, between the North sea and the Breydon Water (formed by the rivers Yare and Waveney) and the river Bure. The old town of Great Yarmouth was built chiefly along the east bank of the Yare, but the modern town has extended beyond its ancient walls, of which some

remains exist, to the seashore. On the landward or Suffolk side of the estuary is the suburb of Southtown, and farther south that of Gorleston. The principal features of Yarmouth are the north and south quays, and the straight narrow lanes called "rows," 145 in number, running at right angles to them. The old town is connected with Little Yarmouth by a bridge across the Yare of stone and iron, erected in 1854. The church of St. Nicholas, founded in 1101 by Herbert Losinga, and consecrated in 1119, is the largest parish church in England.

Yarmouth roads, off the coast, afford excellent anchorage except in E. or N.E. winds. The channel to the quays was made by Joost Jansen, a Dutch engineer, in 1567, and affords a depth at the bar of 12 ft. at low water. The herring and mackerel fisheries are most important, and fish-curing is an extensive industry, Yarmouth bloaters being widely famous. The fishing fleet numbers some 500 vessels of 20,000 tons, and employs about 3,000 hands. The principal imports are coal, timber and seeds, and exports are grain and fish.

See *Victoria County History, Norfolk;* H. Swinden, *History of Great Yarmouth* (1772); C. J. Palmer, *History of Great Yarmouth* (1854): Marlowe, *People and Places in Marshland* (1927)

YARN. The derivation of this word from "*garn,*" a word common to the Scandinavian languages, meaning "guts," is interesting since today "cat-gut," which may be the drawn-out "guts" of the silk-worm, is a well-known commodity; and the same "guts" spun by the silk-worm itself into a fine filament are the basis of the best silk yarn produced. The silk-worm, however, in its "spinning" simply thins-out the silk fluid to a double microscopic strand some 500 to 1,000 yards long, several of which are combined by mechanical means to form a yarn; while the human spinner usually combines a number of much shorter fibres or filaments, also by mechanical means, into a continuous strand often much longer than the 1,000 yards filament of the silk-worm; and this also is spoken of as a yarn.

Materials.—The materials from which yarns are constructed or spun markedly influence the processes of production. In the case of the best silk yarn the worm itself does what is termed the spinning and the later running-together of several of the long silk filaments is not spoken of as spinning but as "throwing." In the case of a typical short fibre—say the cotton fibre ½″–2″ long—the spinning process is the binding together of many thousands of cotton fibres into a fine regular, continuous thread—usually spoken of as "yarn." Two or more of these threads or single yarns may be combined together by "twisting" to produce a thicker, stronger yarn. Of the true long fibres there are only two types, the natural silk reeled from the cultivated silk-cocoon and the synthetic artificial silks.

Of the short fibres there are many classes. The longest are the waste silks just mentioned; then come the animal fibres including hairs and wools up to 18″ long, short wools down to, say, 2″ long and broken-up wool fibres (variously termed shoddy, mungo, extract, flocks, etc., according to their source and manner of breaking up from the virgin wool clothes, knitted garments, etc.) which (it is popularly said) can be spun into yarn if they possess two ends; next come the "stem-fibres" such as flax (producing linen yarn), hemp, jute and china-grass which may vary in length from several inches down to fractions of an inch; lastly come the cotton fibres and cotton wastes often under one inch in length along with which should perhaps be ranked the mineral fibre asbestos, which may be spun into a yarn from which fireproof cloths are woven.

Structures.—Yarn structures may be considered from two points of view. In the first case particular fibres lend themselves only to particular "fibre combinations." Thus long silk filaments can only be "thrown" together with or without "twist." But the twisting of silk filaments is an art in itself. Thus several filaments may be reeled together from separate cocoons and these given a suitable "combining-twist" to produce what is known as singles; then several of these singles may be thrown together with little twist to produce almost a "paralleled-fibre" thread termed "tram" the most lustrous yarn known, or with much twist to produce a strong, fairly lustrous yarn termed "organzine" which is employed as "warp." On the other hand one inch cotton fibres after being drawn into a fairly fine "paralleled sliver" termed a "roving" can only be spun out into a fine thread by means of "supporting twist" which no doubt binds the fibres more or less concentrically in the thread or yarn: this is said to be the true form of spinning—draft (that is, drawing-out thinner) against twist.

Fancy Twists.—These naturally group themselves into three classes, viz., structural twists; colour twists; and structural-and-colour twists. Of the first class the two most important are the knop yarn—in which knops are formed at any required intervals on an otherwise level thread by holding one thread tightly and allowing the second thread to run in slackly to form knops of the required size, after which equal delivery of the two threads for the required length is followed again by the varied delivery to form the knop; and the curl yarn—in which a knop yarn is first formed and then this two-fold yarn twisted, in the opposite direction, with a third thread, this opening out the knops into loops which may be produced at more or less regular intervals or "spaced," *i.e.*, a length of the thread without loops and then a series of loops, which in turn are followed by a length of the thread without loops. Of fancy colour twists the simplest is the corkscrew twist which is formed by first twisting, say, a dark and a light thread in the normal manner and then twisting this two-fold yarn in the reverse direction, with a third dark thread, this producing the special appearance which gives its name to the yarn.

Other Fancy Yarns.—Fancy yarns of an effective character may also be produced with simple modification in the normal carding and spinning processes. Thus "knicker yarns" are produced by throwing little bits of highly coloured material into the last cylinders of the card so that instead of being broken up by carding they are carried forward as "knickers" into the spun thread. "Random yarns" are produced by feeding the card with alternate stripes of dark and light material and taking the condensed slivers off with a zig-zag or moving-laterally doffer which takes sections of the lengths of its slivers from first one and then the other stripes. "Marl yarns" are produced by running two differently coloured slivers together on the roving frame just prior to the worsted spinning process, so that the colours are "regularly irregularly" mixed together.

If on the other hand a very level mixture effect is required dark and light coloured tops are mixed together in the worsted drawing processes, or, better still, the "tops" are printed the required colours in bands and then passed through the worsted drawing processes this producing the extraordinary level mixture effect termed a "melange." Of the simple twofold yarns the best known is the "granderelle" in which a dark and light thread—usually of similar material, but not necessarily so—are finely twisted together as perfectly as possible. Another twofold twist termed a "spiral yarn" is formed by two single threads twisted in opposite directions being combined with twofold twist which necessarily shortens one of the threads by adding twist and markedly lengthens the other by taking out twist. Thus the slack thread "spirals" round the tight thread.

Yarn Effects and Special Properties.—The effects which may be produced by suitable selection of materials and yarn structure may be grouped into three classes, viz., light-reflective effects; form effects, and colour effects. Light reflection from the surface of a woven fabric depends upon the material or materials employed, upon the fibre arrangement in the thread, upon the thread interlacings and upon such modifications as may be introduced in the finishing processes. Thus some wools are lustrous—the Wensleydale wool, for example—and some are opaque and dull—the Down wools. Ordinary cotton is dull, mercerized cotton is lustrous. A lightly twisted net silk yarn ("tram") is the most lustrous yarn known, while a specially hard twisted net silk yarn (crape) is the dullest yarn produced. Tram silk yarn interlaced on the "satin" principle produces the most lustrous fabric and crape silk yarn interlaced on the "crape" principle produces the dullest fabric known.

Merino wool spun on the woollen principle when woven into a normal fabric gives a dull surface but if the fibres are "raised" from the surface and laid parallel in the "finishing" processes then

a brighter fabric may result than that produced from a merino wool spun on the worsted principle in which the fibres are laid parallel in the thread structure only.

The "form" effects will have been appreciated from the descriptions already given of knop, curl, spiral, etc., yarns. These yarns specially coloured as already described offer the designer the opportunity of producing a never-ending array of novel fabrics. Should specially white fabrics be required a "bleached" yarn is employed but it is more usual to bleach the material in the fabric state. Should a yarn which may be spun white but later—either in the yarn or cloth state—dyed two distinct colours be sought for, cotton may be blended with wool in the carding or in the drawing processes, or strands of wool and of cotton may be twisted together and dyed distinctive colours later.

Yarn Counting and Numbering.—The numbering or "counts" of yarns, 30's, 40's, 80's, etc.—may be explained best by the counting of woollen yarns. The basic weight is the "wartern" of six lb. the "quartern" of the old 24 lb. stone. This appears to have been a convenient weight for the spinners to take away to their homes for hand or "jenny" spinning. If this weight was spun in 1,536 yd.—that is each dram spun out to one yard—it was termed "one skeins." If one dram was spun to 2 yd., it was termed "two skeins"; if to 20 yd., it was "twenty skeins." Later it was found more convenient to deal with the unit weight of 1 lb., so that it has come to be usual to reckon the woollen "skein" as 256 yd. and the number of skeins to which a pound of this material is drawn out as the "counts," spoken of as "skeins" in the woollen districts. Thus if 1 lb. is drawn out to 5,120 yards (256×20) the yarn is a "20 skeins." Unfortunately the woollen industry was spread over the whole of the known world before the unifying mechanical era dawned with the result that not only each country but each manufacturing district has adopted its own system of woollen yarn counting. Thus 200, 300, 420 yd. skeins are to be found and there is a still further complication in the United States where in one case the length is fixed and the count or skeins is given by the number of times the unit weight (the grain) is contained in this unit length. This method is that natural to the net silk industry in which the drams per 1,000 yards, or the deniers (or $\frac{1}{2}$ deci-gram) per 450 metres gives the count spoken of as the "deniers."

The cotton spinning industry which started from England adopted from the first a hank (or skein) of 840 yards and the hanks per lb. as the "count" and this has obtained world-wide acceptance. The worsted industry, apparently an off-shoot of the cotton industry, taking a yard instead of a $1\frac{1}{2}$ yard reel has adopted a hank of 560 yards and the hanks per lb. give the count. An attempt is now (1928) being made to adopt a universal system of counting yarns. The kilogram and the kilometre (or gram and metre) are suggested as the universal bases for everything excepting "thrown" silk and artificial silk yarns for which a base length of 500 metres is suggested and the weight of this in decigrams to give the "deniers" or "count."

The yards to which one pound of material may be spun naturally vary with the fineness and nature of the material. Thus cotton has been spun on a commercial basis to 588,000 yd. per lb., linen to 180,000 yd. per lb., worsted yarn to 56,000 yd. per lb., and woollen yarn to 15,000 yd. per lb.; while net silk yarns, if required, may even be thrown finer than the finest cotton.

Sometimes to obtain a fine, straight-fibred thread, wool is spun or twisted with cotton and later the cotton is "carbonized" by acid treatment. The reverse process may also be employed. Special note should be made that in twisting threads together the count number of the yarn will be lessened in proportion to the added weight of the thread or threads. Thus two threads of a 40's count twofolded give a 20's count—written 2/40's. There is, however, an exception to this in spun silk yarn in which a 2/40's yarn (often written 40/2) is a 40's but twofold, *i.e.*, two threads of 80's are twisted together giving a folded yarn with 40 hanks (each 840 yd.) to the pound. The twisting of varied count numbers is really simple but mystifying to the uninitiated. Thus a 10's count twisted with a 40's count does not give an intermediate count number (say 25's) but naturally a thicker count than 10's and consequently a lower count number, viz., 8's count; and this is true in whatever denomination the count may be stated—cotton, linen, woollen, worsted, etc. (A. F. B.)

YAROSLAVL, a province of the Russian S.F.S.R., surrounded by those of Tver, Cherepovetz, Vologda, Kostroma, Ivanovo-Vosnesensk and Vladimir. Area 31,705 sq.km. Pop (1926) 1,337,717. Thick deposits of boulder clay, remains of the bottom-moraine of the ice-cap of the Glacial period, cover the Jurassic clays, and patches of Triassic "variegated marls" outcrop in some places, while Upper Carboniferous limestones crop out only in the north-west and towards the east. Coniferous forest, with firs predominating, occupies 39% of the province, and marshes are extensive, especially between the Sheksna and Mologa, and in the Rostov district. Dwarf birch, the Arctic raspberry (*Rubus arcticus*) and *Linnaea borealis* are widespread. The climate is severe, the rivers being frozen 118 to 183 days per annum, average January temperature 6·5° F, average July 61·5° F. The prevailing south-west and west winds make the rainfall heavier than in central Russia.

Of the land free from forest and marsh, only 25% is under plough culture, with rye (36·9%), oats (23·4%) and flax (7·4%). Potatoes, barley, grass, vegetables, chicory and herbs are grown, the latter especially in the Rostov district. Meadow and grassland prevail and the province has a flourishing dairy industry, with exports of butter and cheese. In the years 1926–27 a peat fuel electric station was opened at Liapinsk near Yaroslavl. Bog iron ores, copper sulphate and pottery clay are obtained and there are salt and mineral springs.

The principal river is the Volga, which is connected with the Neva by the Mariinsk and Tikhvinsk canals through its tributaries the Sheksna and the Mologa. The Kotorost, flowing from Lake Nero to the Volga, is navigable in spring, and the Kostroma, flowing along the north-eastern boundary, is a channel for the export of timber and peat fuel. Of the rivers, 39% are available for steam navigation; the railway net is poor, and good roads are absent, except for the Moscow-Yaroslavl road. Yaroslavl and Rybinsk (*q.v.*) are the chief towns.

Yaroslavl, the chief town of the above province on the right bank of the Volga, at its confluence with the Kotorost, in 57° 38′ N., 39° 50′ E. Pop. (1926) 112,103. It is a productive centre with textile factories, and tobacco, leather and lacquer industries. Founded in 1026–36, it was the chief town of the principality from 1218 to 1417, when it was annexed by Moscow. The Uspenskiy cathedral was begun in 1215 and rebuilt 1646–48, and there are remains of 15th and 17th century monasteries.

YARROW, river and parish of Selkirkshire, Scotland. The river, issuing from St. Mary's Loch, flows for 14 m. E. by N. to the Tweed, which it joins about 3 m. below the county town. The stream and vale are famous in poetry.

YARROW (*Achillea Millefolium*), a plant of the family Compositae, also called milfoil, native throughout the Northern Hemisphere and Great Britain, the United States and Canada. It has white or sometimes rose-red flowers, borne in flat-topped clusters, and very finely divided leaves. Legend ascribes the discovery of its healing virtues to Achilles in whose honour it was named. The leaves, anciently in great repute for use in the treatment of wounds, are said to be occasionally so employed in domestic medicine. The closely allied *A. Ptarmica,* the sneezewort or sneezewort yarrow, so named because of the use of the root for snuff, native to Europe and northern Asia and found in the British Isles, is widely naturalized in eastern North America.

YARURAN, a small group of tribes of South American Indians, constituting an independent linguistic stock. The Yaruros lived in Venezuela, on the Orinoco river between the Meta and the Capanaparo; in recent times they have spread somewhat further down stream to the Arauca and beyond.

See J. Chaffanjon, *L'Orenoque et la Caura* (Paris, 1889).

YATES, RICHARD (1818–1873), American political leader, born at Warsaw, Kentucky, Jan. 18, 1818. He graduated at the Illinois College at Jacksonville in 1838, was admitted to the bar, and entered politics as a Whig. From 1842 to 1845 and again in 1849 he served in the state House of Representatives. He was a

representative in Congress in 1851–1855, but having become a Republican, was defeated for a third term. From 1861 to 1865 he was governor of Illinois, and was successful in enlisting troops and in checking the strong pro-Southern sentiment in the state. He was a member of the United States Senate in 1865–71, and was prominent in Reconstruction legislation. He died at St. Louis, Missouri, on the 27th of November 1873. His son Richard (b. 1860) was governor of Illinois from 1901 to 1905.

YATUNG: *see* TIBET.

YAUCO, a prosperous and progressive town situated in the south-western part of Porto Rico. Its population according to the U.S. census of 1920 was 7,054, and that of the municipal district was 25,848. It is located on the main line of the belt line railroad and on the main highway which connects Ponce with Mayaguez. It is the southern terminus of a newly constructed highway connecting the town with Lares and other northern towns. The largest centre for the manufacture of cane-sugar is in this part of the island at the port of Guánica. This port was the first landing place of the American troops under command of Gen. Miles, on July 25, 1898.

YAWS, the name in use in the British West Indies for a contagious inoculable tropical disease, running a chronic course and characterized by a peculiar eruption, together with more or less constitutional disturbance. It is known by various local names in different parts. The name *framboesia* was first given to the disease by Sauvages in 1759 from the likeness of the typical excrescences to a raspberry. Yaws was long thought to be peculiar to the African negro, but a disease the same in every respect has long been known in the East Indies, affecting the Malays rather than the negroes, its chief seats being Amboyna, Ternate, Timor, Celebes, Java and Sumatra. It has been identified by De Rochas and other observers in New Caledonia and Fiji.

The general course of the disease is as follows. In children (who form a large part of the subjects of yaws) there will probably be early rheumatic pains in the limbs and joints, in adults the eruption is often the first sign. The eruption begins as small pimples that have a whitish speck on their tops, grow rapidly and reach some half-inch in diameter. The pustules then break and a thick viscid ichor exudes and dries upon them as a whitish slough and around their base as a yellowish-brown crust. Beneath the slough is the raspberry excrescence or yaw proper, a reddish fungous growth with a nodular surface. The favourite seats of the eruption are the forehead, face, neck, arm-pits, groin, genitals, perinaeum and buttocks. Hairs at the seat of a yaw turn white. In young children or infants the corners of the mouth ulcerate, as in syphilis, and the perineal excrescences resemble condylomata.

Aetiology.—Yaws is a highly contagious disease. It is neither hereditary nor congenital. The disease spreads by contact with previously infected cases, and it has been proved by experiment that infection may be conveyed by flies, carrying infective material from a yaws sore to an ordinary ulcer. The virus must be introduced directly through a breach of the skin or mucous membrane; an attack in childhood gives a large degree of immunity for the rest of life. In 1905 Aldo Castellani demonstrated in yaws the presence of a slender spirillum, which he named the *Spirochaeta pertenuis* or *Spirochaeta pallidula*. It was also experimentally proved by him (1) that the material taken from persons suffering from yaws and containing the *Spirochaeta pertenuis* is infective to monkeys; (2) that when the *Spirochaeta pertenuis* is removed by filtration the material becomes inert; (3) that the injection of blood from the general circulation of a yaws patient gave positive results in monkeys; (4) by means of the Bordet-Gengou reaction it is possible to detect specific yaws antibodies and antigen.

The prophylaxis consists in the segregation of the patients suffering from the disease, the antiseptic dressing of the eruption, the application of a covering to protect it from flies, and the thorough cleansing and disinfection of infected houses and clothing, even the demolition of houses in endemic centres, and finally compulsory notification to the local sanitary authority.

As regards treatment, the malady in a person of good constitution runs its course and disappears in a few weeks. When the eruption is declared, iodide of potassium and arsenic are very beneficial. As external applications, weak lotions of zinc or carbolic acid may be used, and, if the excrescences are irritable, a watery solution of opium. In 7,157 West Indian cases treated in various hospitals there were only 185 deaths, a mortality of 25·8 per thousand (Nicholls).

YAZDEGERD ("made by God," *Izdegerdes*), the name of three Sassanid kings of Persia. (1) YAZDEGERD I., son of Shapur III., 399–420, called "the sinner" by the Persians, was a highly intelligent ruler, who tried to emancipate himself from the dominion of the magnates and the Magian priests. He punished the nobles severely when they attempted oppression; he stopped the persecution of the Christians and granted them their own organization. With the Roman Empire he lived in peace and friendship, and is therefore as much praised by the Byzantine authors (Procop. *Pers.* i. 2; Agath. iv. 26) as he is blamed by the Persians. After a reign of twenty years he appears to have been murdered in Khurasan. (2) YAZDEGERD II., was the son of Bahram V. Gor, 438–457. He persecuted the Christians and Jews, and had a short war with Rome in 441. He tried to extend his kingdom in the East and fought against the Kushans and Kidarites (or Huns). (3) YAZDEGERD III., a grandson of Chosroes II., who had been murdered by his son Kavadh II. in 628, was raised to the throne in 632 after a series of internal conflicts. He was a mere child and never really ruled; in his first year the Arabic invasion began, and in 637 the battle of Kadisiya decided the fate of the empire. Ctesiphon was occupied by the Arabs, and the king fled into Media. Yazdegerd fled from one district to another, till at last he was murdered at Merv in 651. (*See* CALIPHATE, sect. A. 1.) The Parsees, who use the old Persian calendar, continue to count the years from his accession (era of Yazdegerd, beginning June 16th, A.D. 632). (ED. M.)

YAZOO CITY, a city of western Mississippi, U.S.A., about midway between Memphis and New Orleans, on the (navigable) Yazoo river; the county seat of Yazoo county. It is on Federal highway 49, and is served by the Illinois Central railroad. Pop. 5,244 in 1920 (52% negroes); estimated locally at 10,000 in 1928. At the eastern entrance to the rich "Delta" between the Yazoo and the Mississippi rivers, it is an important market and shipping point. The city was founded about 1830.

YEAR-BOOK, a term applied to annual summaries either of events throughout the world during the previous year or of general or local progress in some one department of administration, art, science or industry. Typical examples are *The Statesman's Year-Book, Annual Register, Whitaker's Almanac, Hazell's Annual,* biographical records like *Who's Who,* genealogical records such as those of Debrett and Burke, and the Continental *Almanach de Gotha,* a scientific and scholastic publication of the type of the *Index Generalis,* and the innumerable specialized economic and industrial publications.

The English legal *Year Books,* described by Pollock as "our glory, for no other country has anything like them," are reports of cases covering the period 1292 to 1534, written in provincial French. Abridgments of these *Year Books* were made by Sir Anthony Fitzherbert in 1516 and by Sir Robert Brooke in 1568. The first systematic printer of them was Richard Pynson, from 1510; the principal publisher, from 1553, was Richard Tottell. In 1863 A. J. Horwood was commissioned by the then master of the Rolls to edit the unpublished *Year Books* of Edward I. This Rolls series was continued by L. O. Pike. The work has been supplemented by Maitland and others working for the Selden Society. The most convenient brief discussions of the *Year Books* are in *Holdsworth's History of English Law* (1903–09), vol. ii., pp. 444–462, and W. C. Bolland's *The Year Books* (1921). They are now thought to have had an official or even semi-official character.

YEAST. The botanist and microbiologist apply the term yeast to a group of plants many of which exhibit a marked ability to change sugar into alcohol and carbon dioxide. The characteristics of the group, which includes hundreds of species, are quite restricted. These, together with discussion of taxonomy,

are given under FUNGI and FERMENTATION. To the layman, untrained in botany, the term yeast suggests the cakes of pressed yeast available in almost every hamlet. The ability of certain yeasts to form carbon dioxide from sugar has caused some of them to be used for leavening bread. For centuries, other species have been used in the making of wine, alcohol, beer, etc.

Yeasts probably have as early origin as the bacteria. Grüss examined some fossil remains of Devonian plants and obtained striking evidence of the existence of budding fungi in this early age. This same investigator on examination of the sediment from a beer jar in Theban tomb of the XIth dynasty (2000 B.C.) isolated a yeast which was named *Saccharomyces Winlocki.* Examination of "beer bread" found among the offerings in other tombs also yielded the same yeast. It is now known that yeasts are widely distributed in nature and that those species concerned in fermentation pass the winter in the soil. They are disseminated by bees, dust and other agents in the spring.

The use of yeast in such fermentations as that of bread has made it convenient to have a constant supply of fresh active yeast. While in former days the by-product of certain fermentation industries was used, pressed (or compressed) yeast is now available to those who desire it. To this end the organism is grown in suitable media and the crop harvested when a sufficient crop of cells has appeared. The medium, according to an older method, consists of wort prepared from grains mashed in water. The mash prepared from grains is inoculated with lactic acid bacteria to "sour" it; the acid prevents putrefaction and also serves as food for the yeasts. The clear wort is passed into fermenters where it receives the seed yeast. The temperature is kept constant and rapid growth takes place. The yeast cells are then separated from the fluid in which they have grown by filter presses. They are mixed with starch and pressed into large cakes. These are sent to distributing centres, where they are cut and wrapped in the small size package commonly used in the home. In more recent times, yeast has been cultivated in mineral salt-sugar solutions instead of the wort described above. The cells are also incorporated in corn meal which is pressed into cakes.

Besides the application of yeasts in fermentology, they have been widely heralded as therapeutic agents. Their application to the cure of disease goes back to very early times. Many of the statements on the use of yeasts in this manner rest upon uncontrolled experiments, if indeed they may be called experiments. We are told that the monks used yeast for curing plague and that Hippocrates advised its use in leucorrhea. Since 1917 great interest was aroused by a publication of Hawk, et al. who reported beneficial results in furunculosis, acne vulgaris, constipation and certain other gastro-intestinal and cutaneous diseases.

YEATS, WILLIAM BUTLER (1865–), Irish author was born at Sandymount near Dublin on the 13th of June 1865. His father J. B. Yeats was a distinguished Irish artist and member of the Royal Hibernian Academy, his mother's family was from County Sligo. Soon after his birth his parents moved to London but his early years were largely spent in Sligo and even when, at the age of nine or ten, he went to school in London he returned to Sligo for his holidays and his early work is full of allusions to its mountains and little lakes, indeed this beautiful county has coloured all his writing. He studied painting for a short time but at the age of twenty-four published his first book of poems *The Wanderings of Oisin* (1889) and from that time forward gave his whole attention to literature. He was now living in London and a member of the group of young writers whose work appeared in *The Yellow Book.* A friend of William Morris and W. E. Henley and a frequent contributor to *The National Observer,* he was one of the founders of the Rhymer's Club and a close friend to Arthur Symons and Lionel Johnson. Years later he published two books, *Reveries over Childhood and Youth* (1915) and *The Trembling of the Veil* (1922)—now brought together in the volume called *Autobiographies*—and in these will be found the history, fascinatingly told, of the first thirty years of his life. In 1892 his first poetic play *The Countess Cathleen* was published; it was followed two years later by another play *The Land of Heart's Desire* and in the previous year appeared his first volume of essays *The Celtic Twilight.* With Edwin J. Ellis he edited the *Works of William Blake* (1893) and also edited *A Book of Irish Verse* (1895). Three books of prose appeared in 1897: *The Secret Rose, The Tables of the Law* and *The Adoration of the Magi;* the last two were published privately but subsequently appeared publicly. By 1897 he had become interested in the formation of an Irish theatre and with the help of Lady Gregory, Edward Martyn and other friends the first performance of the Irish Literary Theatre took place in Dublin in 1899. This Theatre gradually developed, attracting to itself writers such as Mr. George Moore and "A.E." and creating new writers such as J. M. Synge and Mr. Padraic Colum and by 1904 had established itself in the Abbey Theatre of which theatre Yeats has been a Director ever since and has contributed to its repertory many noble plays in verse and prose. Side by side with playwriting went the writing of lyrics and the rewriting of much of his early work—for he has always been his own harshest critic. Since 1897 his most noteworthy volumes of poems are *The Wind among the Reeds* (1899), *Responsibilities* (1914), *The Wild Swans at Coole* (1917), *Later Poems* (1922) and *The Tower* (1927). His literary and critical essays are of importance, they are to be found in the volumes *Ideas of Good and Evil* (1903), *The Cutting of an Agate* (1912), *Per Amica Silentia Lunae* (1918) and a number of witty and profound essays on the art of the theatre now collected into the volume *Plays and Controversies* (1923). The private publication of a philosophic book *A Vision* (1925) must be noted. Owing to his habit of rewriting, versions of his work are many and various and the *Collected Edition* in eight volumes published in 1908 has long ago been superseded. The volumes at present published by Macmillan & Co. are practically a collected edition of the work which he wishes to preserve but in the opinion of many he has discarded or grievously altered many beautiful early poems. His first three plays in prose *Kathleen ni Houlihan* (1902), *The Pot of Broth* (1902) and *The Hour Glass* (1903) are entirely successful stage plays. It is difficult to speak with certainty of the stage success of his verse plays because, owing to the absence of a verse-theatre in England, the number of performances of them has not been large. He hoped in starting the Irish Literary Theatre to found amongst other things a verse-theatre in Ireland and during its early years a number of his verse plays were performed there but later the dramatic genius of Ireland emphatically declared itself to be realistic and not poetic and his dream of a verse-theatre had to be abandoned. But certainly *The Countess Cathleen* has proved itself a very successful stage play, the story is swift and dramatic, the incidents are full of variety, the verse is limpidly clear. The one-act play *The Land of Heart's Desire* (1894) is very popular and frequent performances of it are given by non-professional theatrical companies in England and America. His later plays demand great tragic acting, a demand met by Mrs. Patrick Campbell in her performance in *Deirdre* (1907) when the play showed itself to be of perfect construction and of intense passionate beauty. Given a great tragic actor *The King's Threshold* (1904) is as fine a stage-play as *Deirdre.* Other plays belonging to this period are *The Shadowy Waters* (1900), *On Baile's Strand* (1904) and *The Green Helmet* (1910). By this time he had despaired of finding a verse-theatre and his next play *The Player Queen* was in prose. It is a delightful phantasy and successful on the stage. Later still, influenced by the Japanese, he was to write four curious *Plays for Dancers* (1921) and, in the same mood, *The Cat and the Moon* (1924). Three of these plays have been performed and with success. He finds in this unrealistic form freedom from stage conventions and an opportunity for phantasy, and another volume of plays for dancers will soon appear. They will never have a wide popular appeal but to some they will seem the most beautiful work he has done for the stage. Considered as a poet his poetry falls into three periods, the early, the middle and the late. His early poetry was elaborate and richly wrought, influenced in some de-

gree by the Pre-Raphaelites, yet side by side with these possibly over-decorated poems can be found beautiful lyrics as simple as an Irish country ballad. By 1910 he had wearied of elaboration, he had been too much imitated, and he turned and attacked his own "embroideries." He had found, too, a new inspiration, a national one, and *Poems written in Discouragement* (1913) are the result of that inspiration. A year later with the publication of *Responsibilities* the new note in his verse is firmly struck, the last shred of embroidery for embroidery's sake has been discarded and the beauty of these poems is "like a tightened bow." He is struggling with a new, austere method, he has not entirely mastered it but he triumphantly emerges from the contest in his next volume *The Wild Swans at Coole* (1917). This book and each succeeding book mark his third period, the latest volume being *The Tower* (1927). Some poems in these volumes are obscure but only because they are part of his own difficult philosophy; if that be understood the poems are clear. The sweep and range of his art from *The Wanderings of Oisin* to *The Tower* are amazing and it is difficult to think of any other poet writing in English who is so varied and so developed. In 1928 appeared translations of Sophocle's *Oedipus the King* and *Oedipus at Colonnus*. They are translations made specially for the Abbey Theatre; they are in prose and aim at simple, effective speech rather than meticulous verbal accuracy, the choruses are in rhymed verse and the plays have proved very successful on the stage. As one of the founders of the Irish Literary Society Yeats had early shown his practical concern with the intellectual life of his country; his work at the Abbey Theatre was but a development of that concern and it was natural for the Government of the Irish Free State to nominate him in 1922 as one of its first Senators. In 1924 he was awarded the Nobel Prize for literature. (L. Ro.)

YELLOWBIRD, a name applied in the United States to the American goldfinch (*Astragalinus tristis*) and to the yellow warbler (*Dendroica aestiva*). (*See* GOLDFINCH, WARBLER.)

YELLOW FEVER, a specific infective tropical fever, the virus of which is transmitted by a mosquito. The disease occurs endemically in certain limited areas. The area of distribution includes the West Indies, Mexico, part of Central America, the W. coast of Africa and Brazil.

The incubation period of yellow fever is generally four or five days, but may be as short as twenty-four hours. The illness usually starts like any other febrile attack. But there soon occurs a peculiar look of the eyes and face, which is characteristic: the face is flushed, and the eyes suffused at first and then congested or ferrety, the nostrils and lips red, and the tongue scarlet—these being the most obvious signs of universal congestion of the skin, mucous membranes and organs. There is high fever and albumen will nearly always be found in the urine. After two or three days the temperature falls below the normal; the pulse becomes slow and feeble, the skin cold and of a lemon-yellow tint, the act of vomiting effortless, the first vomit being clear fluid, but afterwards black from admixture of blood. This prostration may end in recovery, with copious flow of urine, which even then is very dark-coloured from the presence of blood or may increase and end in death. Much blood in the vomit and in the stools, together with all other haemorrhagic signs, is of evil omen.

The case mortality averages from 12 to 80%. In Rio in 1898 it reached the appalling height of 94·5%. In cities where it is endemic the case mortality is usually lower.

Modern Researches.—The dreaded "vomito negro" which for four centuries claimed more than 50% mortality among its victims, has been relegated to a place of secondary importance since the institution, in 1901, of the anti-mosquito campaign. Since 1910 no epidemic invasion of yellow fever into temperate regions has occurred, and some of the most noted endemic centres in Ecuador, Mexico and Brazil have been freed of the disease, probably forever; no case has been reported in the entire Western Hemisphere for many months. The use of oil for destroying mosquito larvae has now been practically abandoned in favour of placing in the tanks which serve as water supply for houses in the tropics one or two small fish, which eagerly devour the "wrigglers."

Connor, in Guayaquil, first used this method successfully in 1919, and it has since been used in other countries with excellent results. The fish must be of small size and able to withstand handling and transportation. Those chiefly used are the minnows, *Gambusia affinis, Dormitator latifrons* and *Fundulus heteroclitus* and the common "lefa" of South America (*Pygidium piurae C.*) some being top-feeding and others bottom-feeding fish.

Bacteriological Investigations.—While the transmitter of the yellow fever germ had been experimentally proved, by the American Army Board under Reed, to be the mosquito, *Aedes aegypti* (formerly known as *Stegomyia fasciata* or *S. calopus*), the microbe which produced the disease had remained unknown until 1918 when a minute spiral organism, subsequently named *Leptospira icteroides,* was isolated from the blood and organs of yellow fever patients, in Guayaquil, Ecuador. Inoculation of cultures of this organism reproduced all the characteristic symptoms and lesions of yellow fever in guinea pigs, marmosets and young puppies. Yellow fever was also transmitted directly to guinea pigs with blood taken from yellow fever patients and the same micro-organism from experimentally infected animals.

Investigations previously conducted by the American Army Board in Havana had demonstrated that the germ of yellow fever could pass through the pores of certain bacteria-proof filters (*see* FILTER-PASSING VIRUSES), and this fact alone had been sufficient to disprove the relation to yellow fever of a dozen or more different bacteria. *Leptospira icteroides,* on the other hand, proved to be a filter-passer and to conform with other well-known characteristics of the yellow fever virus; thermal death-point; transmissibility by *Aedes aegypti;* ability to produce typical fever, extensive haemorrhages into the gastro-intestinal tract, resulting in the "black vomitus" and melaena, severe nephritis, general jaundice and the characteristic changes of liver and kidney (fatty degeneration and necrosis). Another important proof that connects *Leptospira icteroides* with yellow fever is that this micro-organism is killed by the blood serum of persons who have just recovered from yellow fever but not by that of healthy persons or persons recovering from other diseases.

Leptospira icteroides was subsequently isolated from cases of yellow fever in Mexico, Peru and Brazil. It is actively motile, measures 4–9 μ long and 0·2 μ wide and there are two spirals for each micron. The ordinary microscope does not reveal its presence in the living condition, but it is easily seen by means of dark-ground illumination. It grows only on special culture media. The isolation of *Leptospira icteroides* has made it possible to prepare a preventive vaccine, similar in type to that in use for protection against typhoid fever, and a curative serum. While a given locality may be freed from yellow fever by destruction of mosquito larvae, this type of preventive work requires some months. Newcomers meantime are in danger, and protection, even of a temporary nature, is welcome. Injection of a small quantity of killed cultures of *Leptospira icteroides,* as first shown in experimental animals, confers temporary protection from the yellow fever infection, the inoculation taking effect within about two weeks. The results of prophylactic inoculation of 20,000 or more individuals since 1919 indicate that if persons are satisfactorily vaccinated they are protected against yellow fever for about six months. The curative serum has been tried in several hundred cases. When it has been used early in the disease, *i.e.,* before the fourth day of illness, the death-rate has been comparatively small (16% as compared with the usual 50% or more in yellow fever). It is without appreciable benefit when given later in the illness, when the micro-organisms have done irreparable injury to the liver and kidneys.

Since 1925 doubt has been thrown on the causal relationship of *Leptospira icteroides* to yellow fever by discovery of the fact that the common rhesus monkey (*Macacus rhesus*) and to a lesser degree the Indian crowned monkey (*M. Sinicus*) are very susceptible to the disease which may be transmitted to them by the bites of infected mosquitoes or inoculation with blood of a yellow fever patient. Material from such infected animals or from yellow fever cases is without effect upon guinea pigs which are extremely susceptible to *L. icteroides.* Since *L. icteroides* is serologically identi-

cal with *L. icterohaemorrhagia* it is thought probable that the organism described by Noguchi as the cause of yellow fever had been obtained from cases of Weil's disease or possibly from patients with a double infection. Working with a strain of yellow fever isolated in Senegal and rhesus monkeys A. W. Sellards and E. Hindle have advanced matters further in favour of a filterable virus theory by showing that like some other filterable viruses yellow fever infective material is unaffected by cold and if frozen will maintain its virulence for at least twelve days (*Brit. Med. Tr. 1928*, i. 713).

YELLOW RIVER: *see* HWANG HO.

YELLOW-ROOT, SHRUB, a small North American shrub of the crowfoot family (Ranunculaceae, *q.v.*) found in woods from western New York to Kentucky and Florida. It has smooth stems, 1 ft. to 2 ft. high, with yellow wood, long yellow roots, parsley-like leaves, and small purplish flowers in slender drooping clusters. It is sparingly planted for ornament.

YELLOWSTONE NATIONAL PARK, a national American public park, the first and most noted of a number of such national reserves set apart by the U.S. Government to preserve, for the benefit and enjoyment of the people, certain regions of extraordinary or unique natural grandeur and impressiveness. Yellowstone National Park includes about 3,350 sq.m.—62 m. long and 54 m. wide—lying largely in the north-west corner of Wyoming but extending a little over 2 m. northward into Montana. National forests surround the park on all sides—the Gallatin, Absaroka and Beartooth to the northward; the Shoshone to the eastward; the Teton and Targhee to the southward; and the Targhee, Madison, and Gallatin to the westward.

A broad volcanic plateau with an average elevation of 8,000 ft. occupies the centre of the park. The park is enclosed on its northern and north-western border by the Gallatin range, a bold picturesque sierra of which Electric peak, elevation 11,000 ft., constitutes the culminating crest. The Teton range, one of the most spectacular features of the northern Rockies, looms high upon the southern horizon, but only its bold spurs and foot-hills enter the park. East of the Tetons stretch the wild Gros Ventre and Wind river ranges well up toward the southern boundary of the park. The majestic Absaroka range, connected at the south with the Wind river range, forms an unbroken barrier along the whole eastern side of the park, its western side and many of its rugged peaks and canyon-grooved mountain masses lying within the park. A confused mass of mountains near the north-eastern part of the park connects the Absaroka with the Snowy range.

The general high elevation of the park is reflected in the climate, the mean annual temperature being considerably lower than that of the surrounding lower areas, and the amount of precipitation, both rainfall and snowfall, higher. At the Yellowstone Park weather station, elevation 6,200 ft., the mean temperature for the year is 38·7° F, ranging from 18·0° F in January to 61·3° F in July. The average annual snowfall at the Yellowstone Park station has been 100·5 in., varying from traces in July and August to 20·6 in. in January. The mean relative humidity varies from 53% at noon to 75% at 6 A.M. The annual percentage of sunshine is 56.

Such climatic conditions favour forest development and the growth of luxuriant grasses together with a varied alpine verdure. The whole of the park lies within the limits of the lodge-pole pine forest characteristic of the high Rockies though the higher slopes of the Absarokas and other high ranges are clothed with belts of spruce-fir forests and the crests of the mountains themselves are above timber line. The lodge-pole pine is a pioneer tree which invades terrain left open by other species, chiefly as the result of forest fires. Sunny, rocky slopes are in places occupied by the Douglas fir. Aspen and Engelmann spruce and a few limber pines are intermingled with the lodge-pole pines. Beautiful intermontane meadows where numerous grasses and sedges carpet the ground, and saxifrages, valerians, cinquefoils, senecios, orchises, betonies, gentians, grass of Parnassus and many other brilliant flowers blossom during the summer are interspersed with the rocky forest-clad ridges, while the banks of many pools, lakes and streams abound in water-lilies, buttercups, cresses, reeds and rushes. A few salt-loving plants grow about the hot springs and geysers, while in the hot waters issuing from them an interesting series of low plant forms is found.

The native fauna of the park area has been jealously guarded and preserved. Many elk and deer, a few antelope, bison, moose and mountain sheep; bears, foxes, coyotes, even wolves, lynxes and panthers; many species of squirrels, ground squirrels, mice, shrews, gophers, rabbits; the beaver, muskrat, otter, marten, skunk, weasel, badger, wolverene, marmot, mink; and several others less common wander in larger or fewer numbers into or about the park, though most of them may be encountered only in the remoter, less frequently visited, sections of the park. Proportionally as richly numerous and varied as the mammal life, the bird forms include over 200 species, some permanently resident, many only migrant. The streams are well stocked with fish, particularly trout, of which the native redthroat (*Salmo clarkii*) is one of the gamest and most eagerly sought.

Perhaps the most amazing spectacle of the park is its display of over 100 geysers and 4,000 hot springs. The geysers are concentrated in three adjoining groups upon the middle-west side, but hot springs occur everywhere at widely separated points, one steam jet even issuing from the Grand Canyon depths, more than 1,000 ft. below the rim. The most famous geyser is Old Faithful, which may be taken as typical. The regularity of its eruptions, the violence of its explosions, and the grace and beauty of its water column make it one of the most admired of the park geysers. The interval between eruptions averages 65 minutes, the period of eruption lasts 4½ minutes, and it throws into the air a column of water from 95 to 130 ft. in height. The Excelsior geyser, which ceased erupting in 1888, hurled aloft a greater volume of water with appalling fury of action. The Giantess geyser, when in action, is far more powerful than Old Faithful, but plays with less regularity, with intervals of nearly three weeks' duration. Another titanic geyser unexpectedly broke forth in 1928 with furious activity. It hurls water in all directions, some columns to a height of 100 feet. Two major eruptions every 24 hours forms its schedule, each eruption lasting for three hours or more, with outbursts at 15 to 20 second intervals.

The Grand Canyon of the Yellowstone is also one of the truly wonderful features of the park. It is a magnificent and picturesque gorge penetrating deep into the volcanic rocks of the park plateau. It presents on a grand scale a remarkable picture of recent canyon cutting by the Yellowstone river, which, leaving Yellowstone lake at its broad outlet, flows northward through an open valley for about 15 m. and then plunges by two impressive falls, respectively 110 and 312 ft. in height, into the Grand Canyon. The walls of the canyon rise abruptly 800 to 1,100 ft. above the rushing turbulent stream which cuts the gorge. Much of the exquisite beauty and impressive grandeur of the region comes from the brilliantly-coloured canyon walls, with their bizarre bands and stripes of soft pink and salmon to blazing Indian red, deep orange in masses, and yellow and green blotches all gayly intermingled. Yellowstone lake is large—20 m. north to south, and 15 m. east to west—irregular in outline, and wooded to the water's edge.

The first recorded visit to Yellowstone Park was made by John Colter in 1810 when he took refuge there from hostile Indians. His story was wholly discredited, as was the story of the next visitor, Joseph Meek, a trapper who visited the region in 1829. The first description of the Firehole geyser basin was written by Warren Angus Ferres, a clerk in the American Fur Company, between 1830 and 1840, but not until 1852 was the region defined and described in its entirety by Father De Smet, the famous Jesuit missionary, who derived his information from the noted Indian scout and frontiersman, Jim Bridger. The first Government

THE YELLOWSTONE TRAIL

expedition sent out in 1859 under the command of Capt. W. F. Reynolds, brought back little authentic information regarding the section, and the reports of private explorers were discredited. Finally the well-equipped expedition under Henry D. Washburn and N. P. Langford, in 1870, established the facts and led to the creation of the Yellowstone National Park.

BIBLIOGRAPHY.—*Glimpses of Our National Parks, Circular of General Information Regarding Yellowstone National Park,* and *Rules and Regulations, Yellowstone National Park,* all by the National Park Service, U.S. Department of the Interior (published annually); A. Yard, *The Book of the National Parks* (1920), and *Annual Reports* of the superintendent of the park (1880 *seq.*). (W. E. E.)

YELLOWSTONE TRAIL, an American highway leading from Plymouth Rock, on the Atlantic, to Seattle, on Puget sound. It is 3,400 m. long. The roadway is paved or hard from Plymouth to Oshkosh, and improved over most of the rest, with some hard surfacing and pavement to the Pacific. This highway is one of the finest across the United States. It touches Albany and Buffalo, N.Y., Cleveland, O., Chicago, Ill., St. Paul, Minn., Selby, S.D., Butte, Mont., and Spokane, Wash.

YELLOW-THROAT, the name given to a species, with several sub-species, of North American birds of the Passerine family Mniotiltidae, the American wood warblers. The best known is the Maryland yellow-throat (*Geothlypis trichas*) which ranges over the greater part of the United States and southern Canada. About 5 in. long, this bird is olive green above, yellow below; with black forehead and cheeks in the male. Its sub-species the tule yellow-throat (*G. t. scirpicola*) is resident in southern California. The western yellow-throat (*G. t. occidentalis*) is found in south-eastern California and south-western Arizona.

YELLOW-WOOD, AMERICAN (*Cladrastis lutea*), a handsome North American tree of the family Leguminosae (*q.v.*), called also yellow locust, gopher-wood and virgilia. Though somewhat rare in the wild state, being found only locally in rich soils, chiefly along mountain streams, from North Carolina to Missouri, it is widely cultivated for ornament. It has a short trunk branching into a graceful crown, sometimes rising 50 ft. high, with smooth bark, pinnate leaves, and fragrant, pea-like, white flowers, 1 in. long, borne in loose, drooping clusters, 10 in. to 20 in. long, blossoming in June. The hard strong wood yields a yellow dye.

YEMEN (*Yaman*), an extensive region forming the south-western portion of Arabia. The limits of power exercised by the various rulers are not clearly defined, but Yemen includes the province of Asir and reaches in the north towards the Hejaz and the Nejd. On the east its limits merge with the desert, while on the south they abut on Hadhramaut. Yemen may be looked upon as possessing three centres: the British protectorate of Aden (*q.v.*) in the south; the domains of the Imam Yahya, whose capital is Sana (*q.v.*) and those of the Idrisi Seyyid Ali Mohammed, whose capital is Sabia (170° 11′ N., 42° 37′ E.), and whose influence stretches down the coast to Hodeida (*q.v.*).

The Imam Yahya is Imam of Yemen proper, and his lands include those abandoned by the Turkish power in 1918 and consequently the limits of his power are in line with those of the Anglo-Turkish boundary of 1902–4. He governs an area of some 75,000 sq.m., with a population between 2,000,000 and 3,000,000.

Ptolemy and the ancient geographers in general include the whole peninsula under the name of Arabia Felix (εὐδαίμων), in which sense they translate the Arabic *Yemen,* literally "right hand," for all Arabia south of the Gulf of Aqaba was to the right from their standpoint of Alexandria; the Mohammedan geographers, however, viewing it from Mecca, confine the term to the regions south of Hejaz, including Asir, Hadhramaut, Oman and part of southern Nejd. Yemen occupies the uptilted edge of a block of ancient land forming Arabia.

The uptilted edge of the old block is known as the Jibal or highlands of Yemen, with an average height of 9,000 ft., though many summits exceed 10,000 ft., *e.g.,* Jebel Manar (10,565 ft.).

The principal town of the Jibal is Ta'iz (pop. about 4,000). It was formerly a large city, and from its position in the centre of a comparatively fertile district at the junction of several trade routes it must always be important. Some 30 m. further north are the small towns of Ibb (6,700 ft.) and Jibla, about 5 m. apart, typical hill towns with their high stone-built houses and paved streets. Manākha produces the best coffee in Yemen. Another group of hill towns lies still further north in the mountain mass between the Wadi Maur and Wadi La'a, where the strongholds of Dhāfir, Afār, Haja and Kaurkabān have long been known for their independence. The last-named was once a city of 20,000 inhabitants, and the capital of a small principality which preserved its independence during the earlier Turkish occupation between 1536 and 1630. The lowland strip of Yemen is known as the Tehama and is hot and generally sterile. The lowland strip is from 20 to 30 m. wide. There are oases, however, near the foot of the mountains, fertilized and irrigated by hill streams and supporting many large villages and towns. The most important of these are Abu Arish, Bet el Fakih and Zubed in the western Tehama, the latter a town of 20,000 inhabitants. Hodeida (*q.v.*) and Aden (*q.v.*) are the only ports of commercial importance, while Mokha is the old centre of the coffee trade. Beyond the crest of the uptilted edge of the old block stretches the third natural region of Yemen—the great desert. As it lies entirely to the east of the high crest, it has a smaller rainfall than the Jibal. Its general character is that of a steppe increasing in aridity towards the east where it merges in the desert, but broken in places by rocky ranges, some of which rise 2,000 ft. above the general level, and which in the Hamdan district north of Sana show evidence of volcanic action. It is intersected by several *wadi* systems, of which the principal are those in the north uniting to form the Wadi Nejrān, in the centre the Wadi Khārid and Shibwān running to the Jauf, and in the south the Wadi Bana and its affluents draining to the Gulf of Aden. The plateau has a gradual fall from the watershed near Yarim, 8,500 ft. above sea-level, to less than 4,000 ft. at the edge of the desert.

The northern part nearly down to the latitude of Sana, is the territory of the Hāshid and Bakīl tribes, which never submitted to the Turks. Sa'da is an important town on the old pilgrim road

120 m. N. of Sana, Khaiwan and Khamr. In the north-east, bordering on the desert, is the district of Nejrān, a mountainous country with several fertile valleys including the Wadi Nejrān, Bedr and Habuna, all probably draining north-east to the Wadi Dāwasir. Further south is the oasis of Jauf, a hollow or depression, as its name signifies, containing many villages. It was the focus of the old Minaean and Sabaean kingdoms, known to the ancients through their control of the frankincense trade of south Arabia. Ma'in, identified by Halévy as the seat of the former, is on a hilltop surrounded by walls still well preserved. Mārib, the Sabaean capital, was celebrated for its great dam. The city was abandoned, probably owing to the deterioration of the country through desiccation, which has forced the settled population farther westward, where Sana became the centre of the later Himyaritic kingdom. The Arhab district drained by the Wadi Khārid and Shibwān between Sana and the Jauf is covered with Himyaritic ruins, showing that the land formerly supported a large settled population where, owing to the want of water, cultivation is now impossible. Throughout the whole of Yemen is found the *majil*—a cemented well for the storing of water. These wells have associations with Persian influence in the 6th century A.D.

South of the territory described above are Amran and Shibān on the road leading north from the capital Sana; Dhamar (the seat of an ancient university) and Yarim are on the road leading south to Aden; and two days' journey to the east is Rada.

The inhabitants of Yemen are settled, and for the most part occupied in agriculture and trade, the conditions which favour the pastoral or Bedouin type found in Hejaz and Nejd hardly existing. The people may be considered under four groups: (1) The Seyyids or Ashrāf, descendants of the prophet, forming a religious aristocracy; (2) the Kabail, or tribesmen, belonging to the Kahtanic or original south Arabian stock, who form the bulk of the population; (3) the trading class, and (4) a mixed group mostly of African descent and including a number of Jews.

Economically, Yemen is more or less in a transitional stage between the passing away of the Turkish control (1853–1918) and the completion of native organization. Agricultural products are widely distributed throughout the country, wheat, barley, millet and coffee being well known.

YEN. The monetary unit of Japan. It is divided into 100 sen, each of 10 rin. The yen is based on the gold standard, which was adopted in 1897. Gold is coined into pieces of 20, 10 and 5 yen. The yen itself is not coined, but is by law equivalent to ·75 gramme of fine gold. This makes the mint par of exchange with England 2s. 0½d. per yen, and with the United States, 49·846 cents per yen.

The following table shows, during the post-war period, the changes in the internal purchasing power of the yen, and also its rate of exchange upon New York, this last figure being a measurement of the yen in terms of gold.

Year	Wholesale price index number (July, 1914 = 100)	Exchange rate on New York par = 49·846 cents
1919	247	51·00
1920	273	40·19
1921	211	48·00
1922	206	48·00
1923	209	48·75
1924	217	43·37
1925	212	41·00
1926	188	45·95
1927 (first nine months)	179	47·75

During the World War, the yen was maintained at or above parity with the dollar, and at the armistice was consequently in a strong position. Nevertheless, Japan was affected by the world-wide trade boom and currency depreciation, rampant in 1919 and early 1920, and the yen depreciated both internally and against the dollar. It was in Japan that the boom first broke, right at the beginning of 1920, and as for a time the fall in prices (*i.e.*, the recovery in internal purchasing power) in Japan preceded similar movements elsewhere, the strength of the yen on the foreign exchange markets was well maintained. On the other hand the trade depression of 1921 was particularly severe in Japan.

During 1922 and 1923, recovery was making slow but sure progress, but all was thrown into confusion by the earthquake of the latter year. Export trade, in common with other forms of activity, was dislocated and heavy imports of materials for reconstruction purposes were needed. Despite loans from abroad, this imposed too great a strain upon the exchanges, and the gold standard had to be temporarily abandoned.

From 1925 to early 1927 prodigious efforts were made to rehabilitate the yen and to restore the full gold standard. Considerable progress was made, but at the cost of more rapid deflation than the already weakened economic system of the country could stand. In early 1927 came a series of bank failures, which shook the country to its core. The Government and the Bank of Japan came to the rescue and after some anxiety, got the situation in hand. It was necessary, however, to abandon the attempt to restore the yen to parity, and the year closed with it standing at 46·55 cents, or 6½% below parity. In fact, during 1927 it had a net fall of two cents. (N. E. C.)

YENISEI (from a Tungus word meaning Great River), a river of Asiatic Russia, rising in Mongolia and flowing into the Arctic Ocean, having a total length of 2,700 m. and a basin extending over a million square miles. It marks a structural boundary of great antiquity in the history of the continent. The western plain, extending from the Urals and covered by quaternary alluvial deposits, with a few isolated remnants of friable Tertiary sandstones, forms, apart from the smaller rivers of the Arctic tundra, a catchment area for the Ob. Near the left bank of the Yenisei there is a slight rise in the plain which deflects a few short tributaries to the Yenisei, but most of its drainage area lies to the right, on the ancient plateau remnant of Angara land, the middle of which forms a watershed, with drainage either to the Arctic, or to the east and west. Thus the Yenisei and the Lena are marginal rivers of an ancient block. Contrasts between the land to the west and that to the east of the Yenisei, north of Krasnoyarsk, are sharp, orographically, geologically, in soil formation and in climate, the winter isotherms curving southward on the higher land. The effects are that the plateau population is scanty, and that the limit of possible cultivation, which from the Urals to long. 50° E. remains considerably north of lat. 60° N., on the plateau lies considerably farther south. North of the Arctic circle, the difference disappears, the whole region being tundra.

Towards the south the plain forms an amphitheatre west of Lake Baikal; within it lie the courses of the Angara, the Stony or Middle Tunguska, the upper courses of the Lower Tunguska and of the Lena. It is bounded by the Archaean masses on the Middle Yenisei, cut off by a fracture along the river between the confluences of the Angara and the Stony Tunguska, and by the pre-Cambrian fold mountains to the south. Bogdanovich supposes that a great inland lake existed in the amphitheatre during the Angara epoch of the Mesozoic. The Yenisei is thus a mountain river of composite character. In Chinese Mongolia it flows through a longitudinal valley at the northern foot of the Tannu-ola; it then cuts through the western Sayan mountains and passes through portions of successive transverse valleys to Krasnoyarsk and its confluence with the Angara. It then flows along the western base of the Archaean range and finally enters the most north-westerly part of the Palaeozoic plateau. The Yenisei is formed by the junction of the Bei-kem and Chua-Kem streams in the Uryankhansk district of Chinese Mongolia, and is known as the Ulukem or Upper Yenisei. It receives the Kemchik river on the left and the town of Kemchik at the junction is much visited by Russian traders, who also have quarters in Krasniy at the junction of the Bei-kem and Chua-kem (or Little Yenisei).

After crossing the frontier it receives the Us on the right bank and there is a Russian settlement at Usinskoe. Eighty-two miles

north of the frontier are formidable rapids, the limit of raft navigation. This part of its course is through coniferous mountain forest, with some meadow land along the banks. Gold, asbestos, salt, coal, magnesia and iron occur in the mountains, but are little worked; the inhabitants are mainly nomad Finno-Tatar hunters, though Russian colonization is slowly spreading. The river now enters a prairie region, with the Abakan draining it on the left and the Tuba on the right. Minusinsk (*q.v.*) lies 8 m. from the confluence of the Abakan and Yenisei; and the Minusinsk black earth region, sheltered by the West Sayan mountains, the Siberian Urals and the Abakan range, is noted for its fertility and its mild climate and has been settled from prehistoric times. Gold and coal are found. Iron is found on the Irba, a tributary of the Tuba. At Novo-Selovsk 55° 5′ N., 91° 16′ E., the Chulim, a tributary of the Ob is only 6 m. distant, but canalization is impracticable owing to difference of level. At Krasnoyarsk (*q.v.*) the railway crosses the river, which here flows through a plain with mountains to the south and west, whose red sandstone and marl have given Krasnoyarsk its name.

South of the Pit mountains (the northern limit of corn growing land), the Angara or Upper Tunguska enters the Yenisei, after flowing 1,100 m. from Lake Baikal. The Selenga and the Angara were probably once united and Lake Baikal is of later formation. A rich gold-bearing region extends from the Angara to the Stony Tunguska, and the Pit enters the Yenisei on the right in this district. The Stony Tunguska, 1,000 m. long, is almost uninhabited, and here the deciduous forest merges into the coniferous. From the Stony Tunguska to Turukhansk is dense coniferous forest, with a few settlements on the right bank mainly. The Bakhta, north of the Stony Tunguska, flows through a marshy, uninhabited country. Above the confluence of the Stony Tunguska, the Yenisei broadens and reefs of rock known as the "Seventy Islands" rise above its waters.

The Lower Tunguska, 2,000 m. long, rising in lat. 57° N., 20 m. from the Lena, winds through a marshy forest country, with no settlements except in its upper course, where the villages are linked with the easily reached Lena. Coal, graphite and asbestos exist, but are not worked. The Turukhan enters from the left and is used by the Samoyedes to link with the Taz. The town of Turukhan, 10 m. from the Yenisei on the delta of the Turukhan, is now derelict and Monastir Turukhan (Troitskoe Monastir) on the right bank has replaced it. The Kureika river enters from the left and is linked with Obdorsk by a western track. There is unworked graphite in the Kureika valley. In lat. 69°–70° N., the scattered larches and birches give way to treeless tundra. There is a Russian trading settlement at Dudinsk, at the confluence of the Dudina and 60 m. E. coal of good quality is found in the Novil mountains, and platinum is reported. A scattered population, descendants of Russian exiles and natives, extends from Dudinsk to the Khatanga river. The Yenisei delta and gulf are not fully explored. The west is low and marshy and the east steep. Fish abound and native fishermen migrate north in summer. Golchikha, a Samoyede village on an island in the delta in 71° 45′ N., 84° E., has steamer communication with Krasnoyarsk and Minusinsk, fish and fur going upstream and corn, meat and manufactured goods downstream. Yenisei navigation is less important than that of the Ob, owing to the scantier population and more difficult environment. In winter the frozen river serves as a good road. At the delta the river is usually frozen from Oct. 30 to June 23; at Turukhansk, from Nov. 11 to June 8, at Krasnoyarsk from Dec. 5 to May 12; and at Minusinsk from Nov. 29 to May 11. There are floods in mid-May and mid-June, and huge blocks of ice collect in and near the mouth after the thaws.

Exploration and Settlement.—The Yenisei was first reached by Cossack bands in 1618 to 1620, who came from the Ob via the portage between the Ket tributary of that river and the Kaz tributary of the Yenisei which is now linked by canal. They met with much opposition from the Tungus and Buriat tribes and it was not till 1648 that the Russians penetrated to Lake Baikal via the Angara river. The exploration of the delta was much delayed, for though English and Russian navigators visited the Kara Sea in the 16th century, the upper course of the river, 6 m. wide near the delta, and with a delta opening into a gulf 40 m. wide, presents great difficulties when the warmer waters from the south undermine the ice and huge ice floes swell up and burst away, forming ice hills sometimes 50 to 60 ft. high on the banks, while the pack ice blocks on the current travel northwards at 20 m. an hour, crashing against one another with deafening reverberations.

After 1853, a wealthy Siberian, Sidoroff, agitated for 20 years to establish links between Europe and the mouths of the Arctic rivers of Siberia and in 1874 an English vessel reached the mouth of the Ob, while Nordenskjöld, the famous Swedish explorer, in 1875 entered the mouth of the Yenisei. In 1876 an English vessel reached Kureika on the Yenisei and in the following year Sidoroff reached the delta from Yeniseisk, and sailed to Leningrad. In 1878, the *Fraser* and *Express,* two ships of Nordenskjöld's "Vega" expedition ascended the Yenisei. A company was formed to establish trade via this route, but was unsuccessful and was dissolved in 1900. The project is now being revived and in 1928 a Kara Sea expedition, consisting of three British and five Norwegian vessels, set out from Hamburg on Aug. 1, sailing via the North Sea, Barents sea, through the Novaya Zemlya islands and the Kara sea to the mouths of the Ob and Yenisei, taking 15,000 tons of agricultural machinery, metals, drugs and coal, to exchange for timber, flax, cow-wool, hides and horsehair, brought up the rivers on barges towed by steamers.

BIBLIOGRAPHY.—Nordenskjöld, *The Voyage of the Vega,* 1881; P. Kropotkin, *Orographie de la Sibérie* (1905); Suess, *The Face of the Earth,* vol. III. (1908), with references to Russian articles, esp. by Obruchev; E. Argand, *La Tectonique de l'Asie* (1922, publ. 1924).

YENISEISK, a town in the Siberian area of the Russian S.F.S.R., in 58° 39′ N., 92° 4′ E., on the right bank of the Yenisei river at an altitude of 285 ft. It is a centre for fur trading and gold mining; pop. (1926) 5,957, about 50% of that in 1913. There is not much wharf accommodation, though there is regular steamer connection to Krasnoyarsk. The river at Yeniseisk is a mile wide and navigation opens about May 19 and closes about Dec. 1. The town was founded in 1618.

YEOMAN, a term meaning, first, a class of holders of land and second, a retainer, guard, attendant or subordinate official. The word appears in M.E. as *3eman, 3oman* and *yeman;* it does not appear in O.E. It is generally accepted that the first part is the same word as the Ger. *Gau,* district, province, and probably occurs in O.E. as *géa* in *Súðri-géa,* Surrey; *i.e.,* southern district, and other place-names. "Yeoman" thus meant a country-man, a man of the district, and it is this sense which has survived in the special use of the word for a class of landholders.

The extent of the class covered by the word "yeoman" in England has never been very exactly defined. One of the earliest pictures of a yeoman is that given by Chaucer in the Prologue to the *Canterbury Tales.* Here, represented as a forester, he follows the esquire as a retainer or dependant. The yeomen of later ages, however, are practically all occupied in cultivating the land, although, doubtless from its younger sons, the class furnished retainers for the great lords, men-at-arms and archers for the wars, and tradesmen for the towns. Medley (*Eng. Const. Hist.*) describes the yeomen of the 15th century as representing on the whole "the small freeholders of the feudal manor." Holinshed, in his *Chronicle,* following Sir T. Smyth (*De republica Anglorum*), and W. Harrison (*Description of England*), describes them as having free land worth £6 annually, and in times past 40s., and as not entitled to bear arms. They formed the intermediate class between the gentry and the labourers and artisans.

YEOMANRY, the name given to the volunteer mounted troops of the home defence army of Great Britain, ever since their original formation; it indicated that recruiting, organization and command were upon a county basis, the county gentlemen officering the force, the farmers and yeomen serving in its ranks, and all alike providing their own horses. Although the yeomanry was created in 1761, it was not organized until 1794. Under the stimulus of the French War recruiting was easy, and 5,000 men were quickly enrolled. A little later, when more cavalry were needed, the Provisional Cavalry Act was passed, whereby a sort of revived knight-service was established, every owner of ten

horses having to find and equip a horseman, and all who owned fewer than ten, grouped by tens of horses, similarly finding one. A great stimulus to yeomanry recruiting was given by an amending act which was soon passed by which yeomanry cavalry could be substituted for provisional cavalry in the county quota. At the peace of Amiens, the yeomanry was retained, although the provisional cavalry was disbanded. There was thus a nucleus for expansion when Napoleon's threatened invasion (1803–5) called out the defensive powers of the country, and as early as December 1803 there were in England, Scotland and Ireland, 44,000 yeomen. At the same time the limitations as to place of service in Great Britain were abolished.

From the extinction of Chartism to the South African War the history of the yeomanry is uneventful. The strength of the force gradually sank to 10,000. But when it became apparent that mounted troops would play a decisive part in the war against the Boers, the yeomanry again came to the front. Of its 10,000 serving officers and men, 3,000 went to South Africa in newly formed battalions of "Imperial Yeomanry," armed and organized purely as mounted rifles, and to these were added over 32,000 fresh men, for whom the yeomanry organization provided the cadres and training. In 1901 the yeomanry was remodelled; the strength of regiments was equalized on a four squadron basis, fresh regiments were formed and the strength of the force was more than trebled. In 1907 the yeomanry became part of the new Territorial Force.

At the outbreak of the World War in 1914, 53 regiments of yeomanry mobilized. The first to see active service was the Oxfordshire Yeomanry who accompanied the Royal Naval Division in the Antwerp campaign, but it was not until the spring of 1915 that the employment of yeomanry was seen on any considerable scale. In France four regiments of yeomanry were brigaded with regular cavalry in the cavalry corps and proved in every way worthy of this distinction.

Only in the Palestine campaign was opportunity found for the successful employment of large cavalry formations. Fourteen regiments of yeomanry, nine of which had formed part of an improvised dismounted force in Gallipoli, served in the various divisions of the Desert Mounted Corps and contributed very materially to the success of Allenby's Jerusalem campaign and of the final advance on Damascus and Aleppo. The actions of Huj and El Mughar in the operations following the third battle of Gaza, both executed entirely by yeomanry, provided classic examples of the successful employment of the mounted attack in mobile warfare. In the spring of 1918 eight of these regiments were grouped into machine gun battalions and sent to France, their places being taken by Indian Cavalry.

One complete infantry division was formed entirely of yeomanry units. This was the 74th Division (the "broken spur" division), so called from the divisional sign which they adopted. This division was formed in Palestine at the beginning of 1917 from 18 yeomanry regiments, 12 of which had previously seen service in Gallipoli. The 74th Division first saw service as a division at the second battle of Gaza, and served with considerable distinction in the third Gaza campaign and in the operations attending the capture of Jerusalem, and afterwards in France and Flanders whither it was sent in the spring of 1918. The Scottish Horse and Lovat's Scouts Brigade served as infantry in Gallipoli, Macedonia and France and Flanders. The remaining yeomanry regiments were employed as divisional cavalry.

Since the war much attention has been given to the training of the unit and efficiency has been largely increased by the presence in the force of so many officers with experience of war.

(E. F. La.)

YEOMEN OF THE GUARD, originally "Yeomen of the Guard of (the body of) our Lord the King"—"Valecti garde (corporis) domini Regis"—the title maintained with but a slight variation since their institution in 1485, of a permanent military corps in attendance on the sovereign of England, as part of the royal household, whose duties, now purely ceremonial, were originally those of the sovereign's personal bodyguard. They are the oldest existing body of the kind. The first warrants to individual "Yeomen of the Guard" date from Sept. 16, 1485, immediately after the victory of Henry VII. at Bosworth (Aug. 22).

The first official recorded appearance of the king's bodyguard of the Yeomen of the Guard was at the coronation of its founder Henry VII. at Westminster Abbey on Oct. 31, 1485, when it numbered 50 members. That number was rapidly increased, for there is an authentic roll of 126 attending the king's funeral in 1509. Henry VIII. raised the strength of the Guard to 600 when he took it to visit Francis I. of France at the Field of the Cloth of Gold (*q.v.*). In Queen Elizabeth's reign it numbered 200. The corps was originally officered by a captain (a post long associated with that of vice-chamberlain), an ensign (or standard-bearer), a clerk of the cheque (or chequer roll, his duty being to keep the roll of every one connected with the household), besides petty officers, captains, sergeants or ushers. In 1669 Charles II. reorganized the Guard and gave it a fixed establishment of 100 yeomen, officered by a captain, a lieutenant, an ensign, a clerk of the cheque and four corporals, which is the present organization and strength. The captaincy is now a ministerial appointment filled by a nobleman of distinction under the lord chamberlain, and the old rank of "corporals" has been changed to "exon," a title derived from "exempt," *i.e.*, exempted from regular regimental duty for employment on the staff. Formerly officers on the active list were given these appointments in addition to their own.

The original duties of the Guard were of the most comprehensive nature. They were the king's personal attendants day and night at home and abroad. They were responsible for his safety not only on journeys and on the battlefield, but also within the precincts of the palace itself. In Tudor times the Yeomen of the Guard alone were entrusted with the elaborate formality of making the king's bed. Another of their duties still retained is the searching of the vaults of the houses of parliament at the opening of each session, dating from the "Gunpowder plot," in 1605, when the Yeomen of the Guard seized Guy Fawkes and his fellow-traitors and conveyed them to the Tower.

The dress worn by the Yeomen of the Guard is in its most striking characteristics the same as it was in Tudor times. It has consisted from the first of a royal red tunic with purple facings and stripes and gold lace ornaments. Sometimes the sleeves have been fuller and the skirts longer. Red knee-breeches and red stockings (white in Georgian period only), flat hat, and black shoes with red, white, and blue rosettes are worn. Queen Elizabeth added the ruff. The Stuarts replaced the ruff and round hats with fancy lace and plumed hats. Queen Anne discarded both the ruff and the lace. The Georges reintroduced the ruff, and it has ever since been part of the permanent dress. Up to 1830 the officers of the Guard wore the same Tudor dress as the non-commissioned officers and men, but under William IV. the officers were given the dress of a field officer of the Peninsular period. The weapons of the Guard are a steel gilt halberd with a tassel of red and gold and an ornamental sword.

The real fighting days of the Guard ended with the Tudor period, but it was only with the final appearance of an English King in battle (Dettingen 1743) that the Guard's function of attending a sovereign on the battlefield ceased. For a brief period during the Georgian era the Guard lost to a certain extent its distinctive military character and a custom crept in of filling vacancies with civilians, who bought their places for considerable sums, the appointments being of great value. William IV. put a stop to the practice, the last civilian retired in 1848, and the Guard regained its original military character. Every officer (except the captain), non-commissioned officer, and yeoman must have served in the Home or Indian army or Royal Marines. They are selected for distinguished conduct in the field, and their pay is looked upon as a pension.

The nickname "Beef-eaters," which is sometimes associated with the Yeomen of the Guard, had its origin in 1669, when Count Cosimo, grand duke of Tuscany, was in England, and, writing of the size and stature of this magnificent Guard, said, "They are great eaters of beef, of which a very large ration is given them daily at the court, and they might be called 'Beef-eaters.'"

In 1509, Henry VIII., envying the magnificence of the body-guard of Francis I. of France, decided to have a noble guard of his own, which he accordingly instituted and called "The Gentlemen Speers." It was composed of young nobles gorgeously attired. In 1539 the guard was reorganized and called "Gentlemen Pensioners." That title it retained till William IV.'s reign, when the corps regained its military character and received their present designation, "The Honourable Corps of Gentlemen-at-Arms."

See *The History of the King's Body Guard of the Yeomen of the Guard,* by Colonel Sir Reginald Hennell, D.S.O., Lieutenant of the Yeomen of the Guard (1904).

YEOTMAL, a town and district of India in Berar. It stands on an elevated plain at about 1,400 feet. The population in 1921 was 17,238. It was formerly the headquarters of the Wun district but in 1905 the new district of Yeotmal was established, the old Wun district being renamed with additions from the district of Basim. Cotton ginning and pressing are the main industries. The town is also the chief trading centre of the district, being connected by a road, 29 miles long, with Dhamangaon on the G.I.P. railway, while a narrow gauge line recently constructed connects it through Darhwa and Karinja with Murtizapur on the main G.I.P. line.

The DISTRICT OF YEOTMAL has an area of 5,219 square miles. Yeotmal is a large cotton producing district, but its upland is less fertile than the average of Berar. The greater part of the district is drained by the Penganga River, which joins the Wardha in the south-east corner. There are large forest reserves in the south and south-east in which game abounds. There is a considerable aboriginal element of Gonds and Kalams in the wilder portions. The 1921 population was 748,959. There is coal at Pisgaon in the Wun *taluq* near the Wardha River. The climate in the uplands is cool and the rainfall (41″) plentiful.

YEOVIL, a market town and municipal borough in the Yeovil parliamentary division of Somersetshire, England, on the G.W. and S. railways, 127 m. W. by S. of London. Pop. (1921) 14,994. The town lies on the river Yeo, and is a thriving place, with a few old houses. The town is famous for its manufacture of gloves (dating from 1565). It has also brick works, a brewery, and large engineering works. Its agricultural trade is considerable. Yeovil (Gyoele, Evill, Ivle, Yeoele) before the Conquest was part of the private domains of the Anglo-Saxon kings.

YERBA BUENA (*Micromeria Chamissonis*), a pleasantly aromatic North American herb of the mint family (Labiatae, *q.v.*), found in woods from British Columbia to southern California. It is a slender perennial, with trailing stems ½ ft. to 2 ft. in length; roundish, short-stalked leaves, ½ in. to 1 in. broad, and delicate, two-lipped, white flowers, borne on hair-like stalks usually singly in the leaf-axils. Medicinal properties were ascribed to it.

YERBA MANSA (*Anemopsis californica*), a North American herb of the lizard's-tail family (Saururaceae), found in wet saline places from western Texas to central California and southward to Mexico. It is a perennial with upright stems, ½ ft. to 2 ft. high, springing from aromatic, creeping rootstalks, and astringent, slightly spicy foliage. The flowers are borne in terminal spikes, ½ in. to 1½ in. long, surrounded at the base by a circle of conspicuous white bracts; the fruit is a capsule, splitting open from the top. The Spanish-Californians used the plant medicinally.

YERBA MATÉ: *see* MATÉ.

YERBA SANTA (*Eriodictyon californicum*), a North American balsamic shrub of the water-leaf family (*Hydrophyllaceae*), native to dry slopes and mountain ridges from south central California to southern Oregon. It grows from 2 ft. to 8 ft. high, bearing narrowly lanceolate leaves, which are very glutinous-resinous above and densely white-woolly below, and bluish or white flowers in loose clusters. The Indians and early Spanish settlers made extensive medicinal use of the bitter-aromatic leaves; the Indians also chewed and smoked them.

YERSIN, ALEXANDRE ÉMILE JOHN (1863–), Swiss bacteriologist, was born at Rougemont, Switzerland, on Sept. 22, 1863, and studied at Lausanne, Marburg and Paris. He was associated with Roux in his researches on the diphtheria serum at the Pasteur institute, and then continued his researches in China and Indo-China, where he explored the Mois country and prepared a series of maps of the region. He introduced the culture of rubber into Indo-China. The plague bacillus was discovered by him in Hongkong in 1894, Kitasato simultaneously making the same discovery. The next year Yersin prepared a serum to combat the disease. Under the auspices of the Chinese Government a branch of the Pasteur institute was founded by him at Canton. Yersin established a similar institution at Nha Nang, Annam, in the same year, of which he became director. Yersin was awarded le grand prix Leconte by the Paris Académie des Sciences in 1927.

YEW (*Taxus baccata*), a tree which belongs to a genus of Coniferae (*see* GYMNOSPERMS), in which the ordinarily woody

FROM COOPER AND WESTALL, "TREES AND SHRUBS OF THE BRITISH EMPIRE" (J. M. DENT & SONS, LTD.)

YEW (TAXUS BACCATA), TWIGS WITH (A) MALE AND (B) FEMALE FLOWERS

cone of the pines and spruces is represented by a single seed surrounded by a fleshy berry-like cup. Usually it forms a low-growing evergreen tree of very diverse habit, but generally with dense spreading branches, thickly covered with very dark green linear leaves, which are given off from all sides of the branch, but which, owing to a twist in the base of the leaf, become arranged in a single series on each side of it.

The trees are usually dioecious, the male flowers being borne on one individual and the female on another. The male and the female flowers are placed each separately in the axil of a leaf, and consist of a number of overlapping scales. In the female flower these scales surround a cup which is at first shallow, green and thin (the so-called aril), but which subsequently becomes fleshy and red, while it increases so much in length as almost entirely to conceal the single straight seed. It is clear that the structure of the female flower differs from that of most conifers, from which it is now separated in a distinct family, Taxaceae.

The poisonous properties, referred to by classical writers such as Caesar, Virgil and Livy, reside chiefly if not entirely in the foliage. This, if eaten by horses or cattle, especially when it has been cut and thrown in heaps so as to undergo a process of fermentation, is very injurious. As a timber tree the yew is used for cabinet-work and axle-trees, where strength and durability are required. It was once largely used for the English long-bow.

The European yew, *T. baccata,* is a native of Europe, north Africa, and Asia as far as the Himalayas and the Amur region. The yew is wild in Great Britain, forming a characteristic feature of the chalk downs of the southern counties and of the vegetation of parts of the Lake District and elsewhere. The evidence of fossil remains, antiquities and place-names indicates that it was formerly more widely spread in Europe than at the present day. The varie-

ties grown in the United Kingdom are numerous, one of the most striking being that known as the Irish yew—a shrub with the pyramidal or columnar habit of a cypress.

The yew is a favourite evergreen tree, either for planting separately or for hedges, for which its dense foliage renders it well suited. Its dense growth when pruned has led to its extensive use in topiary work, which was introduced by John Evelyn and became very prevalent at about the beginning of the 18th century.

In the United States and Canada the best known native yews are the American yew or ground-hemlock (*T. canadensis*), a low, straggling shrub rarely over 5 ft. high, found in woods from Newfoundland to Manitoba and southward to Virginia and Iowa, and the western or Pacific yew (*T. brevifolia*), a tree sometimes 50 ft. high, with a trunk diameter of 2 ft., which grows from California to Alaska and eastward to Montana. The hard, heavy, very fine-grained, exceedingly durable wood of the Pacific yew, one of the best woods used by the Indians for making bows, is especially suitable for tool-handles and similar purposes. Two other North American species occur: the Florida yew (*T. floridana*), a rare tree of western Florida, and the Mexican yew (*T. globosa*), found in the mountains of Mexico.

Numerous dwarf forms and leaf-colour variants of the Japanese yew (*T. cuspidata*), a tree sometimes 50 ft. high, native to north-eastern Asia, are planted for ornament.

For further details *see* Veitch, *Manual of Coniferae* (1900); Elwes and Henry, *Trees of Great Britain and Ireland* (1906); C. S. Sargent, *Manual of the Trees of North America* (1905, 2nd ed. 1922); L. H. Bailey, *Manual of Cultivated Plants* (1924); G. B. Sudworth, "Check List of the Forest Trees of the United States," *U.S. Dept. Agric. Misc. Cir. 92* (1927).

YEZD, a province and town of Persia. The former is bounded on the west by the province of Isfahan, on the north by Samnan-Damghan, on the east by Khurasan and on the south by Kerman and Fars. Much silk is produced in this district, but not sufficient for the requirements of the looms of Yezd, and quantities are imported from Gilan. Other products are opium, madder, almonds and grain, of which last, however, only one-third of the supply required for local consumption is grown, the surplus requirements being brought from the adjacent province of Khurasan. The eartern part of the province bordering on the Dasht i Lut (desert) is much exposed to moving sands, and cultivation here is very sparse. The revenue of the province amounted in 1926–7 to 2,754,933 krans.

Yezd, the chief town of the province, is situated in 31° 54′ N. and 54° 22′ E. at an elevation of 4,240 ft., 162 m. S.E. of Isfahan and 192 m. N.W. of Kerman. The population according to one authority was estimated at 60,000 in 1900 while another gives 50,000 only, of whom Zoroastrians or Parsees form a considerable proportion. When the Arabs invaded Persia, the Zoroastrians fled before the persecution of the Muslims towards Yezd and Kerman and they have since remained here. The town, with its narrow, dirty and unpaved streets, is divided into the Shahr i Nau (new town) and Shahr i Kohneh (old), separated by a wall with two gates. There are several mosques, seven colleges and numerous caravanserais. The main building of the old town is the Ark, or citadel, where the governor resides. In the Parsee quarter the streets are wider and cleaner, and the houses better, each having its own garden. The highest and lowest recorded shade temperatures are respectively 106° Fahr. in July and 20° in December. Commercially speaking Yezd occupies an important central position in Persia, whence a number of routes radiate. Passable roads for motors lead to Isfahan and to Kerman, from which latter place Duzdab, at the Indian railhead, and Seistan, are reached by a choice of caravan tracks. There is also an important direct caravan track to Bandar Abbas.

See G. N. Curzon, *Persia and the Persian Question* (1892); E. G. Browne, *A year amongst the Persians* (1893 and 1926); P. M. Sykes, *Ten thousand miles in Persia* (1902) and "A Fourth Journey in Persia," *Geogr. J.*, 1902, XIX. (P. Z. C.)

YEZIDIS, a religious sect, numbering about 50,000 persons, dwelling chiefly in the neighbourhood of Mosul. Their own name for themselves is Dasni, but they are called by their neighbours Yezidi; the origin of both names is uncertain, but the latter is probably derived from the Persian *Yazdān*, God. Their religion was probably originally an offshoot of Mazdaism, but it has absorbed elements from Christianity and Islam, for they regard Christ as an angel in human form and recognize Muḥammad as a prophet with Abraham and the other prophets, and practise circumcision and baptism. They regard the devil as the creative agent of the Supreme God, and seek to propitiate him as the author of evil; they avoid mentioning his name and represent him by the peacock. Their sacred books have been translated by F. Nau, *Recueil de textes et de documents sur les Yézidis* (1918).

BIBLIOGRAPHY.—L. Menant, *Les Yézidis* (1892); R. Frank, *Scheich Adi, der grosse Heilige der Jezîdîs* (1911); R. H. W. Empson, *The cult of the Peacock Angel* (1928, bibl.)

YEZO, the most northerly of the five principal islands forming the Japanese empire, the five being Yezo, Hondo, Shikoku, Kyūshu and Formosa. It is situated between 45° 30′ and 41° 21′ N. and between 146° 7′ and 139° 11′ E.; its coast-line measures 1,423·32 m., and it has an area of 30,148·41 square miles. On the north it is separated from Sakhalin by Soya Strait (La Pérouse) and on the south from Nippon by Tsugaru Strait. Its northern shores are washed by the Sea of Okhotsk, its southern and eastern by the Pacific Ocean, and its western by the Sea of Japan.

Orography.—The highest mountain in the island is Ishikaridake (6,955 ft.) and the next in importance is Tokachi-dake (6,541 ft.). Yubari-take in Ishikari has a height of 6,508 ft., and in the province of Kushiro are O-akan-dake (4,470 ft.) and Meakan-take (4,500 ft.). Near Hakodate are two conspicuous volcanic peaks, Komaga-take (3,822 ft.) and Tokatsu-dake (3,800 ft.); and 24 m. from Kushiro (by rail) is a volcano called Atosanobori, or Iwo-zan (sulphur mountain), whence great quantities of first-rate sulphur are exported to the United States. Rishiri, an islet on the extreme N.W., has a peak of the same name rising to 6,000 ft.

Rivers.—Yezo boasts the largest river in the Japanese empire, the Ishikari-gawa, which is estimated to measure 275 m. Its other large rivers are the Teshio-gawa (192 m.), the Tokachi-gawa (120 m.), the Shiribeshi-gawa (88 m.), the Kushiro-gawa (81 m.), the Toshibetsu-gawa (64 m.) and the Yubetsu-gawa (64 m.). The valley of the Ishikari is the most fertile part of the island; the Tokachi is navigable to a point 56 m. from its mouth, but the Teshio has a bar which renders its approach extremely difficult. Nearly all the rivers abound with salmon.

Lakes.—There are no large lakes, the most extensive—Toyako, Shikotsuko and Kushiroko—not having a circumference of more than 25 miles. Lagoons, however, are not uncommon. The largest of these—Saruma-ko in Kitami—is some 17 m. long by 7 wide. It abounds with oysters nearly as large as those for which the much smaller lagoon at Akkeshi is famous, the molluscs measuring about 18 in. in length.

Climate.—The climate differs markedly from that of the main island of Japan, resembling rather the climate of the British Isles, though the winter is longer and more severe, and the atmosphere in the warm season contains a greater quantity of moisture. During five months the country is under snow, its depth averaging about 2 ft. in the regions along the southern coast and more than 6 ft. in the northern and western regions. An ice-drift, setting from the north and working southwards as far as Nemuro, stops all sea trade on the east coast during January, February and March, though the west coast is protected by the warm current of the Kuro-shiwo. Fogs prevail along the east coast during the summer months, and it is not uncommon to find a damp, chilly atmosphere near the sea in July, whereas, a mile inland, the thermometer stands at 80° or 90° F in the shade, and magnolia trees are in full blossom.

Fauna.—Tsugaru Strait has been shown to form a line of zoological division. Pheasants and monkeys are not found on the Yezo side of this line, though they abound on Hondo, and, on the other hand, Yezo has grouse and solitary snipe which do not exist in Hondo. The Yezo bear, too, is of a distinct species.

Population.—The island seems to have been originally peopled by a semi-barbarous race of pit-dwellers, whose modern

representatives are to be found in the Kuriles or their neighbours of Kamchatka and Sakhalin. These autochthons were driven out by the Ainu, and the latter, in their turn, succumbed to the Japanese. The population of Yezo is about 630,000 of whom some 14,000 are Ainu. There is a steadily growing but not large emigration from Japan proper to Yezo. Yezo is divided into ten provinces, the names of which, beginning from the south, are Oshima, Shiribeshi, Ishikari, Teshio, Kitami, Iburi, Hidaka, Tokachi, Kushiro and Nemuro. Of these, Oshima, Shiribeshi and Ishikari are by far the most important. There are only three towns having a large population, viz., Hakodate (163,972), Sapporo (145,065) and Otaru (134,469).

Industries and Products.—Marine products constitute the principal wealth of Yezo. Great quantities of salmon, sardines and codfish are taken. The salmon are salted for export to Nippon and other parts of Japan; the sardines are used as an agricultural fertilizer and the codfish serve for the manufacture of oil. An immense crop of edible seaweed is also gathered and sent to Chinese as well as to Japanese markets. This *kombu*, as it is called, sometimes reaches a length of 90 ft. and a width of 6 in. The herring fishery, too, is a source of wealth, and the canning of Akkeshi oysters as well as of salmon gives employment to many hands. Vast tracts are covered with a luxuriant growth of ash, oak, elm, birch, chestnut and pine, but, owing to difficulties of carriage, this supply of timber has not yet been much utilized.

Communications.—The roads are few and in bad order, but there is a railway which, setting out from Hakodate in the extreme south, runs, via Sapporo and Iwamizawa, to the extreme N. with branches from Iwamizawa, S. to Mororan and E. to Poronai, and from Oiwake N.E. to the Yubari coal-mines. There is also a line W. along the S. coast from Nemuro.

History.—Yezo was not brought under Japan's effective control until mediaeval times. In 1604 the island was granted in fief to Matsumae Yoshihiro, whose ancestor had overrun it, and from the close of the 18th century the east was governed by officials sent by the shōgun, whose attention had been attracted to it by Russian trespassers. In 1871 the task of developing its resources and administering its affairs was entrusted to a special bureau, which employed American agriculturists to assist the work and American engineers to construct roads and railways; but in 1881 this bureau was abolished, and the government abandoned to private hands the various enterprises it had inaugurated. The modern government departments attend to the development of Yezo in the same way as for the rest of the islands of the Empire. *See* the *Annual Report* of the Japanese Government.

YGGDRASIL, in Scandinavian mythology the mystical ash tree which symbolizes existence, binds together earth, heaven and hell, and is the tree of life, knowledge, fate, time and space. Its three roots go down into the realms—(1) of death, where, in the well Hvergelmer, the dragon Nidhug (Niðhöggr) and his brood are ever gnawing it; (2) of the giants; (3) of the gods, Asgard. Its stem upholds the earth, its branches overshadow the world and reach up beyond the heavens. Honey-dew falls from the tree, and on its topmost bough sits an eagle. G. Vigfusson and York Powell (*Corpus Poeticum Boreale*, Oxford, 1883) see in Yggdrasil not a primitive Norse idea, but one due to early contact with Christianity.

YIDDISH LANGUAGE AND LITERATURE. The word Yiddish is derived from the modern German *Jüdisch Deutsch* or Jewish German. It is the language spoken by the Polish and Russian Jews whose forbears, early in the middle ages, were invited to Poland from the Rhineland, to form a trading class in between the nobles and the serfs. They have kept their Low German tongue, writing and printing it in Hebrew characters to this day. Yiddish, though based on a Low German vocabulary and construction, was cut off from living German, whence its irregularities of grammar and spelling. It continued to absorb Hebrew and Aramaic words and expressions, together with Slav ones, Polish or Russian, and has a few of older Romance origin. The Hebrew and Aramaic came from the Hebrew Bible and its huge commentary the Talmud, which is largely Aramaic (*q.v.*). For the women, notably in the *Tzènah Urènah!* (Heb. "Come out and see!"), there were prayers and legends in Yiddish, or Màmelòshen (class. Heb. *lashòn*="tongue") or *Zhargòn*, in modern Hebrew: *Yehudit*="Jewish" (*s.* Judith), *Yiddit*, *Zhargòn*. Yiddish is essentially a folk-tongue, it had no written grammar, it eludes all strict grammatical analysis, though efforts are now being made to bring about uniformity in its grammar and spelling in view of its continued existence among the Jews of east Europe.

Yiddish Literature is merely the reflection of the segregated, intense Jewish world of Eastern Europe which has been broken up, never to be reconstructed. It enshrines a distinct phase of Jewish history, one which began when the first Jews migrated to Poland from the Rhinelands in the middle ages, and which lately closed in a darkness still hard to penetrate. It is a literature rich in folksongs and tales. A wealth of folk-lore, still in course of discovery, gathered on the long road from Ur of the Chaldees to Pinsk and Minsk, passed into Yiddish from Talmudical and European sources. This legendary material remained common to the Jews of Poland and Germany.

The literature of the latter differed at all times little from that of their Gentile neighbours except for the Hebrew lettering. The Oppenheim collection in the Bodleian library contains many publications of these earlier periods. Across the Polish frontier the literary cleavage between Jew and Gentile was complete. Intercourse with Germany grew ever less. Yiddish literature came to mean one or two chapbooks of legends and the still familiar devotional work for women, the *Tzènah Urènah*, delightful in its renderings of Talmudical traditions.

Early in the 19th century the Haskalah, a movement for the enlightenment of the Jewish masses, initiated in Berlin by Moses Mendelssohn, began to creep across the Russo-Polish frontiers. The young Talmud student deciphered his first German book, frequently the poems of Schiller, in secret and in fear—woe betide him were he found with a volume of secular recreation, and in the tongue spoken by so many heretic Jews! Still he read and then came the wish to express his own feelings in Yiddish, to speak to the people in their every-day language. Lefin translated the Psalms and Ecclesiastes, Linetzki wrote his autobiography, the *Polish Boy*, J. L. Gordon his few powerful verses.

Revival in Russia.—Round the '60s and '70s, when Russian schools and culture were made accessible to Jewish youth, Yiddish literature suffered a decline. After the persecutions of the '80s it took on fresh life. The Jewish people, re-awakened to the fact that they were not Jewish Russians but Russian Jews, said in the words of Peretz: "We also want to bring our sheaf to the universal harvest." The people needed comfort and guidance. Spektor wrote his tales, sweet and simple in style, priceless in observation; Frug, till then a Russian poet, his melodious verse; J. Dienensohn his pathetic *Jossele*. Abramovitch laid aside his fluent Hebrew pen and wrote novels in a rich Yiddish, dealing with evil inside as well as outside the community; I. L. Peretz and "Sholem Alechem," both now dead, wrote abundantly. Peretz produced tales, poems and dramas. The two last have a spectral charm, but his *Stories and Pictures* is his great achievement. "Sholem Alechem," the humourist, is even more of a household word in the humblest home where Yiddish is spoken. His *Tovie der Milchiger* (Tobias the Milkman) is an immortal type. David Frishman is a distinguished critic. Among other later and gifted story-tellers, much of whose work was published in New York, are Sholem Asch, A. Reisin, Libin and Peretz Hirschbein.

Leo Wiener's *History of Yiddish Literature in the 19th Century* (1899), is invaluable to the student. Some English translations are: *Jewish Children* (Sholem Alechem), by Hannah Berman; *One Act Plays from the Yiddish*, by Etta Block; *A Lithuanian Village* (Leon Kobrin), by I. Goldberg, who has also translated the *Haunted Inn* of Peretz Hirschbein and other plays; *Stories and Pictures* (I. L. Peretz) and *Yiddish Tales* (20 different authors), by H. Frank. (H. F.)

The United States.—Yiddish literature in America developed under a combination of influences. On the one hand Russian literature—the writings of Tolstoi, Turgeniev, Dostoievski and Chekhov—played a decisive rôle in its growth for the obvious reason that nearly all Yiddish writers came from Russia and it was they who founded the Yiddish press, wrote the plays for the theatres, started weekly and monthly publications.

The distinctive contribution of the United States to Yiddish literature of the world has been the Yiddish language press. During the past four decades Yiddish journalism has swallowed up the ablest writers. There has never been a profitable market for Yiddish books in America on account of the poverty of the Jewish masses. Nine-tenths of the novelists, short story writers, poets, playwrights and critics have been obliged to eke out a livelihood as practising newspapermen. Hence the Yiddish press has been more than a purveyor of news and political comment. The man who has created modern Yiddish journalism is Abraham Cahan. From the founding of the *Jewish Daily Forward* in 1897 Cahan has been guide and mentor of the Yiddish press.

In addition to *The Forward* there are three other dailies in New York, viz., *Jewish Morning Journal, Day-Warheit* and *Freiheit.* The *Morning Journal* (edited by Peter Wiernik) is a conservative paper in politics no less than in religion. The *Day-Warheit* espouses the cause of Jewish nationalism, while *Freiheit* advocates communism. The total circulation of the several papers is in the neighbourhood of 400,000. Among the leading journalists in addition to those already mentioned are Zivion, Hillel Rogoff, Dr. A. Coralnik, M. Olgin, Dr. S. Margoshes, Jacob Fishman. The name of the late Louis E. Miller, one of the founders of *The Forward* and for years editor-publisher of *Warheit* and other publications, must be included in this list. Also S. Yanofsky, long the editor of *Freie Arbeiter Shtimme* (Free Workmen's Voice), an influential literary weekly of anarchist tendencies.

Much of the best modern Yiddish poetry has been written in the United States. Morris Rosenfeld was the most popular and most versatile poet produced in America. He was lyricist, satirist, polemicist. Yehoash, regarded by some as superior to Rosenfeld, was less popular. His poetry is cerebral, much of it obscure. Yehoash wrote magnificent nature poems; he translated Longfellow's "Hiawatha," devoted long years to the translation of the Old Testament from the original Hebrew into Yiddish and was the author of a *Dictionary of Hebraic Elements* in the Yiddish language, a pioneer work. A. Reisin, for years editor of the monthly magazine *Zukunft* (Future) is a poet of great power and originality as well as a foremost publicist. Excellent poetry has also been written by M. Winchevsky, Mani Leib, Rolnik, Joel Slonim, M. L. Halpern, Zisha Landau, Dilon, Nochem Yud.

The earliest writers of short stories were Z. Libin, Jacob Gordin and Leon Kobrin. Libin's career dates from the '90s. His sketches are full of a peculiar humour tinctured with sadness inspired by the hardships of life of the early immigrants. Libin has written extensively for the stage not without success. Kobrin has been a prolific playwright and translator. Gordin's fame rests on the seventy-odd plays which he wrote for the stage during the last 20 years of his life rather than his earlier sketches. He was the reformer of the Yiddish stage in America.

Only two or three of the many plays which David Pinski has written proved successful on the stage, notably *Yekel the Blacksmith* and *The Treasure.* Some of his plays, short stories and a novel have been translated into English. Strongly under the influence of the Russian realists, Z. Levine occupies a unique position as a writer of grim stories unrelieved by humour. Highly esteemed by some critics, his reading public remains limited.

Fifteen or more years ago there emerged a group of young writers who challenged the supremacy of the older men. To-day (1929) their position is being challenged by a still younger group. The most notable of the young writers are Opatosho, Ignatev and Raboi.

Many of the leading writers of Europe have lived in America for shorter or longer periods but have remained distinctly European writers for the most part. None of the sketches or poems which Reisin, for instance, has written in America are equal to his best European work. Asch, who is indubitably one of the two or three greatest living Yiddish writers, is the author of two novels of American life: *Uncle Moses* and *Lederer.* His fame, however, will rest on *Motke Ganef, Kidush Hashem, Gott fun Nekomah* and *Dos Shtetel*—all written in the old country.

Next to the press the stage has been the most potent cultural influence in the life of the Jewish immigrants. Long under the domination of Shomer, Lateiner and "Professor" Hurwich, it was devoted to the presentation of vapid musical comedies, operettas and blood-curdling melodramas. Jacob Gordin, and after him Libin, Kobrin, Asch, Pinski, Sackler, Gottesfeld and Leiwick, rescued the stage from the doldrums. Asch's *God of Vengeance,* though dealing with life in Warsaw, was first produced in New York and is perhaps the greatest single Jewish drama of modern times. Of plays dealing essentially with American conditions, Leiwick's *Shmattess* (Rags) ranks near the top. In recent years Gottesfeld has written delightful comedies of American life. Peretz Hirschbein's idyllic plays (*Dos Fervorfen Winkel, Grinne Felder,* etc.) have been extremely successful and have vastly enriched the repertoire of the American Yiddish stage. There are approximately 20 Yiddish theatres in the country, fully half of them in greater New York. Second avenue in New York is the Yiddish "Great White Way." (N. Z.)

YLANG-YLANG (*Cananga odorata*), a medium-sized tree of the custard-apple family (Anonaceae), found in southern India, Java and the Philippines and planted in warm regions for its exceedingly fragrant flowers, which yield the widely-prized perfume of the Pacific islands, known as ylang-ylang among the Malays. The tree has somewhat drooping branches; large, ovate, sharp-pointed leaves; numerous greenish or yellowish flowers, about 2 in. long, and oblong, greenish fruits about 1 in. long. It has been sparingly cultivated in southern Florida.

YO-CHOW-FU, a city in the Chinese province of Hunan standing on high ground east of the outlet of Tung-Ting lake. Population about 20,000. The actual settlement is at Chinling-Ki, a village 5½ m. below Yo-Chow and ½ m. from the Yangtze. From Yo-Chow the cities of Chang Sha and Chang Teh are accessible, for steam vessels drawing 4 to 5 ft. of water, by means of the Tung-Ting lake and its affluents the Siang and Yuan rivers. The district in which Yo-Chow-Fu stands is the ancient habitat of the aboriginal San Miao tribes who were deported into south-west China. The city, which was built in 1371 is about 3 m. in circumference, and is surrounded by a wall. The city was entered by the T'aip'ing rebels in 1853. Yo-Chow-Fu is a collecting centre for native export products and for foreign goods on their way inland. It was opened to foreign trade in 1899.

YODEL, a peculiar kind of singing consisting of alternations of high falsetto notes with ordinary chest tones. It is practised by the Swiss and Tirolese in the singing of their native melodies.

YOGA, "diversion of the senses from the external world, and concentration of thought within" (Sanskrit "yoking"). The Yoga system in Hindu philosophy is a branch of the Sankhya (*q.v.*), but loosely inserted into it is the conception of a personal God, who is indissolubly connected with the subtlest form of matter. Union with him was not the original object of *yoga.* By its practices of hypnotism and self-mortification the Yogi (mod. Jogi) could attain miraculous powers and control of nature itself. Siva (*q.v.*), was essentially the great Yogi.

YOKOHAMA, a seaport of Japan on the west shore of Tokyo Bay, 18 m. south of Tokyo by rail. It stands on a plain shut in by hills, one of which, towards the south-east, terminates in a promontory called Honmoku-misaki or Treaty Point. The temperature ranges from 95° to 43° F, and the mean temperature is 57·7°. The cold in winter is severe, owing to north winds, while the heat is great in summer, though tempered by south-west sea breezes. The rainfall is about 70 in. annually. In 1859, when the neighbouring town of Kanagawa was opened to foreigners under the treaty with the United States, Yokohama was an insig-

nificant fishing village; and notwithstanding the protests of the foreign representatives the Japanese government shortly afterwards chose the latter place as the settlement instead of Kanagawa. Pop. (1927) 518,902. The Japanese government constructed public works, and excellent water was supplied from the Sagamigawa. The foreign settlement has well-constructed streets, but the wealthier foreigners reside south of the town, on the Bluff. The land occupied by foreigners was leased to them by the Japanese government, 20% of the annual rent being set aside for municipal expenses.

The harbour, which is a part of Tokyo Bay, is good and commodious, somewhat exposed, but enclosed by two breakwaters. The average depth in the harbour at high water is about 46 ft., with a fall of tide of about 8 ft. Rice, metal, woollen and cotton goods are the chief imports; and silk, silk goods and tea are the chief exports. The town was almost obliterated by an earthquake in Sept. 1923. Many thousands of its inhabitants were killed, some 80% of the houses were destroyed.

The starting-point of reconstruction was the new railway station on the coast, and the widening of 25 m. of existing streets and the building of 29 m. of new streets was undertaken. Railways have been restored, and plans for their further reconstruction are in hand. During the earthquake about a mile of the breakwater sank 8 ft. and most of the wharves were destroyed. The repair of the docks and harbour has been completed.

YOKOHAMA SPECIE BANK, LTD., THE (*Yokohama Shokin Ginko*). This bank was founded in 1880 with an authorised capital of Yen 3,000,000 with the object of affording financial facilities in respect of the foreign trade of Japan. Subsequently, its capital was increased several times until it stood at Yen 100,000,000, all paid up by December 1920.

The business carried on by the bank consists of (1) foreign exchange, (2) inland exchange, (3) loans, (4) deposits of money and custody of articles of value, (5) discount and collection of bills of exchange, promissory notes and other securities, and (6) exchange of coins. The bank may also buy or sell public bonds, gold and silver bullion, and foreign coins, if so required by the condition of its business. It may also be entrusted with matters relating to foreign loans and with the management of public money for international account.

The head office of the bank is in Yokohama, and there are 44 branches, 7 of which are in Japan and the remainder distributed throughout China, Manchuria, Europe, North and South America, India, Australia and the East Indies. On the 30th June, 1928, the ordinary reserve fund of the bank was raised to Yen 102,500,000, actually exceeding the capital, while a special reserve for bad debts was over Yen 4,000,000. (D. No.)

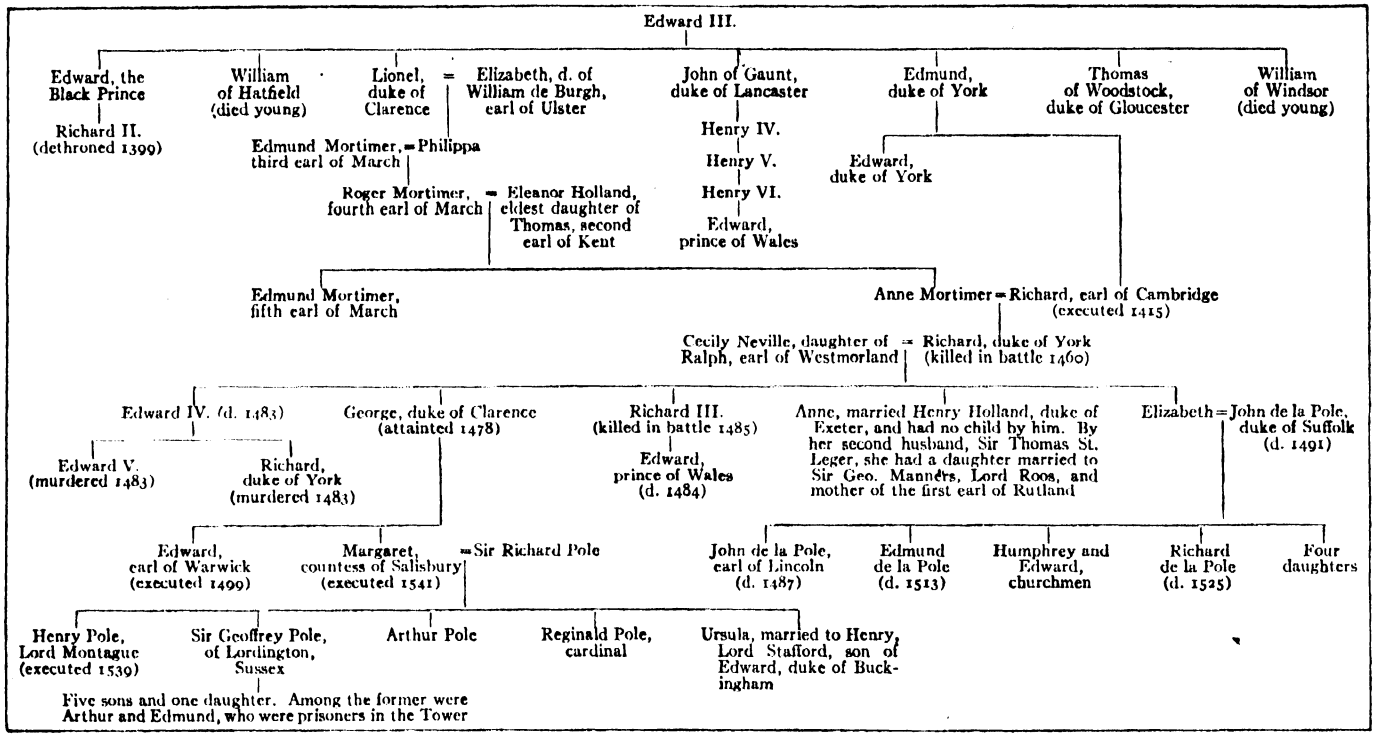
YOKOSUKA, a seaport and naval station of Japan, on the west shore of Tokyo Bay, 12 m. south of Yokohama. The town is connected by a branch line with the main railway from Tokyo. The port is sheltered by hills and affords good anchorage. The site was occupied by a small fishing village until 1865, when the shogun's government established a shipyard here. In 1868 the Japanese government converted the shipyard into a naval dockyard, and subsequently carried out many improvements. In 1884 the port became a first-class naval station.

YOLA, a native state of British West Africa, forming the major part of the province of Adamawa, Northern Nigeria. In the partition of Africa part of Adamawa fell to Germany and was included in the Cameroons. The British part was known as the province and emirate of Yola. In 1919 the former German part of Adamawa came under British mandate and was incorporated with Yola. In 1926 the name of the province and emirate was changed to Adamawa. By the people the Fula ruler is known as the Lamido of Adamawa. The capital is Yola, a town founded by the Fula conqueror Adama about the middle of the 19th century. The town is situated in 9° 12′ N., 12° 40′ E. and is built on the left or south bank of the Benue, 480 m. by river from Lokoja. It can be reached by shallow draught steamers when the river is in flood. The Niger Company had trading relations with Yola before the establishment of British administration in Northern Nigeria.

In 1903 an exploring expedition was sent up the Gongola, which coming from the north joins the Benue below Yola, and the navigability of the river for steam launches as far as Gombe at high water was demonstrated. The Gongola valley was in ancient times extensively cultivated and after the establishment of the British protectorate it again became a prosperous agricultural region. Cotton and food crops are cultivated.

Adamawa province has an area of 33,424 sq.m. and a pop. (1926) of 549,137. In many districts the Fulani and indigenous tribes are inextricably intermingled.

See NIGERIA; ADAMAWA, and the *Annual Report* on the Northern Provinces, Nigeria (Kaduna), first issued in 1928.



YONGE, CHARLOTTE MARY (1823–1901), English novelist and writer on religious and educational subjects, daughter of William Crawley Yonge, 52nd Regiment, and Frances Mary Bargus, was born on Aug. 11, 1823 at Otterbourne, Hants. She was educated by her parents, and from them inherited much of the religious feeling and High Church sympathy which coloured her work. She lived at Otterbourne all her life, and was one of the most prolific writers of the Victorian era. In 1841 she published five works of fiction, including *The Clever Woman of the Family, Dynevor Terrace* and *The Trial;* and after that she was the author of about 120 volumes, including novels, tales, school manuals and biographies. Her first conspicuous success was attained with *The Heir of Redclyffe* (1853), which enjoyed an enormous vogue. *The Daisy Chain* (1856, repr. 1911) continued the success. She was for more than 30 years editor of the *Monthly Packet.* She died at Otterbourne on March 24, 1901.

See E. Romanes, *Charlotte Mary Yonge: an Appreciation* (1908); and C. Coleridge, *Charlotte Mary Yonge, her Life and Letters* (1903).

YONKERS, a city of Westchester county, New York, U.S.A., on the east bank of the Hudson river, adjoining New York city on the north and facing the Palisades. It is served by the New York Central and electric railways, motor-bus lines, a ferry to Alpine, N.J., and river steamers. Pop. (1920) 100,176 (26% foreign-born white); 1928 estimate, 121,300. Yonkers is an important manufacturing city as well as a popular residential suburb. It has 4.5 m. of water front and a 30 ft. channel, and is within the limits of the Port of New York. The business streets, in the old part of the town along the river, too narrow for modern demands, are congested with traffic. In the heart of the business district stands the Philipse Manor-hall (built in 1682 and enlarged in 1745), one of the best examples of colonial architecture in America, now maintained as a State museum. In the northern part of the city (Glenwood) are the old Colgate mansion and the home of Samuel J. Tilden. There are many beautiful residential districts, on hills commanding delightful views, and many fine estates and country clubs in the environs.

An Indian village (Nappeckameck) stood on the site of Yonkers, at the mouth of the Nepperhan creek, when the Dutch founded New Amsterdam, and the territory was within the "Keskeskick Purchase," acquired from the Indians by the Dutch West India company in 1639. In 1646 it was included in the large grant extending from the Hudson to the Bronx river, made to Adrian van der Donck, the first lawyer and historian of New Netherland. He encouraged settlers to come in, built a saw-mill near the mouth of Nepperhan creek (or Saw-Mill river), and soon the settlement came to be known as De Jonkheer's Land (the estate of the young lord), from which the name of Yonkers was gradually evolved. Later much of the estate passed into the hands of Frederick Philipse, who in 1682 built for his son the manor house mentioned above. This mansion was confiscated in 1779, as the Frederick Philipse of that time was suspected of Toryism. It came into the possession of Yonkers in 1867, and was used as the city hall from 1872 until it was bought by the State in 1908. Early in the Revolution Yonkers was occupied for a time by part of Washington's army and was the scene of several skirmishes. In 1854 the manufacture of elevators was begun in Yonkers by Elijah G. Otis. The village was incorporated in 1855 and in 1872 it became a city. In 1880 the population was 18,892, which increased to 47,931 in 1900 (a gain of 154% in 20 years) and then more than doubled between 1900 and 1920.

GENEALOGICAL TABLE OF THE HOUSE OF YORK

YONNE, a department of central France, formed partly from the province of Champagne proper (with its dependencies, Sénonais and Tonnerrois), partly from Burgundy proper (with its dependencies, the county of Auxerre and Avallonnais) and partly from Gâtinais (Orléanais and Île-de-France). It is bounded by Aube on the north-east, Côte-d'Or on the south-east, Nièvre on the south, Loiret on the west and Seine-et-Marne on the north-west. Pop. (1926) 277,230. Area 2,892 sq. miles. The highest elevation (2,000 ft.) is in the granitic highlands of Morvan. The department belongs to the basin of the Seine, except a small district in the south-west (Puisaye), which belongs to that of the Loire. The river Yonne flows through it from south to north-north-west, receiving on the right bank the Cure, the Serein and the Armançon, which water the south-east of the department. Farther north it is joined by the Vanne.

The department is served chiefly by the P.L.M. railway. The canal of Burgundy, which follows the valley of the Armançon, has a length of 57 m. in the department, that of Nivernais, following the valley of the Yonne, a length of 33 miles. The department constitutes the archiepiscopal diocese of Sens, has its court of appeal in Paris, its educational centre at Dijon, and belongs to the district of the V. army corps. It is divided into 3 arrondissements (37 cantons, 486 communes), of which the capitals are Auxerre, also capital of the department, Avallon and Sens; these with Chablis, St. Florentin and Vézelay are its chief towns (*qq.v.*). Pontigny has a Cistercian abbey, where Thomas Becket spent two years of his exile, with a 12th century church. Druyes has a 12th-century château. Villeneuve-sur-Yonne has a mediaeval keep and gateways and a church of the 13th and 16th centuries. The Renaissance châteaux of Fleurigny, Ancy-le-France, Tanlay and the château of St. Fargeau, of the 13th century, rebuilt by Mademoiselle de Montpensier under Louis XIV., are all noteworthy. At St. Moré there are remains of the Roman road from Lyons to Gallia Belgica and of a Roman fortified post. There are many megalithic monuments in the department.

YORCK VON WARTENBURG, HANS DAVID LUDWIG, COUNT (1759–1830), Prussian general field-marshal, was of English ancestry. He entered the Prussian army in 1772, but in 1779 was cashiered for disobedience. Entering the Dutch service, he took part in the operations of 1783–84 in the East Indies as captain. Returning to Prussia in 1785 he was, on the death of Frederick the Great, reinstated in his old service, and in 1794 took part in the operations in Poland. Five years afterwards Yorck began to make a name as commander of a light infantry regiment, being one of the first to give prominence to the training of skirmishers. In 1805 he was appointed to an infantry brigade, and in the Jena campaign played a successful part as a rearguard commander, especially at Altenzaun. He was taken prisoner, severely wounded, at Lübeck. In the reorganization of the Prussian army after the peace of Tilsit, Yorck took a leading part. At first major-general commanding the West Prussian brigade, afterwards inspector-general of light infantry, he was finally appointed second in command to General Grawert, the leader of the auxiliary corps which Prussia was compelled to send to the Russian War of 1812, succeeding to the command on Grawert's retirement. He conducted the advance on Riga with great skill; but his conviction that the French army was doomed led him at last to neutralize the Prussian army by the Convention of Tauroggen (Dec. 30). The step was intensely popular, and although it was officially proposed to court-martial Yorck, he was absolved when the Treaty of Kalisch ranged Prussia with the Allies. During 1813–14 Yorck led his veterans with success at Bautzen, Katzbach, Wartenburg (Oct. 4) and Leipzig (Oct. 18). In France, he distinguished himself at Montmirail and Laon. The storm of Paris was his last fight. In 1821 he was created general field-marshal. He had been made Count Yorck von Wartenburg in 1814. He died at his estate of Klein-Öls, the gift of the king, on Oct. 4, 1830.

See Seydlitz, *Tagebuch des Preussischen Armee Korps 1812* (1823); Droysen, *Leben des G. F. M. Grafen Yorck von Wartenburg* (1851).

YORK (HOUSE OF), a royal line in England, founded by Richard, duke of York (*q.v.*), who claimed the crown in opposition to Henry VI. His claim was, perhaps rightly, barred by prescription, the house of Lancaster having then occupied the throne for three generations; it was really owing to the misgovernment of Margaret of Anjou that it was advanced at all. The duke was descended from Lionel, the third son of Edward III., while the house of Lancaster came of John of Gaunt, the fourth son. The claim was derived (*see* the Table) through females; but this could not reasonably have been objected to after Edward III.'s claim to the crown of France; and the duke's claim was probably supported by the fact that he was descended from Edward III. both through his father and through his mother. (*See* Table.) The earldom of Ulster, the old inheritance of the De Burghs, had descended to him from Lionel;

the earldom of March from the Mortimers, and the dukedom of York and the earldom of Cambridge from his paternal ancestry. His marriage with Cecily Neville, daughter of Ralph, 1st earl of Westmorland, allied him to a powerful family in the north.

The reasons why the claims of the line of Clarence had been so long forborne are easy to explain. Richard II. named Roger Mortimer, 4th earl of March, as his successor; but he died in 1398, and his son Edmund was a child at the time of Henry IV.'s usurpation. Henry took care to secure his person; but the claims of the family troubled his and Henry V.'s reigns. And it was to make Edmund king that his brother-in-law Richard, earl of Cambridge, conspired against Henry V. soon after his accession.

Richard, duke of York, seems to have taken warning by his father's fate; but, after seeking to correct by other means the weakness of Henry VI.'s government, he took up arms against the ill advisers, and claimed the crown in parliament as his right. The Lords admitted that his claim was unimpeachable, but suggested that Henry should retain the crown for life, and the duke and his heirs succeed after his death. This was accepted by the duke, and an act to that effect received Henry's own assent. But the act was repudiated by Margaret of Anjou, and the duke was slain at Wakefield. Soon afterwards, however, his son was proclaimed king at London as Edward IV., and the victory of Towton immediately after drove his enemies into exile. After his recovery of the throne in 1471 he had little more to fear from the house of Lancaster. But the seeds of distrust had already been sown in his own family, and in 1478 his brother Clarence was put to death as a traitor. In 1483 Edward died; and Edward V., after a nominal reign of two months and a half, was put aside by the duke of Gloucester, who became Richard III. But Richard was in turn slain at Bosworth by the earl of Richmond, who, as Henry VII., married the eldest daughter of Edward IV. and united the houses of York and Lancaster.

Here the dynastic history of the house of York ends. But a host of debatable questions and pretexts for rebellion remained. The legitimacy of Edward IV.'s children had been denied by Richard III. and, though the act was denounced as scandalous, the slander might still be reasserted. The duke of Clarence had left two children and the attainder of their father could not be a greater bar to the crown than the attainder of Henry VII. himself. Seeing this, Henry had kept Edward, earl of Warwick, a prisoner in the Tower of London. Yet a rebellion was raised in his behalf by means of Lambert Simnel, who was defeated and taken prisoner at the battle of Stoke in 1487. The earl of Warwick lived for 12 years later in confinement, and was ultimately put to death in 1499. His sister Margaret married Sir Richard Pole (or Poole), and could give no trouble, so that Henry VIII. treated her with kindness. He made her countess of Salisbury, reversed her brother's attainder, created her eldest son, Henry, Lord Montague, and had one of her younger sons, Reginald, carefully educated. (*See* POLE, REGINALD and POLE, FAMILY.)

YORK, ALBERT FREDERICK ARTHUR GEORGE, DUKE OF (1895–), second son of King George V. and Queen Mary, was born at York Cottage, Sandringham, Dec. 14, 1895. After passing through Osborne and the Royal Naval college, Dartmouth, he was gazetted midshipman in Sept. 1913. Though debarred by ill health from active service during the early years of the World War, he served in the battle of Jutland as a sub-lieutenant, being mentioned in despatches. At the end of 1917 he was attached to the naval branch of the Royal Air Force and, in Oct. 1918, was on the Western Front, qualified as a pilot and eventually became wing-commander in 1920. After the war (Oct. 1919) he entered Trinity college, Cambridge, taking an abridged course in history, economics and civics. He has since shown a special interest in industrial questions, becoming president of the Society for Industrial Welfare. He was created duke of York in June 1920 and K.T. on the occasion of his marriage to Lady Elizabeth Bowes-Lyon, April 26, 1923, having been previously (Dec. 1916) created K.G. In 1922 and 1923 the Duke represented the King at court ceremonies in Rumania, Serbia and Czechoslovakia. In 1925 he was made president of the British Empire Exhibition, Wembley, and in June was appointed to the Privy Council. On April 21, 1926 a daughter was born to the duke and duchess of York. The Princess Elizabeth, as she is called, is in the direct succession, after the Prince of Wales and her father, to the British throne.

YORK, EDMUND OF LANGLEY, DUKE OF (1341–1402), fifth son of Edward III., was born at King's Langley in Hertfordshire on June 5, 1341. He accompanied his father on a campaign in France in 1359, was created earl of Cambridge in 1362, and took part in expeditions to France and Spain. After marrying Isabella (d. 1393), daughter of Peter the Cruel, king of Castile, he was appointed one of the English lieutenants in Brittany, whither he led an army in 1375. A second campaign in Brittany was followed in 1381 by an expedition under his leadership to aid Ferdinand, king of Portugal, against John I., king of Castile; but Edmund shortly returned to England as Ferdinand had concluded an independent peace with John. Accompanying Richard II. on his march into Scotland, he was created duke of York in Aug. 1385, and subsequently on three occasions acted as regent of England. He held a parliament in 1395, and he was again serving as regent when Henry of Lancaster landed in England in 1399. After a feeble attempt to defend the interests of the absent king, York joined the victorious invader; but soon retired from public life. He died at King's Langley on Aug. 1, 1402.

YORK, EDWARD, DUKE OF (*c.* 1373–1415), elder son of the preceding (Edmund of Langley), was created earl of Rutland in 1390. Being a friend of his cousin, Richard II., he became admiral of the fleet, constable of the tower of London and warden of the Cinque Ports. He accompanied the king to Ireland in 1394 and was made earl of Cork; arranged Richard's marriage with Isabella, daughter of Charles VI. of France; and was one of the king's best helpers in the proceedings against the "lords appellant" in 1397. He became constable of England and obtained the lands in Holderness previously belonging to Thomas of Woodstock, duke of Gloucester, together with other estates and the title of duke of Aumerle or Albemarle. He deserted Richard in 1399, but only at the last moment; and in Henry IV.'s first parliament he was denounced as the murderer of Gloucester. He was reduced to his former rank as earl of Rutland, and deprived of his recent acquisitions of land. It is uncertain what share Rutland had in the conspiracy against Henry IV. in Jan. 1400, but he was probably not seriously involved. He served as royal lieutenant in Aquitaine and in Wales, and became duke of York on his father's death in 1402. He was concerned in the scheme, concocted in 1405 by his sister, Constance, for seizing the young earl of March, and his brother Roger Mortimer, and carrying them into Wales, and he was imprisoned in Pevensey castle. Released a few months later, he was restored to the privy council and regained his estates. York led one division of the English army at Agincourt, where, on Oct. 25, 1415, he was killed by "much hete and thronggid." He was buried in Fotheringhay church.

YORK, FREDERICK AUGUSTUS, DUKE OF (1763–1827), second son of George III., was born at St. James's Palace on Aug. 16, 1763. At the age of six months his father secured his election to the rich bishopric of Osnabrück. He became a knight of the Bath in 1767, a K.G. in 1771, and was gazetted colonel in 1780. From 1781 to 1787 he lived in Germany. He was appointed colonel of the 2nd horse grenadier guards in 1782, and promoted major-general and appointed colonel of the Coldstream Guards in 1784.

He was created duke of York and Albany and earl of Ulster in 1784, but retained the bishopric of Osnabrück until 1803. On his return to England he took his seat in the House of Lords, where, on Dec. 15, 1788, he opposed Pitt's Regency bill in a speech which was supposed to have been inspired by the prince of Wales. A duel fought on Wimbledon Common with Colonel Lennox, afterwards duke of Richmond, served to increase the duke of York's popularity. In 1791 he married Princess Frederica (b. 1767), daughter of Frederick William II. of Prussia. The princess was enthusiastically received in London, but the marriage was not happy, and a separation soon took place; the princess retired to Oatlands Park, Weybridge, where she died on Aug. 6, 1820.

In 1793 the duke of York was sent to Flanders in command

of the English contingent of Coburg's army. (*See* FRENCH REVOLUTIONARY WARS.) On his return in 1795 the king promoted him field-marshal, and on April 3, 1798, commander-in-chief. He then led the army sent to invade Holland in conjunction with a Russian *corps d'armée* in 1799. From the time of the duke's arrival with the main body of the army, disaster followed disaster until, on Oct. 17, the duke signed the convention of Alkmaar, by which the allied expedition withdrew after giving up its prisoners. Although unsuccessful as commander of a field army the duke devoted himself with the greatest vigour and success to reforms at home until his enforced retirement from the office of commander-in-chief on March 18, 1809. In the proceedings for bribery in connection with Mary Anne Clarke (*q.v.*) the duke was acquitted of having received bribes himself by 278 votes to 196. In May 1811, he was again placed at the head of the army by the prince regent, and rendered valuable services. He died on Jan. 5, 1827, and was buried at St. George's Chapel, Windsor.

A firm friendship existed between the duke and his elder brother, afterwards George IV., and he was also his father's favourite son. He founded the Duke of York's school for the sons of soldiers at Chelsea, and his name is also commemorated by the Duke of York's column in Waterloo place, London.

YORK, RICHARD, DUKE OF (1411–1460), was born on Sept. 21, 1411, the son of Richard, earl of Cambridge. He became duke of York in 1415, and on the death of Edmund Mortimer in 1425 he represented in the female line the elder branch of the royal family. He had been kindly treated by Henry V., and his name appears at the head of the knights made by Henry VI. at Leicester on May 19, 1426. York served in France (1430–31), and in 1432 he obtained livery of his lands and went over to Ireland to take possession of his estates there. In Jan. 1436 he was appointed lieutenant-general of France and Normandy. He showed vigour and capacity, and recovered Fécamp and other places in Normandy. He was not supported cordially by the home Government, and in 1437 applied to be recalled. York returned to England in the autumn of 1437. From this time he attached himself to Humphrey of Gloucester's party, in opposition to the Government under Cardinal Beaufort. By his marriage in 1438 to Cicely, sister of the earl of Salisbury, he allied himself to the rising family of the Nevilles. On July 2, 1440, York was again appointed to the French command. His previous experience made him stipulate for full powers and a sufficient revenue. He did not go to Rouen till June 1441. During his second governorship York maintained the English position in Normandy. Hampered by his political opponents at home, he was recalled in 1446 on the pretext that his term of office had expired.

The death of Humphrey of Gloucester in 1447 made York the first prince of the blood. Suffolk, now Henry's chief minister, found a convenient banishment for a dangerous rival by appointing York to be lieutenant of Ireland for ten years (Dec. 9, 1447). York, however, put off his departure for 18 months.

During his absence Jack Cade's rebellion occurred. In Sept. 1450 York landed in Wales, came to London with an armed retinue and forced himself into the king's presence. He declared that he desired only justice and good government. He took part in the punishment of Cade's supporters, and discountenanced a proposal in parliament that he should be declared heir to the crown. In March 1452 he came once more in arms to London, and endeavoured to obtain Somerset's dismissal. On a promise that his rival should be held in custody he disbanded his men, and, thus outwitted, found himself virtually a prisoner. However, a nominal agreement was concluded, and York accepted the king's pardon. The situation was changed by the birth of a prince of Wales and the king's illness in Oct. 1453. York secured his recognition as protector on March 27, 1454. But at the end of the year the king's sudden recovery brought York's protectorate to an end.

When it was clear that the queen and Somerset would proceed to extremities, York and his friends took up arms in self-defence. Even when the two armies met at St. Albans, York endeavoured to treat for settlement. The issue was decided by the defeat and death of Somerset on May 22, 1455. York used his success with moderation. He became constable of England, and his friends obtained office. This was no more than a change of ministers. But a return of the king's illness in Oct. 1455 made York again for a brief space protector. Henry recovered in Feb. 1456, and at Coventry, in October, the Yorkist officials were displaced. Still there was no open breach. York would not again accept honourable banishment to Ireland, but made no move till the queen's preparations forced him to act. In Sept. 1459 both parties were once more in arms. York protested that he acted only in self-defence, but the desertion of his best soldiers at Ludlow on Oct. 12 left him helpless. With a few followers he escaped to Ireland, where his position as lord-lieutenant was confirmed by an Irish parliament, and he ruled in full defiance of the English government. In March 1460 the earl of Warwick came from Calais to concert plans with his leader. York landed in England on Sept. 8, and marched on London. On reaching Westminster, he took up his residence in the royal palace, and formally asserted his claim to the throne in parliament. A compromise was arranged; Henry was to retain the crown for life, but Richard was to succeed him. On Nov. 8, he was accordingly proclaimed heir-apparent and protector. Early in December, Richard went north with a small force. On Dec. 30, he was hemmed in by a force of Lancastrians at Wakefield. Declaring that he had never kept castle in the face of the enemy, Richard rashly offered battle, and was defeated and slain. His enemies had his head cut off, and set it up on the walls of York adorned with a paper crown.

Richard of York was not a great statesman, but he had qualities of restraint and moderation, and might have made a good king. He had four daughters and four sons. Edmund, earl of Rutland, his second son, was killed at Wakefield. The other three were Edward IV., George, duke of Clarence, and Richard III.

C. L. Kingsford, 1905); J. S. Stevenson's *Wars of the English in France* (Rolls Series). The French chronicles of Matthieu d'Escouchy, T. Basin and Jehan Waurin should also be consulted (these three are published by the *Société de l'Histoire de France*). For modern accounts *see* especially Sir James Ramsay's *Lancaster and York,* and *The Political History of England,* vol. iv., by Professor C. Oman.

YORK, a county and parliamentary borough, archiepiscopal city, county town of Yorkshire and county in itself, on the L.N.E.R. and Derwent Valley light railway, 188 m. N.W. of London. Pop. (1921) 84,039. It is situated in the low lying vale of York at the junction of the Ouse with the Foss. It lies at the crossing of the two most important natural routes of the region, the north-south waterway formed by the Ouse and the east-west landway on the York moraine ridge through which the river has cut a gap. The town is thus well above flood level, and at the head of the tidal part of the Ouse before the regulation of the river in the 18th century. The tides are now felt 7 m. down-stream from York.

York may have been a British settlement. As Eboracum or Eburacum it was the military capital of Roman Britain, the fortress of Legio IX. and later of Legio VI. Victrix being situated near the site of the cathedral on the defensive land between the Ouse and the Foss; a municipality (*colonia*) grew up on the opposite side of the Ouse. The emperor Hadrian visited York in 120 and, according to tradition, the body of the emperor Severus who died there in 211 was burnt on Severus hill near the city. After the death of Constantinus Chlorus, which also took place in York, his son, Constantine the Great, was inaugurated emperor there. In 314, a bishop of York is mentioned together with, and with precedence of, a bishop of London, as present at the council of Arles. Nothing is known of the history of the city from the time the Romans withdrew from Britain in 410 until 627 when King Edwin was baptized there; shortly afterwards, Paulinus, the first archbishop, was consecrated. York became the capital of the Angle kingdom of Northumbria and when in the 7th century, Britain was divided into two archiepiscopal provinces, York was made the capital of the northerly one, and still remains the ecclesiastical capital of the northern province which now does not include Scotland. In the years 732 to 766, York became one of the most celebrated places of education in Europe. The Danish kingdom of York was formed from that part of Angle Northum-

bria to the south of the Tees and later, when the country was organized into shires by the West Saxon kings, the remoteness of this region hindered organization which was possible in the south and it became first a vassal state and later one shire. The city was taken by Harold Hardrada in 1066. The fortress built there by William the Conqueror in 1068 was stormed by the men of the north of England who put to death the whole of the Norman garrison. In revenge, the Conqueror burnt the town and laid waste the country between the Humber and the Tees. York was an important calling place on the route to Scotland and several parliaments were held there by the English kings, the first being that of 1175, when Malcolm, king of Scotland, did homage to Henry II. The Council of the North was established in York in 1537 after the suppression of the Pilgrimage of Grace. During the Civil War, York was garrisoned by Royalists. It was besieged by parliament in 1642 and surrendered after Marston Moor.

York is not mentioned in Domesday survey. The first charter, which is undated, was given by Henry II. granting the citizens a merchant guild and all the free customs which they had in the time of Henry I. In 1194 Richard I. granted exemption from toll throughout the kingdom and in 1200 King John confirmed the preceding charters and in 1212 granted the city to the citizens at a fee-farm of £160 a year. Richard II. conferred the title of lord mayor and in 1396 the city was made a county of itself and the burgesses were given power to elect two sheriffs. The town was incorporated in 1464, and in 1473 the citizens were directed to choose a mayor from among the aldermen. As this led to constant disputes, Henry VII. arranged that a common council, consisting of two men from each of the more important gilds and one from each of the less important ones, should elect the mayor. The city is now governed under a charter of Charles II. confirming that of 1464. It has been represented in parliament since 1295.

Numerous remains of Roman occupation have been found, including the Multangular tower whose base is of mingled stone and brick work. It was at the western corner of the fortress and formed part of the reconstruction of Constantine in about 300. In 1925 a systematic excavation was undertaken at the eastern corner of the fortress, which had been covered by a mound since Norman times. It proved to be of older date, the earliest finds dating back probably to 71. This corner formed probably the earliest building of the fortress and around it was placed a rampart of clay, surrounded by a wooden palisade. Remains of the clay rampart and some of the post holes of the palisade have been found and in the basement chamber of the corner tower part of the rampart is still visible. The fortress was first girded with a stone wall in about 105–108 and a fragment of this may be seen. There was possibly some reconstruction in 120. In 180 a great rising against the Romans took place in the north and amongst other forts York suffered. Great damage was done at the east corner and the old wall had to be rebuilt. Excavations also show that towers were built along the wall, probably at intervals of 45 yards. Remains of a Roman gateway have been found in the north-east rampart.

The cathedral of St. Peter, commonly known as the Minster, is in the form of a Latin cross, consisting of nave with aisles, transepts, choir with aisles, a central tower and two west towers. It occupies the site of the wooden church in which King Edwin was baptized by Paulinus on Easter Day 627. Following his baptism, Edwin began to build a church in stone, but it was partly destroyed during the troubles which followed his death. It was repaired but suffered from fire in 741. At the time of the Norman invasion the Saxon cathedral with the archbishop's library, perished in the fire by which the greater part of the city was destroyed, the only relic remaining being the central wall of the crypt. It was reconstructed in 1070–1100, but of this building few portions remain. The apsidal choir and crypt were rebuilt in 1154–81, the south transept in 1216–55, and the north transept and central tower in 1228–56. With the exception of the crypt the early English transepts are the oldest portions of the building now remaining. The south transept is the richest and most elaborate in its details, one of its principal features being the magnificent rose window; the north transept contains a famous series of lancet windows called the "Five Sisters," with specially fine glass. The foundation of the new nave was laid in the last years of the 13th century and the work was completed about 1340; the chapter house was built about the same period. The Lady chapel and presbytery were begun in the early Perpendicular style in 1361. The rebuilding of the choir was begun at the same period, but was not completed until about 1400. It is late Perpendicular, with a very fine great east window. During this rebuilding, the whole of the ancient Norman edifice was removed and the only Norman architecture now remaining is the east portion of the crypt of the second period. To correspond with the later alterations the central tower was recased and changed into a Perpendicular lantern tower in 1444. The south-west tower was begun in 1432, and the north-west tower in 1470, and with the erection of this tower, the church was completed as it now stands; it was reconsecrated on Feb. 3, 1472. The woodwork of the choir was burnt in 1829 and in 1840 the south-west tower was reduced to a mere shell by fire.

The stained glass, both in the cathedral and in other churches of the city, is famous; its survival may be traced to the stipulation made by the citizens, when surrendering to parliament in the Civil War, that it should not be damaged. During the World War, the fall of German aircraft bombs in the vicinity of the Minster made it advisable to remove some of the most precious mediaeval glass to a position of safety. It was then found that owing to the corrosive effect of the atmosphere, it was necessary to clean each quarry, and lead lights in many instances replace stone mullions. About three-fifths of the work has been completed, including that on the "Five Sisters" window, the cost of which was borne by the women of the country as a national memorial to the women of the empire who gave their lives in the World War.

St. Mary's abbey situated in the present museum gardens was founded for Benedictines in 1078; its head ranked as a mitred abbot with a seat in parliament. The principal remains of the abbey are the north wall and the ruins of the church in Early English and Decorated styles, and the principal gateway with a Norman arch. They lie outside the walls near the cathedral. The hospitium, built in the 14th and 15th centuries with its upper part of wood, houses the collection of Roman antiquities.

York also possesses a large number of churches of special architectural interest including All Saints, North street, Early English, Decorated and Perpendicular, with a spire 120 ft. in height; Christ church with south door in Decorated style, supposed to occupy the site of the old Roman palace; Holy Trinity, in Goodramgate, Decorated and Perpendicular, with Perpendicular tower; Holy Trinity, Micklegate, formerly a priory church, now restored, showing Roman masonry in its walls; St. Denis, Walmgate, with rich Norman doorway and Norman tower arches; St. Helen's, St. Helen's square, chiefly Decorated; St. John's, North street, chiefly Perpendicular; St. Margaret's, Walmgate, celebrated for its curiously sculptured Norman porch and doorway; St. Mary the Elder, Bishophill, Early English and Decorated, with brick tower, rebuilt in 1659; St. Mary the Younger, Bishophill, with a square tower in the Saxon style, rebuilt probably in the 13th century; St. Mary, Castlegate with Perpendicular tower and spire 154 ft. in height, the body of the church dating back to transitional Norman times; St. Michael-le-Belfry, founded in 1066, but rebuilt in 1538 in late Perpendicular style; St. Martin's-le-Grand, fine Perpendicular; and St. Martin's-cum-Gregory, Early English and Perpendicular.

The ancient city is enclosed by walls dating in part from Norman times, but they are, in the main, of the 14th century. Their circuit is a little over 2½ m. and the area enclosed is divided by the river Ouse, the larger part lying on the left bank. On the east for a short distance the Foss takes the place of a wall. The walls are pierced by four principal gates or bars. On the south-west is Micklegate bar, a square tower built over a circular, probably Norman, arch, and with embattled corner turrets on which the heads of traitors were formerly exposed. Bootham bar, the main entrance from the north also has a Norman arch.

Monk bar on the north-east was formerly called Goodramgate, but was renamed in honour of General Monk. Malmgate bar retains the barbican which was repaired in 1648.

Of the castle built by the Conqueror, in 1068, in the angle between the Ouse and the Foss, some portions were probably incorporated in Clifford's tower, the shell of which, showing an unusual ground plan of four intersecting circles, rises from an artificial mound. To-day, the castle serves as the prison and county courts.

St. William's college, near the Minster, was founded in 1453 as a college for priests holding chantries in the Minster; its restoration as a church house and meeting place for Convocation was undertaken in 1906. Restoration of the Merchant Adventurers hall, a mediaeval building with half-timbered work has been in progress for some years.

The county borough was created in 1888. The division of Yorkshire into three separate administrative and registration counties has deprived York of its position as a civil capital. The municipal city and the Ainsty (a district on the south-west included in the city bounds in 1449) are, for parliamentary purposes, included in the North Riding; for registration purposes in the East Riding; and for all other purposes in the West Riding. The parliamentary borough extends into the East Riding. York is the garrison town and headquarters of the northern command.

YORK, a town of York county, Maine, U.S.A., on the Atlantic coast, 45 m. S.W. of Portland; served by motor-bus lines connecting with the Boston and Maine railroad. Pop. (1920) 2,727. The town has an area of 64 sq.m., embracing the widely known summer resorts of York Beach and York Harbor and several other villages. The first settlement was made about 1624. In 1641 Sir Ferdinando Gorges made it the borough of Agamenticus, which in 1642 he chartered as the city of Gorgeana. In 1652, when Massachusetts extended her jurisdiction over Maine, it became the town of York. In 1692 most of the houses were destroyed by Indians and the inhabitants killed or taken captive. York was the shire-town of Yorkshire from 1716 to 1735; of the district of Maine from 1735 to 1760 (together with Falmouth, now Portland); and a county seat of York county from 1760 to 1832. In the 18th century York had a considerable trade with the West Indies and along the coast, and as late as the middle of the 19th century it had important fishing interests. Development as a summer resort began about 1873.

YORK, a city of south-eastern Pennsylvania, U.S.A., the county seat of York county; on Federal highways 30 (the Lincoln) and 111, 90 m. W. of Philadelphia and 28 m. S. by E. of Harrisburg. It is served by the Maryland and Pennsylvania, the Pennsylvania and the Western Maryland railways. Pop. (1920) 47,512 (94% native white); 1928 local estimate (including contiguous boroughs) 70,000. The city's area of 3·5 sq.m. is built up closely and there are populous industrial districts just outside the corporate limits in several directions. The streets in the central part of the city (laid out in 1741 in a bend of Codorus creek, by a surveyor for the Penns) bear such names as King, Queen, Duke, Princess and George, and the city itself was named after the English York. Penn common was set aside for the public in the original plan. The Quaker meeting house was erected in 1765, and there are several old burying grounds. The building used by Gen. Wayne for his headquarters while recruiting his brigade for the march on Yorktown still stands, in the heart of the city, and in Farquhar park there is a copy of the Provincial court house in which the Continental Congress held its sessions. The city's assessed valuation for 1927 was $52,109,350. Since 1912 it has had a commission form of government. York is the commercial centre of a rich agricultural region, and it has many large and diversified manufacturing industries. There are some 325 plants in the city and its immediate suburbs, with an annual output valued at $90,000,000. Bank debits in 1927 aggregated $282,610,000.

York was the first permanent settlement in Pennsylvania west of the Susquehanna. It was laid out in 1741 in the centre of Springettsbury manor, a tract of 64,000 ac. granted to Springett Penn (a grandson of William Penn) in 1722. The first settlers were chiefly Germans from the Rhenish Palatinate (Lutherans, Reformed, Mennonites and Moravians), with some English Quakers and Scotch-Irish. The village was on the Monocacy road, the main route to the South and the South-west, and grew rapidly. When York county was erected in 1749 it was made the county seat, and by 1754 it had 210 houses and a thousand inhabitants. In 1777, when the British approached Philadelphia, the Continental Congress left the city, and after holding one day's session in Lancaster, crossed the Susquehanna to York and made it the national capital from Sept. 30, 1777, to June 27, 1778. In the old county court-house (built 1754–56 and torn down in 1849) the Congress passed the Articles of Confederation, received the news of Burgoyne's surrender, issued the first national Thanksgiving proclamation, received word from Franklin in Paris that France would aid with money, ships and men, received Von Steuben and Lafayette and commissioned them as major-generals. It was in York that the Conway Cabal was frustrated by Lafayette. Here $1,500,000 in silver, lent by France, was brought in Sept. 1778, and here Benjamin Franklin's printing press, moved from Philadelphia, issued $10,000,000 of Continental money. During the Civil War Confederate troops entered the town on June 28, 1863, and a small Federal force retreated before them. York was incorporated as a borough in 1787 and as a city in 1887.

YORKE, CHARLES (1722–1770), English lord chancellor, second son of Philip Yorke, was born in London on Dec. 30, 1722, and was educated at Corpus Christi college, Cambridge. In 1745 he published a treatise on the law of forfeiture for high treason; in 1746 he was called to the bar. Yorke obtained a sinecure appointment in the Court of Chancery in 1747, and became M.P. for Reigate. In 1751 he became counsel to the East India Company, and in 1756 solicitor-general. He resigned with Pitt in 1761, but in 1762–3 was attorney-general under Lord Bute. Resisting Pitt's attempt to draw him into alliance against the ministry he had quitted, Yorke maintained that parliamentary privilege did not extend to cases of libel; though he agreed with Pitt in condemning the principle of general warrants. Yorke became recorder of Dover in 1764, and in 1765 again became attorney-general in the Rockingham administration. He supported the repeal of the Stamp Act, while urging the simultaneous passing of the Declaratory Act. He drew up the constitution for Quebec. In 1767, Yorke resigned office. In 1770 he was invited by the duke of Grafton to take Camden's seat on the woolsack, but was pledged not to take office with Grafton. However, Yorke yielded to the king's entreaty, met the leaders of the Opposition on Jan. 17, and, overwhelmed with shame, fled to his own house, where he died on Jan. 20. The patent raising him to the peerage as Baron Morden had been made out, but his last act was to refuse his sanction to the sealing of the document.

YORKSHIRE, a north-eastern county of England, bounded by Durham, the North sea, the Humber estuary (separating it from Lincolnshire), Nottinghamshire, Derbyshire, Cheshire, Lancashire and Westmorland. It is the largest county in England, having an area of 6,046·3 sq.m. (exclusive of water) and being more than double the size of Lincolnshire, which ranks next to it. In a description of the county it is constantly necessary to refer to its three great divisions, the North Riding, East Riding and West Riding. (*See* map of ENGLAND, Sections I., II.)

Physical Features.—The county of Yorkshire can be divided into four upland tracts separated by lowland areas. These lie in the south-west, north-west, north-east and south-east quadrants of the county respectively. The great Yorkshire plain, drained by the Yorkshire Ouse (*q.v.*), stretches from the river Tees, which forms the northern boundary of the county, through the Vale of Mowbray, Vale of York and Vale of Ouse to the Trent basin in

the south. The Ouse divides the county into an eastern and a western division; whilst the "Aire Gap" separates the north Pennine moors from the south Pennine moors, and on the eastern side the Vale of Pickering separates the north Yorkshire moors from the Yorkshire Wolds. The north Pennine moors, which stretch northwards beyond the limits of the county, form a high moorland tract of Carboniferous limestone and Yoredale beds capped by millstone grit. The rocks have a very small dip eastward but are fractured by a series of faults, the most important being the Craven faults from Kirkby Lonsdale by Ingleton, Stainforth and Linton. There are also inliers of Ordovician and Silurian rocks at Horton and at Sedbergh.

The chief valleys are Teesdale, Swaledale, Wensleydale, Nidderdale, Wharfedale and Airedale. The chief peaks are Mickle Fell (2,591 ft.), Whernside (2,414 ft.), Ingleborough (2,373 ft.), Buckden Pike (2,302 ft.) and Penyghent (2,273 ft.). The "Aire Gap," which forms the gateway between north Lancashire and Yorkshire, has been followed by roads, railways and canals. The south Pennine moors are formed of millstone grit, which has been arched upwards approximately along the county boundary and the coal measures are preserved along the eastern and western flanks. The uplands are bleak grouse moors in which the feeders of the rivers Aire, Calder and Don, have carved out valleys across the northern portion of the Yorkshire, Derby and Notts coalfield. Between the Yorkshire plain and the Pennines there is a belt of magnesian limestone, which, lying across various members of the Carboniferous, forms a well marked scarp-face toward them in the southern half of the county. The country along this belt forms a marked contrast with the districts of Palaeozoic rocks on the west, for the limestone produces a rich soil, the effect of which is seen in a luxuriant vegetation.

On the south the alluvium-filled Vale of Pickering marks the site of an ancient lake and the river Derwent, which drains the vale, has broken its way through the Jurassic ridge of the Howardian hills to reach the Vale of York. In this south-eastern quadrant the chalk forms the Yorkshire Wolds and has a general dip towards the south-east thus forming scarp edges from Flamborough Head, along the south side of the Vale of Pickering and sweeping round in a broad arc toward Market Weighton. This ridge of higher ground is continued southward across the Humber into the Lincolnshire Wolds. The north Yorkshire moors rise immediately from the coast and form cliffs for the most part, whilst to the south of Flamborough Head the cliffs disappear beneath the low-lying drift-covered Holderness. There are several watering-places along the coast; the principal are Redcar, Saltburn-by-the-Sea, Whitby, Robin Hood's bay, Scarborough, Filey, Bridlington and Hornsea. There are numerous mineral springs in Yorkshire, the principal being at Harrogate.

Minerals.—The coal-field in the West Riding is one of the chief sources of mineral wealth in Yorkshire, the most valuable seams being the silkstone, which is bituminous and of the highest reputation as a house coal, and the Barnsley thick coal, the great seam of the Yorkshire coal-field, which is of special value, on account of its semi-anthracitic quality, for iron-smelting and engine furnaces. Associated with the upper coal measures are iron-ores, occurring in the form of nodules. Brick-clay, pottery-clay and fire-clay are also raised, as well as gannister and oil-shale. Middlesbrough is the most important centre of pig-iron manufacture in the kingdom. Lead-ore occurs in the Yoredale beds of the north Pennine moors, and flagstones are quarried in the Yoredale rocks. In the millstone grit there are several beds of good building stone, but that most largely quarried is the magnesian limestone of the Permian series.

Archaeology.—In spite of the importance of the Creswell caves in Derbyshire for Palaeolithic remains, Yorkshire has very little to show until the end of that stage, and remains which belong typologically to this period may actually date from a considerably later period. In this connection we note objects from the Victoria cave, Settle, and from Holderness. Petch has made special studies of the pigmy flints of south Yorkshire and has found large numbers of sites all above the 1,000 ft. contour line. (*See* J. A. Petch, *Early Man in the District of Huddersfield* [Huddersfield, 1924].) Implements of Late Neolithic type are found almost all over the county, and such implements, made of finely chipped flints, are especially characteristic of the district behind Scarborough and the Yorkshire Wolds, which henceforth stands out as an especially important region in prehistoric times. The Yorkshire Wolds are one of the chief regions of Britain for round barrows and Beaker pottery, while remains of the Bronze age abound both here and in the Aire gap. The north Yorkshire moors are in process of detailed study by Elgee. On the moors above Ilkley are interesting traces of an apparently megalithic culture, with large stones decorated with cup and ring markings, supposed swastikas, etc. Three decorated chalk drums from Folkton Wold are important, showing southern and probably Iberian influence. Jet ornaments are another feature. The rarity of Bronze age finds in the central Ouse basin is a noteworthy feature. The Yorkshire Wolds yield abundant evidences of early Iron age finds, and important settlements have been located near Arras and Hessleskar farms, 3 m. E. of Market Weighton. The finds in these regions show affinities with those of the period on the English plain and in north-eastern Gaul.

History.—By Roman times the Vale of York had become important and carried the north road. From Lindum (Lincoln) the main road ran north-west to Danum (Doncaster) and thence to Legiolium and Calcaria (Tadcaster), thence branching off to Eburacum (York, *q.v.*), the Roman capital of the north. The main road continued through the Vale of York from Calcaria past Isurium to Cataractorium (Catterick Bridge) and thence over the Tees to the north.

In the 6th century, an Anglian tribe having seized the promontory at the mouth of the Humber, named by the invaders Holderness, gradually subjugated the East Riding. The earliest settlements were chiefly confined to the rich valley of the lower Derwent, but the district around Weighton became the sacred ground of the kingdom which was named Deira, and Goodmanham is said to mark the site of a temple. Ella, the first king of Deira, extended his territory north to the Wear, and his son Edwin completed the conquest of the district which was to become Yorkshire. Traces of the "burhs" by which Edwin secured his conquests are perhaps visible in the group of earthworks at Barwick and on the site of Cambodunum, but the district long remained scantily populated. The defeat of Edwin at Hatfield in 633 was followed by a succession of struggles between Mercia and Northumbria for the supremacy over Deira. After the Danish conquest of Deira, Guthrum in 875 portioned the district among his followers, under whose lordship the English retained their lands. Cleveland came under Scandinavian influence, and the division into tithings probably originated about this date, the boundaries being arranged to meet at York, the administrative centre which, by A.D. 1000, had a population of over 30,000. At the battle of Stamford Bridge in 1066 Harold Hardrada, who had seized York, and Earl Tosti were defeated and slain by Harold of England.

For many years after the harrying of the country by the Conqueror all the towns between York and Durham lay uninhabited. In 1138 David of Scotland was defeated near Northallerton in the battle of the Standard. In the barons' wars of the reign of Henry II. Thirsk and Malgeard castles were captured and demolished. Robert Bruce in 1318 destroyed Northallerton, Boroughbridge, Scarborough and Skipton. In 1322 at the battle of Boroughbridge, the rebel barons were defeated by the forces of Edward II. In 1399 Richard II. was murdered in Pontefract castle. In 1408 the rebel forces of the earl of Northumberland were defeated at Bramham moor near Tadcaster. In 1453 a skirmish at Stamford Bridge was the opening event in the struggle between the houses of York and Lancaster; in 1460 the duke of York was defeated and slain at Wakefield; in 1461 the Lancastrians were defeated at Towton. The suppression of the monasteries roused deep resentment in Yorkshire, and the inhabitants flocked to join the Pilgrimage of Grace. On the outbreak of the Civil War of the 17th century, opinion was divided in Yorkshire. Sir William Savile captured Leeds and Wakefield for the king in 1642, and in 1643 Newcastle, having defeated the Fairfaxes at Adwalton moor, held all Yorkshire except Hull. In 1644, how-

ever, the Fairfaxes secured the East and West Ridings, while Cromwell's victory at Marston moor was followed by the capture of York, and in the next year of Pontefract and Scarborough.

On the redistribution of estates after the Norman Conquest, Alan of Brittany, founder of Richmond castle, received the honour of Richmond, and Ilbert de Laci the honour of Pontefract. Earl Harold's estate at Coningsburgh passed to William de Warenne, earl of Surrey, together with Sandal castle, which in the 14th century was bestowed on Edmund Langley, duke of York. Other Domesday landholders were William de Percy, founder of the abbey of Whitby; Robert de Bruce, ancestor of the royal line in Scotland; Roger de Busli; the archbishop of York enjoyed the great lordship of Sherburn, and Howdenshire was a liberty of the bishop of Durham.

The shire court for Yorkshire was held at York, but extensive privileges were enjoyed at various times by the great landowners. In the 13th century the diocese of York included in this county the archdeaconries of York, Cleveland, East Riding and Richmond. In 1541 the deaneries of Richmond were transferred to Henry VIII.'s new diocese of Chester. Ripon was created an episcopal see by act of parliament in 1836, and the deaneries of Craven and Pontefract were formed into the archdeaconry of Craven within its jurisdiction, together with the archdeaconry of Richmond. The archdeaconry of Sheffield was created in 1884. In 1888 the area of the diocese of Ripon was reduced by the creation of the see of Wakefield, including the archdeaconry of Halifax and the archdeaconry of Huddersfield. The diocese of Ripon now includes in this county the archdeaconries of Craven, Richmond and Ripon. The diocese of York includes the archdeaconries of York, East Riding and Cleveland. Between 1913 and 1919 the bishoprics of Sheffield and Bradford were created.

The woollen industry began after the Conquest, and historical details may be found under LEEDS, BRADFORD, etc. The time of the American War marked the gradual absorption by Yorkshire of the clothing trade from the eastern counties. Coal appears to have been used in Yorkshire by the Romans, and was dug at Leeds in the 13th century. The early fame of Sheffield as the centre of the cutlery and iron trade is demonstrated by a line in Chaucer. In the 13th century forges are mentioned at Rosedale and at Gisburn. In the 16th century limestone was dug in many parts of Elmet, and Huddlestone, Hesselwood and Tadcaster had famous quarries; Pontefract was famous for its liquorice, Aberford for its pins, Whitby for its jet. Alum was dug at Guisborough, Sandsend, Dunsley and Whitby in the 17th century. Bolton market was an important distributive centre in the 17th century, and in 1787 there were 11 cotton mills in the county.

Architecture.—Of ancient castles Yorkshire retains many interesting examples. The fine ruins at Knaresborough, Pickering, Pontefract, Richmond, Scarborough and Skipton are described under their respective headings. Barden tower, picturesquely situated in upper Wharfedale, was built by Henry de Clifford (d. 1523). Bolton castle, which rises above Wensleydale, is a square building with towers, erected in the reign of Richard II. by Richard Scrope; it was rendered untenable in 1647. Of Bowes castle near Barnard castle, there remains only the square keep. Cawood castle, near Selby, retains its gateway tower erected in the reign of Henry VI. Conisborough castle stands by the Don between Rotherham and Doncaster. The ruins of Danby castle are of various dates. Harewood castle in lower Wharfedale contains no portions earlier than the reign of Edward III. The keep of Helmsley castle was built late in the 12th century. Other remains are:—The fortress of Middleham, Mulgraves castle, Ravensworth castle, Sheriff Hutton castle, Spofforth castle, Tickhill castle, Whorlton castle, the fortress of Wressell, the mansions Gilling, Ripley, Skelton and the Elizabethan hall of Burton Agnes.

In ecclesiastical architecture Yorkshire is extraordinarily rich. At the time of the Dissolution there were 28 abbeys, 26 priories, 23 nunneries, 30 friaries, 13 cells, four commanderies of Knights Hospitallers and 4 preceptories of Knights Templars. The principal monastic ruins are described under separate headings and elsewhere. These are Bolton abbey (properly priory), a foundation of Augustinian canons; Fountains abbey, a Cistercian foundation, the finest and most complete of the ruined abbeys in England; the Cistercian abbey of Kirkstall near Leeds (*q.v.*); the Cistercian abbey of Rievaulx, and the Benedictine abbey of St. Mary, at York. Separate reference is also made to the ruins of Jervaulz (Cistercian) and Coverham (Premonstratensian) in Wensleydale, and to the remains at Bridlington, Guisborough, Malton, Whitby, Easby near Richmond, Kirkham near Malton, Monk Bretton near Barnsley, and Mount Grace near Northallerton. There are fine though scanty remains of Byland abbey, of Early English date, between Thirsk and Malton. There was a house of Premonstratensians at Egglestone above the Tees near Barnard castle. Other ruins are the Cistercian foundations at Meaux in Holderness, Roche, east of Rotherham, and Sawley in Ribblesdale; the Benedictine nunneries of Marrick, and Rosedale; and the Gilbertine house of Watton in Holderness.

Agriculture and Manufactures.—Nearly nine-tenths of the East Riding is under cultivation, but of the North and West Ridings only about three-fifths. The boulder-clay of Holderness forms the richest soil in Yorkshire, and the chalk wolds, by careful cultivation, form one of the best soils for grain crops. The central plains bear all kinds of crops excellently. Wheat is grown in the East and West Ridings, but oats are the principal crop in these ridings, whilst barley exceeds wheat in the East and North. The bulk of the acreage under green crops is devoted to turnips and swedes but potatoes form an important crop, especially in the West Riding. Liquorice is cultivated near Pontefract. The proportion of hill pasture is greatest in the North Riding and least in the East, and the North and West are amongst the principal sheep-farming districts in England.

The industrial district of south Yorkshire is situated on the northern half of the Yorkshire, Derby and Notts coal-field. The West Riding is the chief seat of the woollen manufacture of the United Kingdom, and has almost the monopoly in the production of worsted cloths. The early development of the industry was in part due to the rearing of sheep on the moors and to the abundance of water-power, while later the presence of coal further established it, but now most of the wool used is imported from abroad. The industry engages the most important towns. Almost every variety of woollen and worsted cloth is produced at Leeds; Bradford is especially concerned with yarns and mixed worsted goods; Dewsbury and Batley with shoddy; Huddersfield with fancy goods and Halifax with carpets. Linen is also manufactured at Leeds and Barnsley and the cotton industry has also penetrated to the neighbourhood of Halifax. The people of the industrial part of Yorkshire are noted for their singing, and choral societies are numerous. The woollen industry flourishes in the soft-water area and gives place to the iron-and-steel industry south of the Calder valley. Sheffield is especially famous for the finest grades of steel, for heavy machinery, hardware, fine metal-work, cutlery and plated-goods. The development of the iron ore deposits of Cleveland dates only from the middle of the 19th century. In addition to a large amount raised locally, the smelters of the Middlesbrough district import large quantities of ore from Sweden and Spain. The attendant industries such as the production of steel, shipbuilding, etc., also flourish. The chemical industry is important both here and in the West Riding where also a great variety of other industries has sprung up, such as the great leather industry at Leeds, the manufacture of clothing, printing and bleaching, and paper-making. Besides coal and iron ore, large quantities of clay, limestone and sandstone are raised. Excellent building-stone is obtained in the West Riding. The sea-fisheries are important, the chief fishing ports being Hull, Scarborough, Whitby and Filey. Leeds has become a great business centre and almost a metropolis for the woollen area of the West Riding.

Communications.—Two main lines traverse the county, the L.N.E. line from London, passing through Doncaster, Selby, York, Northallerton, to Durham and the north; the other, the L.M.S. line from London and Derby to Sheffield, Leeds, Skipton, Settle and on to Carlisle. In addition to these there is a perfect network of lines, the L.N.E. serving for the most part the north and east of Leeds and the L.M.S. the West Riding. The Pennines are crossed by the L.M.S. from Huddersfield to Manchester, Halifax

to Todmorden, as well as through the "Aire gap," and by the L.N.E. from Penistone to Manchester, Northallerton to Hawes Junction and across the north-west of the county from Barnard Castle to Kirkby Stephen. A complete system of canals links the centres of the southern West Riding, with the sea, east and west.

Population and Administration.—The area of the ancient county is 3,889,432 ac.; its population (1921) 4,182,529. The distribution of the population may be inferred from the following statement of the parliamentary divisions, parliamentary, county and municipal boroughs, and urban districts in the three ridings. It should be premised that each of the three ridings is a distinct administrative county though there is one high sheriff for the whole county. The city of York (pop. 84,039) is situated where the three ridings meet in the Ainsty of York, wholly outside the three ridings.

District	Parliamentary divisions, each returning one member	Parliamentary boroughs	Number of members returned by parliamentary boroughs	County boroughs	Municipal boroughs	Urban districts
York City	..	1	1	1	..	..
West Riding	19	10	24	10	10	114
East Riding	3	1	4	1	3	8
North Riding	4	1	2	1	3	14
Totals for County	26	13	31	13	16	136

The county and boroughs of Yorkshire return a total of 57 members to parliament. The West Riding has an area of 1,773,529 ac., with a population in 1921 of 3,181,174. Of this area the south industrial district, considered in the broadest sense as extending between Sheffield and Skipton, Sheffield and Doncaster, and Leeds and the county boundary, covers rather less than one half. The North Riding has an area of 1,362,058 ac., with a population (1921) 456,436. The East Riding has an area of 750,115 ac., with a population (1921) 460,880. The county is divided between the dioceses of York, Ripon and Wakefield, Sheffield, and Bradford with small parts in those of Manchester, Blackburn, Southwell, Durham and Lincoln. York is the seat of the northern archdiocese.

YORKSHIRE ELECTRIC POWER COMPANY. A group of men in the West Riding, interested in the woollen and colliery industries, promoted a bill in 1901 which incorporated The Yorkshire Electric Power company with an authorized share capital of £2,000,000. The concern was vested with powers of supplying over a large area in perpetuity and established a generating station near Dewsbury. A supply was made available in Dec. 1904, but for many years difficulties were experienced in consequence of the conservatism of manufacturers and the opposition of vested interests. During the war the company played an important part in the provision of munitions, the first shell-filling factory being supplied by them near Leeds.

The company's second generating station was established near Barnsley, where electricity is generated by means of surplus coke oven gas. A third station was put into commission in 1927 at Ferrybridge near Knottingley. It is of interest that the system of generation and supply adopted by the company in 1903, viz., 50 cycles, three-phase alternating current, has now become the British national standard.

A large number of collieries in the West Riding and many textile mills and engineering works are now supplied by the company, and in addition about 60 local authorities and other authorized distributors are taking a bulk supply for distribution in the towns and villages. This work has been greatly facilitated by an associated company, Electrical Distribution of Yorkshire, Ltd., formed in 1905. The original capital was increased in 1922 to £4,000,000, and in 1927 a further act was obtained authorizing a further £2,000,000. At the beginning of 1928 the capital expenditure of the company and its associated distribution company was over £5,500,000. (L. C. M.)

YORKTOWN, a town and the county seat of York county, Virginia, U.S.A., on the York river 10m. from its mouth, and about 60m. E.S.E. of Richmond. In 1920 the population of Nelson district, which includes Yorktown town, was 986. It is served by a steamship line, and about 6½m. distant is Lee Hall, a station on the Chesapeake and Ohio railway. Large deposits of marl near the town are used for the manufacture of cement. In the main street is the oldest custom-house in the United States, and the house of Thomas Nelson (1738–1789), a signer of the Declaration of Independence. In commemoration of the surrender of Lord Cornwallis in October 1781, there is a monument of Maine granite (100ft. 6in. high) designed by R. M. Hunt and J. Q. A. Ward; its cornerstone was laid in 1881 during the centennial celebration of the surrender, and it was completed in 1883. Yorktown was founded in 1691, as a port of entry for York county. It became the county seat in 1696, and although it never had more than about 200 houses its trade was considerable until it was ruined by the Revolutionary War. In that war the final victory of the Americans and their French allies took place at Yorktown.

Baffled by Gen. Nathanael Greene in his campaign in the Carolinas, his diminished force (fewer than 1,400) sadly in need of reinforcement, and persuaded that the more southern colonies could not be held until Virginia had been reduced, Lord Cornwallis marched out of Wilmington, N.C., on April 25, 1781, arrived at Petersburg, Va., on May 20, and there, with the troops which had been under William Phillips and Benedict Arnold and with further reinforcements from New York, raised his army to more than 7,000 men. Facing him in Richmond was Lafayette, whom Washington had sent earlier in the year with a small force of light infantry to check Arnold, and who had now been placed in command of all the American troops in Virginia. Cornwallis's first attempt was to prevent the union of Lafayette and Gen. Anthony Wayne. Failing in this, he retired down the James in the hope, it is thought, of receiving reinforcements from Gen. Henry Clinton. While Cornwallis was marching from N. Carolina to Virginia, Washington learned that a large French fleet under De Grasse was to come up from the West Indies in the summer and for a brief period co-operate with the American and French armies. At a conference on May 21 at Wethersfield, Conn., with the French commanders, Washington favoured a plan for a joint attack on New York when De Grasse should arrive. An attack on the British in Virginia was, however, considered. The minutes of the conference with some suggestions from Rochambeau having been sent to De Grasse, he announced in a letter received on Aug. 14 that he would sail for the Chesapeake for united action against Cornwallis. About the same time Washington learned from Lafayette that Cornwallis was fortifying Yorktown. Sir Samuel Hood with 14 ships-of-the-line arrived at the Chesapeake from the West Indies three days ahead of De Grasse, and proceeding to New York warned Admiral Thomas Graves of the danger. Graves took command of the combined fleet, 19 ships-of-the-line, and on Aug. 31 sailed for the Chesapeake in the hope of preventing the union of the French fleet from Newport, under Count de Barras, with that under De Grasse. He arrived at the Chesapeake ahead of De Barras, but after an encounter with De Grasse alone (September 5), who had 24 ships-of-the-line, he was obliged to return to New York to refit, and the French were left in control of the coast. Leaving only about 4,000 men to guard the forts on the Hudson, Washington set out for Virginia with the remainder of his army immediately after learning of De Grasse's plan, and the French land forces followed. The allied army was transported by water from the head of the Chesapeake to the vicinity of Williamsburg, and on Sept. 28 it marched to Yorktown. Receiving, on the same day, a despatch from Clinton promising relief, and fearing the enemy might outflank him, Cornwallis abandoned his outposts during the following night and withdrew to his inner defences, consisting of seven redoubts and six batteries connected by intrenchments, besides batteries along the river bank.

The allies, 16,000 strong, took possession of the abandoned posts and closed in on the town in a semicircle extending from Wormley Creek below it to about a mile above it, the Americans holding the right and the French the left. On the night of Oct. 5–6 the allies opened the first parallel about 600yd. from the British works, and extending from a deep ravine on the north-west to the river bank on the south-east, a distance of nearly two miles. Six days later the second parallel was begun within 300yds. of the British lines, and it was practically completed on the night of the 14th and 15th, when two British redoubts were carried by assault, one by the Americans led by Alexander Hamilton and one by the French led by Lieut.-colonel G. de Deux-Ponts. On the morning of the 16th Cornwallis ordered Lieut.-colonel Abercrombie to make an assault on two French batteries. He carried them and spiked 11 guns, but they were recovered and the guns were ready for service again 12 hours later. On the night of the 16th and 17th Cornwallis attempted to escape with his army to Gloucester on the opposite side of the river, but a storm ruined what little chance of success there was in this venture. In grave danger of an assault from the allies, Cornwallis offered to surrender on the 17th; two days later his whole army, consisting of 7,073 officers and men, was surrendered, and American Independence was practically assured. The British loss during the siege was about 156 killed and 326 wounded; the American and French losses were 85 killed and 199 wounded.

In 1862 the Confederate defences about Yorktown were besieged for a month (April 4–May 3) by the Army of the Potomac under Gen. McClellan. There was no intention on the part of the Confederate commander-in-chief, Joseph Johnston, to do more than gain time by holding Yorktown and the line of the Warwick river as long as possible without serious fighting, and without imperilling the line of retreat on Richmond; and when after many delays McClellan was in a position to assault with full assistance from his heavy siege guns, the Confederates fell back on Williamsburg.

See T. N. Page, "Old Yorktown," in *Scribner's Magazine* (Oct. 1881); H. P. Johnston, *The Yorktown Campaign and the Surrender of Cornwallis* (New York, 1881); A. S. Webb, *The Peninsular Campaign* (New York, 1882); J. C. Ropes, *Story of the Civil War*, vol. ii. (1898); and Jean Henri Clos, *The Glory of Yorktown* (Yorktown, 1924).

YORUBA, a people inhabiting the Ilorin and Sokoto provinces of Northern Nigeria and the Abeokuta, Ijebu, Ondo and Oyo provinces, and the Lagos district, of Southern Nigeria, and comprising the following sub-tribes: Abori, Egba-Awori, Ekiti, Eko, Ijebu, Ijesha, Jekri and Oyo. The kingship was at first hereditary but later became elective, and there were numerous ministers, officials, and eunuchs. Each province, town or village also had its chief. They are divided into clans and extended family groups, but have no age-classes except among the Ekiti. Marriage is prohibited between those whose paternal or maternal kinship can be proved. Descent was formerly matrilineal but is now patrilineal, the widows being inherited by the sons, except in the case of their own mothers. The father's property is inherited by the sons, the mother's by the daughters. There are societies of a political and religious character, having secret rites, such as the *Egungun, Oro,* and *Ogboni.* The Yoruba are cultivators, and their religion is animist; they practise divination (*Ifa*).

See P. Amaury Talbot, *The Peoples of Southern Nigeria* (1926).

YOSEMITE, the name given to a beautiful valley and its picturesque environs in east-central California on the west slope of the Sierra Nevada mountains almost 150 m. due E. from San Francisco. It embraces 1,125 sq.m. of magnificent mountain scenery, of which the valley is the crowning glory. The park extends from the cold alpine granite crags and humble storm-torn pines of the Mt. Lyell crests of the Sierra Nevada divide, 13,090 ft. above sea level, westward 30 m. or more down the slope to the mild forest-clad valley-floors where stand the giant sequoias, towering sugar pines, superb yellow pines and stalwart Douglas firs, only 2,000 ft. above the sea.

The picturesque country north of the valley was occupied from early times by trappers; but the valley itself was unknown to the white man until March 21, 1851, when a Captain Boling of the Mariposa battalion pursuing Tenaya, chieftain of the Yosemite (Indian word meaning "grizzly bear") Indians, and his warriors, entered the majestic valley which was their stronghold. On his return he gave a vivid account of the wonderful place.

By 1865 the valley had become so well known and so popular that Congress granted it to the State of California as a reservation with the agreement that the State should use all income from it in building a road into it and improving the reservation. The Mariposa big tree grove, discovered by Galen Clark in 1857, was granted to the State at the same time. California kept faith, and in a few years the Yosemite became world famous. In 1890 Yosemite National Park was established, and in March 1905, California re-ceded the valley to the National Government.

Climate.—The climate of the park is unusually mild for its altitude, and from June to October little rain falls. In late October or early November the heavier rains begin, soon changing to snows which fill the valleys and drift about the slopes so that for months at a time travel is well-nigh impossible over most of the trails. The annual precipitation in the park ranges from 30 in. in the valley to 55 in. at an elevation of 5,000 feet. Over practically the whole park except a few of the lowest slopes and valleys the precipitation is adequate for forest growth. The average annual snowfall at Yosemite over a period of 16 years was 110·7 in. beginning in October and ending in May; the maximum recorded for Tamarack was in the winter of 1906–07 when the snowfall attained 884 in., or about 75 feet. The snow which sometimes accumulates to a depth of 30 or 40 ft. melts slowly in spring and early summer. In the summer months terrifying thunderstorms with destructive lightning are frequent, though yielding little rain.

Flora and Fauna.—The flora of the park is rich and varied, illustrating by the changes in character and species with elevation the effect of altitude. The lower slopes and valleys of the park lie in the main timber belt where yellow pine (*Pinus ponderosa*), sugar pine (*Pinus Lambertiana*), incense cedar (*Libocedrus decurrens*), white fir (*Abies concolor*), Douglas fir (*Pseudotsuga mucronata*), some black oak (*Quercus Kelloggii*) and the big tree (*Sequoia gigantea*) are the conspicuous or dominant species; the middle slopes lie in the upper portion of the main timber belt where red fir (*Abies magnifica*), tamarack pine (*Pinus contorta*), and Jeffrey pine (*Pinus Jefferyi*) come in; the upper slopes and knobs lie in the timber-line belt of Sierra juniper (*Juniperus occidentalis*), mountain hemlock (*Psuga Mertensiana*), white-bark pine (*Pinus albicaulis*), foxtail pine (*Pinus Balfouriana*) and tamarack pine; and the uppermost peaks and crests lie above timber-line where willows and dwarf junipers and pines but a few inches high creep close to sheltering ledges and boulders, with arctic and alpine grasses and flowers struggling to mature their seed in the crevices of the cold gray granite. Gaily coloured flowers burst into bloom on all but the very highest crests during the mild summer months, making the alpine meadows and mountain woodlands a continuous garden of bloom. The rare flame-red spike of the beauteous snowplant rises above the meadows of the park like a glowing torch.

The fauna of the park is somewhat zoned as is the vegetation, but not within such regularly defined and discernible limits. Wolves, mountain lions and grizzly bears have been almost, if not quite, exterminated within the confines of the park. The black or brown bear and deer are common. Small mammals, like chipmunks, the Sierra red squirrel, Sierra marmot (*Marmota flaviventris* subsp.), porcupine and the bushy tailed wood-rat (*Neotoma cinerea* subsp.) characterize the conspicuous animal life, in most of the timbered areas, while above timber-line the coney makes his permanent residence. In the lower forests western robins, bluefronted jays, Sierra juncos, and a number of woodpeckers are distinctive species. Higher, in the red fir forests, ruby-crowned and golden-crowned kinglets, several species of nuthatches and sapsuckers, and the Townsend solitaire distinguish the avifauna. At timber-line is the famous Clark nutcracker, and above timber-line the rosy finch.

The Scenic Valley.—In this picturesque environment the Yosemite valley, declared to be the most beautiful valley in the world, is set like a precious gem. Entrance to the park by train

is from the west, by automobile from both east and west, and all routes converge upon the valley whence the rest of the park may readily be explored. The train from the station at Merced climbs up the slope from a hot treeless plain into the very heart of the calm cool forest at the entrance of the park. At El Portal automobiles take the place of the train, and after a few miles of travel, the route opens upon the wonderful vista of the valley, with El Capitan rising 3,000 ft. above the valley floor guarding the causeway upon the left, and the Cathedral Rocks with their shimmering, lacy Bridal Veil falls, 900 ft. high, standing guard upon the right. Within the gateway three main roadways enter the valley to merge into one at El Capitan bridge, the Big Oak flat road on the north side of the valley, Wawona road on the south side, and El Portal road along the Merced river in the middle.

Within the portal formed by El Capitan and Cathedral Rocks the valley widens. El Capitan meadows constitute the first open vista. At the back of Cathedral Rocks on the south side of the valley rise the Gothic pinnacles of Cathedral Spires, beyond them eastward Taft Point with its Profile cliff and farther eastward Sentinel Rock and Union Point. Across the valley and eastward from El Capitan on the north side of the valley, Rocky Point rises abruptly from the bank of Merced river to be continued upward and northward to Eagle Peak by the majestic Three Brothers, while Columbia Rock still a little farther eastward overlooks Camp Yosemite. Opposite Union Point, and far above Yosemite, towers Yosemite Point with its striking Castle cliffs. Near Yosemite Point, Yosemite creek dashes over the precipice, 2,600 ft. high, one sheer drop of 1,430 ft. and tumbles along over the rocks a few hundred yards, to cascade again over the lesser Lower falls 320 ft. high. Beyond Yosemite falls and the camp below, the valley extends several miles farther eastward, with Glacier Point and Sentinel Dome to the southward, and Washington Column, North Dome and Basket Dome to the northward, to terminate at the juncture of the two superb canyons, Tenaya entering from the north-east and Merced or Little Yosemite valley from the south and east, with the spectacular massive buttress of Half Dome standing between. Mirror lake lies in the lower valley of Tenaya creek between Half Dome and Basket Dome.

Geology.—Yosemite valley is 8 m. long, and from ½ to 1 m. wide. Its walls rise sheer from 2,000 to 6,000 ft. above the valley floor. The origin of the valley has long been controversial, but the weight of opinion inclines toward the theory that glacial grooving and carving down a valley, previously determined by streams cutting along fault and fracture planes in the granite, have formed the canyon. The peneplain has a precipitous escarpment facing eastward over the great basin, the down-throw side of a great fault zone, and a gentler slope westward toward the great valley of California. The tilting clearly evident in the formations and physiography of the park, probably began slightly in Cretaceous time, continuing as a more or less gradual movement until the Tertiary, when tremendous volcanic and tectonic action filled the valleys, with the exception of the Yosemite, the Hetch Hetchy and similar others, with thousands of feet of lava, and raised the crest of the Sierras abruptly several thousand feet, tilting the great block more sharply westward, and stimulating the streams to renewed erosional activity. From Tertiary time the volcanic activity continued and the Sierra crest kept rising until the beginning of the Quaternary when the greatest movement of all was initiated and the crest of the Sierras was lifted as much as 8,000 ft., the block tilted at a very high angle, and the streams, like the Merced and the Yosemite, were given accentuated cutting power. Since that time many small movements have taken place, the streams of Yosemite park with their high gradients have cut and worn their beds deeper and deeper, and the great glaciers that formed on the high slopes of the Sierran crests grooved them still deeper, straightened the walls of the sides, transformed the cascades of the tributary streams into sheer cataracts, and sculptured the impressive cliffs and domes.

YOSHIHITO (1879–1926), 123rd Emperor of Japan, third son of the Emperor Meiji (Mutsuhito), was born at Tokyo on Aug. 31, 1879. On the eighth anniversary of his birthday the Prince was proclaimed heir-apparent, the first and second sons of the Emperor Meiji having died in infancy. In Sept. 1887 the Prince commenced attending the Peers' School, and on Nov. 3, 1889, entered the army and was declared imperial crown prince. Two years later he left the school to continue his studies under private tutors. In 1897 he took his seat, in accordance with prescriptive right, in the house of peers. On May 10, 1900, the crown prince married Sadako, fourth daughter of the late Prince Michitaka Kujo, and on April 29, 1901, a son, Hirohito, was born, followed by a second son Prince Yasuhito Chichibunomiya, on June 25, 1902, and a third, Prince Nobuhito Takamatsunomiya, on Jan. 3, 1905. On July 30, 1912, on the demise of his father, the crown prince ascended the throne but owing to the national mourning the formal ceremony of enthronement did not take place until Nov. 1914. His reign was proclaimed as the era of Taisho (Righteousness). In the following year a fourth son, Prince Takahito Suminomiya, was born on Dec. 2. Owing to the indifferent health of the Emperor, whose life was a constant struggle against disease, his son Hirohito became prince regent on Nov. 25, 1921. The Emperor died on Dec. 25, 1926, of heart failure following bronchial pneumonia. The reign of Hirohito, who succeeded his father as emperor, is designated the period of Showa (Light and Peace).

Prince Chichibu (Yasuhito Chichibunomiya) came to England in 1925 and studied at Magdalen College, Oxford. He left England for Japan in Dec. 1926, when his father was seriously ill. He married Princess Setsuko, the eldest daughter of Ambassador Matsudaira, on Sept. 28, 1928.

YOSHIZAWA, KENKICHI (1874–), Japanese diplomat, was born in Niigata-Ken. He studied English literature for his degree in the Imperial university of Tokyo. He entered the diplomatic service, was consular assistant at Amoz, South China. After two years spent at Shanghai and in London he returned to the Foreign Office in Tokyo, and was sent as secretary to the Legation in Peking. This office he held until, in 1919, he became director of the Asiatic bureau, where his experience of Far-Eastern people enabled him to adjust differences between his own country and other oriental Powers. He retained this post until 1923, and was again in Peking in an official capacity when the new Russo-Japanese alliance was broached in 1924. Many Japanese fought against the proposed alliance, but the treaty was signed in January 1925.

YOUGHAL (pronounced *Yawl*), a seaport and watering-place of co. Cork, Ireland, on the west side of the Blackwater estuary, and on the Cork and Youghal branch of the Great Southern railway, 26¼ m. E. of Cork. Pop. (1926) 5,340. Youghal was a settlement of the Northmen in the 9th century, and was incorporated by King John in 1209. The Franciscan monastery, founded at Youghal by FitzGerald in 1224, was the earliest house of that order in Ireland. Sir Roger Mortimer landed at Youghal in 1317. The town was plundered by the earl of Desmond in 1579. In 1641 it was garrisoned and defended by the earl of Cork. Sir Walter Raleigh was mayor of Youghal in 1588–89, and is said to have first cultivated the potato here.

YOUNG, ARTHUR (1741–1820), English writer on agriculture and social economy, second son of the Rev. Arthur Young, rector of Bradfield, in Suffolk, chaplain to Speaker Onslow, was born on Sept. 11, 1741. After being at a school at Lavenham, he was in 1758 placed in a mercantile house at Lynn, but showed no taste for commercial pursuits. He published, when only 17, a pamphlet *On the War in North America*, and in 1761 went to London and started a periodical work, entitled *The Universal Museum*, which was dropped by the advice of Samuel Johnson. He also wrote four novels, and *Reflections on the Present State of Affairs at Home and Abroad* in 1759. After his father's death in 1759, his mother had given him the direction of the family estate

at Bradfield Hall; but the property was small and encumbered with debt. From 1763 to 1766 he devoted himself to farming on his mother's property. In 1767 he undertook on his own account the management of a farm in Essex. He engaged in various experiments, and embodied the results of them in *A Course of Experimental Agriculture* (1770).

In 1768 he published the *Farmer's Letters to the People of England,* in 1771 the *Farmer's Calendar,* which went through a great number of editions, and in 1774 his *Political Arithmetic,* which was widely translated. About this time Young acted as parliamentary reporter for the *Morning Post.* He made a tour in Ireland in 1776, publishing his *Tour in Ireland* in 1780. In 1784 he began the publication of the *Annals of Agriculture,* which was continued for 45 volumes. This work had many contributors, among whom was George III., writing under the *nom de plume* of "Ralph Robinson." Young's first visit to France was made in 1787. Traversing that country in every direction just before and during the first movements of the Revolution, he has given valuable notices of the condition of the people and the conduct of public affairs at that critical juncture. The famous book *Travels in France* appeared in 2 vols. in 1792; it is an historical document of the first importance on the condition of the French provinces on the eve of the Revolution.

On his return home he was appointed secretary of the Board of Agriculture, then (1793) just formed under the presidency of Sir John Sinclair. In this capacity he gave most valuable assistance in the collection and preparation of agricultural surveys of the English counties. His sight, however, failed, and in 1811 he had an operation for cataract, which proved unsuccessful. He died on April 20, 1820. He left an autobiography in ms., which was edited (1898) by Miss M. Betham-Edwards.

YOUNG, BRIGHAM (1801–77), Mormon leader, born at Whittingham, Vt. (U.S.A.), June 1, 1801. He moved to Mendon, N.Y., in 1829, and three years later joined the newly organized Mormon Church. (*See* MORMONS.) He was appointed an apostle in 1835, played a leading rôle in the removal of the Mormons from Missouri to Illinois, and in 1840 was sent to Liverpool to direct Mormon missionary work in England. There he organized branch missions, established emigrating agencies and began publication of the *Millennial Star.* He returned to America two months after the death of the prophet, Joseph Smith (*q.v.*), to take over the leadership of the church. The people of Illinois having demanded the removal of the Mormons, Young was faced with the Herculean task of leading them to a new country where they would be free from interference. After organizing the groups and planning every move in detail, the migration of nearly 5,000 people was gotten under way in 1846. Early in 1847 Young, leading the advance band, reached the valley of Great Salt Lake, and there decided to settle. He founded Salt Lake City, began the cultivation of crops by irrigation and directed the dispersal of the emigrant trains as they arrived. Both in moral and economic realms his word was law and he laid down the policies of the settlement. When the Territory of Utah was organized in 1850 he was appointed governor by President Fillmore and reappointed in 1854. Though not appointed again in 1858 because of his defiance of the United States in the so-called Mormon War, he continued to be the supreme power of the Territory. He encouraged agriculture, developed natural resources, established manufactures, founded Deseret University at Salt Lake City and Brigham Young Academy at Provo, built the Salt Lake Theatre, laid the foundations of the Mormon Temple, and created the Zion's Co-operative Mercantile Institution which grew into the largest institution of its kind in the West. His genius as a leader is generally recognized, the settlement of Utah being one of the best examples of organic colonization in history. He followed the doctrine of plural marriage and at his death at Salt Lake City Aug. 29, 1877, was survived by 17 wives and 47 children.

For bibliography *see* MORMONS.

YOUNG, EDWARD (1683–1765), English poet, author of *Night Thoughts,* son of Edward Young, afterwards dean of Salisbury, was born at his father's rectory at Upham, near Winchester, and was baptized on July 3, 1683. He was educated at Winchester College and New College, and Corpus Christi, Oxford. His first publication was an *Epistle to . . . Lord Lansdoune* (1713). It was followed by a *Poem on the Last Day* (1713), dedicated to Queen Anne; *The Force of Religion: or Vanquish'd Love* (1714), a poem on the execution of Lady Jane Grey and her husband, dedicated to the countess of Salisbury; and an epistle to Addison, *On the late Queen's Death and His Majesty's Accession to the Throne* (1714), in which he made indecent haste to praise the new king. About this time began his connection with Philip, duke of Wharton, whom he accompanied to Dublin in 1717, and with whom he had a lawsuit in 1740; the upshot was that Young was awarded an annuity of £100, but failed to secure a sum of £600 which he claimed. Meanwhile, his plays, *Busiris* and *Revenge,* were produced at Drury Lane in 1719 and 1721. Between 1725 and 1728 Young published a series of seven satires on *The Universal Passion.* They were dedicated to various personages, and were collected in 1728 as *Love of Fame, the Universal Passion.* This is qualified by Samuel Johnson as a "very great performance," and abounds in striking and pithy couplets. In 1726 he received, through Walpole, a pension of £200 a year.

Young was nearly fifty when he decided to take holy orders. In 1728 he was made one of the royal chaplains, and in 1730 was presented to the college living of Welwyn, Hertfordshire. He married in 1731 Lady Elizabeth Lee, daughter of the 1st earl of Lichfield. *The Complaint,* or *Night Thoughts on Life, Death and Immortality,* was published in 1742, and was followed by other "Nights," the eighth and ninth appearing in 1745. In 1753 his tragedy of *The Brothers,* written many years before, but suppressed because he was about to enter the Church, was produced at Drury Lane. *Night Thoughts* had made him famous, but he lived in almost uninterrupted retirement, although he continued vainly to solicit preferment. He was never cheerful, it was said, after his wife's death in 1740. He disagreed with his son, who had remonstrated, apparently, on the excessive influence exerted by his housekeeper Miss (known as Mrs.) Hallows. He died at Welwyn on April 5, 1765.

Other works by Young are: *The Instalment* (to Sir R. Walpole, 1726); *Cynthio* (1727); *A Vindication of Providence . . .* (1728), a sermon; *An Apology for Punch* (1729), a sermon; *Imperium Pelagi, a Naval Lyrick . . .* (1730); *Two Epistles to Mr. Pope concerning the Authors of the Age* (1730); *A Sea-Piece . . .* (1733); *The Foreign Address, or The Best Argument for Peace* (1734); *The Centaur not Fabulous; in Five Letters to a Friend* (1755); *An Argument . . . for the Truth of His* [Christ's] *Religion* (1758), a sermon preached before the king; *Conjectures on Original Composition . . .* (1759), addressed to Samuel Richardson; and *Resignation . . .* (1762), a poem.

YOUNG, JAMES (1811–1883), Scottish industrial chemist, born in Glasgow, July 13, 1811, is best known in connection with the establishment of the Scottish mineral-oil industry. In 1847 Lyon Playfair told him of a spring of petroleum which had made its appearance at Ridding's colliery at Alfreton in Derbyshire, and in the following year he began to utilize it for making both burning and lubricating oils. This spring was practically exhausted by 1851. It had served to draw Young's attention to the question of oil-production, and in 1850 he took out his fundamental patent for the distillation of bituminous substances. This was soon put into operation in Scotland, first with the Boghead coal and later with bituminous shales, and Young successfully employed it in the manufacture of naphtha and lubricating oils, and subsequently of illuminating oils and paraffin wax. Young died at Wemyss Bay on May 14, 1883.

YOUNG, MAHONRI MACKINTOSH (1877–), American sculptor, painter and etcher, was born at Salt Lake City, Utah, on Aug. 9, 1877. He studied with J. T. Harwood, Salt Lake City, at the Art Students' League, New York city, and at the Julien and other academies in Paris. After his return to the United States he became instructor in drawing at the Art Students' League and later instructor in sculpture at the American School of Sculpture. His works are characterized by simplicity, dignity and breadth of conception, united with exquisite workmanship. He is known chiefly through his statuettes, figures of labourers and

cowboys, which exhibit close observation of nature and virile form. Among his best known works are "Man with Pick" in the Metropolitan Museum of Art; the Hopi and Apache groups in the Museum of Natural History, New York city; "A Labourer" and "The Rigger" in the free public library, Newark, N.J.; the "Sea-Gull" monument in Salt Lake City; "Rolling His Own" and "Monument to the Dead" (with Bertram Goodhue), in Paris.

YOUNG, OWEN D. (1874–), American lawyer and business man, was born at Van Hornesville, N.Y., on Oct. 27, 1874. He was educated at St. Lawrence university, N.Y. (A.B., 1894), and Boston university law school (LL.B., 1896). He commenced the practice of law in Boston (1896), being associated with and later a partner of Charles H. Tyler until 1912, when he retired in order to become general counsel for the General Electric Company. In 1913 he was elected vice president in charge of policy and in 1922 was elected chairman of the board of directors. He organized and became chairman of the board of the Radio Corporation of America. He was also a director of the Federal Reserve Bank of New York, General Motors Corporation, the International General Electric Company, and chairman of the American section of the international chamber of commerce. He was a member of President Wilson's second industrial conference, chairman of the committee on business cycles and unemployment appointed by President Harding, and chairman of the American group, international court of arbitration of trade disputes of the international chamber of commerce. In Dec. 1923, he accepted the invitation of the reparations commission to act as a member of the first committee of experts charged with the enquiry into the balancing of the German budget and the stabilizing of the German currency. Their ensuing report was accepted by the commission. He was appointed agent-general for reparations payments *ad interim* on that date, holding the position till Oct. 31, when he resigned. Again by invitation Young became a member of the second committee of experts which met in Paris in January, 1929, to draw up a plan for the permanent settlement of the reparations problem. Because of the unusual confidence in his ability and fairness felt by the European governments, he was drafted as chairman of the conference against his own desires. When the conference seemed on the verge of collapse in mid-April he offered a compromise which served as the basis of the final settlement arrived at in June. (*See* REPARATIONS.)

YOUNGHUSBAND, SIR FRANCIS (EDWARD) (1863–), British soldier, explorer and author, was born at Murree, India, on May 31, 1863, and educated at Clifton and Sandhurst. He entered the army in 1882, and rose to the rank of lieutenant-colonel in 1908. In 1886 he crossed the heart of Central Asia, by crossing the Muztagh, the great mountain barrier between China and Kashmir. In 1890 he was transferred to the Indian political department, and in 1902 accompanied the British mission to Tibet, sent out to counteract the Russian influence on the Dalai Lama. The mission was ended by the treaty of Sept. 7, 1904, and Younghusband was made K.C.I.E. in the same year. His work during this period resulted in an extension of the Indian system of triangulation which finally determined the geographical position of Lhasa. He also proved that the Muztagh is the true water-divide west of the Tibetan plateau. Sir Francis returned to England in 1905 and was appointed Bede lecturer at Cambridge, but in 1906 he went to Kashmir as resident, remaining there until 1909. From the time when he first went to India he travelled widely in India and also in Manchuria, China, Turkistan and South Africa. He was made K.C.S.I. in 1917.

His publications are: *Heart of a Continent* (1898); *Relief of Chitral* (1898); *South Africa of To-day* (1898); *Kashmir* (1909); *India and Tibet* (1912); *Within* (1912); *The Heart of Nature* (1921); *The Gleam* (1923); *Wonders of the Himalaya* (1924); *But in Our Lives* (1926); *The Epic of Everest* (1927); *The Light of Experience* (1927); *Life in the Stars* (1927).

YOUNG MEN'S CHRISTIAN ASSOCIATION, an organization for social and religious work among young men, founded in England in 1844 by George Williams (1821–1905). It grew out of meetings for prayer and Bible-reading which Williams held among his fellow-workers in a dry-goods business in the City of London. Similar associations had been founded earlier in Scotland. The distinctive feature of the movement was the combined interest in social and in religious welfare. It spread rapidly; branches were soon formed in France and Holland, and overseas in the United States, Canada, India and Australia. The first world-conference was held in Paris in 1855. The primary purpose was to win men to Christ and enlist them in His service, as understood by evangelical Christians in the mid-19th century. But the story of the association—especially under the stimulus of conditions created by the World War—has been one of steady evolution with centres in every part of the civilized world.

Under the leadership of Dr. John R. Mott, the Y.M.C.A., as an international agency of religious influence, social service, industrial goodwill, physical recreation and inter-racial conciliation, has been extended until it is now active in 56 countries, autonomously organised under the World Committee at Geneva. There are 9,754 associations, employing 7,396 executive officers, with a membership of 1,601,967, of whom 474,922 are boys. The value of the property and funds is $242,636,070. In the United States, the Association is accepted frequently as a quasi-municipal institution, supported by citizens of all opinions and a similar endorsement of the Association has been forthcoming from many statesmen and governments.

YOUNGSTOWN, a city of north-eastern Ohio, U.S.A., on the Mahoning river, about equally distant (65 m.) from Cleveland and Pittsburgh; the county seat of Mahoning county. It has a municipal airport; is served by the Baltimore and Ohio, the Erie, the New York Central, the Pennsylvania, the Pittsburgh and Lake Erie and the Lake Erie and Eastern railways, two industrial belt lines, inter-urban trolleys, motor-bus and truck lines; and is on the route of the proposed barge canal from Lake Erie to the Ohio river. Pop. (1920) 132,258 (26% foreign-born white); 1928 local estimate over 178,000.

The city occupies 34·5 sq.m., lying on both sides of the river, at an altitude of 858 ft. at the public square. It is on the watershed between Lake Erie and the Ohio river, and is surrounded by rolling hills. The adjacent country is a fine agricultural region, rich in mineral resources. Youngstown is the centre of the second largest iron and steel district of the country, producing $\frac{1}{6}$ of all the pig iron and $\frac{1}{8}$ of all the steel made in the United States, and using annually more than 8,500,000 tons of iron ore from the Lake Superior mines. Coal comes in over relatively short hauls, and the limestone needed in the production of steel is quarried in the immediate vicinity.

The public square (given in 1802 by the founder of the city) is still the centre of municipal life. Facing it, or near by, are several of the older churches, several banks, stores and office buildings, the fine Stambaugh memorial auditorium, the Reuben McMillan free library (named after the city's first superintendent of schools), and the beautiful Butler Art institute, of Georgia marble, designed by McKim, Mead and White. The parks of the city cover 1,950 ac. The character of the chief occupations is reflected in the preponderance of men in the population (115 males to 100 females in 1920), the small proportion of women employed (18·5% of all ten years of age and over, the smallest proportion in any of the large cities in 1920) and the very small proportion of children 10 to 14 years of age working for wages (2·5% in 1920). The city's assessed valuation for 1927 was $364,669,130. Bank debits for 1927 aggregated $853,827,000.

Youngstown was named in honour of John Young (1763–1825) of New Hampshire, who in 1796 bought a tract of land in the Western Reserve, on which the city now stands, from the Connecticut Land Company, and lived here from 1799 until 1803. The first settlement was made in 1796 by William Hillman. A township government was organized in 1802, the town was incorporated in 1848 and in 1867 it was chartered as a city. In 1876 the county seat was moved from Canfield to Youngstown, and in 1879, after much litigation, the legality of the change was confirmed by the U.S. Supreme Court. Iron was mined in the vicinity in 1803 by Daniel Eaton, who in 1804 built the first blast furnace north of the Ohio and west of Pennsylvania and in 1826

the first one within the present limits of Youngstown. As late as 1860 the population of the city was only 2,759. By 1880 it had grown to 15,435 and by 1900 to 44,885. The 20th century has been the period of rapid development. Between 1900 and 1920 the population increased threefold, and the area was enlarged in about the same ratio.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION, an organization founded in 1855 by two ladies simultaneously. In the south of England Miss Robarts started a prayer union with a purely spiritual aim, and in London Lady Kinnaird commenced the practical work of opening homes and institutes for young women in business. In 1887 the two branches united in the Young Women's Christian Association, which seeks to promote the all-round welfare of young women by means of residential and holiday homes, club and rest rooms, classes and lectures, and other useful departments. The association has spread all over the world, and the total membership is over half a million.

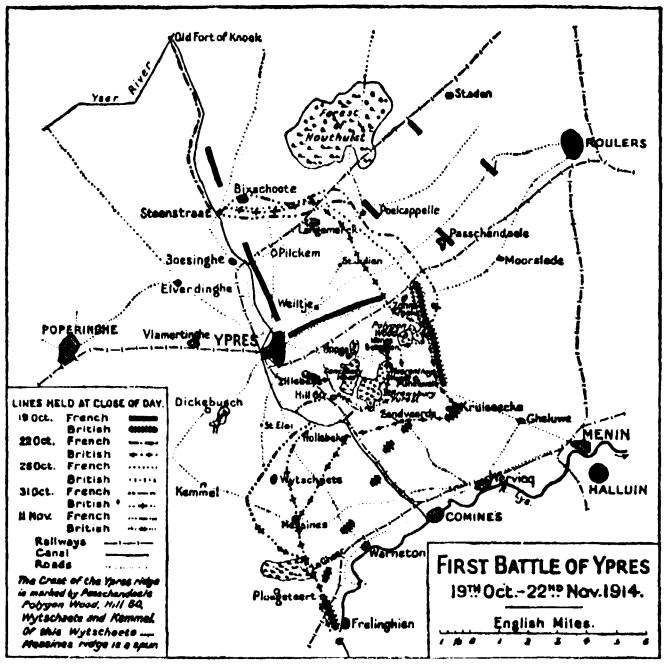
See article "Young Women's Christian Association," by Emily Kinnaird, in Hastings' *Encyclopaedia of Religion and Ethics,* vol. xii.

YPRES, JOHN DENTON PINKSTONE FRENCH, 1ST EARL OF (1852–1925), British soldier, was born at Ripple, Kent, on Sept. 28, 1852. The son of a naval officer, he entered the royal navy, in which he served as cadet and midshipman from 1866 to 1870. Joining the militia he passed from this into the army in 1874 and was gazetted to the 19th Hussars. He married Eleanora, daughter of R. W. Selby Lowndes in 1880. He served in the Nile expedition in 1884–5, and commanded his regiment from 1889 to 1893. After two years on the war office staff he commanded a cavalry brigade (1897–9), and on the mobilisation of the expeditionary force for S. Africa in 1899 he was chosen to command the Cavalry Division and was promoted major-general. Pending the assembly of this he served in Natal where he commanded the troops on the field at Elandslaagte and took part in the early combats near Ladysmith, but he proceeded to Cape Colony just before the place was invested. After a few weeks in charge of the force at Colesburg, he led the cavalry during Lord Roberts' advance from Cape Colony, relieved Kimberley, cut off the retreat of Cronje's army, and occupied Bloemfontein. During the subsequent advance into the Transvaal he was in command of the left wing, and at a later stage of the victorious campaign he played a prominent part in the move from Pretoria to Komati Poort. For these services he was given the K.C.B. During most of the second phase of the struggle he was in command of the forces operating against the enemy in Cape Colony, and he was on the conclusion of hostilities promoted lieutenant-general and was given the K.C.M.G.

He commanded at Aldershot from 1902 to 1907, in which year he was promoted general, and he then became inspector-general of the Forces for five years. He was appointed chief of the Imperial General Staff in 1912 and was promoted field-marshal in 1913. In April 1914 he vacated the post of C.I.G.S., owing to military troubles in Ireland in connection with Ulster, but four months later he was chosen to take charge of the Expeditionary Force on the outbreak of the World War, and he commanded the British Army on the Western Front from the outset of the struggle until the end of 1915. The terribly costly and somewhat fruitless advances of this year, culminating in Loos, provoked criticism at the time, and controversy has raged over French's share in them since. He certainly failed signally to harmonise with Kitchener at the War office. He resigned in December of that year, Sir D. Haig taking his place, and he returned to England, to be raised to the peerage as Viscount French of Ypres and High Lake. He then became commander-in-chief in the United Kingdom, and he held that appointment until May 1918, when he was selected to be lord lieutenant of Ireland. This position he occupied under most trying conditions until early in 1921. On resigning he was rewarded with an earldom. He died on May 22, 1925, at Deal Castle, Kent. At the end of the war, Lord French published his personal narrative under the title, *"1914."*

YPRES (ēpr, popularly wi'purz), a town of Belgium in West Flanders, of which it was formerly considered the capital. Pop. (1925), 14,845. It is situated 35 m. S. of Ostend and 12 m. W. of Courtrai, on the Yperlée, a small river flowing into the Yser, both of which have been canalized. In the 14th century it ranked with Bruges and Ghent. Its fine Halles or cloth market, with a façade of over 150 yd., was begun in 1201, completed in 1304, and reduced to ruins in the World War. The cathedral of St. Martin dated from the 13th century, with a tower of the 15th century and was also ruined in 1914–18. Jansen, bishop of Ypres and the founder of the Jansenist school, is buried in the cathedral. For four war years (1914–18) the town was the centre of a salient of the British armies and was reduced to ruins, but has been largely rebuilt. The Menin Gate has been built as a memorial to missing British soldiers. There are 40 cemeteries within two miles of Ypres.

YPRES, THE BATTLE OF, 1914, is the name given to the heavy but indecisive fighting near Ypres at the close of the "race to the sea" (Oct. 19 to Nov. 22, 1914). It is commonly spoken of as the First Battle of Ypres.



Genesis of the Battle.—When in Oct. 1914 the British Expeditionary Force under F.M. Sir John French left the Aisne front to be transferred to Flanders, its various corps, as they arrived in succession on the left of the Allied line, at once came into contact with the enemy, for each of the two belligerent forces was simultaneously extending its front northwards. Thus the II. Corps (Smith-Dorrien) on Oct. 10 began the "battle of La Bassée," and the III. Corps (Pulteney) and the Cavalry Corps (the 1st and 2nd Cavalry Divisions under Allenby), on Oct. 12–13, the battles of "Armentières" and "Messines." On Oct. 14–15 the IV. Corps (Rawlinson), the Belgian army and a French Marine brigade, falling back from Antwerp, and de Mitry's cavalry corps and two French Territorial divisions, coming up from the west between Ypres and the Belgians, completed the Allied line to the sea. Of this line, the British held the portion from the La Bassée canal to Langemarck, north of Ypres.

The co-ordination of the Allied operations in Flanders was placed by Gen. Joffre in the hands of Gen. Foch, and the general plan now adopted was for the British, supported by the French and Belgians, to advance from the neighbourhood of Ypres, break through the enemy's front, cut off any Germans between the gaps thus made and the sea, and then turn southward to roll up the German line.

The Opening of the Battle.—On Oct. 19, on the arrival behind Ypres of the I. Corps (Haig), Sir J. French sent forward Rawlinson's corps (consisting only of the 7th Division and the 3rd Cavalry Division) towards Menin, and directed Pulteney's and Allenby's corps to move down the Lys on both banks in the same direction. But on the day previous, the 18th, the enemy, with a general plan similar to that of the Allies, had also begun an advance, with a new IV. Army under Duke Albrecht of Württemberg, on a front from the Ypres-Gheluvelt (Menin) road to the sea. This army consisted of the new XXII., XXIII., XXVI. and XXVII. Reserve Corps composed of young volunteers with 25% of old soldiers and the III. Reserve Corps of three divisions which had besieged Antwerp. Thus, as the German VI. Army, under Crown Prince Rupprecht of Bavaria, south of the IV. Army, also attacked, battle was engaged on the 19th on the whole front from La Bassée to the sea. In the sector between the river Lys and the sea, the German XIX. Corps attacked the left wing of Wilson's division (4th) of Pulteney's corps; four German cavalry corps advanced against Allenby's two cavalry divisions; whilst of the 11 divisions of the German IV. Army, four were sent against Capper's division (7th) and Byng's cavalry division of Rawlinson's corps, two and one-half against the French north of Ypres, and four and one-half against the Belgians.

On Oct. 21, just as Haig's corps, which had been put in on the left of Rawlinson's, was making good progress towards Langemarck, the French on its left fell back before the enemy to the Ypres canal. Haig, with his flank thus exposed to the attack of the XXIII. Reserve Corps, whilst engaged with the XXVI. on his front, had to use his reserve to cover his left, and his advance, thus deprived of any fresh impetus, came to an end. Elsewhere, the British were opposed to at least double their numbers: Capper's division to the XXVII. Reserve Corps, the three British

cavalry divisions to eight German, and Wilson's division to the XIX. Corps. Nevertheless, they managed to hold their line unbroken on the 21st and 22nd. When on Oct. 23 the French IX. Corps (Gen. Dubois) reached Ypres and took over the Zonnebeke–Langemarck sector from Lomax's 1st Division of Haig's corps, a further slight advance was made; but the enemy was in superior numbers and had too much heavy artillery for any decisive success to be obtained. On the 24th Duke Albrecht equally abandoned any hope of a break-through until he could be reinforced; but desultory fighting continued, and on the 26th Capper's division lost the Kruiseecke salient, south-east of Gheluvelt. Meantime, the Belgians had been hard put to it and on Oct. 27 let in the sea at Nieuport to form an inundation in front of their line along the Yser.

The Second German Offensive.—On the same day, the 27th, Gen. von Falkenhayn, the chief of the German general staff, issued instructions for a new attack with increased forces. Six fresh divisions, brought from quiet parts of the line, to form under Gen. von Fabeck, the right of the VI. Army, were on the 30th to take the place of the four cavalry corps and attack Ypres from the south-east for the purpose of breaking through on the front Messines—Gheluvelt, which was held by two of the three cavalry divisions, now all united under Allenby's command, and Capper's division. At the same time, all the German troops north of the La Bassée canal were ordered to make a general attack. The addition of six divisions to the Ypres front gave, excluding cavalry, the Germans 15½ to the French and British six and one-half; but their artillery was even more overwhelming, for Fabeck, apart from what the other German commanders before Ypres possessed, was allotted over 250 heavy and super-heavy guns and howitzers, to which the Allies could only oppose 50, and of these more than half were of old and obsolete patterns.

There was some preliminary fighting on the 29th, when the British lost a little ground near Menin road. On this date, the eve of the second German offensive at Ypres, the line was held from the Lys to Zonnebeke by part of Wilson's division, the cavalry corps and the 7th, 1st and 2nd Divisions, all three since the 27th under Haig, who henceforward commanded in front of Ypres. Thence Dubois's IX. Corps and de Mitry's cavalry corps carried it on to the canal. The greater part of the Allied front maintained its ground on the 30th, but, under the heavy pressure of the six fresh German divisions, Allenby's cavalry divisions and Capper's division were forced back to the Messines-Wytschaete ridge, losing Zandvoorde and Hollebeke. Further danger in this sector was averted by Gen. Dubois, at Haig's request, sending his own reserve of four battalions and three batteries to the assistance of the British cavalry, and Gen. Haig himself despatching first two battalions and later three more, under Maj.-gen. E. Bulfin.

Gheluvelt, Oct. 31.—Matters, however, became more serious on the 31st, when, after a heavy bombardment, a convergent attack of five German divisions and three brigades on Haig's three divisions broke the line on a two battalion front at Gheluvelt, despite the desperate resistance of the 1st Battalion of the Queen's, which was annihilated. Elsewhere the front held, but at Messines part of the village was lost, and immediately south of the Menin road the line was pushed back. The situation was critical, and just at this time the staffs of Lomax's and Monro's divisions of Haig's corps were nearly all killed or disabled by a shell that struck Hooge Chateau.

A counter-attack ordered by Brig.-gen. H. Landon (3rd Brigade) drove back the Germans who had advanced from Gheluvelt along the Menin road; the village itself was recovered owing to the stout defence of the 1st South Wales Borderers north of the break, who held on to the park and chateau to the north of the village until a determined counter-attack of the 2nd Worcestershires initiated by Brig.-gen. C. Fitzclarence (1st Brigade) recaptured it; whilst south of the road a third counter-attack by the 2nd Royal Sussex, 1st Northamptonshire, and 2nd Gordon Highlanders, under the orders of Maj.-gen. E. Bulfin, regained all the ground that had been lost there, and more. At night, however, a retirement was made to a selected line east of Gheluvelt.

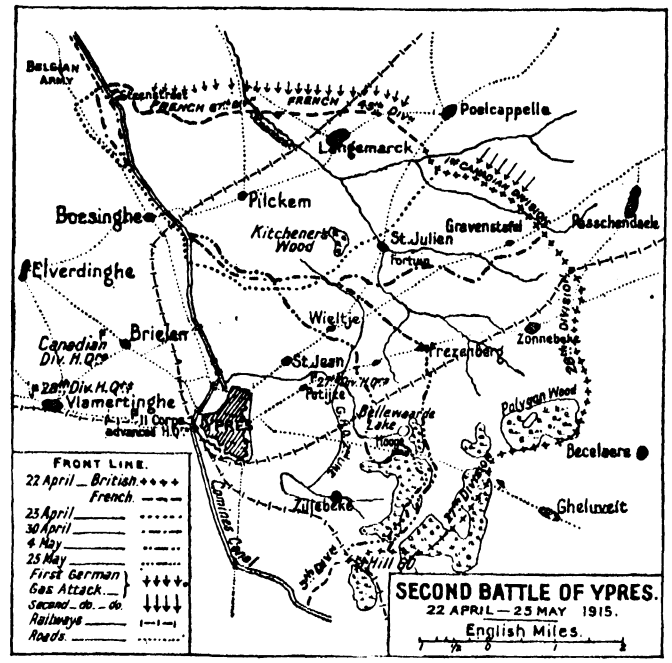
French Reinforcements.—On Nov. 1 the Germans continued to attack, and Messines was lost by Allenby's cavalry corps, but the French XVI. Corps (32nd, 39th and 43rd Divisions under Gen. Grossetti) arriving to relieve the cavalry, greatly strengthened the defence. Wytschaete and the rest of the ridge, however, were lost by the French next day. The Allied line was now held by the British and French alternately: from the Lys to opposite Messines by the British; thence as far as the Ypres-Comines railway by the French; thence along the front of Shrewsbury forest and Polygon wood to Zonnebeke by Haig's three divisions; and thence to the canal, by the French again; and this remained the distribution until the end of the battle. During Nov. 3, 4 and 5 the German attacks somewhat died down; a composite division of Smith-Dorrien's II. Corps (under Maj.-gen. F. W. D. Wing) and the French 11th Division reinforced the Allies. But this assistance was counter-balanced by three out of five German divisions on the Belgian front being brought down against Ypres.

The Final German Effort.—The German supreme command now decided to attack the haunches of the Allied salient round Ypres from the north-east and south-east. Four more divisions, including a composite one of the Guard Corps, and the 4th (Pomeranian), one of the best in the whole army, were despatched to the sector with more heavy artillery. On the 4th, Crown Prince Rupprecht was given a definite order to break through south-east of Ypres, and whilst this offensive was in preparation to continue attacks all along the line, and the Duke of Württemberg was ordered to move against the north-east part of Ypres. During the 6th, 7th, 8th and 9th the Germans managed to make a little progress at several points; they gained Le Gheer on the edge of Ploegsteert wood, and Zwarteleen near Hill 60, barely 2m. from Ypres; but elsewhere they were repulsed with heavy loss, and Grossetti's corps recovered ground lost between Wytschaete and St. Eloi. On the 10th, after a long and desperate defence, Dixmude (13m. north of Ypres) was lost by the Belgians, and a very heavy attack was delivered against the French on the north-east and north of Ypres which gained a small amount of ground.

The Prussian Guard Attack on Nov. 11.—On Nov. 11 at 6:30 A.M., on a dark and misty morning, the German artillery opened a terrific fire, increasing in intensity as 9 A.M. approached, at which hour the German infantry, under cover of the mist, advanced to the assault on the Lys-Polygon wood front. The British were weary with three weeks' continuous fighting without reliefs, the French nearly as tired. But, in spite of the German numerical superiority—23 divisions to 9½, with cavalry in about the same proportion—the Allied line resisted the enemy's repeated assaults except at two places—just north of the Menin canal,

where a detachment of Dubois's IX. Corps was driven back, and just north of the Menin road. South of and across this road, where the German 4th Division and Winckler's Guard Division attacked, a front of about 2m., stood Wing's composite division of Smith-Dorrien's II. Corps, its battalions so weak that it was about the strength of a brigade, the 2nd K. O. Scottish Borderers on the right, then the 2nd R. Irish Rifles, 1st Gordon Highlanders, 1st Cheshire, 2nd Bedfordshire, 1st Lincolnshire, 1st Northumberland Fusiliers, 4th Royal Fusiliers, and 2nd Duke of Wellington's. North of the road was Fitzclarence's brigade of the 1st Division (the 1st Scots Guards, 2nd Cameron Highlanders and 1st Black Watch), 800 men in all, with the 1st King's of Monro's division in Polygon wood beyond them. By the mere weight of the advance of the German 2nd Guards Brigade (six battalions of the 1st and 3rd Foot Guards Regiments), the front and support lines of Fitzclarence's three Scots battalions were overwhelmed. The attack passed over them, but fire from the 1st King's in Polygon wood, from three strong points (small defended posts with all-round defence) which formed Fitzclarence's third line of defence, and from various battalion headquarters in farms put in a state of defence, then held the Germans up and took heavy toll of them. About 400 or 500, however, pressed on into the Nonne Bosschen (wood), only to be met by the point-blank fire of Haig's field artillery in action beyond it; and the rifle-fire of some artillery men and engineers, including cooks and grooms, hastily collected. The final discomfiture of the German Guards was completed by a counter-attack of the 2nd Oxfordshire and Buckinghamshire through the Nonne Bosschen.

The Close of the Battle.—On the next day, Nov. 12, the weather began to break and become wintry; nevertheless, on this and the following days the Germans made several further attacks against the French in the Wytschaete area and against Wing's division south of the Menin road. These did not alter the situation, and the fighting then died down, and both sides set about completing their defences. With the end of the First Battle of Ypres, on the 22nd, open warfare ceased, and the operations of siege warfare, so-called trench warfare, begun on the Aisne in September, prevailed along the whole western front.



Opposed to more than double its own numbers, the British Expeditionary Force had held its own by sheer good shooting and superior training, and the skilful use by Gen. Sir Douglas Haig of his very small reserve. But such heavy losses had been incurred in the five weeks' battle and in the fighting at La Bassée and Armentières, which went on during the same period, that of the original British Expeditionary Force of fully trained officers and men very few remained, and for the future the empire was dependent on three divisions from overseas garrisons, on Territorial and New Army divisions, and dominion troops.

YPRES, THE BATTLES OF, 1915, commonly called the second battle of Ypres, comprise the period of severe fighting that took place in front of Ypres beginning on April 22 with the first gas attack and continuing to May 25, 1915. It resulted in heavy casualties and considerable loss of ground round the town of Ypres, the base of the Allied salient, measured along the Ypres canal, being reduced from 8m. to 5½m., and its maximum depth from 6m. to 2½ miles.

Phases of the Battle.—For the purposes of general description, the battle is best divided into five phases (*see* sketch map): (1) the first German attack on April 22 against the French, resulting in the loss of the Pilckem area; (2) the second attack on April 24 against the Canadian Division, resulting in the loss of the St. Julien-Gravenstafel area; (3) the fruitless British counter-attacks; (4) the British withdrawal to the Frezenberg line, abandoning the Zonnebeke area; and (5) the renewed German attacks (Frezenberg-Bellewaarde), resulting in further loss by the British of a narrow belt of ground.

The Situation Before the Battle.—During the winter of 1914–15 the German Supreme Command had decided to carry out an offensive against Russia in 1915, and to stand on the defensive in the western theatre, leaving only sufficient troops there to hold the line. No general attack at Ypres was contemplated. It was, however, desired to try a new weapon, gas, thoroughly in the field, and the Ypres front was selected for the purpose on the advice of the German meteorological experts. Duke Albrecht of Württemberg commanding the IV. Army, which held

the sector from the Comines-Ypres canal to the coast, proposed to turn the use of gas to local advantage, to improve his position. If he could obliterate the Ypres salient and drive the Allies beyond the canal, he would deprive them of a bridgehead which gave them facilities for attack. The duke's forces consisted of the XV. Corps, the four new Reserve Corps, XXVII., XXVI., XXIII. and XXII., and two *Ersatz* and two *Landwehr* brigades which had fought at the first battle of Ypres. The Marine Division guarded the Belgian coast.

The Allied line from the Comines canal northward was held by part of the 5th Division (Morland), as far as Hill 60; the 27th Division (Snow); the 28th Division (Bulfin); and the 1st Canadian Division (Alderson). The last three formed the II. Corps (Plumer) of the II. Army (Smith-Dorrien). The 27th and 28th Divisions had been formed of troops from Indian and overseas garrisons, but, having suffered heavily from the winter conditions in Flanders, contained in April a considerable proportion of partially trained reinforcements. The Canadian Division had reached England in Oct. 1914, and had embarked for France in Feb. 1915. After being in the line at Neuve Chapelle, it had, between April 15 and 17, relieved French troops covering Ypres. The front defences taken over by the II. Corps were poor, but there was a well-developed back line known as "the G.H.Q. Line." The left of the Canadians extended as far as the Ypres—St. Julien—Poelcappelle road, beyond which were two French divisions under Gen. Putz: the 45th Division, which had arrived on April 16, containing nine newly raised Zouave battalions and three battalions of African natives, these latter being in the line; and the 87th Territorial Division, a division of elderly reservists.

The First Gas Attack.—On April 22, after an afternoon of comparative quiet, suddenly at 5 P.M. a yellowish cloud—now known to have proceeded from chlorine gas released from cylinders in the trenches—was seen to form on the German front opposite the African troops and French Territorials. It blew slowly towards them, whilst the German artillery opened with every kind of gun, firing on the French troops with shrapnel and bombarding all the villages in the salient and the town of Ypres with high-explosive shell. The French infantry in the line fled beyond the canal, leaving their artillery to be captured, abandon-

ing a large area of ground and entirely exposing the British left flank (*see* sketch map). Fortunately for the Allies, the enemy had begun his attack so late in the afternoon that in the dusk he did not discover his immense success. Content with having secured Pilckem ridge and establishing outposts beyond it, about 7.30 P.M., according to plan, as it is asserted, but more probably in consequence of the stout defence put up by various small Canadian detachments, the Germans ceased any attempt to push into the gap, except at Steenstraat.

Gen. Plumer and his divisional commanders hurried what available troops they had to cover the gap, and when Gen. Putz in the course of the evening informed Gen. Smith-Dorrien that he meant to counter-attack at 4.30 A.M., and requested that the British should assist, arrangements were made to co-operate. But no movement of the French took place, nor were they in the succeeding days able to make any serious effort to recover the ground they had lost on the eastern bank of the canal.

Several counter-attacks were made by the British on April 23 to regain the ground lost by the French. They were carried out by the Canadians, the 13th Infantry Brigade, and Geddes's detachment—a temporary formation composed of six battalions of the 27th and 28th Divisions—without avail. The forces were too small, and there was not sufficient artillery or ammunition to support them. The Germans did no more than repel the counter-attacks on the 23rd, but from the 24th onward proceeded to follow two objectives: first to roll up the flank of the British line, aiming to get behind the troops still in position; secondly, to increase their gains across the canal near Steenstraat and separate the Belgians from the French and British. By the division of their forces, they failed to achieve either purpose.

The Second Gas Attack.—On April 24, at 4 A.M., the enemy released gas against the front of the 2nd and 3rd Canadian Brigades. In spite of having only extemporized means of protection (handkerchiefs, linen bandoliers, etc., dipped in water), they held fast for a time, but the enemy, after breaking in at one place, enlarged his gains, and the 3rd Canadian Brigade was gradually forced back, involving in the retirement through St. Julien the troops on the new left flank that had been built up. Gen. Snow, the only divisional general who had his headquarters east of the canal, at Potijze, took charge of the defence, and such reserves as could be hurried up were eventually placed by Gen. Plumer under his command, as communication across the canal between the headquarters of the other commanders and their troops was constantly interrupted. Although the Germans were driven out of St. Julien by a counter-attack of two battalions of the York and Durham Infantry Brigade of the Northumbrian (Territorial) Division, another large piece of the salient was lost, and after further German attacks on the 25th, Gravenstavel was abandoned, and the British line ran from the original left of the 28th Division past St. Julien, almost due west to the canal.

The British Counter-Attacks.—Counter-attack after counter-attack was now made by fresh troops hurried up to Ypres, the 11th Infantry Brigade (4th Division), the Lahore Division and the Northumberland Infantry Brigade (Northumbrian Division) with assistance on the left from the French. All were without success; they found the enemy well entrenched, and their only result was heavy casualties. In the operations of April 26, when some of the French 45th Division co-operated on the left of the Lahore Division, the Germans opened a few gas cylinders in defence, and broke the attack; whilst on the 27th gas shelling alarmed the African natives and caused them a second time to retreat in panic.

The position of the British troops in the narrow salient, projecting 6m. in front of Ypres and only some 3m. across was obviously untenable, as it was surrounded on three sides by the enemy and subject to constant bombardment. Gen. Smith-Dorrien proposed to withdraw to a line nearer Ypres. In consequence, however, of Gen. Foch's protests and promises that the French would regain the ground they had lost, and of the political desirability of not abandoning any more Belgian territory if it could be avoided, Sir John French agreed to leave his troops in their exposed position for some days longer. Gen. Joffre, having in preparation his great offensive which was to begin on May 9, near Arras, was not disposed to allow Gen. Foch to employ any more troops near Ypres; and the French attacks languished.

The Withdrawal from the Apex of the Salient.—When on May 1 the French infantry in a projected attack failed to leave their trenches, all hope of their recovering ground came to an end, and Sir John French directed Gen. Plumer, who by his orders was now in special charge of the operations near Ypres, to begin the retirement to the Frezenberg line, abandoning a zone some 2m. deep. This retirement was carried out with complete success by the infantry brigades of the 27th, 28th and 4th (which had replaced the Canadian) Divisions in the line on the nights of May 1–2, 2–3, and 3–4. The French now held the 1½m. of the left of the new semicircle round Ypres.

The Renewed German Attacks.—All hope of obtaining victory by gas attacks having disappeared, as the Allies were prepared for them, the Germans now tried by sheer weight of artillery to drive the British off their new position. After finally getting possession of Hill 60 on May 5–6, they made carefully prepared attacks on May 8 and on May 24. In spite of splendid defence and desperate British counter-attacks, in which the 4th, 27th, 28th, and Northumbrian Divisions and the Cavalry Corps troops were engaged, the enemy, dominating the situation with heavy artillery, gained a small amount of ground. Meanwhile, on the night of May 15–16, he had been compelled by the French to abandon his position on the western bank of the canal. On May 25, after the II. Corps had established itself on a strong line, the Germans brought the battle to a close.

The total British losses in the Ypres and Hill 60 fighting were 2,150 officers and 57,125 other ranks, the total killed being 10,519. The German losses on the Allied front were returned at 860 officers and 34,073 other ranks.

See "Military Operations, France and Belgium, 1915," *History of the Great War based on Official Documents*, vol. i., with a bibliography (1927); Palat, *Grande Guerre sur le front Occidental*, vol. ix. (1922); M. Schwarte, *De deutsche Landkrieg*, vol. ii. (1923). The French and German official accounts are not yet available, but official information furnished in advance is included in the British account. (J. E. E.)

YPRES, BATTLES OF 1917. Almost continuous fighting took place in the Ypres-Yser region during many weeks in the summer and autumn of 1917, but the operations as a whole may be said to have consisted of two distinct phases. First came the brilliantly successful combat, lasting a few hours, which has come to be known as the battle of Messines. Then, after a lull, there came to be launched immediately north of the scene of the Messines victory a series of attacks at short intervals which lasted four months. This was not a battle, but rather a campaign, with the fighting more defined than the purpose—of the nature familiar in the military annals of Flanders and the Low Countries generally. Like its German forerunners of 1914 and 1915, it achieved little except loss—in which, again, it repeated the earlier history of this theatre of war. So fruitless in its results, so depressing in its direction was this 1917 offensive, that "Passchendaele" has come to be, like Walcheren a century before, a name of ill-omen and a synonym for military barrenness.

An offensive in this sector had formed part of Haig's original contribution to the Allied plan for 1917. Its actual inauguration had been postponed by the unfortunate turn of events elsewhere. When the ill-success of the opening offensive in the spring at Arras (*q.v.*) and in Champagne (*q.v.*) was followed by the threatened collapse of the French army as a fighting force, Haig's "first-aid" treatment was to allow the British offensive at Arras by the III. Army to continue for some weeks longer, with the general object of keeping the Germans occupied, and with the local object of reaching a good defensive line. When successive thrusts, against an enemy now fully warned and strengthened, failed to reach this line, Haig decided to transfer the main weight of this effort northward to Flanders, as he had originally intended. His loyalty to his Allies and his acute sense of the common interest, inspired him to press on with an offensive policy.

It is right to emphasise that in May Haig's opinion of the policy to pursue was reinforced by the Prime Minister, Lloyd George, who, having committed himself to the Nivelle gamble for victory,

was equally ardent to continue the offensive. It is true, however, that on cooler reflection he subsequently tried in vain to check the policy which he had countenanced.

British Objectives.—The aim was the occupation of the whole of the belt of high ground which extends from a point about three miles north of Armentières, to near Dixmude. It rises some 100 to 150 ft. above the great Flanders plain, and reaches a height of over 200 ft. at some points. In the spring of 1917 its southern portion enclosed to a great extent the Ypres salient, although the Allies' trenches gave them possession of the lower slopes of their side of the high ground. Farther to the north the enemy held the whole of the high ground. The general plan of operations was to begin at the southern end and to work thence northwards. The capture of the high ground was to be followed by an advance in the coast district. But the axis of the attack diverged from, instead of converging on, the German main communications, so that an advance could not vitally endanger the security of the enemy's position in France.

But, worse still, the Ypres offensive was doomed before it began—by its own destruction of the intricate drainage system in this part of Flanders. The High Command had persevered for over two years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in October, threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable.

THE BATTLE OF MESSINES

The preliminary move is known as the Battle of Messines, and its purpose was to gain the high ground about Messines and Wytschaete as a flank bastion for the subsequent advance from Ypres. For while in German possession it gave the enemy complete observation of the British trenches and forward battery positions, enabled them to command the British communications up to the Ypres salient, and to take in enfilade, or even in reverse, the trench positions therein. General Plumer and his II. Army, who had been acting as wardens of the Ypres front for two years, had been selected to carry out this operation, while the V. Army under General Gough had been transferred from the Somme to hold the line north of the II. Army. Preparations for the undertaking had begun nearly a year before although their real development dated from the winter. Thus when Haig asked Plumer, on May 7, when he would be ready to deliver the attack Plumer was able to say, "a month from to-day," and to keep his promise.

Messines was to be a strict siege operation, the capture of a fortified salient at the minimum cost of lives by the maximum substitution of mind (care in preparation) and material for manpower. Mines, artillery, gas and tanks all contributed. But a contrary wind curtailed most of the scheme of gas projection, and the effect of the mines and artillery was so overwhelming that the tanks were hardly needed. On the centre corps front alone, of about three miles, a total of 718 guns and howitzers, 192 trench mortars, and 198 machine-guns was concentrated.

For the defence of this salient the Germans depended on two separate trench systems coinciding in trace with its arc, the more advanced one pushed down the forward slope of the high ground while the rear one followed its crest; they had also constructed two chord positions, stretching along the base of the salient on the reverse slope. The troops of the II. Army detailed for the enterprise were, from right to left, the II. Anzac Corps, with the Australian 4th Division in support, the IX. Corps with the 11th Division in support, and the X. Corps with the 24th Division in support. There were thus nine divisions in front line and three in support. The fact that the attack would converge against a salient increased its chances, but it complicated the staff, troop, and artillery organization of the attack. For the sectors of each attacking corps were of varying depths, and contracted more and more in width up to the final objective which was the chord of the arc forming the salient. As, however, it was a siege operation, without any attempt at exploitation or a break-through, it was easier to avoid the congestion which had occurred at Arras (*q.v.*). The problem was further simplified by the plan of allotting sectors so that five of the divisions had sectors of equal breadth from front to rear, while the four which filled the interstices had smaller tasks. Further, when the main ridge was captured, fresh troops were to "leap-frog" through to gain the final Oosttaverne line across the base of the salient. The first bombardment and "wire-cutting" began on May 21, were developed on May 28 and culminated in a seven days' intense bombardment, mingled with practice barrages to test the arrangements. The loss of surprise did not matter at Messines as it was a purely "limited" attack.

At 3.10 A.M. on June 7 the nineteen mines—one only had previously been blown by the enemy—were exploded, wrecking large portions of the Germans' front trenches. Simultaneously the barrage fell. When the débris and shock of the mines subsided, the infantry advanced and within a few minutes the whole of the enemy's front line system was overrun, almost without opposition. Resistance stiffened as the penetration was deepened, but the training of the infantry and the efficiency of the barrage enabled continuous progress to be made, and within three hours the whole crest of the ridge was secured.

The New Zealand Division had cleared the intricate fortifications of Messines itself—here the pace of the barrage was regulated to 100 yards in fifteen minutes instead of the general pace of 100 yards in three minutes. The garrisons of Wytschaete and the White Chateau held out for a time, but the first village was captured after a fierce struggle by troops of the 36th (Ulster) and 16th (Irish) Divisions in a combined effort—a feat of symbolical significance. Perhaps the most difficult sector was that of the 47th (London) Division, which had not only to overcome the highly fortified position of the White Chateau but had the Ypres-Comines canal as an oblique interruption across its line of advance. The Londoners, however, overcame both and by 10 A.M. the objective of the first phase was reached along the whole attacking line. While it was being consolidated, over forty batteries were moved forward to support the next pounce.

At 3.10 P.M. the reserve divisions and tanks "leap-frogged" through and within an hour almost the whole of the final objective was captured. Some 7,000 prisoners had been taken, apart from dead and wounded. The success had been so complete that only feeble counter-attacks were attempted that day. When the expected general counter-attack was launched on the whole front on the morrow, it failed everywhere against defences that had been rapidly and firmly organized, and in the recoil yielded the British still more ground.

THE MAIN OFFENSIVE

A long pause now occurred while preparations for carrying out the rest of Haig's programme were being completed. Although Plumer's victory of June 7 had put an end to the enemy overlooking Ypres from the south, the Germans still, in a measure, dominated the place from the east, from the north-east and from the north. Thus the preparations could not be concealed and the Germans knew that they were being made. The plan at the outset was that, while the II. Army stood fast, the V. Army under Gough on its left with the French I. Army still further to the left, should attack the enemy front from near Hooge to north of Steenstraat on the Yser canal.

Nearly two months passed before the preparations for the main advance were completed. This gave the Germans, amply warned, time to make counter-preparations of characteristic thoroughness and ingenuity. Having learnt by experience that a continuous system of trenches did not offer a satisfactory form of defence unless there was abundant underground cover, and realizing that the waterlogged soil of Flanders handicapped the creation of subterranean galleries, they had established a system of numerous disconnected trenches and strong points, arranged in depth rather than in breadth, together with numbers of concrete blockhouses armed with machine-guns. As their front line near Ypres had been in existence since 1915, they trusted to the old system to meet the first shock of attack, and it was rather in the

later offensive operations that the Allies found themselves confronted with these new defensive devices. A further new asset was the introduction of mustard gas which the Germans used to cause serious interference with the attackers' artillery.

On July 22 the bombardment opened, by 2,300 guns, to continue for ten days, until on July 31 the infantry advanced on a fifteen-mile front to the accompaniment of torrential rain. On the left substantial progress was made, Bixschoote, St. Julien, and the Pilckem Ridge being gained, and the line of the Steenbeke reached. But in the more vital sector round the Menin road the attack was repulsed.

The second blow, on Aug. 16, was a diminished replica of the first in its results. The left wing was again advanced across the shallow depression formed by the little valley of the Steenbeke and past the ruins of what had been Langemarck. But on the right, where alone an advance might have a strategic effect, a heavy price was paid for nought, and even the tally of prisoners shrank to a mere two thousand. Nor did men feel that the enemy's skilful resistance and the mud were the sole explanation of their fruitless sacrifice. Severe complaints against the direction and staff work were general, and their justness seemed to receive recognition when Haig extended the II. Army's front northward to include the Menin road sector, and thereby entrusted to Plumer the direction of the main advance towards the ridge east of Ypres.

It was a thankless task at the best, for the experience of war attested the futility of pressing on in places where failure had already become established, and it seemed heavy odds that the laurels earned by Messines must become submerged in the swamps beyond Ypres. Yet, in the outcome, the reputation of Plumer and the II. Army staff, headed by Harington, was enhanced—less because of what was achieved in scale than because so much more was achieved than could reasonably have been expected.

Bad weather and the need for preparation delayed the resumption of the offensive until Sept. 20, but that morning the II. Army attack, on a four-mile front, achieved success in the area of previous failure—on either side of the Menin Road. Fractions of six divisions, the 19th, 39th, 41st, 23rd, 1st and 2nd Australian advanced at 5.40 A.M.; by 6.15 A.M. the first objective was gained almost unopposed, and, with the exception of one or two strong points, the third and last objective was gained soon after midday, and the counter-attacks were repulsed by fire. A fresh spring on Sept. 26, and another on Oct. 4—the last a larger one on a six-mile front, by troops of the 37th, 5th, 21st, and 7th Divisions, the 1st, 2nd, and 3rd Australian Divisions, and the New Zealand Division—gained possession of the main ridge east of Ypres, with Gheluvelt, Polygon Wood, and Broodseinde, despite torrents of rain, which made the battlefield a worse morass than ever. On each occasion the majority of the counter-attacks had broken down under the British fire, a result which owed much to the good observation work of the Royal Flying Corps and the quick response of the artillery. Some 10,000 prisoners were swallowed in the three bites, and this frightened the enemy into modifying his elastic tactics and strengthening his forward troops—to their increased loss.

As a result of the operations begun on June 7 the crest of the long belt of high ground overlooking the Flanders plain had now, after four months of intermittent fighting, been secured from Messines northwards to within a few hundred yards of the Ypres-Roulers railway. And yet, regarding this Flanders offensive as a whole, the work was in reality only begun. The Houthulst forest, with the long line of high ground forming the quadrant of a circle beyond it, was still in the enemy's hands. Until the ridge had been secured to the vicinity of Staden it would be premature to embark upon the second part of the general scheme of operations—an attack on the German positions along the coast between Nieuport and Ostend, for which the IV. Army under General Rawlinson had been assembled on the extreme left.

Unhappily, the Higher Command decided to continue the pointless offensive during the few remaining weeks before the winter, and thereby used up reserves which might have saved the belated experiment of Cambrai (*q.v.*) from bankruptcy. Having wasted the summer and strength in the mud, where tanks foundered and infantry floundered, they turned in November to dry ground—where a decisive success went begging for lack of reserves.

At Ypres minor attacks on Oct. 9 and 12 advanced the line a trifle, and then, after an interval, a combined attack by the V. Army and the French was tried, with small result, on Oct. 22. On Oct. 26 the II. Army, in torrents of rain, as usual, made a fresh effort, which was less successful than before, owing to the exhaustion caused by pushing forward over a morass and to the fact that the mud not only got into and jammed rifles and machine-guns but nullified the effect of the shell-bursts. The trials of the attackers were augmented by the enemy's increasing use of mustard gas, and by his renewed adoption of his tactics of holding the bulk of his troops well back for counter-attack. Thus when, on Nov. 4, a sudden advance by the 1st Division and 2nd Canadian Division gained the empty satisfaction of occupying the site of Passchendaele village, the curtain was at last rung down on the pitiful tragedy of "Third Ypres." It was the long-overdue close of a campaign which had brought the British armies to the verge of exhaustion, one in which had been enacted the most doleful scenes in their history, and for which the only justification evoked the reply that, in order to absorb the enemy's attention and forces the Higher Command had chosen the spot most difficult for the defender and least vital for the attacker.

(B. H. L. H.)

YPSILANTI or HYPSILANTI, the name of a family of Phanariot Greeks claiming descent from the Comneni. ALEXANDER YPSILANTI (1725–1805) was dragoman of the Porte, and from 1774 to 1782 hospodar of Wallachia. He was again appointed hospodar just before the outbreak of the war with Austria and Russia in 1790. He allowed himself to be taken prisoner by the Austrians, and was interned at Brünn till 1792. Returning to Constantinople, he fell under the suspicion of the sultan and was executed in 1805. His son CONSTANTINE (d. 1816), who had joined in a conspiracy to liberate Greece and, on its discovery, fled to Vienna, had been pardoned by the sultan and in 1799 appointed by him hospodar of Moldavia. Deposed in 1805, he escaped to St. Petersburg, and in 1806, at the head of some 20,000 Russians, returned to Bucharest, where he set to work on a fresh attempt to liberate Greece. His plans were ruined by the peace of Tilsit; he retired to Russia, and died at Kiev. He left five sons, of whom two played a conspicuous part in the Greek war of independence.

ALEXANDER YPSILANTI (1792–1828), eldest son of Constantine Ypsilanti, accompanied his father in 1805 to St. Petersburg, and in 1809 received a commission in the Imperial Guard. He fought with distinction in 1812 and 1813, losing an arm at the battle of Dresden. He was one of Alexander's adjutants at the congress of Vienna. In 1820, on the refusal of Capo d'Istria to accept the post of president of the Greek *Hetairia Philike*, Ypsilanti was elected, and in 1821 he placed himself at the head of the insurrection against the Turks in the Danubian principalities. With other Greek officers in the Russian service he crossed the Pruth on March 6, announcing that he had the support of a "great power." There followed a series of humiliating defeats, culminating in that of Dragashan on June 19. Eventually he crossed the frontier into Austria in the hope of finding an asylum. He was immediately thrown into prison, where he remained for seven years. He died at Vienna on Jan. 31, 1828.

DEMETRIOS YPSILANTI (1793–1832), second son of Prince Constantine, fought as a Russian officer in the campaign of 1814, and in the spring of 1821 went to Morea, where the war of Greek independence had just broken out. In January 1822 he was elected president of the legislative assembly; but retired early in 1823. In 1828 he was appointed by Capo d'Istria commander of the troops in East Hellas. He succeeded, on Sept. 25, 1829, in forcing the Turkish commander Aslan Bey to capitulate at the Pass of Petra, which ended the active operations of the war. He died at Vienna on Jan. 3, 1832.

See the works cited in the bibliography of the article GREEK INDEPENDENCE, WAR OF, especially the Δοκίμιον ἱστορικόν of J. Philemon.

YPSILANTI (ĭp-sĭ-lăn'tĭ), a city of Washtenaw county, Michigan, U.S.A., on the Huron river, 713 ft. above sea-level,

30 m. W. by S. of Detroit. It is on Federal highways 23 and 112, and is served by the Michigan Central and the New York Central railways, interurban trolleys and motor-bus lines. The population was 7,413 in 1920 (83% native white) and was estimated locally at 13,500 in 1928. It is the seat of the Michigan State Normal college (1849), one of the pioneer institutions of the kind in the United States, with an annual enrollment of over 3,500. The city's assessed valuation for 1926 was $13,476,786, and the output of its diversified manufacturing plants was valued at $5,140,000. Ypsilanti was laid out in 1825 and named after the Greek patriot. It was incorporated in 1832 and chartered as a city in 1858.

YPURINAN, a small group of tribes of South American Indians, forming an independent linguistic stock. The Ypurinas (Hypurinas) live in western Brazil, on the upper Purus and Acre rivers. They are forest rather than river Indians.

See W. Chandless, "Notes on the Tapajos, Purus and Aquiry" (*J. Roy. Geog. Soc.* vol. xxxvi., xxxix.); J. B. Steere, "Narrative of a visit to Indian Tribes of the Purus River, Brazil" (*U.S. Nat. Museum, Rep.* 1901).

YSAŸE, EUGÈNE (1858–), Belgian violinist, was born at Liége in 1858, where he studied with his father and under R. Massart, at the Conservatoire, until he was fifteen; he had some lessons from Wieniawski, and later from Vieuxtemps. In 1879 Ysaÿe played in Germany, and next year acted as leader of Bilse's orchestra in Berlin; he appeared in Paris in 1883, and for the first time in London at a Philharmonic concert in 1889. He was violin professor at the Brussels Conservatoire from 1886 to 1898, and instituted the celebrated orchestral concerts of which he was manager and conductor. Ysaÿe first appeared as conductor before a London audience in 1900, and in 1907 conducted *Fidelio* at Covent Garden. The sonata concerts in which he played with Raoul Pugno (b. 1852), the French pianist, became very popular in Paris and Brussels, and were notable features of several London concert seasons. As a violinist he ranks with the finest masters of the instrument, with extraordinary temperamental power as an interpreter. During the war he went to America, and for some time conducted the Cincinnati orchestra. He has received many orders and decorations, including the Legion of Honour. His compositions include *Poème élégiaque* for violin and orchestra and other pieces for violin, violoncello, etc. His brother THÉOPHILE YSAŸE (1865–1918), pianist and composer, was born at Verviers in 1865. He studied at Liége and in Berlin, and finally in Paris under César Franck.

YSER, a small coastal river, 78 km. long, of which 50 km. are in Belgian territory. It is famous as marking the point, in the World War (1914–18), at which the German advance towards Calais and the English coast was checked. On Oct. 10, 1914, the Belgian army, after being forced to evacuate Antwerp and Ghent, retreated on the Yser; on the 16th the battle of the Yser began, and the Allied troops fought desperately for 15 days. Eventually, assisted by the floods which, beginning on Oct. 29, reached Dixmude by Nov. 2, the allies succeeded in establishing themselves in an impregnable position on the left bank of the Yser.

YSER, BATTLE OF THE. On Oct. 10, 1914, the Belgian field army encamped on the west bank of the Ghent-Terneuzen canal (*see* ANTWERP, SIEGE OF). The British Naval Division, which had embarked at St. Gilles-Waes, regained Dunkirk except two battalions, which were cut off, and passed into Holland; the French Fusilier Marine Brigade, half of the British 7th Division and the 4th Belgian Brigade were holding Ghent and had repulsed an attack on that city by the 1st Res. Ersatz Brigade. Information had been received that a Bavarian cavalry division had advanced towards Deynze exploring between the Schelde and the Lys; that a column of 20,000 men had passed through Courtrai and Menin and that the German IV. Cavalry Corps was holding the region Tourcoing-Ypres-Poperinghe. The only way for the Belgian army to baffle the threat of envelopment on a large scale was an immediate march to the coast. It was decided to transport all the forces without delay to the region of Ostend-Thourout-Dixmude-Furnes, the infantry by rail, the artillery and transport by road, under the protection of all the cavalry and Rawlinson's Corps.

Plans of Opposing Commanders.—The "race to the sea" had in the meantime caused the Western Front to extend to La Bassée. The British army had been withdrawn from the region of the Aisne and was beginning to detrain west of Lille. A few French divisions, taken from other sectors, were given the same destination. It seemed to Gen. Joffre that the moment had come for bringing about the much-desired envelopment of the German right wing by a concentric offensive against Lille. The British army, the Belgian army and some French reinforcements would constitute, it was believed, under the high command of Gen. Foch, an *ensemble* capable of securing a decisive victory. Unfortunately, the assembling of the Allied troops by means of the Paris-Calais and Paris-Hazebrouck railways would take time. On the other hand, it was necessary to take in account that the Beseler Army Group would not fail to follow the Belgians.

The mission of the Belgian army was once again that of gaining time. The king, anxious to keep his left wing resting on the sea, and to preserve at all costs a fragment of national territory from invasion, thought best to entrench the army on the river Yser and the Ypres canal.

Events soon proved the wisdom of this decision. The British II. and III. and Cavalry Corps were stopped at the Lys by the German IV., VII. and XIII. Corps; Rawlinson's Corps found Menin in the hands of the XIX. Corps. Beseler's troops now entered Bruges and Ostend. It was known that numerous detrainments were taking place west of Brussels and that a new German IV. Army had installed its headquarters at Ghent. In fact Falkenhayn, the new chief of the German general staff, had anticipated the Allies' projects and like them, considered the moment for a decisive victory to have arrived.

With four new army corps, composed mainly of volunteers, the XXII., XXIII., XXVI. and XXVII. Res. Corps, Beseler's group and the artillery park from the siege of Antwerp, Prince Albert of Württemberg was charged to proceed to the Yser with his right resting on the sea, in order to attack in flank and in rear the Allied left, whose front the VI. Army was engaging between Arras and Armentières. Falkenhayn considered that: "The conquest of the coast was the sole means of frustrating the war of blockade which England contemplated and of retaliating through our destroyers, submarines, aeroplanes and Zepplins. . . . If we succeeded in driving the enemy out of the Yser valley and pursuing him at the point of the sword, there was no doubt that, having replenished our ranks and our stores, we should be in a condition to overthrow the western front."

Thus the Belgian army, which had only just moved into position in the general Allied line, found itself in focus for a new battle. It occupied a front of 40 km., from the sea to Boesinghe, with 4½ divisions and 1½ divisions in reserve behind the centre. The cavalry division was operating with de Mitry's French Cavalry Corps, east of the forest of Houthulst. On the army's right a French territorial division extended as far as Ypres and Rawlinson's Corps had entrenched itself along the line Passchendaele-Gheluvelt.

Opening of the Battle.—The battle commenced on the 18th with an attack by Beseler's corps (4th Ersatz and 5th and 6th Reserve Divisions) between the sea and Keyem. The Belgian outposts were only driven back after desperate fighting and the enemy did not even reach the Yser. On the morning of the 19th Ronarc'h's Marine Brigade and the 5th Division debouched from Dixmude on the flank of the III. Res. Corps. Beerst and Vladsloo were retaken; but the intervention of the XXII. Corps, coming from Thourout, and the XXIII. coming from Cortemarck, foiled the counter-attack. By the 20th the fighting had become general all the way from the sea to Gheluvelt between the Duke of Württemberg's 5½ divisions on the one hand and the Belgian army, de Mitry's Cavalry Corps and Rawlinson's Corps on the other. After 48 hours of obstinate fighting the Belgian positions remained practically unchanged.

The attack of the 4th Ersatz Division on Nieuport had failed, partly on account of the flanking fire from Admiral Hood's flotilla; while that of the XXII. Corps against the bridgehead at Dixmude had been checked by Meiser's Brigade. But in the night

of the 21st–22nd the 6th Reserve Division made a surprise crossing of the Yser in the Tervaete salient and threw over 2½ battalions to the west bank. Concentrated artillery fire prevented the division from making any progress on the 22nd, but a gallant counter-attack, in which four battalions of grenadiers and carabineers faced death with superb indifference, broke down completely under their machine-gun fire, owing to the exposed nature of the ground. The following night the Germans passed a second regiment into the bend without, however, extending their ground.

On the 24th, the whole of the III. Reserve Corps and half of the 44th Reserve Division, covered by a bombardment from 10 heavy howitzer batteries and 150 field guns, broke through the front at St. Georges-Tervaete, only to find the Belgians deployed behind the Nieuport-Dixmude railway embankment, together with the French 42nd Division which had arrived in the meantime.

Finding themselves checked in this direction, the Germans renewed their attack on Dixmude. After a four hours' bombardment (in which 21 and 42 cm. howitzers were employed amongst others) which turned the town into a mass of burning ruins, the 43rd Reserve Division delivered its assault at midnight, driving its guns through the middle of—and even in advance of—its infantry. In spite of a threefold attempt it was completely repulsed by the 12th Belgian Regiment, assisted by some French companies of marines. A new attack on the night of the 25th–26th met with the same fate.

Opening of the Nieuport Sluices.—The battle had been in progress for eight days. Over a total of 48,000 rifles the losses amounted to 15,000 in all ranks. Many guns had been put out of action, by excessive use of rapid fire; the munitions were nearly exhausted, the men at the end of their tether. Neither the British nor the French, both hard pressed at Bixscoote, Langemarck and Zonnebeke, were able to send reinforcements. Having no reserves, the Belgian commander decided to call in the sea to his assistance.

On the 26th and 27th all the pioneers were set to stop up the 22 culverts of the Nieuport-Dixmude railway embankment so as to prevent the liberating tide from invading the Belgian positions. On the 27th at dawn a first attempt by the sluice of the Furnes canal, at high tide, failed to yield an effective result. Fresh attempts on the 28th and 29th proved that the inflow of water from this canal was too slight and too slow. Actually, another sluice, that of the Noordvaart, promised a larger delivery but as it lay in No Man's Land its utilization appeared hazardous. Fortunately, the Germans—also being weary—remained relatively quiet during that time. On the 29th, however, their artillery blazed forth again, and it seemed that a new attack was imminent. The Belgian command, acting on information from a waterman named Geeraert, determined on an audacious *coup*. During the night a party of pioneers opened the Noordvaart sluice under the noses of the enemy. Driven by a strong gale the sea water rushed through in a flood. At dawn on the 30th, the three divisions of Beseler's corps attacked along the line of the railway, taking possession finally of Ramscapelle and Pervyse; but the drains were now overflowing; the flooded meadows soon made it impossible for the Germans to advance or even to stay; no alternative was left to them but a hasty retreat. The battle of the Yser was won and the left flank of the Allies definitely saved. Checked along the coast line, the Germans moved the weight of their attack farther inland and made their desperate assault on Ypres. The Belgian army, in scrupulous observance of the spirit of the obligations of neutrality, had, from Aug. 4 to Oct. 31, 1914, gloriously defended its honour, paying the price with its blood and also with the loss of practically the whole of its territory. (*See* also YPRES, BATTLES OF, 1914.)

(R. VAN O.; X.)

YSTAD, a seaport of Sweden on the S. Baltic coast, in the district (*län*) of Malmöhus, 39 m. E.S.E. of Malmö by rail. Pop. (1928), 11,247. Two of its churches date from the 13th century. Its artificial harbour, which admits vessels drawing 19 ft., is freer from ice in winter than any other Swedish Baltic port.

YTTERBIUM, a rare metallic element (symbol Yb, atomic number 70, atomic weight 173·5), of the rare-earth group, was first separated by Marignac in 1878. In 1907 G. Urbain split paleoytterbium into neoytterbium and lutecium. Von Welsbach also, independently, separated Marignac's ytterbium into its two component elements. The new ytterbium he named aldebaranium. The name ytterbium is reserved by most chemists for that portion of the mixture exhibiting the main characteristics of Marignac's element. Ytterbium is almost identical with lutecium in its properties. It possesses a very characteristic spectrum and has a higher magnetic susceptibility than lutecium. (*See* RARE EARTHS.) (C. J.)

YTTRIUM, a metallic element (symbol Y, atomic number 39, atomic weight 89·0), belonging to the rare-earth group, was discovered by Gadolin in 1794 and further purified by Mosander in 1843. Only a few workers have prepared absolutely pure yttrium compounds. The common impurities are small amounts of holmium and erbium. The purity of yttrium compounds can best be determined by measuring the magnetic susceptibility, which for the oxide should be $-0{\cdot}12\times10^{-6}$. Traces of erbium and holmium cause the magnetic susceptibility to become strongly positive. Yttrium is one of the commoner rare earths found in the minerals gadolinite, xenotime, euxenite, etc. It may be separated from all others except erbium by the fractional crystallization of the bromates. The erbium may then be removed by boiling the nitrate solution with sodium nitrite, when the yttrium is the last to be precipitated. Yttrium oxide, Y_2O_3, is pure white and is rapidly attacked by most acids giving colourless solutions which show no absorption spectrum. The spark spectrum is very characteristic and strong. The pure metal has never been prepared. (*See* RARE EARTHS.) (C. J.)

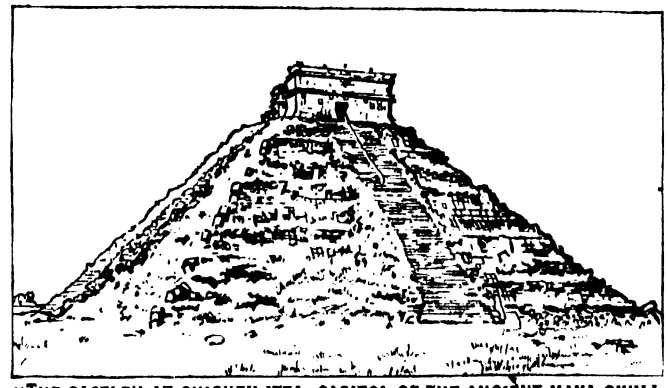
YUAN SHIH-K'AI (1859–1916), Chinese statesman, was born at Hsiang Cheng, a member of a family belonging to the smaller landed gentry of the province of Honan. His first important post was in Korea, where, as Imperial Resident and the trusted lieutenant of the Viceroy Li Hung-chang, he strove by adroit diplomacy to preserve China's shadowy suzerainty over the Hermit Kingdom and to check the steadily increasing ascendancy of Japan. After the Chino-Japanese war (1894–95) he held office as judicial commissioner, with military functions, under the viceroy Li, in Chihli, where he brought the troops to a remarkable standard of efficiency.

In Aug. 1898, the emperor Kuang Hsü, hoping to secure Yuan's services in support of his scheme to seize and imprison the empress dowager, summoned him to a special audience at the Summer Palace. The subsequent *coup d'état* by the empress dowager, which removed the emperor from the throne and replaced him under severe tutelage, owed its success to Yuan's betrayal of the emperor's confidence and to his active support of the conservative Manchu party. To the end of his unhappy career, the emperor never forgave Yuan's treachery, and on his death-bed (Nov. 1908) bade his brother, Prince Chun, see to it that he should not go unpunished.

Yuan received from the empress dowager the governorship of Shantung as reward for his services. In the summer of 1900, on the outbreak of the Boxer rising, he maintained order and protected foreigners throughout his jurisdiction. He had no sympathy with the empress dowager's anti-foreign policy. After the signature of the peace protocol (Peking 1901), as the aged Li Hung-chang desired to be relieved of further duty, Yuan was appointed to act in his place as viceroy of Chihli. At Li's death (Dec. 1901) the appointment was made substantive. Yuan now held the highest office in the gift of the Throne; at the same time he was made a Junior Guardian of the heir apparent. A month later the Yellow Jacket was conferred upon him, together with the appointments of consulting minister to the Government council and director general of the northern railway. In the following year he became a minister of the army reorganization council. During the five years of his viceroyalty, he raised and equipped six divisions of troops, greatly superior in every way to those of the Peking field force or the best provincial levies. But his rapid rise to place and power aroused much jealousy, and, in 1907, a cabal

against him, led by his old rival, the ex-Boxer Tatar general Tieh Liang, persuaded the empress dowager to transfer him from the Tientsin viceroyalty to the capital. He was made grand councillor and president of the Board of Foreign Affairs, which post he held until the death of the dowager and the emperor in Nov. 1908.

For a month after the death of the "Old Buddha," rumours were rife in the north concerning the regent, Prince Chun's, vindictive intentions with regard to Yuan. But he merely deprived Yuan of office (Jan. 2, 1909) and ordered him into retirement at his native place in Honan. But on the outbreak of the revolution the regent, by an edict of Nov. 14, 1911, appointed him viceroy of Hunan and Hupeh, with a mandate to proceed south with his foreign-drilled troops and put an end to the insurrection. Yuan clearly foresaw and declared that if the monarchy were overthrown, the result would be chaos, "amidst which all interests would suffer and for several decades there would be no peace." Thus his avowed policy was to preserve a limited monarchy, pledged to systematic and practical reforms. Had he been loyally served by his representative, Tang Shao-yi, in the negotiations with the revolutionary leaders at Shanghai, above all, had he received the support which he was entitled to expect in the shape of a foreign loan, he might have won. As it was, he continued to fight on, practically single-handed, against the forces of disruption, until Feb. 1912 when the terrified Manchu court decided to abdicate. Within two days of the issue of the abdication edict (Feb. 12), the southern revolutionaries, on the initiative of Sun Yat-Sen, exemplified the "unbroken continuity of immemorial tradition" in China by inviting him to stand for the presidency of the republic.



Yuan made a virtue of necessity, and on March 12 took the oath of office as president. Nevertheless he continued to uphold the principles which he had publicly proclaimed in justification of his defence of the monarchy, and to insist upon maintenance of the continuity of the classical tradition of government and the preservation of the Confucian system. He was willing for a time to pay lip-service to the republican formulas, but his actions proved clearly that he had no sympathy with Canton.

In the summer of 1913, a "war to punish Yuan" was started in the south by Sun Yat-Sen, Huang Hsing and other malcontents, but Yuan, having by this time secured a foreign loan and the moral support of the Powers, had no difficulty in retaining the venal "loyalty" of the chief military commanders in the provinces; the Cantonese insurrection came, therefore, to a swift and inglorious end. But Yuan dissolved and proscribed the Kuo-min tang, and with it made an end of its farce of parliamentary government and representative institutions.

The movement for the restoration of the throne organized by Yuan's adherents, began to take shape in the autumn of 1915. The leaders of the movement failed especially to perceive the danger created by Japan's 21 demands (May 1915), and to realize that the active opposition of the Japanese Government would in all probability be fatal to Yuan's ambitions. In October the State council referred the question of the monarchy to the provinces. The result (a foregone conclusion) was a practically unanimous vote in favour of Yuan's accession. Meanwhile, however, the Japanese minister at Peking, supported by his British and Russian colleagues, had made friendly representations to the Chinese Foreign Office, deprecating the restoration of the monarchical system at this juncture. But on Dec. 12 the monarchy was proclaimed and the enthronement ceremony fixed for Feb. 9, 1916. A week after this announcement, an insurrection, led by one of Yuan's own nominees, broke out in Yünnan. The movement spread rapidly, one province after another declaring its independence. On Jan. 22 Yuan announced the postponement and the establishment of the monarchy. Towards the end of April he consented, while retaining the presidency, to surrender all civil authority to the cabinet, under the premiership of Tuan Chi-jui. He died on June 6, 1916. With him passed the last of the great viceroys of the old régime.

YUCATAN, a peninsula of Central America, which includes in its area of 55,400 sq.m. the States of Campeche and Yucatan and the territory of Quintana Roo in Mexico, plus small parts of British Honduras and Guatemala. The natural boundary of the peninsula on the south is formed in part by the ridges extending across northern Guatemala, the line terminating in the east at the lower part of Chetumal bay, and in the west at Laguna de Terminos. From this base the land extends north and slightly east between the Gulf of Mexico and the Caribbean sea in nearly rectangular form for about 280 m., with a mean breadth of about 200 m., and a coast-line of 700 miles.

Physical Features.—The coast on the north and west is low, sandy and semi-barren. The outer shore-line on the north for nearly 200 m. consists of a narrow strip of low sand dunes, within

"THE CASTLE" AT CHICHEN ITZA, CAPITOL OF THE ANCIENT MAYA CIVILIZATION, SHOWING A CEREMONIAL TEMPLE ON TOP OF THE GREAT MOUND

which is a broad channel terminating to the east in a large lagoon. There are a number of openings through the outer bank and several small towns or ports have been built upon it. The eastern coast consists of bluffs, indented with bays and bordered by several islands, the larger ones being Cozumel (where Cortés first landed), Cancum, Mujeres and Contoy. There is more vegetation on this coast, and the bays of Chetumal, Espiritu Santo, Ascencion and San Miguel (on Cozumel island) afford good protection for shipping. It is, however, sparsely settled and has little commerce except in henequén, and in chicle, the basis for chewing gum.

The peninsula is almost wholly composed of a bed of coralline and porous limestone rocks, forming a low tableland, which rises gradually toward the south until it is merged in the great Central American plateau. It is covered with a layer of thin, dry soil, through the slow weathering of the coral rocks.

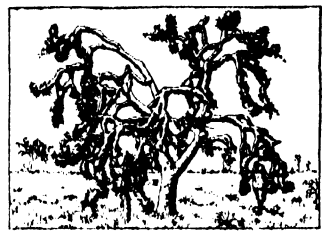
LOADING SISAL AT PROGRESO, YUCATAN, FOR SHIPMENT TO AN AMERICAN CORDAGE FACTORY

The climate of Yucatan is hot and dry and the absence of high mountainous ridges to intercept the moisture-bearing clouds from the Atlantic gives it a limited rainfall. The temperature ranges from 75° to 98° F in the shade, but the heat is modified by cool sea winds which prevail day and night throughout the greater part of the year. The atmosphere is also purified by the fierce *temporales,* or "northers," which occasionally sweep down over the Gulf and across this open region. The dry season lasts from October to May, the hottest months appear to be in March and April, when the heat is increased by the burning of the corn and henequén fields.

All the northern districts, as well as the greater part of the Sierra Alta, are destitute of large trees; but the coast-lands on both sides towards Tabasco and British Honduras enjoy a sufficient rainfall to support forests containing the mahogany tree, several valuable cabinet woods, vanilla, logwood and other dye-woods. Logwood forests fringe all the lagoons and many parts of the seaboard, which are flooded during the rainy season. The chief cultivated plants are maize, the sugar-cane, tobacco, cotton, coffee and

especially henequén, which produces the so-called "sisal hemp."

History.—The modern history of Yucatan begins with the expedition of Francisco Hernandez de Cordova, a Spanish adventurer settled in Cuba, who discovered the east coast of Yucatan in Feb. 1517, when on a slave-hunting expedition. He followed the coast round to Campeche, but was unable to penetrate the interior. In 1518 Juan de Grijalva followed the same coast, but added nothing to the information sought by the governor of Cuba. In 1519 a third expedition, under Hernando Cortés, the conqueror of Mexico, came into collision with the natives of the island of Cozumel. In 1525 the inland part of the peninsula was traversed by Cortés during an expedition to Honduras. The conquest of the peninsula was undertaken in 1527 by Francisco de Montejo, who encountered a more vigorous opposition than Cortés had on the high plateau of Anáhuac. In 1549 Montejo had succeeded in establishing Spanish rule over barely one-half of the peninsula, and it was never extended further. The Spaniards found here the remains of a high aboriginal civilization which had already entered upon decline. There were deserted cities falling into ruins, and others, like Chichen-itza, Uxmal and Tuloom, which were still inhabited by remnants of their former Maya populations. (For details of the Maya civilization *see* CENTRAL AMERICA: *Archaeology* and *Ethnology;* also CHRONOLOGY: *Mexican and Maya.*)



CHARACTERISTIC THATCH-ROOF DWELLING OF THE POORER CLASS IN YUCATAN

Since the Spanish conquest, the Mayas have clung to the semi-barren, open plains of the peninsula, and have more than once revolted. They seceded in 1839 and maintained their independence until 1843. In 1847 another revolt followed, and the Indians were practically independent throughout the greater part of the peninsula until near the beginning of the Diaz administration. In 1910 there was another revolt with some initial successes, such as the capture of Valladolid, but then the Indians withdrew to the unknown fastnesses of Quintana Roo.

The Mexican State of Yucatan occupies the northern part of the Yucatan peninsula, and is bounded east and south by the territory of Quintana Roo, and south and west by the State of Campeche. Its population in 1921 was 358,221 or a density of 24·10 per square mile. The capital is Merida.

Quintana Roo was separated from the State of Yucatan in 1902 and received a territorial government under the immediate supervision of the national executive, but its few remaining Indian tribes (pop. in 1921, 10,966, or 0·57 per sq.m.) are practically independent.

YUCCA, a genus of the family Liliaceae (*q.v.*), containing about 30 species. The plants occur in greatest frequency in Mexico and the south-west United States, extending also into Central America, and occurring in such numbers in some places as to form straggling forests. They have a woody or fibrous stem, sometimes short, and in other cases attaining a height of 30 ft. to 40 ft., and branching at the top into a series of forks. The leaves are crowded in tufts at the ends of the stem or branches, and are generally stiff and sword-shaped, with a sharp point, sometimes flaccid and in other cases fibrous at the edges. The numerous flowers are usually white, bell-shaped and pendulous, and are borne in much-branched terminal panicles. The three-celled ovary is surmounted by a short thick style, dividing above into three stigmas, and ripens into a succulent berry in some of the species, and into a dry three-valved capsule in others. The flowers are fertilized entirely through the agency of certain moths. (*See* POLLINATION and YUCCA-MOTH.)

THE JOSHUA-TREE (YUCCA BREVIFOLIA), A TREE YUCCA OF THE SOUTHWESTERN DESERTS OF THE UNITED STATES, SOMETIMES 35 FT. HIGH

A coarse fibre is obtained by the Mexicans from the stem and foliage, which they utilize for cordage, and in the south-east United States the leaves of some species, under the name "bear-grass," are used for seating chairs, etc. The fruits of some species are cooked as food, and the roots of others contain a saponaceous matter used in place of soap.

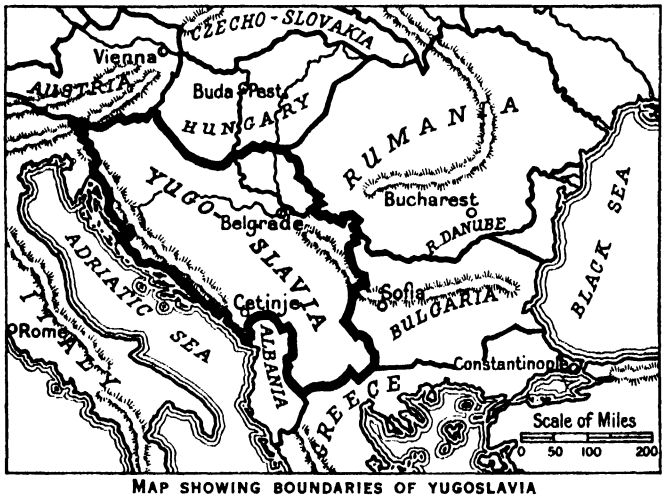
Some 15 species of Yucca are native to the United States; of these nine attain the stature of small trees. Among the best known are the Spanish bayonet (*Y. aloifolia*), the Spanish dagger (*Y. gloriosa*) and the bear-grass or Adam's-needle (*Y. filamentosa*), of the south Atlantic and Gulf coast, all of which are planted for ornament. Among the most conspicuous are the Joshua tree (*Y. brevifolia*), sometimes 35 ft. high, and the Mohave yucca (*Y. mohavensia*), 8 ft. to 15 ft. high. An almost stemless species (*Y. Whipplei*), called mission bells and Quixote-plant, which rears a stout flower-stalk, 12 ft. to 15 ft. high, bearing an immense cluster, 3 ft. to 6 ft. long, of fragrant, creamy-white, drooping bell-shaped flowers, is a strikingly handsome plant of the southern California chaparral (*q.v.*). The western Spanish bayonet (*Y. baccata*), found from New Mexico to California, bears a dark purple edible fruit.

YUCCA-MOTH, the name given to a genus of moths, *Pronuba,* the various species of which are each adapted to a separate species of the yucca (*q.v.*). The moth emerges at the time of opening of the yucca flowers, which frequently remain open only for a single night. The female moth rolls together a ball of pollen, flies to another flower, lays four or five eggs in the pistil and inserts the pollen mass in the opening thus formed. Each larva, on hatching from the egg, requires about 20 seeds of the yucca plant as food. As the plant produces some 200 ovules, this leaves about 100 seeds over to perpetuate the plant. The yucca can be fertilized by no other insect. The larva of the yucca-moth can only live on its own species of yucca.

YUCHI, an Indian tribe, formerly on the Savannah river in Georgia and South Carolina to the number of 3,000–4,000, constituting a separate linguistic stock. They gradually joined the Creek confederacy and about 500, mixed with white and negro blood, survive in the Creek area in Oklahoma. Their culture was marked by traits of Muskogi type.

See F. G. Speck, *Anthr. Publ. Mus. Univ. Penn.,* i. (1909).

YUDENICH, NIKOLAI NIKOLAEVICH (1862–), Russian soldier, was born July 18, 1862. He entered the army in 1879, and from 1887 to 1902 served on the general staff. In 1902 he became a regimental commander, in 1905 a general, an assistant chief of staff in 1907 and a chief of staff in 1913. At the beginning of the World War he commanded the II. Turkistan Corps, and was soon placed in command of all the military forces in the Caucasus, a post which he held till the arrival of the Grand Duke Nicholas in 1915. In March 1917 he resumed command, but further advance was rendered impossible by the increasing disorganisation of the Russian army. In 1919 Yudenich led anti-Bolshevik forces in an attempt against Petrograd (Leningrad). This venture was a failure, and Yudenich retired.



YUE-CHI or **YUEH-CHIH,** the Chinese name of a central Asiatic tribe who ruled in Bactria and India, are also known as Kushans (from one of their subdivisions) and Indo-Scythians (*q.v.*). They appear to have been a nomad tribe, inhabiting part of the present Chinese province of Kan-suh, and to have been driven W. by Hiung-nu (*q.v.*) tribes of the same stock. They conquered a tribe called the Wusun, who lived in the basin of the Ili river, and settled for some time in their territory (*c.* 175–140 B.C.). They then attacked another tribe known as Sakas (*q.v.*) and drove them to Persia and India. For about twenty years it would seem that the Yue-Chi were settled in the country between the rivers Chu and Syr-Darya, but here they were attacked again by the Hiung-nu, their old enemies, with whom was the son of the defeated Wusun chieftain. The Yue-Chi then occupied Bactria (*q.v.*), and little is heard of them for a hundred years. During this period they became a united people, having previously been a confederacy of five tribes, the principal of which, the Kushans (or Kwei-Shwang), supplied the new national name.

The chronology of this invasion and of the history of the

Kushans in India is uncertain; available evidence seems to show that a king called Kozulokadphises, Kujulakasa or Kieu-tsieu-k'io (? A.D. 45–85) united the five tribes, conquered the Kabul valley and annihilated the remnants of Greek dominion. He was succeeded, possibly after an interval, by Oocmokadphises (Himakapisa or Yen-kao-tsin-tai), who completed the annexation of N. India. Then followed Kanishka (*?c.* A.D. 123–53), who is celebrated throughout eastern Asia as a patron of the Buddhist church and convener of the third Buddhist council. He is also said to have conquered Kashgar, Yarkand and Khotan. His successors were Huvishka and then Vasudeva, who may have died *c.* A.D. 225. After Vasudeva's reign the power of the Kushans gradually decayed, and they were driven back into the valley of the Indus and N.E. Afghanistan. Here, according to Chinese authorities, their royal family was supplanted by a dynasty called Ki-to-lo (Kidara), who were also of Yue-Chi stock, but belonged to one of the tribes who had remained in Bactria when the Kushans marched to India. The subsequent migration of the Kitolo S. of the Hindu Kush was due to the movements of the Jwen-Jwen, who advanced W. from the Chinese frontier. Under this dynasty a state known as the Little Kushan kingdom flourished in Gandhâra (E. Afghanistan) about A.D. 430, but was broken up by the attacks of the Hûnas.

Stein, Vincent Smith, Sylvain Levi, E. H. Parker and others in the *Journal of the Royal Asiatic Society, Asiatic Quarterly,* etc.

YUGOSLAVIA, a convenient name for the Serb, Croat, and Slovene state (*Kraljevina Srba, Hrvata, i Slovenaca*), which originated at the end of 1918 by the union of parts of the former Austro-Hungarian empire with Serbia and, at a slightly later date, with Montenegro. The declared basis of the union was ethnic, the desire being to group together all the South Slavs (Yugoslavs), though the actual frontiers represent a series of compromises. The inhabitants are mainly South Slav, but the new kingdom is, nevertheless, one of the most heterogeneous of the post-war states of Europe. Serbs constitute over one-third of the total population, and outnumber any other single element. But the Serbia of 1918 was not a unit, its frontiers having undergone notable changes since the outbreak of the Balkan wars. The Catholic Croats of Croatia-Slavonia and Dalmatia, the next largest group, number

MAP SHOWING BOUNDARIES OF YUGOSLAVIA

over three millions, but surpass the Serbs of Serbia both in culture and economic development. Serbia—or, more accurately, the Serbs of Belgrade, the only large town in the old kingdom—is however quite definitely the dominant partner.

The predominance of the Serbs of Belgrade is due both to political and geographical causes. Among the former we have to note that Belgrade, the capital of the old Serbian state as it is of the new Yugoslav one, possessed all the advantages of the presence of an organized national administration. No other part of the new state—apart from the small kingdom of Montenegro—had had any experience of complete self-government. Even when associated with numerical preponderance and military strength this might not have ensured concentration of power at Belgrade, had it not been for the outstanding position of the town at the convergence of great highways.

Divisions.—Yugoslavia has an area of 96,000 sq.m., almost precisely three times that of post-war Austria, with a population not quite twice as great as that of Austria. It is made up of the following 7 areas: (1) the Serbia of the treaty of Bucharest (1913) with some minor modifications; (2) the Montenegro of 1912; (3) Bosnia and Hercegovina; (4) Dalmatia, without the town of Zara and the islands of Lagosta and Pelagosa; (5) Croatia-Slavonia, without Fiume but with some minor additions; (6) Slovenia; (7) the Voyvodina or Duchy.

Of these the first two were independent South Slav states, Serbia having had its area nearly doubled and its population increased by one-half as the result of the Balkan wars. In both the Cyrillic alphabet is used, and the majority of the people belong to the Eastern or Orthodox church. But the new territories in the south, obtained by Serbia as the result of the Balkan wars, contain a considerable Muslim element, both in Old Serbia and in Macedonia. Bosnia and Hercegovina, nominally Turkish till the Austro-Hungarian annexation in 1908, had been administered by the Austro-Hungarian government since 1878. There is a large Muslim element in the population, Bosnia being the most northerly Muslim outpost in Europe.

Dalmatia was a purely Austrian province, with a mainly Catholic population. Italian influence was, however, strong in the coastal towns, particularly in Zara, which has been assigned to Italy. The Catholic Slavs of Dalmatia use the Latin alphabet and thus technically rank as Croats. Croatia-Slavonia (capital Zagreb) was formerly attached to Hungary, its port, Fiume, forming the chief Hungarian sea-outlet. To the Croatia-Slavonia which is included in Yugoslavia were added the commune of Kastav, on the peninsula of Istria to the west of Fiume, the island of Krk (Veglia), and a small area (Medjimurje) between the Mur and the Drava, with a Croat population. The port of Fiume, after long negotiation, went to Italy. Slovenia, the land of the Slovenes, is a name which has been given to a part of pre-war Austria inhabited by Slovenes and now attached to Yugoslavia: there has, however, never been a Slovene state since the early Middle Ages, and Slovenia is made up of fragments of former Austrian provinces. Thus it includes southern Styria, with the town of Maribor (Marburg), the greater part of Carniola, with the town of Ljubljana (Laibach), and a few communes only of Carinthia. To these has been added a small area (Prekmurje) north of the river Mur, formerly attached to Hungary but containing a Slovene population. The Slovenes are predominantly Catholics and highly westernized. Finally, the Voyvodina is similarly composed of scraps of territory, brought together because of the composition of the population and without any physical unity of its own. It includes the southern and often swampy southern part of the Hungarian plain, and both from the ethnic and the religious standpoint the population is very mixed. The Slav majority is due primarily to the flight of Balkan Serbs before the advancing Turk, for such low-lying lands were as a rule avoided by the early Slav settlers, who preferred wooded and hilly country. The considerable German and Magyar groups mostly owe their origin to a deliberate process of colonization, the Germans particularly having done much to drain and make habitable the swampy lands. The Rumanian element is due to migration from the hilly country to the east, especially during the 18th century. Many of the Slavs, particularly towards the east, belong to the Orthodox Church, while Catholics are in a majority to the west. There is also a Protestant element (German and Magyar).

The lands included are a part of the Baranja, the Mesopotamian area in the angle between the Danube and the Drava, the remainder of the Baranja being still attached to Hungary; the greater part of the Bačka, the area between the Danube and the Lower Tisa, the smaller part remaining Hungarian; the western part of the Banat, or area east of the Lower Tisa, the eastern part

being attached to Greater Rumania. The Voyvodina in this sense includes the town of many names now officially called Subotica (Ger. *Theresiopel,* Magyar *Szbadka*), a market-town and a considerable centre of communication for the plain. Subotica (102,000) is the third largest town of the new kingdom.

Regional Division.—It has to be noted that while the lands briefly described above are those which were united together to form Yugoslavia, they have ceased to exist as units. By a decree promulgated by the Ministerial Council in 1922, Yugoslavia was divided into 33 *oblasti* or regions, on a basis which has been stated to show "strong religious and political party influences"; which may be interpreted as meaning that they are intended to ensure Serb predominance. It is noteworthy that the old administrative or political river frontiers have sometimes been preserved in the regions; as occurs for example with the Drina (where it separated Bosnia and Serbia) and the Sava (where it separated Bosnia and Slavonia), and there they isolate from each other groups of different religious and political sympathies. But the old political frontier of the Danube has been disregarded to allow the oblast of Belgrade to extend into the eastern part of the Bačka which has a considerable Orthodox element as well as many Catholics, and also into a part of the Banat where there is a similar mingling of creeds. The remainder of the Banat is included in a region (Podu Navska or Danube) which also extends across the Danube. Here the solidly Orthodox element in that part of the oblast which lies in Serbia more than counter-balances the Catholics which are intermixed with the Orthodox in the formerly Hungarian region on the left bank of the Danube.

Population.—The 1921 census showed that about 9 out of the 12 million inhabitants of Yugo-Slavia spoke Serbo-Croat, and over 1 million the Slovene language. Thus Serbs, Croats and Slovenes constitute together about 83% of the total population. The largest minority group is the German-speaking one, numbering over half a million. Most of the Germans inhabit the Voyvodina where they form about 23% of the population of that heterogeneous territory. There they live in compact agricultural colonies as well as forming a considerable part of the town population. The remainder live for the most part in Croatia-Slavonia and in Slovenia. In the latter area they are mainly urban. The Magyar-speaking element is only slightly less than the German-speaking one, and the Magyars constitute nearly the same percentage of the population in the Voyvodina as do the Germans. There they occur particularly in the neighbourhood of the river Tisa, often in compact groups. Elsewhere they occur chiefly in Croatia-Slavonia. The third considerable minority element is formed by the Albanian-speaking peoples. These are not much inferior to the Hungarians in numbers, and their proximity to the independent kingdom of Albania in Old Serbia and Serbian Macedonia gives a possibility of irredentist propaganda. Albanians are practically limited to this part of Yugoslavia. There are also about ¼ million Rumanian-speaking people, of whom the majority live in the Timok region of Serbia, or more accurately, between the river Timok, the Danube and Upper Mlava. Rather more than ¼ million people are registered as speaking Slav languages other than Serbo-Croat or Slovene. These include a certain number of Czechoslovaks in the Voyvodina and Croatia-Slavonia.

The density of population is highest in the Voyvodina (181 per sq. m.), a fact which reflects the productivity of this fertile agricultural region, well fitted for the growth of cereals. In Slovenia (169) and Croatia-Slavonia (162) the density is not greatly inferior. Here the causes are not only the presence of productive lands but the considerable degree of development of the economic resources, associated with marked urbanization. While Serbia has but one large town, and outside of that town has a population mainly of peasants, occupations in Croatia and Slovenia are diverse, mining and manufacturing having made a good deal of progress. Serbia as a whole has a density (111 per sq. mile) lower than that of Dalmatia (126), but the figure is reduced by the fact that the lands added in 1913 are undeveloped and thinly-peopled. In Bosnia and Hercegovina and particularly in barren Montenegro the density is low. For the whole kingdom the density is 125 per square mile.

Frontiers.—Yugoslavia is of trapezoidal shape, the long axis having a N.W.-S.E. direction. The south-eastward extension is narrowed by Albania, which separates Old Serbia and Serbian Macedonia from the Adriatic. The national seaboard extends from the river Fiumara, on which stands the Italian port of Fiume, to the river Bojana, which forms the frontier with Albania. Owing to the numerous islands and peninsulas, the latter with long bordering channels, the coast has a total length of nearly 1,000 miles.

Of the four sides of the trapezium the northern one abuts, from west to east, on Austria, Hungary and Rumania. Strategically it is the weakest of all the frontiers, but this means that there is easy communication with the adjacent states and with Central Europe in general. The Hungarian section (353 m.) of this frontier is the longest, and is traversed by the most important lines of rail. The Austrian frontier (160 m.) is short but is again traversed by important railway lines. The Rumanian section (337 m.) falls into two parts, the old Danube frontier with Serbia and the new one in the Banat.

To the east Yugoslavia marches with Bulgaria, and this frontier (283 m.) is strategically the strongest of all. Strategic changes have been made in the old Serbo-Bulgarian frontier in four places. In the north, in the Timok region, a slight rectification had for its object the affording of greater protection to the railway which follows the Timok valley from Knjaževac and Zaječar to Negotin and thus to the Danube below the obstacle of the Iron Gate. Formerly this railway was close to the frontier. The other changes have been made in the region of Caribrod, where the Niš-Sofia railway line crosses the frontier; to the east of Vranje; and in the Strumica region.

To the south the frontier with Greece (152 m.) remains that agreed upon between Greece and Serbia in 1913. The Albanian part (277 m.) of the western frontier is similarly in essentials that laid down by the Conference of Ambassadors at London in 1913.

The north-western frontier with Italy (132 m.) has only been settled with a considerable degree of difficulty, particularly in the Fiume region, where only the small port of Baros with the delta region remains to Yugoslavia. The frontier is not drawn on a linguistic basis, large numbers of Croats and Slovenes being included within the borders of enlarged Italy.

Within these boundaries Yugoslavia has an extreme range in latitude of from 41°–47° N., and in longitude of from about 14°–23° E.

Communications.—A section of the main European highway passes through Belgrade, branching at Niš for Constantinople and Salonika respectively. Thus the new state had not to improvise a national system from the cut fragments of routes which converged on centres outside the national territories, for a main trunk line was already present.

In the northern area Yugoslavia obtained in the first place that part of the Belgrade-Budapest route which runs via Novi Sad to Subotica. This section was already linked to an important east-west trunk line, with many branches, which follows broadly the Sava valley. Thus Zagreb (130,000) the second city of the kingdom, lying in the Sava valley, had direct connection with Belgrade (250,000), as had also Ljubljana further west. Zagreb was also connected, if by a somewhat difficult route, to the Hungarian port of Fiume, and directly to Budapest. Ljubljana (53,000) had similarly railway connections both to Fiume and to Trieste and directly to Vienna through Maribor.

Further, southern Hungary had an excellent system of waterways, and just as Belgrade was linked to the Hungarian railway net because of its position, so also that position makes it the centre of the waterways. Navigation is possible on the R. Sava to Sišak, south-east of Zagreb; on the Danube; on the Tisa; and on the Drava as far as Barcs on the left or Hungarian bank of the river. In addition the Voyvodina contains a number of canals, constructed to function both as means of irrigation and as waterways. Again, the navigable Sava receives a number of powerful tributaries from forested Bosnia, well fitted for floating timber.

Conditions are different in Bosnia where Austrian policy in railway construction was determined by political motives. It was not to Austria's interest to facilitate communication between

Turkish lands and Bosnia, and there is not even now any railway through what used to be the *sanjak* of Novipazar. From Skoplje in Serbian Macedonia a railway runs towards Novipazar, but this line ends "in the air" at Mitrovica. Again, since the Bosnians, whether Muslims or not, are Slavs, it was contrary to Austria's interest to permit of any direct connection being made between Serbia and Bosnia. A possible route does, however, occur between the Morava valley and Sarajevo (66,000). The Morava has a large left-bank tributary, the Western or Serbian Morava, which flows in a generally west-to-east direction, and opens up a line of communication into western Serbia. A Serbian railway was built from the Belgrade-Niš route along this valley line, which ended blindly at Užice, near the Serbian-Bosnian frontier. Within Bosnia feeders of the River Drina made it easy to construct a line from Sarajevo of similar direction. This line, however, stopped at Višegrad, a short distance from the frontier. By filling up the Užice-Višegrad gap Yugoslavia was able to connect Sarajevo to the main Belgrade-Niš line. Further, there is a connection from Paraćin on that line to Zaječar in the Timok valley, already mentioned. Since the Zaječar line runs down to the Danube near Negotin there is thus a transverse connection from Sarajevo to the navigable section of the Danube below the Iron Gate and thus to the Black sea.

Sarajevo was linked to Austria by a line through the Bosnia valley which joined the Sava valley trunk-line at the town of Brod. The Austrians also connected Sarajevo with the Dalmatian coast by a narrow-gauge line, which has a rack-and-pinion section and is quite unsuited for heavy traffic. It was largely a tourist line, Austria having done much to develop the Dalmatian coast as a tourist resort.

During the Austrian period Dalmatia may be said broadly to have had no railways of any account apart from this line. The multitude of small ports made coastal traffic easy, and the population is chiefly centred in the towns on the fertile parts of the shore—for the coast is not uniformly productive. Dalmatia was not effectively linked with the interior, and without such links there was no hope of finding outlets on the national seaboard. The problem has not yet been solved, despite a certain amount of railway construction. During the post-war period when feeling ran high between Italy and Yugoslavia all sorts of obstacles were put in the way of Italian coastal steamer services, and since Yugoslavia found it impossible to organize an effective national service, trade and the revival of tourist traffic were seriously hampered. Such facts are of importance because they give reasons for the intensity of the political feeling between Serbs and Croats, and the danger of a policy so centralized at Belgrade as to be out of touch with local needs. Railway construction in Dalmatia has led to the two ports of Sebenico (Šibenik) and Spalato (Split) being connected via Knin and Gospic to Ogulin on the main route between Zagreb and Fiume. A branch line from Knin goes by a very indirect route via Prijedor to the main Sava valley line. Even if it were possible to build a number of railway lines between Dalmatian ports and the interior, the long and expensive haul would complicate their use. Further, the ports are not equipped for dealing with heavy traffic. It would appear, therefore, as though Yugoslav maritime trade must continue to use foreign ports, especially Salonika, where there is a Free Zone, and Fiume.

NATURAL REGIONS

Three great types of land-forms are represented in Yugoslavia: — (1) the western mountain belt which is a continuation of the Alpine folding; (2) the Danubian plains, or Pannonian basin of Austrian geographers, with their southern hilly rim; (3) the much disturbed belt of country, with alternating hills and small plains, separating the western mountains from the crust-block of old rocks which forms the core of the Balkan peninsula; this is best called the Morava-Vardar depression, from the great valley which traverses it from north to south. Speaking broadly, we may say that (1) includes the Slovene lands, the western and south-western part of Croatia-Slavonia, Dalmatia, a large part of Bosnia, Hercegovina and Montenegro. The extreme eastern edge of the Slovene lands, the eastern part of Croatia-Slavonia, the northern part of Bosnia and Serbia, with the whole of Voyvodina, fall into (2), while a large part of Serbia is included under (3).

Of these three types, however, the mountain belt in particular is too complex to be regarded as a unit. In the first place the mountains of the north-west show some striking contrasts to the Dinaric Alps which margin the west coast of the Balkan Peninsula proper. The former are made up of the Julian Alps (Terglav, 9,400 ft.), the Karawanken, the Steiner Alps (Grintovec, 8,395 ft.) and some smaller ranges, all with a general west to east direction. This means that the intervening valleys open towards the Danubian plains. North of the Karawanken lies the valley of the Upper Drava, of which, however, only a comparatively small part lies in Yugoslavia. The river may be said to emerge from the mountain to the plain section at the town of Maribor. Between the Karawanken and the Julian Alps lies the roughly parallel Upper Sava valley, of which a larger part falls within the state. Here the considerable (25 m. by 6 m.) basin in which lies the town of Ljubljana may be said to mark the end of the mountain section.

Farther south the mountain belt differs greatly in character. The fold-lines take on a south-easterly direction, parallel to the coast-line, and three distinct zones can be recognized. The coastal ranges have been largely submerged beneath the sea to form the chain of islands and the characteristic peninsulas. Here, particularly in the islands and occasionally in narrow strips on the mainland, there are areas with a considerable depth of fertile soil, enjoying a Mediterranean type of climate, despite the blasts of the bora, or cold northerly wind. Water occurs in the form of springs, often of great force, with, on the mainland, rivers which sometimes mingle their waters with the sea within a mile or two, or even a few hundred yards, of their sources in the limestones, but occasionally reach a considerable length. This coastal belt, with its characteristic products, form a distinct natural region, and is separated by steep limestone cliffs or hills from the barren karst behind. The karst area of massive limestones extends from Carniola, south of the Ljubljana basin, through western Croatia, the interior of Dalmatia, a part of western Bosnia, the greater part of Hercegovina and western Montenegro to the Albanian frontier. It includes ridges such as the Great and Little Kapela and the Velebit, the Uskok Mts. west of Zagreb and other hilly areas, with intervening basins and depressions of varying sizes, much of the surface being below 2,000 ft. above sea-level.

Further inland, however, especially to the south, in Bosnia, the extreme east of Hercegovina and eastern Montenegro, the elevation increases notably, outstanding heights being Durmitor (8,234 ft.) in north-west Montenegro and Majlić (7,840 ft.) on the frontier between Montenegro and Hercegovina. This elevated area is the Planina region of the Slavs, planina being the precise equivalent of alp (mountain pasture) in the Alps proper. In the Planinas or high mountain region then, upland pastures and forests re-appear.

The Five Natural Regions.—We may therefore recognize five natural regions in Yugoslavia, falling into three groups. Of these (1) the Pannonian basin in the wide sense is by far the most important economically, and with it may be associated (2) the Slovene Alps, which are linked to it by the Drava and Sava valleys. (3) The Morava-Vardar depression forms a unit by itself. In the west, despite the difficulties of communication (4) the coastal belt may be associated with (5) the Dinaric karst and mountain belt.

1. **The Pannonian Basin.**—This obtains its name from the old Roman province of Pannonia, the name being applied by geologists to a great depression between the Alps on the west and the Transylvanian Mts. on the east which was flooded by water during the Tertiary period. The water was finally drained off by the Danube as it cut its way through the encircling mountain rim by the gorge which forms the Iron Gate. Northwards the plain left by the ebbing of the waters extends beyond the limits of Yugoslavia; southwards, beyond the plain which fringes the Sava-Danube, it gives place to an undulating platform which seems to represent the shore of the old lake. This hill country forms part of northern Bosnia and northern Serbia, extending in the latter country southwards to the hills west of Niš, notably the Jastrebac and Kopaonik ranges.

That part of this productive Tertiary hill country which extends

eastwards from the Kolubara to the Morava and is bounded to the south by the valley of the Western Morava, forms the Šumadija of the Serbs and constituted the heart of modern Serbia. Originally thickly forested—Šumadija means forest—the woods have been largely cleared except on the island-like mountains of older rock, such as Rudnik, which rise from the general surface. In Bosnia, however, much of the original woodland remains.

The whole region, including plains, river valleys, hill country and isolated mountains and uplands, constitutes economically the most important part of the state, and has a considerable variety of resources. In Serbia the characteristic occupation is mixed farming carried on by peasants on small holdings. The cereals include maize, wheat, barley and oats. A great variety of vegetables is grown for local use, and there are numerous orchards, the characteristic plum being accompanied by all the usual temperate fruit-trees. Local advantages of climate and soil account for certain special crops, such as tobacco (especially near Užice in the valley of the Western Morava); the vine for table grapes or wine in the more sheltered areas, especially near Smederevo in the Morava valley and in the lower Timok valley; sugar beet in the Morava valley; flax, especially in the Drina and Kolubara valleys; mulberry for silkworm-rearing in the Morava valley, and so on. Of stock animals the pig is particularly important but cattle and horses are reared, with many sheep on the uplands.

In the Voyvodina conditions are broadly similar, but cereal production, especially of wheat, is more important, and the farming is of a more advanced type. There is a correspondingly greater development of the industries using local raw material, such as flour-milling, sugar-extraction, brewing and distilling, rope-making from local hemp, the making of linen and silk goods, etc., and as a consequence towns are more numerous and larger. The greater variety of the surface in Croatia-Slavonia, again, brings certain modifications. Orchards are numerous, and to the plums, vines, apples, pears, etc., of Serbia are added walnuts and chestnuts. Stock-rearing is extensively practised, and the fact that there are large forested areas results in a great development of industries based on wood and wood products.

The part of Bosnia included within the region may be said to resemble a more backward Serbia. Maize is the most important cereal, and since there has been less clearing for agriculture here extensive and valuable forests remain. As in Serbia the plum is by far the most important fruit-tree.

2. **The Slovene Alps.**—The essential features of this region have been described. From the economic standpoint it has to be noted that, on account of the limited amount of arable land, there is not only no surplus of cereals, such as is found in (1), but an actual deficiency, so that additional supplies have to be obtained especially from Slavonia, Bačka and the Banat. On the other hand the well-organized dairying industry permits of a considerable export of dairy products. Ljubljana and Maribor are not only centres of this trade but also of a number of minor industries similarly dependent on the extensive rearing of live stock, such as meat-packing, the making of margarine, soap, candles and so forth. Further, the valleys and the margins of the basins yield fruit, including walnuts and chestnuts, the vine, especially in the Drava valley where Maribor carries on a considerable trade in wine of good quality, as well as small fruits.

Forests are not only extensive but include both conifers and such hardwoods as beech, oak, chestnut, etc., and industries dealing with timber are important. Since water-power is abundant and coal also occurs, while the forests are widely distributed, many of the industries are of old standing and of the small, scattered type rather than commercialized undertakings. The products, notably furniture, show the influence of localized skill and tradition and had a ready sale in the old Austria-Hungary. Minerals, in addition to coal, are of some importance, though many of the industries based upon them have suffered from the drawing of the new frontiers.

3. **The Morava-Vardar Depression.**—This not very appropriate name may be given to the region which extends from the southern margin of the Šumadija to the Greek frontier. It is traversed by a series of basins strung along the Morava and Vardar systems, and affording a continuous route from north to south. Structurally the region is remarkably complex, for it represents the zone of weakness where the fold-mountains of the west and north-east abut upon the central crust-block of the peninsula. Instead of the continuous and extensive depression which gave rise to the Pannonian basin to the north, earth movements were limited and localised, producing numerous small basins, originally flooded by water but now largely drained by river action. These basins are floored by soft deposits and are in consequence fertile, containing arable land. With them alternate great mountain masses, such as the Kopaonik, Golja, Crna Gora, Šar and others. The Crna Gora marks the limit between Old Serbia or Raška to the north and Serbian Macedonia (*see* MACEDONIA) to the south.

Among the more important rivers may be noted the Nišava, a right-bank tributary of the Morava which allows of the passage of the railway from Niš to Sofia and Constantinople. The Toplica, a left-bank tributary of the Morava, drains a very fertile valley. The long stream of the Ibar has a small headstream, the Sitnica, which drains a part of the productive Kosovo polje, or plain of the blackbirds, with the town of Priština. The Ibar itself passes through a wide valley containing the towns of Mitrovica and Raška and enters the western Morava. In a side valley to the west lies the town of Novipazar, which is extremely "Turkish" in appearance and has a large Muslim element.

As regards resources the arable plains and basins produce a considerable variety of crops, becoming more and more southern in type as the Greek frontier is approached. The mountains and uplands allow for a notable development of the live stock industry, the area in earlier days having furnished a considerable part of the meat supplies of Constantinople, to which the sheep could be driven by successive stages. Finally the mineral resources are considerable, especially round Skoplje, Veles and Kumanovo. Coal, copper, silver-lead, chrome ore, iron and antimony all occur.

Among the products of the live stock industry is wool of good quality, particularly from the sheep reared on the eastern uplands. This forms the basis of the celebrated carpet industry of Pirot, in the upper Nišava valley, the carpets being noted for their excellent colours and designs. Round Lake Dojran the camel is present.

The crops of Old Serbia are generally similar to those of the Šumadija, but in Macedonia they are more varied. Thus the Bregalnica valley near Kočane is famous for its rice fields and near Štip for opium poppy yielding a high percentage of opium, exported from Salonika. In the Strumica valley farther south cotton, rice, sesame, tobacco, with much fruit and a variety of other crops, all occur. Gevgeli, the frontier station on the Skoplje-Salonika line, is famous for its silk production and silk factories.

4. **The Coastal Belt.**—The general geographical interest of this region far exceeds its economic one. Even the name is somewhat deceptive, for parts of the coast are as barren and arid as the karst lands of the interior. Characteristic Dalmatian landscapes are best seen in such areas as the Riviera of the Seven Castles, which stretches from Spalato to Trau (Trogir), forming a narrow, fertile strip about 10 m. in length, watered by short, spring-fed streams and backed and sheltered by bare and waterless limestone hills; or round Ragusa, one of the most perfect examples of the Mediterranean city-state in miniature. The olive grows round Spalato, but olive oil is imported from Italy.

The coastal belt is for the most part unsuited to cereals, which are grown in the poljen of the interior. But the marshy area round the mouth of the river Narenta forms an exception to the general statement. Wine is made and exported largely to France to be mingled with locally-produced kinds. Special products of some interest are the liqueur maraschino, distilled from cherries at Spalato and Sebenico (Šibenik); insect powder made from locally-grown and wild pyrethrum, and a variety of substances obtained from the aromatic plants of the maquis. Among the last rosemary (especially from the islands of Lesina [Hvar] and Lissa [Vis]), sage and noble laurel may be named. Apart from the shrubs, wood is rare.

Minerals are not very important, but large beds of cement-stones occur near Spalato and form the basis of a considerable industry using the water-power of the short river Jader, which

gushes out of the limestone nearby. The water-power of the river Kerka near Sebenico and of the river Cetina near Almissa (Omiš) is also used for such industries as the making of calcium carbide and cyanamide. These industries were mainly established with Italian capital. Fishing is of some importance, especially on the islands, where Lissa has a canning industry. The catch includes tunny, sardines, mackerel and crabs and lobsters.

5. **The Dinaric Karst and Mountain Region.**—If the coast of Dalmatia is apt to be estimated too highly, precisely the reverse is true of this region which is less unproductive than it appears at first sight. From the human standpoint the contrasts are very striking, for if Ragusa and Spalato are western and Latin, with many evidences of a great past, towns like Sarajevo, Mostar, Trebinje and Cetinje are thoroughly eastern in appearance, and the rural population is in many ways highly primitive and backward. The area owes its Slav population to the Turkish advance, to the same cause, that is to say, as that which led ultimately to the decay of the coastal towns. The Slavs of the interior fled, at various times, before the advancing Turk, and were constrained to occupy and use poor land.

Montenegro is particularly well fitted for live stock rearing because of the appearance of schists in the mountain belt which lies east of the Zeta valley. Here there is a better and more permanent water-supply and a richer growth of grass.

Cereals, especially maize, with wheat and barley, are produced, if not on a very large scale, in the depressions of the karst, as in the basins of Knin, Sinj, Imotski and Vrgorac in Dalmatia; in the similar basins of western Bosnia round Glamoč, Livno and Duvno; and in the wider and more fertile parts of the river valleys, especially in the lower Narenta valley in Hercegovina, and in those of the Morača near Podgorica and of the White Drin round Ipek in Montenegro. As contrasted with Bosnia, which is definitely Central European in climate and crops, Mediterranean influences penetrate a considerable distance into both Montenegro and Hercegovina, very fine tobacco is produced in Hercegovina and to a less extent in Montenegro, in the former especially round Trebinje, Mostar and Ljubuški. Wine is also produced in both.

DEFENCE

The first shots in the World War were fired by Austrian guns bombarding Belgrade on July 29, 1914. After a gallant resistance the Serbian army was overpowered by its Northern adversaries in October 1915, and forced into a disastrous retreat across Albania as the result of a sudden blow struck from the right rear by the old adversary Bulgaria. After being reconstituted in Greek territory (Corfu) the Serbian troops joined the Allied army at Salonika, and those troops formed the nucleus of the Yugoslavian army of to-day. In October 1918, when the resistance of the central powers was on the point of collapse and the Bulgarians had already thrown up the sponge, the Serbian army numbered 63,050 combatants, with a ration strength of 110,550. It was organized in 6 infantry divisions and one of cavalry, with 289 field guns. Its battle casualties had exceeded 331,000, a figure which included 45,000 killed and over 133,000 wounded in action. Such was the recent war record of the Serbian troops in what is now the army of Yugoslavia.

Present-day Army: Recruitment and Service.—The territory of the Serbs, Croats and Slovenes is divided into 5 Army areas, each of these containing 3 or 4 divisional areas subdivided into military districts. Military service is obligatory for all physically fit citizens between the ages of 21 and 40 with the active army and subsequently with the reserve up to the age of 50. With the sanction of the cabinet, the war minister can also call up youths of ages from 18 to 20 and all men under 55 years. Service with the colours is for 18 months from the year in which the 21st birthday falls.

Strength and Organization.—The budget effectives (1927) numbered 115,942, including 6,433 officers and 7,509 non-commissioned officers. To this total 4,696 must be added if the students at the various military schools are included, some of these being liable to military service. The arms of the military service are infantry, cavalry, artillery, engineers and air force. Of these the cavalry is organized in two independent cavalry divisions, each consisting of two brigades of cavalry and one group of horse artillery. A cavalry brigade contains two regiments of cavalry, each of four groups and a machine-gun squadron. These cavalry divisions, a small corps of frontier troops, a railway command, and a motor-troops command (one battalion of motor troops with park, depot and workshops), are organized independently, and not included in the troops distributed territorially in the "divisional" areas. The largest infantry formation therein is the brigade of 3 regiments each of 3 battalions each of 3 companies. The largest artillery formation is the brigade of 2 regiments each of 2 groups with 2 batteries in a group. Each divisional area contains a brigade of artillery, a brigade of infantry and non-combatant departmental troops. In addition to these the army troops in each army area include 1 artillery regiment of 3 groups and an engineer detachment containing 1 pioneer battalion, 1 bridging battalion, 1 telegraph and 1 searchlight company, 1 carrier pigeon section and wireless telegraph stations. The 16 divisional areas are grouped in 5 army areas. In addition to the army proper, account should be taken of the 9 regiments and 2 extra battalions of *gendarmerie*.

Higher Command.—The king is the supreme head of the army. In time of war he can appoint a commander of the field troops. The officer so appointed is responsible to the war minister. The higher command includes a ministry of war with the usual departments (including naval and air), a general staff, inspectorates of troops and technical committees working under the war ministry. The general staff and inspectorates of the different arms are also defined as being the organs of the war ministry. That ministry contains the usual departments for dealing with personnel and material. The general staff contains sections to deal with operations, intelligence, education, communications and historical work. The "arms and departments" are grouped as (a) principal arms, (b) auxiliary arms and (c) special departments. The minister of war commands the army in time of peace in the name of the king, and with the assistance of the general staff.

The fortress command of Boka Kotorska (in the 2nd army area) contains a garrison of 1 regiment of infantry, 1 regiment of fortress artillery, 1 engineer battalion, 1 battalion of non-combatants, 1 medical company, 1 squadron of train and 1 motor-section. A sum of 25,500,000 *dinars* was set apart for fortification in 1926–27, compared with 16,000,000 in 1922–23.

Military Air Force.—The air force is described as one of the "arms" of the army. The head of the air department in the war ministry also acts as inspector of the air force, thus holding a position parallel to that of the inspector of the navy, who is head of the marine department in the war ministry. The air force is organized in 2 air regiments (10 squadrons), 1 ballooning company, 5 training schools, 1 aero-technical institution, and 1 air battalion. There is a school for the advanced training of air officers on the same lines as the similar schools for the other arms. The defence estimates for 1926–27 showed a sum of 59,200,000 *dinars* for aviation, as compared with 24,000 in 1922–23.

In considering the preceding information, two points seem to call for comment. The first of these is the organization of the bulk of the troops in "divisional areas" with one infantry brigade in each area, while the most mobile arm, the cavalry, is organized in regular independent divisions. The reason for this divergence from the usual custom is obscure. It is probably attributable to political or topographical rather than to military reasons. The second is the central control by the war minister of army (including air force) and navy. With an infinitesimal sea-force, incapable of serious or distant operations, cooperation with the army in coastal defence is doubtless facilitated by this arrangement.

See also the League of Nations *Armaments Year-Book* (Geneva 1928); also *Law on the Organization of the Army* (August 9, 1923). (G. G. A.)

ECONOMIC AND FINANCIAL POSITION

Agriculture and Live Stock.—Agriculture occupies about 80% of the total population of Yugoslavia. The different provinces vary greatly in climate, soil, configuration and methods of cultivation. The coastal districts and the high Karst land immediately behind them are mountainous and often barren, and present great difficulties of communication. The most fertile districts are the Voivodina (Banat and Bačka), Slavonia and northern Serbia (especially the Mačva, Morava and Timok districts) and portions of Croatia, Slovenia and Bosnia. The principal crops are maize and wheat (40% of both being produced in the Voivodina), sugar-beet, hemp and hops (also in the north), opium (in Macedonia), and tobacco (chiefly in Macedonia and Hercegovina).

Areas Sown and Productions in 1926

	Hectares	Quintals
Wheat	1,726,940	18,855,919
Barley	367,490	3,761,072
Rye	171,851	1,557,827
Oats	371,115	3,577,250
Maize	2,173,534	34,101,063
Beans, various	..	1,194,574
Potatoes	233,127	9,400,206
Sugar beet	37,110	5,918,631
Beet for fodder	18,905	2,072,737
Flax	12,233	75,242
Hemp	32,499	258,385
Clover	106,465	3,424,195
Lucerne	61,805	2,263,749

Admirable wines are produced in Dalmatia and Hercegovina in Syrmia (of the Hungarian type) and along the Danube in Serbia (Smederevo). The fruit industry is important, notably in the Sumadija district of Serbia and in the east of Bosnia. In an average year some 750,000 tons of fresh plums are produced, and 40,000 to 50,000 tons of dried plums and pulp are exported. In 1928 there were eight sugar factories, two state-owned, the rest in the hands of foreign banks and companies.

In Jan. 1927 there were in Yugoslavia 1,227,707 horses, mules and asses; 3,737,538 horned cattle; 7,932,875 sheep; 2,806,182 pigs; and 1,721,283 goats. The forests cover 7,500,000 hectares of land, of which all save 2,000,000 is old forest. Timber is a main article of export, Italy, Egypt and the Levant being the best customers. The most important state forests are in Bosnia, beech, fir and oak being the commonest trees. The Slavonian oak (known abroad as "Austrian oak") is valuable and of high quality. In Serbia 60% of the forests are beech. At Teslić there is a wood-distilling factory, which is the largest in Europe, and produces methylated spirit, alcohol, formaldehyde and acetone.

Mining and Mineral Resources.—The mineral resources of Yugoslavia have for the most part lain idle since Roman and mediaeval times, but offer very great possibilities. Iron ore of good quality occurs in enormous quantity and near the surface at Ljubija, in Bosnia, where it is mined by the state mining authorities and sold for exportation. Another iron mine worked by the state exists at Vareš, in Bosnia, and is worked in conjunction with a coal mine and iron-smelting establishment and the ironworks at Zenica. The metallurgical works here are on a primitive scale, their production being pig-iron and small castings. The ironworks at Jesenice (Slovenia), which have a capacity of 70,000 tons per annum, produce bar iron, iron and steel sheets, steel rails up to 22 kilograms per metre (as used on the Bosnian narrow-gauge railways), rolled iron, drawn iron and wire nails. Bar iron is manufactured at Store, near Celje, in Slovenia; steel and steel springs at Guštanj, on the Maribor-Klagenfurt railway, and highly-silicated foundry iron is produced at Sopusko in Slovenia. Large deposits of brown coal and lignite occur in many parts of Yugoslavia, but there is no coking coal. Copper is produced at Bor and Majdanpek in Serbia.

Foreign Trade.—The total exports in 1927 amounted to 4,251,459 metric tons, valued at 6,400,153,000 dinars—the principal items being as follows:

	Metric tons	Value in thousands of dinars
Building timber	1,150,071	885,404
Live swine	42,114	518,042
Eggs	26,350	512,866
Live cattle	39,673	354,501
Maize	107,689	337,194
Raw copper	13,395	257,645
Fresh meat	17,141	247,449
Hops	4,096	197,666
Wheat	64,053	195,522
Prunes	32,283	156,517
Wood for fuel	557,365	127,584
Small livestock	13,688	121,461
Cement	317,427	116,589
Fresh fruits	41,028	110,344
All others	1,735,086	2,261,369
Total	4,251,459	6,400,153

Their chief countries of destination were as follows:

	Value in thousands of dinars
Italy	1,589,982
Austria	1,448,795
Czechoslovakia	726,722
Germany	678,774
Greece	619,800
Hungary	488,165
Switzerland	216,306
France	176,540
Great Britain	83,566

Imports during 1927 amounted to 1,331,256 metric tons, valued at 7,286,291,000 dinars, the most important items being cotton and cotton manufactures (1,680,132,000 dinars), iron and iron manufactures (688,814,000 dinars) and wool and woollen manufactures (723,222,000 dinars). Austria took first place on the list of countries supplying Yugoslavia's imports, with Czechoslovakia a close second; Italy, Germany and Great Britain, in the order named, coming next after these.

Revenue and Expenditure.—For the 1926–1927 budget year the expenditure estimated by the Government was, if additional credits voted after the enactments of the budget proper are considered, 12,821,770,208 dinars. That year, however, according to the statement issued by the Ministry for Finance, only yielded 11,294,221,348 dinars in revenues, while up to the end of the year the monthly returns showed that revenues were continuing to diminish. The budget estimates for the succeeding, 1927–1928, year were, however, allowed to mount to 11,477,570,000 dinars, the principal sources being as follows:

Revenues	Dinars
Direct taxation	1,706,250,600
Indirect taxation	3,505,690,000
Monopolies	2,296,947,000
State enterprise	3,851,976,329
Various revenues	116,706,071
	11,477,570,000

By the monetary convention, known as the Latin Union, to which Yugoslavia is a party, the dinar was held to be the equivalent of the French franc.

The system of presenting the estimates was changed after the 1926–27 budget, so that the budget proper, relating to administration, was separated from the budget of State enterprises. The view was then taken that Government enterprises such as railways, forests and mines could not be properly developed under the system by which they drew their capital from budget sources, and a new system of "commercialization" of state enterprises was adopted. Under the revised system the estimates for the financial year 1928–29 (April 1, 1928, to March 31, 1929) were as follows:

State Revenue and Expenditure	
	Dinars
Total of regular and extraordinary revenues (including surplus revenues from state enterprises)	7,668,958,647
Total of regular and extraordinary expenditure	7,489,638,059
Surplus revenues	179,320,588

Budget of State Enterprises	
	Dinars
Total of regular and extraordinary revenues	6,429,887,721
Total of regular and extraordinary expenditure	4,090,481,023
Surplus revenues	2,339,406,698

The surplus of revenue over expenditure in the general budget (179,320,588 dinars), served to cover expenditure under article No. 2 of the Financial Law (credit to Local Government Boards). For purposes of comparison with preceding budgets the 1928–29 budget may be stated as follows:

Expenditure	
	Dinars
Regular expenditure	6,623,490,459
Extraordinary expenditure	866,147,600
Expenditure on Government enterprises	4,090,481,023
Expenditure on local government	179,320,588
Total	11,759,439,670

Revenues	
	Dinars
Regular revenue	5,229,551,949
Extraordinary revenue	100,000,000
Revenues from Government enterprises	6,429,887,721
Total	11,759,439,670

Public Debts.—The following statement of the public debts of the Serb-Croat-Slovene kingdom was given officially by the Ministry for Finance:

POSITION OF STATE DEBTS OF THE KINGDOM OF SERBIA, CROATIA AND SLOVENIA ON NOV. 1, 1927

	Original amount	Present amount
I. *Pre-War Debts*	Fr.	Fr.
2% Lottery Loan of 1881	33,000,000	14,340,000
Tobacco Lottery Loan, 1888	10,000,000	8,410,000
4% Conversion Loan, 1895	355,292,000	317,290,000
5% Monopoly Loan, 1902	60,000,000	41,547,500
4½% Loan, 1906	95,000,000	67,976,500
4½% Loan, 1909	150,000,000	124,760,000
5% Loan, 1913	250,000,000	213,785,500
II. *War Debts*	£	£
(2) War debt to British Government	32,800,000	32,725,000
	$	$
(4) War debt to U.S.A.	62,850,000	62,450,000
(1) Material received from French Government	Fr. 1,000,000,000	Fr. 1,000,000,000
(1) Advance received from French Government	486,581,250	486,581,250
III. *Post-War Debts*		
(*a*) Internal Debts	Dinars	Dinars
7% Investment Loan, 1921	500,000,000	496,050,000
4% Agrarian Loan for Bosnia and Hercegovina, 1921	130,000,000	125,390,000
(5) 2½% War Indemnity Bonds	4,454,218,000	4,329,362,000

POSITION OF STATE DEBTS OF THE KINGDOM OF SERBIA, CROATIA AND SLOVENIA ON NOV. 1, 1927—Continued

	Original amount	Present amount
III. *Post-War Debts*—Continued		
(*b*) Foreign Debts	£	£
(3) Relief debt to British Government	3,105,848	3,054,127
Government Foreign Loan of 100 million dollars in gold, 1922	$	$
(7) (*a*) I. Instalment 8% bonds, 1922	15,250,000	15,250,000
(7) (*b*) II. Instalment 7% bonds, 1927	30,000,000	30,000,000
	£	£
5% London (Montenegrin) Loan	250,000	216,340
	Fr.	Fr.
6% Montenegrin Loan, 1913	11,284,060	9,600,936
7½% Loan for buying up of Oriental railways	149,971,581	119,977,265
(8) 5% Loan of 300 million francs	..	214,635,312
(6) Privileged Austro-Hungarian Company "Steg"	7,965,187	7,114,578
IV. *Participation in Loans of the public debt of the former Austro-Hungarian Monarchy, the service of which is entrusted to the Caisse Commune of the Foreign Holders of the Austrian and Hungarian pre-War public debts at Paris.*		
Debt on 3% bonds of "Steg" company	Fr. 36,086,929	Fr. 35,382,429
(9.10.12) 4% Austrian bonds in gold (perpetual)	Gold florins 8,917,341	Gold florins 8,917,341
(9.10.12) 4% Hungarian bonds in gold (perpetual)	84,691,079	84,691,079
(9.11.12) 4½% Austrian treasury bonds of 1914	Crowns 4,544,023	Crowns 4,544,023
(9.11.12) 4½% Hungarian bonds of 1913 (perpetual)	18,463,440	18,463,440
(9.11.12) 4½% Hungarian bonds of 1914	67,121,332	67,121,332
(9.11.12) 4% Perpetual Hungarian bonds of 1910	38,132,220	38,132,220

Notes on War Debts.—(1) The above represents only the capital sum on Dec. 31, 1919. (2) The sum shown above represents the total of annuities. The capital sum of this debt was fixed on Jan. 1, 1927, at the amount of £25,591,428. The debt to be paid in 62 years. (3) The sum shown above represents the total of annuities. The capital sum of this debt was fixed on Jan. 1, 1927, at £2,068,843. The debt to be paid in 15 years. (4) The sum shown above represents the total of annuities. The capital sum of this debt was fixed on June 15, 1925, at the amount of $51,037,886. The debt to be paid in 62 years. (5) The distribution of bonds of this loan has not yet been completed. The position shown is that on Dec. 31, 1927. (6) The sum shown above represents the total of annuities remaining. (7) The amortization of this loan commences on May 1, 1932. (8) The above sum represents the amount of this credit of 300 million francs drawn upon at that date. (9) The kingdom's share in the public debt of the former Austro-Hungarian monarchy in accordance with the distribution made by the Reparations Commission. (10) In accordance with the Innsbruck Protocol and the Prague Agreement the coupon service is carried out on the basis of 32% nominal value. (11) In accordance with the Innsbruck Protocol and the Prague Agreement the coupon service is carried out at present on the basis of 27% nominal value. (12) The share of the loans of the public debt of the former Austro-Hungarian monarchy, which were allotted to the Kingdom by the Peace Treaty, and the bonds of which are in the possession of Serb-Croat-Slovene subjects is not included; neither is the share of the

debt in paper bonds which was allotted to the Kingdom and the bonds of which are in the possession either of foreigners or of Yugoslav subjects for the reason that the distribution of these loans is not completed. To the foregoing should be added the sum of 176,657,500 crowns, representing the outstanding portion of the "autonomous" loans of the former Austro-Hungarian provinces, the repayment of which devolves upon the Serb-Croat-Slovene kingdom, but whose service had not been resumed at that time.

War and Relief Debts Settlement.—By the War Debt Agreement signed in London on Aug. 9, 1927, the Yugoslav Government agreed to pay in full and final settlement of the war debt due to Great Britain, the following annuities:—

Year	Sterling
	£
1927	150,000
1928	200,000
1929	250,000
1930-35 (inclusive)	300,000 a year
1936-39 ,,	350,000 ,, ,,
1940 and 1941	400,000 ,, ,,
1942-88 (inclusive)	600,000 ,, ,,

i.e., a total of £32,800,000; the payments to be made half-yearly over a period of 62 years. On Aug. 8, 1927, a proposal was signed in London for the funding and repayment of the Yugoslav relief debts to Great Britain, Australia and certain European States. The relief debt to Great Britain was fixed, inclusive of interest at 6% up to Jan. 1, 1927, at £2,068,843 7s. 1d., the sum to be repaid within 15 years, with interest upon the amount from time to time outstanding at 5% as from Jan. 1, 1927. The first instalment fell due on July 1, 1927; the last falls due on Jan. 1, 1942. The International Relief Bonds committee accepted the proposal on Aug. 12. The other relief debts were repaid in cash.

HISTORY

The Adriatic Dispute at Paris.—At the Paris Conference there was from the first a deadlock in the Adriatic dispute. (*See* SERBIA.) Clemenceau and Lloyd George found themselves between two irreconcilable standpoints—between Sonnino, who claimed the literal fulfilment of their treaty pledges, with the addition of the port of Fiume, and Wilson, who refused all cognizance of the secret treaties and regarded them as abrogated by the Allies when they accepted his successive Notes as the basis of the Armistice. The three Western Powers were in the impossible position of judges in a dispute to which one was a party, while two were accessories. On Feb. 11, 1919, the Yugoslavs offered to submit the whole dispute to the arbitration of President Wilson, and on April 16 to leave the settlement of frontiers to a plebiscite.

But these proposals were rejected by the Italians, who even withdrew for a time from Paris; and Wilson's public manifesto on the Adriatic question (April 23) so far from improving matters, actually stiffened Italian resistance. The problem was left unsolved during the final stages of the negotiations on the German treaty, and was still being postponed when, on Sept. 12, D'Annunzio and his Arditi, with official Italian connivance, seized Fiume and proceeded to create a *fait accompli*. On Dec. 9, 1919, the Supreme Council made a definite proposal to Italy on the basis of a slight modification of the so-called "Wilson Line," Fiume as a buffer State, a special régime in Zara, Valona in full sovereignty and an Italian mandate in Albania.

Late in April the Yugoslavs consented to direct negotiations with Italy, but the Nitti cabinet fell before any decision could be reached, and it was not till Nov. 12, 1920, that the Treaty of Rapallo was signed. By it Italy acquired a frontier considerably farther east than the Wilson line, the watershed of the Julian Alps as far as Snježnik (Monte Nevoso), almost all Istria with Abbazia and Volosca, and a narrow strip of shore connecting it with Fiume, which was to become an independent unit under the League of Nations, while the Croat suburb of Sušak was to remain in Yugoslavia and the Baroš Port was added as an outlet for Yugoslav trade. Zara became a free city under Italian sovereignty, but as a tiny island isthmus without hinterland or islands. Italy renounced all claim to Dalmatia, and of all the islands retained only Lussin and Cherso. Special linguistic and other privileges were assured to the tiny Italian minority in the Dalmatian towns, but no corresponding charter was granted to the 400,000 to 500,000 Slovenes and Croats annexed to Italy. One practical result of the treaty was that Italy tacitly abandoned the cause of King Nicholas and accepted as inevitable Montenegro's incorporation in Yugoslavia. Unhappily Italy allowed the treaty to remain a dead letter as regards Fiume, which was firmly held by D'Annunzio's irregulars, to the utter ruin of its trade and prosperity. The final liquidation of the Adriatic dispute was postponed till Jan. 27, 1924, when Mussolini and Pašić (Pashitch) concluded the so-called "Pact of Rome" guaranteeing the Peace Treaties of St. Germain, Trianon and Neuilly and promising neutrality if either should be attacked by a third party. A supplementary agreement recognized Italy's annexation of Fiume, but left to Yugoslavia the Baroš Harbour and also a free commercial zone in Fiume itself, with proper railway access.

The New Frontiers.—In five other directions also the regulation of the new frontiers was a slow and difficult process.

1. The frontier between Yugoslavia and Rumania rests on a decision of the Peace Conference, published on June 13, 1919. Rejecting equally the frontier fixed by the secret treaty of 1916, under the terms of which Rumania entered the war, and the line up to which the Serbs had been allowed to occupy after the Armistice, the Allies divided the Banat on a mainly ethnographic basis. At the last moment they drove two awkward salients into Rumanian territory, in order to include Vršac and Bela Crkva in Yugoslavia, thereby blocking the railway outlet of Timişoara and Arad towards the Danube at Bazias.

2. The regulation of the Austro-Yugoslav frontier was decided according to a plebiscite supervized by an inter-Allied Commission at Klagenfurt. After a keen contest between rival Slovene and Pan-German propagandists, voting took place in Oct. 1920 and resulted in a majority of 12,747 for Austria in Zone A (the more southerly section in dispute), whereupon Zone B also was automatically assigned to Austria.

3. By the Treaty of Neuilly (Nov. 27, 1919), Bulgaria was forced to cede to Yugoslavia (*a*) the Strumnica salient, which threatened the Vardar railway from the east, (*b*) the district of Kočana and the Bregalnica and (*c*) the town and district of Tsaribrod, which places Sofia strategically at the mercy of her neighbour.

4. The Albanian frontier remained in suspense till 1921, when the Supreme Council sanctioned the line laid down by the Council of Ambassadors in the winter of 1913, thus putting an end to the disreputable design favoured in some quarters of an Italo-Yugoslav "deal" on the lines of "Scutari for Fiume."

5. The frontier with Hungary was the last to be regulated. By the Treaty of Trianon the Banat (save a small Magyar triangle opposite the city of Szeged) was divided between Rumania and Yugoslavia, while the latter received the whole Bačka (except Baja and district), part of the Baranya (forming the angle between Drave and Danube) and the Medjumurje (between Drave and Mur). Thus, in order to secure the town of Subotica (Szabadka) with its large Bunjevac (or Catholic Serb) population, she was allowed to annex not less than 250,000 Magyars.

Internal Politics.—So long as these vital frontier disputes were outstanding, the Government hesitated to hold new elections, and the new united parliament rested on a highly irregular basis, the Serbian mandates having actually expired in June 1914, and the delegates from most of the new provinces owing their positions to membership in the numerous revolutionary committees which sprang up in Oct. 1918. The chaotic party conditions slowly crystallized into a keen struggle between the Radicals, who still possessed the best party machine and stood for a narrowly Serbian as opposed to a Yugoslav programme, and the new Democratic party, which absorbed most of the Opposition groups in Serbia, the old Serbo-Croat coalition of Croatia and the Slovene Liberals. In Aug. 1919 Protić was replaced by Davidović, the Democratic

leader, and the weight of the Coalition was transferred further to the Left. A trial of strength continued inside its ranks, until, in May 1920, Vesnić, who had been minister in Paris since 1905, became premier and won the parties for a new parliamentary franchise, based on universal suffrage. At the elections to the Constituent Assembly (Nov. 1920) no party secured an absolute majority, and the Radical-Democratic coalition was perforce maintained, the Opposition consisting of 50 Croat peasants under Stephen Radić (*q.v.*), the Croat and Slovene Clericals, and 58 Communists, largely recruited from the malcontents in the south. Pašić, who again became premier in Jan. 1921, built up a majority by astute party bargaining, and thanks to the unwise abstention of the Croat peasants, was able to steer through parliament a new Constitution framed on extreme centralist lines.

On June 28 (Kosovo day) the prince regent took oath to the new constitution, but he and Pašić narrowly escaped assassination while driving home from the ceremony. On July 21, Drašković, who as minister of the interior had issued repressive decrees (*Obznane*) against the Communists, was murdered by a young Bosnian Communist, whereupon parliament passed drastic laws for "the defence of the State," annulled the mandates of the 58 Communist deputies, and reduced their party to impotence. In the winter of 1922 the latent quarrel between Radicals and Democrats ended in open rupture, and Pašić formed a purely Radical cabinet and appealed to the country. But the elections of 1923 brought no decision, and the Radicals clung precariously to power. In August, Radić, rejecting the inadequate offers of Pašić, fled abroad, in the hope of winning over Western opinion to his cause. Realizing in London the hopelessness of such a design, he settled in Vienna, and from there concluded a joint Opposition bloc with the Democrats, Agrarians, Slovenes and Muslims, and instructed his deputies to abandon their abstention and enter the Skupština. Pašić was thus without a majority, and resigned; and in July 1924 Davidović took office, but was compromised by the indiscretions of Radić, who in the interval had visited Moscow and coquetted with the "Peasant International."

In October Davidović was forced to resign, and a concentration cabinet under Pašić and Pribičević, on rigidly centralist and reactionary lines, ordered new elections, dissolved the Croat Peasant party, suppressed its newspaper and threw Radić into prison. At the elections of Feb. 1925 the Government, by pressure and corruption, secured a small working majority (163 to 152), though it polled 300,000 fewer votes than its rivals. It then annulled 58 out of the 67 Croat mandates, and was preparing further reprisals when Radić's nephew issued a declaration in the party's name, recognizing the Constitution, dynasty and army, and thus abandoning the whole basis of its agitation for the six previous years. This was followed by an unholy alliance between Pašić and Radić, who each threw over their now useless allies and formed a joint cabinet. In November Radić himself became minister of education. In April 1926, however, he withdrew his support from Pašić, who was thus without a majority and finally resigned, his position being weakened by age and by the public scandals connected with his son, Rade; and though Pašić's successor, Uzunović, included representatives of the Croat peasants in the new cabinet, the final breach between Radić and the Radicals came in May.

A political deadlock ensued, until, in Dec. 1926, the news of the Italo-Albanian Treaty led to the resignation of the foreign minister, Dr. Ninčić, and a prolonged cabinet crisis, complicated by the sudden death of Pašić. At last, in April 1927, a Coalition cabinet was formed by Velja Vukićević, between Radicals, Democrats, Slovene Clericals and Muslims: and the elections held in September confirmed this coalition's majority. This was followed by a reconciliation between the two former rivals, Radić and Pribičević, who set themselves to organize the "Prećani" (or former subjects of Austria-Hungary) in opposition to Belgrade. Their campaign, which owed much of its strength to the inefficient administration of the centralist régime and to the gross inequality of taxation, was waged with increasing violence and culminated in the tragedy of June 20, 1928, when an unbalanced Montenegrin Radical deputy, Puniša Račić, fired upon the Croat peasant deputies on the floor of the Skupština, killing Pavle Radić and one colleague outright and mortally wounding Stephen Radić. The Croats withdrew to Zagreb and declined to re-enter the Skupština until new elections had wiped out the crime; and when the Vukićević cabinet was reconstructed under the Slovene Clerical leader, Father Korošec, they refused to negotiate and proclaimed a so-called "social boycott" of Belgrade.

Serbo-Croat relations once more became extremely strained, although reasons alike of home and foreign policy rendered a separatist movement impossible. Croatia could not stand alone with Italy and Hungary in their post-war mood, and no human skill could draw a frontier line dividing Croat and Serb. On the other hand, the demand for a revision of the unduly centralist Constitution of 1921 seemed likely to prove irresistible, and it seemed probable that decentralization would provide a basis for reconciliation.

The coup d'état of Jan. 1929.—In actual fact, the deadlock was solved, for the time being, by King Alexander, on Jan. 6. 1929, suspending the Constitution of 1921 and appointing General Peraˌ Živković as prime minister, with a cabinet consisting of representatives of all the different provinces. Its programme was unity, decentralization and improved administration, and both king and premier expressly pledged themselves to introduce a new democratic and parliamentary régime.

YUKON, the largest river in Alaska, and the fifth largest in North America. With its longest tributaries not in Alaska, the Lewes and the Teslin (or Hootalinqua), its length is about 2,300 m., in the form of a great arc, beginning in the Yukon district of British Columbia, near the Pacific ocean, and ending at the Bering sea coast. Its catchment area is about 330,000 sq.m., more than one-half of which lies in Canada. The Lewes river rises in Lake Bennet, or, more accurately speaking, Lake Lindeman, on the northern slope of the coast range just over the Dyea pass up from Lynn canal (at the head of Chatham strait). It flows north through a chain of lakes with connecting streams until it is joined by the Hootalinqua about 30 m. below the last of these lakes (Lebarge). Its confluence with the Pelly river, at Selkirk, Yukon district, about 120 m. due east of the Alaskan-Canadian boundary, forms the headwaters of the Yukon proper. Flowing thence north-west, the Yukon turns abruptly to the south-west near Ft. Yukon, Alaska, on the Arctic Circle, and continues nearly at right angles to its former course to a point south of the head of Norton sound, where it turns again and flows in a north-west direction, emptying into the sound from its south shore.

The Yukon valley comprises four sub-provinces, or physiographic divisions, called the "Upper Yukon," "Yukon flats," "Rampart region" and "Lower Yukon." The "Upper Yukon" valley is about 450 m. long and from 1 to 3 m. broad, and is flanked by walls rising to the plateau level from 1,500 to 3,000 ft. above the stream. In this part of its course the Yukon receives from the south the Selwyn river (about 40 m. below the junction of the Lewes and Pelly rivers); from the west the White river (about 60 m. below the Selwyn); from the north the Stewart river (about 10 m. below the White), one of the largest tributaries of the Yukon; from the east the Klondike river (near 64° N. lat.); from the west Forty-mile creek (about 40 m. above the Alaskan-Canadian boundary line), and many other smaller streams. The "Yukon flats" flank the river for about 200 m. and are from 40 to 100 m. wide. Here the stream varies in width from 10 to nearly 20 m., and involves a confused network of constantly changing channels. Here, too, the river makes its great bend to the south-west, and its channels are constantly changing. The "flats" are monotonous areas of sand bars and low islands, thickly wooded with spruce. The principal tributaries here are the Porcupine river (an important affluent, which enters the main stream at the great bend about 3 m. N. of the Arctic Circle); the Chandlar river, also confluent at the great bend, from the north, and, near the west edge of the flats, the Dall river, also

from the north. The "Rampart region" begins near 66° N. lat., where the "flats" end abruptly, and includes about 110 m. of the valley, from 1 to 3 m. wide, and extending to the mouth of the Tanana. No large tributaries are received in this part of the river. At the west edge of the Ramparts the Yukon receives the Tanana river, its largest tributary lying wholly within Alaska. The Tanana valley is about 450 m. long, nearly parallel to the Yukon from about due west of its headquarters to the great bend, and drains about 25,000 square miles. Its sources lie in the glaciers on the north slopes of the coast, or St. Elias range, and it receives many tributaries. The Lower Yukon includes that portion between the ramparts and the sea, a stretch of about 800 m. At the mouth of the Tanana (which enters the main stream from the south) the gorge opens into a lowland from 15 to 20 m. wide. Along the north-west boundary of the valley are low mountains whose base the Yukon skirts, and it continues to press upon its north bank until the delta is reached. The valley is never less than 2 or 3 m., and the river has many channels and numerous islands; it has walls nearly to the head of the delta, though about 100 m. above the delta the south wall merges into the lowland coastal plain; the relief is about 1,000 feet. The Yukon delta begins near 63° N. lat. Here the main stream branches into several channels which follow north or north-west courses to Norton sound. The northernmost of these channels is the Aphoon pass, and the most southerly is Kwikpak pass; their outlets are about 75 m. apart on the coast, and from 40 to 50 m. from the head of the delta. Between them is a labyrinth of waterways, most of the intervening land being not more than 10 ft. above low tide.

The Yukon river is unique among rivers, in that it rises within 15 m. of tidal waters in the Dyea inlet on the Pacific coast, whence it flows in a north-westerly direction nearly 1,000 m., just crossing the Arctic Circle, where it turns south-west through the middle of Alaska, and then flows more than 1,200 m. until it reaches the ocean within sight of which it rose; for we may properly call Bering sea a part of the Pacific ocean. This grand stream is also surprising in the length of navigation way it gives in proportion to its length, for less than 15 m. N. from where its tiniest streamlets trickle from the crest of Dyea pass lies Lake Bennet, whose head is the true beginning of steamboat navigation on this noble stream. From the starting-point of those same streamlets one can look down on other streamlets beginning their steep descent of the Dyea pass to the waters of the Lynn canal. The nearest harbour for ocean-going vessels is a poor one at St. Michael's island, about 60 m. north-east of the delta; here freight and passengers are transferred to flat-bottomed river steamers. These enter the delta and the river by the Aphoon pass, which is about 4 ft. deep at mean low water, the current varying from 1½ to 4 m. an hour. The Lewes is navigable as far as White Horse rapids, which with Miles cañon obstruct the river for a few miles. Above them the stream is again navigable to its source, about 100 m. beyond. The White pass and Yukon railway from Skagway to White Horse (111 m.) overcomes these obstructions, however, for traffic and travel. The Stewart river, seldom less than 150 yd. wide, is navigable by light-draught steamers to Frazer falls, a distance of nearly 200 miles. The Tanana is navigable for about 225 m. to the mouth of the Chena, and above the mouth of the Chena it again becomes navigable for more than 250 m., including its principal upper tributary, the Nebesna. The Koyukuk, the second largest tributary, entering the Yukon about 600 m. up from its mouth, is navigable for 570 m. (Camden). Altogether the Yukon proper with its principal tributaries embraces more than 3,500 m. of navigable waters. The system is open to navigation from May until September.

Cantwell, R.C.S., *Report of the Operations of the U.S. Revenue Steamer Nunivak of the Yukon River Station, Alaska, 1899–1901* (Washington); W. Ogilvie, *Early Days on the Yukon* (Ottawa); A. H. Brooks, "The Geography and Geology of Alaska," *U.S. Geol. Survey, Doc. No. 201* (Washington, 1906).

YUKON TERRITORY, the most westerly of the northern territories of Canada, bounded south by British Columbia, west by Alaska, north by the Arctic ocean and east by the watershed of Mackenzie river. It has an area of 206,427 sq.m. (excluding water). The territory is chiefly drained by the Yukon river and its tributaries, though at the south-east corner the headwaters of the Liard river, flowing into the Mackenzie, occupy a part of its area. The margins of the territory are mountainous, including part of the St. Elias range with the highest mountains in Canada at the south-west corner, Mount Logan (19,850 ft.) and Mount St. Elias (18,008 ft.), and the north extension of the Rocky mountains along the south and north-east sides; here, however, not very lofty. The interior of the territory is high toward the south-east and sinks toward the north-west and may be described as a much dissected peneplain with low mountains to the south. The most important feature of the hydrography is the Yukon (*q.v.*) and the rivers which flow into it. The Klondike gold mines are reached by river boats coming down 460 m. from White Horse, the terminus of the White Pass railway, 111 m. long, from Skagway on an inlet of the Pacific.

Before the discovery of gold on the Forty Mile and other rivers flowing into the Yukon the region was inhabited only by a few Indians, but the sensational finds of rich placers in the Klondike (*q.v.*) in 1896 brought in a vigorous population centred in the mines and at Dawson City, which was made the capital of the newly constituted Yukon territory. With the decline of the gold-mining industry, the population decreased from 27,219 in 1901 to 8,512 in 1911 and 4,157 in 1921. In 1918 an amendment to the Yukon Act abolished the council of the Yukon and the territory is now administered by the Northwest Territories Branch of the Canadian Department of the Interior. Law and order are enforced by members of the Royal Canadian Mounted Police. The Yukon is represented in the Dominion Parliament by one member in the House of Commons. Placer gold is still the principal mineral product, the value of the gold output in 1925, when 52 mines were working, being £988,465. The Yukon has also been a steady producer of silver and in 1926 yielded 1,686,106 fine oz., mostly from Keno and Galena Hills, in the Mayo district. A concentrator has been installed at Keno Hill. The wide distribution of the ores of gold, copper, silver and lead indicate enormous mining possibilities. Coal, of which there are large reserves, is being mined in increasing quantities. Large game and fur-bearing animals abound.

Though so near the Pacific the Yukon territory has a rigorous continental climate with very cold winters seven months long, and delightful sunny summers. Owing to the lofty mountains to the west the amount of rain and snow is rather small, and the line of perpetual snow is more than 4,000 ft. above sea-level, so that glaciers are found only on the higher mountains; but the moss-covered ground is often perpetually frozen to a depth of 100 or 200 ft. Vegetation is luxuriant along the river valleys, where fine forests of spruce and poplar are found, and the hardier grains and vegetables are cultivated with success.

YUMA, a city near the south-western corner of Arizona, U.S.A., on the Colorado river, at the mouth of the Gila river; it is the county seat of Yuma county. It is on Federal highway 80; has a municipal airport; and is served by the Southern Pacific and the Yuma Valley railways. Pop. (1920) 4,237 (74% native white).

YUMAN, a speech stock of American Indians, named from the Yuma tribe, living about the lower Colorado river and occupying a distinctly desert habitat. The groups that belong are the Havasupai, Walapai and Yavapai of the mountains of western Arizona; the Mohave (*q.v.*), Yuma, Kamia and Cocopa (*q.v.*) in the Colorado river bottomlands; the Maricopa (*q.v.*), Halchidhoma, Kohuana, Halyikwamai, once on the river but driven out and the remnants, except the Maricopa, lost to tribal identity; the Diegueño to the rear of San Diego in California; and the Akwa'ala, Yukiliwa, Cochimi and other groups known under varying local names in Mexican California. Of these tribes, the most advanced were those on the Colorado, who have changed little since their discovery by Alarcon in 1540. They have always been warlike and turbulent, but chiefly among one another. They are agricultural, marking the north-western frontier in the continent of the native practice of maize farming. They make pottery but no basketry. They are divided into totemic patrilineal clans.

YUNCAN, a group of tribes of South American Indians, forming an independent linguistic stock. The Yuncas (known also as Chimus and Muchic) occupied originally the arid coastal region of northern Peru comprised within the valleys of Trujillo, Chicama, Jequetepeque, Lambayeque and Morope; later, by conquest, they extended the area controlled north as far as Tumbez and southward to Chancay. In the 15th century they were conquered, after stubborn resistance, by the Incas and their territory included within the Inca empire. Their most important centre was the great city of Chanchan (Gran Chimu), which was situated near the present Trujillo.

The Yuncas were a city-dwelling, agricultural people with highly developed agriculture, growing manioc, maize and sweet potatoes. While the houses of the poorer people were doubtless of reeds and matting or thatch, the better dwellings and all the important structures were built of sun-dried brick. The temples were stepped pyramids, raised on high platforms, and containing burial chambers within. Some of the palaces were decorated with elaborately executed stucco relief patterns in geometric style derived from textiles, and reminiscent of the stone mosaics of Mitla in Mexico. The Yuncas were wide traders along the coast, using reed and log balsas or rafts, and constructed regular harbour works at their ports. They were expert textile makers and raised cotton for the purpose; were very skilful workers in gold, of which great amounts have been excavated by treasure-hunters; and were also makers of very fine pottery, of which three sequent styles may be distinguished. They would appear to have had a rather elaborate social and governmental organization, with kings or chiefs of considerable power. In their religion they venerated the moon more than the sun (in contrast to their Inca conquerors), and also held sea deities in high esteem.

Uhle, "Die Ruinen von Moche," *J. Soc. Americanistes de Paris,* (ms.) vol. x., pp. 95–119; A. L. Kroeber, "The Uhle Collection from Moche," *Univ. of California, Pub. Amer. Arch. Ethnol.,* vol. xxi., pt. 5.

YUNNAN (*i.e.,* Cloudy South), a south-west province of China, bounded north by Szechwan, east by Kwei-chow and Kwang-si, south by Burma and the Lao tribes, and west by Burma and Tibet; area 146,718 sq. miles. The population is variously estimated at four to 12 millions, a recent and probable estimate being between eight and nine millions. The inhabitants include many races beside Chinese, such as Shans, Lolos and Maotsze. The Musus, in north-west Yunnan, once formed an independent kingdom which extended into East Tibet. Some of the inhabitants are nominally Muslim. The west and north-west have high mountain ranges and deep gorges of the Kinsha-kiang (upper Yangtze-Kiang), the Mekong and the Salwen; the ridges have peaks over 16,000 ft. high, the slopes are often heavily forested, population is small, communications are bad, and a journey from Yunnan Fu to Bhamo, via Têng-yueh (505 m.) takes nearly four weeks. The south-east includes the upper basin of the Songkoi or Red river, and of the Pata-ho (upper Si-kiang); the former becomes navigable near Man-hao, just before it leaves Yunnan for Tongking. This region has rich valleys and open, undulating country. The north-east, near the Yangtze-Kiang's right bank, is not very high, though higher than Kwei-chow, over the border, but it is deeply dissected and sparsely peopled. There are a few lakes, especially near the capital, Yunnan Fu. The mean monthly temperature of Yunnan Fu varies from 47° F in December to 69° F in July, the warm season being April to August and the rainy season March to August, with the maximum in June (13·34 in.). The total annual fall is 37 to 38 inches.

Besides Yunnan Fu, the capital, the province contains 13 prefectural cities, several of which—Teng-ch'uen Fu, Ta-li Fu, Yung-ch'ang Fu, Ch'u-siung Fu and Lin-gan Fu, for example—are situated in the valley plains. Mengtsze, Szemao and Momein (or Têng-yueh) are open to foreign trade. Yunnan Fu is connected by railway (1910) with Tongking. The line, which starts from Haiphong, runs, in Yunnan, via Mengtsze hsien (a great commercial centre), to the capital. Several important roads intersect the province; among them are:—(1) The road from Yunnan Fu to Bhamo in Burma via Ta-li Fu (12 days), Têng-yueh Chow or Momein (eight days), and Manwyne—beyond Ta-li Fu it is a difficult mountain route. (2) The road from Ta-li Fu North to Patang via Li-kiang Fu, which thus connects West Yunnan with Tibet. (3) The ancient trade road to Canton, which connects Yunnan Fu with Pai-sê Fu, in Kwang-si, on the Canton West river, a land journey which occupies about 20 days. From this point the river is navigable to Canton.

Yunnan, long independent, was subdued by Kublai Khan, but was not finally incorporated in the empire until the 17th century. It was the principal centre of the great Mohammedan rebellion, which lasted 16 years and was suppressed in 1872.

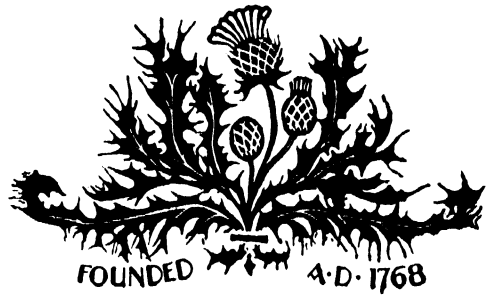
See H. R. Davies, *Yunnan, the Link between India and the Yangtze* (Cambridge, 1909); A. Little, *Across Yunnan* (London, 1910); Rev. J. M'Carthy, "The Province of Yunnan," in *The Chinese Empire* (London, 1907); L. Richard, *Comprehensive Geography of the Chinese Empire* (Shanghai, 1908).

YÜN-NAN-FU, the capital of the province of Yün-nan, China, about 500 m. by rail N.N.W. of the port of Hai-Gong, Tongking. The town is centrally placed at a focus of ways within the province. The plain in the neighbourhood of the city is fertile and well populated and Yün-nan-Fu is said to have about 45,000 inhabitants. Originally the surrounding district was known as the "land of the southern barbarians" and the city is surrounded by fortified walls some 6½ m. in circuit. The city has a strong Mohammedan colony and was almost reduced to ruin by the Mohammedan rising in 1855. The rise to prosperity was slow, but the opening in 1910 of the railway from Tongking, built by the French, gave a fresh impetus to commerce. The copper works are important and there is a mint at Yün-nan-Fu. Silk and leather goods are made while English cotton fabrics are imported as well as raw cotton from Burma.

YURIEV: *see* TARTU.

YUROK, a tribe on the lower Klamath river, asserted but also disputed to be of Algonkin speech lineage, is perhaps the nuclear group of the north-west California Indian culture, the principal others being the Hokan Karok upstream from them, the Athabascan Hupa (*q.v.*) of Trinity, the Chilula of Redwood, the Tolowa of Smith river; and the Algonkin (?) Wiyot of Humboldt bay. The Yurok once numbered about 2,400 in more than 50 small villages; 500 remain.

YURUCAREAN, a small group of tribes of South American Indians, constituting an independent linguistic stock. The Yurucares live in Bolivia on the eastern slopes of the Andes and the lowlands along the Chaparé, Isiboro and Securé rivers, tributaries of the Mamoré. They are a tall, well-built folk, slightly lighter in colour than the Quechua of the highlands, who gave them the name by which they are known, signifying "white men." Their dress consisted of a poncho-like garment, without sleeves, of bast, decorated with geometric patterns, printed by means of large wooden dies. The Yurucares are sedentary agriculturalists and hunters, living in open thatched shelters.



See A. D'Orbigny, *L'Homme Americain* (Paris, 1839); L. E. Miller, The "Yurucare Indians of Eastern Bolivia" (*Geog. Review,* 1917, pp. 450–464).

YUSAFZAI, a large group of Pathan tribes, originally immigrants from the neighbourhood of Kandahar, which includes those of the Black Mountain, the Bunerwals, the Swatis, the people of Dir and the Panjkora valley, and also the inhabitants of the Yusafzai plain in Peshawar district of the North-West Frontier Province of India. Three sections of the tribe, the Hassanzais, Akazais and Chagarzais, inhabit the W. slopes of the Black Mountain, and the Yusafzai country extends to the Utman Khel territory.

YVERDON (1,437 ft.), a town in the canton of Vaud, Switzerland, and on the south-western corner of Lake Neuchatel, at the mouth of the Thièle. It is situated on the site of the small Roman town of Eburodunum. The population is 8,850, French-speaking and mostly Protestant. At the beginning of the 19th century its castle was the home of Pestalozzi's school. It has an historical museum and several industries. It is a well-known spa with warm and sulphurous springs.

YVES, SAINT, OF BRITTANY (1253–1303), was born in 1253 at Kermartin, near Tréguier, Brittany. His father was Héloury, seigneur of Kermartin, and his mother Azou de Quenquis. In 1267 he went to Paris to study law, and ten years later to Orléans to study canon law. On returning to Brittany he was appointed ecclesiastical judge under the archdeacon of Rennes. In 1285 he was ordained priest and appointed first to the parish of Trédrez, and afterwards to Louannec, where he died on May 19, 1303. He was buried in the cathedral of Tréguier, and was canonized by Clement VI. in 1347. As a lawyer and judge he was famed for his rectitude and wisdom and for his zeal in defending the cause of widows and orphans. His feast is celebrated on May 19. He is the patron saint of lawyers for he was "advocatus et non latro, res miranda populo" (a lawyer and not a thief, a marvel to the people).

YVETOT, a town of north France, in the department of Seine-Inférieure, 24 m. N.W. of Rouen on the railway to Havre. Pop. (1926) 6,136. Cotton goods and hats are made; also trade in agricultural products. The lords of Yvetot bore the title of king from the 15th till the middle of the 16th century, their petty monarchy being popularized in one of Béranger's songs. In 1592 Henry IV. here defeated the troops of the League.

Z This letter together with Y was adapted by the Romans from the Greek alphabet after the conquest of Greece for use in Greek words borrowed or transliterated. It was the seventh letter of the Greek alphabet and had the form I or Z. It was not taken over by the Latins from the Chalcidic alphabet with the rest of the letters as the sound it represented did not occur in Latin. Its place in the alphabet was filled by the letter G adapted from C to represent the voiced velar stop. The letter corresponded to Semitic I (*zain*).

The minuscule letter has generally retained the form of the majuscule, though in certain hands the form ȝ has developed.

The sound represented by the letter in Greek is not precisely known. It was, at least in certain cases, a double sound and probably varied in separate dialects as well as in different words between *z, ž, zd, dz,* or *dž*. In Latin it was probably the voiced fricative corresponding to *s* and this value it has retained till modern times. (B. F. C. A.)

ZABRZE: *see* HINDENBURG.

ZACATECAS, a State of Mexico. Its area is 28,125 sq.m., pop. (1921) 379,329. It belongs wholly to the great central plateau of Mexico, with an average elevation of about 7,700 feet. The State is somewhat mountainous, being traversed in the west by lateral ranges of the Sierra Madre Occidental, and by numerous isolated ranges in other parts—Mazapil, Norillos, Guadalupe and others. There are no large rivers, only the small headstreams of the Aguanaval in the north, and of the Guazamota, Bolanos and Juchipila in the west, the last three being tributaries of the Rio Grande de Santiago. As the rainfall is light this lack of streams suitable for irrigation is a drawback to agriculture. The climate is dry and generally healthy, being warm in the valleys and temperate in the mountains. The agricultural products are cereals, sugar and maguey; the first depends on the rainfall which often fails altogether, the second on irrigation in the lower valleys, and the latter doing best in a dry climate on a calcareous soil with water not far beneath the surface. A natural product is *guayule,* a shrub from which rubber is extracted. The chief industry of Zacatecas, however, is mining for silver, gold, mercury, copper, iron, zinc, lead, bismuth, antimony and salt. Its mineral wealth was discovered soon after the conquest, and some of its mines are among the most famous of Mexico, dating from 1546. The State is traversed by the Mexican Central and the Mexican National railways. Its manufactures are limited chiefly to the reduction of mineral ores, the extraction of rubber from *guayule,* the making of sugar, rum, mescal, pulque, woollen and cotton fabrics, and some minor industries of the capital. The capital is Zacatecas, and the other principal towns are: Sombrerete, pop. (1910) 6,311; an important silver-mining town 70 m. north-west of the capital (elevation 8,430 ft.); Villa Garcia, pop. (1910) 7,813; Guadalupe, pop. (1910) 5,551; Pinos, pop. (1910) 5,097, a mining town; San Juan de Mezquital, pop. (1910) 4,220; and Fresnillo, an important silver- and copper-mining centre.

ZACATECAS, a city of Mexico, capital of the State of Zacatecas, 442 m. by the Mexican Central railway north-west of Mexico City. Pop. (1921) 15,462. It is built in a deep, narrow ravine, 8,050 ft. above sea-level, with narrow, crooked streets climbing the steep hillsides, and white, flat-roofed houses of four and five storeys overtopping each other. The city is well drained and has a fine aqueduct for its water supply. The cathedral is an elaborately carved red-stone structure with unfinished towers and richly decorated interior. Overlooking the city from an elevation of 500 ft. is the Bufa Hill, which is crowned by a chapel and is a popular pilgrimage resort.

Zacatecas was founded in 1546 and was built over a rich vein of silver discovered by Juan de Tolosa in the same year. This and other mines in the vicinity attracted a large population, and it soon became one of the chief mining centres of Mexico. It was made a city in 1585 by Philip II.

ZACCONI, LUDOVICO, Italian musical theorist, was born about the middle of the 16th century at Pesaro, the years of his birth and death being unknown. He made his home in Venice, where he became an Augustine monk and was appointed maestro di cappella at the church of his Order. After a short time spent in the service of Wilhelm, duke of Bavaria in 1592, and a longer period in Vienna with the archduke Charles, he returned in 1619 to Venice. Zacconi's fame is based on a single monumental work, the *Prattica di musica utile et necessaria si al compositore . . . si anco al cantore* (2 pts., Venice, 1596 and 1619). It is one of three standard theoretical works of the Polyphonic period, the others being the *Dodecachordon* of Glaureanus and the *Musicae activae Micrologus* of Ornithoparcus; Zacconi's work, being the latest of the three, treats of the methods of the ripest period of the Polyphonic school.

Complete copies of the *Prattica di Musica* are in the British Museum and the Royal College of Music, London. *See* the article by W. S. Rockstro in Grove's *Dictionary of Music;* also F. Batielli, *Un musicista pesarese nel seccolo* xvi. (1905) and *Notizie su la vita e le opere di L. Zacconi* (1912); H. Kretzschmar, *Ludovico Zacconi's Leben auf Grund seiner Autobiographie* (1910).

ZACHARIAE VON LINGENTHAL, KARL SALOMO (1769–1843), German jurist, was born on Sept. 14, 1769, at Meissen in Saxony, the son of a lawyer, and was educated there and at Leipzig university. He was professor of law at Wittenberg (1798), and at Heidelberg from 1807 till his death on March 27, 1843. In 1820 he was member for his university in the new parliament of Baden, and in 1825, after the revision of the constitution, for the district of Heidelberg. Throughout his parliamentary career he was a strong conservative, and it was the growth of liberalism that induced him to retire in 1829, and devote himself entirely to juridical work. The German universities still had their old jurisdiction in legal questions of international importance, and Zachariae had referred to him such points as the claim of Sir Augustus d'Este to the dukedom of Sussex, and the dispute about debts due to the elector of Hesse-Cassel, confiscated by Napoleon. He was ennobled in 1842.

His writings deal with almost every branch of jurisprudence, and relate to Roman, Canon, German, French and English law. The first book of much consequence which he published was *Die Einheit des Staats und der Kirche mit Rücksicht auf die Deutsche Reichsverfassung* (1797), a work on the relations of church and State, with special reference to the constitution of the empire. In 1805 appeared *Versuch einer allgemeinen Hermeneutik des Rechts;* and in 1806 *Die Wissenschaft der Gesetzgebung,* an attempt to find a new theoretical basis for society in place of the opportunist politics which had led to the French Revolution. This basis he seemed to discover in something resembling Bentham's utilitarianism. Zachariae's last work of importance was *Vierzig Bücher vom Staate* (1839–42), to which his admirers point as his enduring monument. It has been compared to Montesquieu's *L'Ésprit des lois,* and covers no small part of the field of Buckle's first volume of the *History of Civilization.*

For an account of Zachariae and his works, *see* Robert von Mohl, *Geschichte u. Literatur der Staatswissenschaften* (1855–58), and Charles Brocher, *K. S. Zachariae, sa vie et ses oeuvres* (1870); also his biography in *Allgem. Deutsche Biographie* (vol. 44) by Wilhelm Fischer, and Holtzendorff, *Rechts-Lexicon, Zachariae von Lingenthal.*

His son, KARL EDUARD ZACHARIAE (1812–1894), also an eminent jurist, was born on Dec. 24, 1812, and studied at Leipzig, Berlin and Heidelberg. Having made Roman and Byzantine law his special study, he visited Paris in 1832 to examine Byzantine mss., went in 1834 to St. Petersburg (Leningrad) and Copenhagen for the same purpose, and in 1835 worked in the libraries

of Brussels, London, Oxford, Dublin, Edinburgh and Cambridge. In 1837 he went in search of materials, to Italy and the East, visiting Athens, Constantinople and the monasteries of Mount Athos. Having a taste for a country life, and none for teaching, he gave up his position as extraordinary professor at Heidelberg, and in 1845 bought an estate in the Prussian province of Saxony. He died on June 3, 1894.

For a list of Zachariae's works, see *Allgem. Deutsche Biogr.*

ZACHARIAS, ST., pope from 741 to 752, was a Greek by birth, and appears to have been on intimate terms with Gregory III., whom he succeeded (November 741). Contemporary history dwells chiefly on his great personal influence with the Lombard king Luitprand, and with his successor Rachis; it was largely through his tact in dealing with these princes in a variety of emergencies that the exarchate of Ravenna was rescued from becoming part of the Lombard kingdom. A correspondence, between Zacharias and St. Boniface, the apostle of Germany, is still extant, and shows how great was the influence of this pope on events then passing in France and Germany; he encouraged the deposition of Childeric, and it was with his sanction that Boniface crowned Pippin as king of the Franks at Soissons in 752. Zacharias is stated to have remonstrated with the emperor Constantine Copronymus on the part he had taken in the iconoclastic controversy. He died on March 14, 752, and was succeeded by Stephen II.

The letters and decrees of Zacharias are published in Migne, *Patrolog. lat.* lxxxix. p. 917–960.

ZAGAZIG (Zaḳāzīk), a town of Lower Egypt, capital of the province of Sharkia. Pop. about 37,000. It is built on a branch of the Fresh Water or Ismailia canal, and on the Al-Mo'izz canal (the ancient Tanitic channel of the Nile), and is 47 m. by rail N.N.E. of Cairo. Situated on the Delta in the midst of a fertile district, Zagazig is a great centre of the cotton and grain trade of Egypt. It has large cotton factories and the offices of numerous European merchants. About a mile south of the town are the ruins of Bubastis (*q.v.*).

ZAGHAWA: *see* NUBA.

ZAGHLUL, SAAD (1860–1927), Egyptian patriot, came of fellahin stock in the district of Ibian, Gharbia Province. He was educated at the village school and at the university of El Azhar, in Cairo. In 1880, he became editor of the *Official Journal.* Later he was nominated a Moawin under the Ministry of the Interior and eventually became Chief of the Contentieux for the province of Giza. Involved in the Arabi revolt, he was one of the many notables detained on the occupation of Egypt by British troops in 1882. In 1884 he began to practise at the bar, and in 1893 became a judge in the native court of appeal. He became Minister of Education in 1906, and in 1910 Minister of Justice. At the Ministry of Justice he made a charge of corruption against the Khedive Abbas Hilmi, and was asked (1912) by Lord Kitchener to resign. Zaghlul's evidence was insufficient, but he was thought to have been fundamentally justified, and his fierce opposition to British domination was undisguised from that time onwards. He then became vice-president of the Legislative Assembly.

On the signing of the Armistice (Nov. 1918) Zaghlul, who had for long been considered the principal spokesman of the Nationalist party, appealed to the Residency in Cairo for the recognition of Egyptian independence, basing his demand on President Wilson's self-determination policy and the British proclamation defining the status of the other countries liberated from Turkish rule by the World War. His proposal that he, with other representative Nationalists, should visit London to press their views was refused by the Government, and his attitude was so hostile that he and three others were arrested on March 8, 1919 and deported to Malta. This was the signal for a murderous outbreak in Egypt and serious disturbances (*see* EGYPT, *History*). Zaghlul and his friends were later released by Lord Allenby, and a special mission under Viscount Milner was sent to Egypt in Nov. 1919 to report on the situation.

Zaghlul returned to Egypt early in 1921, where he represented the extreme Nationalist party in opposition to the more moderate ministry under the presidency of Adly Pasha. At the end of the year, when trouble again broke out in Egypt, Zaghlul was arrested once more and deported, first to Aden and then to the Seychelles. In Sept. 1922 he was transferred to Gibralter, whence he was released on April 4, 1923, on the grounds of ill-health. After the promulgation of the new constitution, martial law was abolished and Zaghlul was free to return to Egypt. He was enthusiastically received, and in the elections of Jan. 1924 his supporters gained an overwhelming majority. Yehia Ibrahim Pasha resigned and Zaghlul formed a ministry. Conversations to secure a settlement between England and Egypt took place in London (Sept. 25—Oct. 3) between Zaghlul and Ramsay Macdonald; Zaghlul refused to modify his intransigent attitude, and no agreement was reached. On Nov. 19, 1924 Sir Lee Stack, the Sirdar, was assassinated and Zaghlul was forced to resign. Nevertheless he became president of the new Chamber of Deputies. From that time the history of Zaghlul Pasha is the history of Egypt (*q.v.*).

Zaghlul died at Cairo on Aug. 23, 1927. He was 74, and his health had long been failing, but he was still the life and soul of Egyptian nationalism.

ZAGHOUAN, a small town of Tunisia, French North Africa, 35 m. S. of Tunis by rail, 275 ft. above sea-level. Pop. about 2,000. It occupies the site of an ancient town (perhaps Onellana) of which nothing remains but a monumental entrance gate. Below the rocky mass known as the Djebel Zaghouan (over 4,000 ft.) are the openings which were used for the Roman aqueduct of Carthage; they were directed into an oval basin, behind which was a hemicycle 100 ft. wide; in the centre of the curve stood the temple of the protecting nymph or divinity.

ZAGREB, the capital of Croatia-Slavonia, Yugoslavia (German, *Agram*), lies on the Sava, with a background of mountains and surrounded by vineyards and country houses. Pop. (1921) 108,338. In 1910 it was only 79,083, but the influx of officials and business men since the formation of the state of Yugoslavia, has more than outweighed the exodus of Magyars and Germans. Zagreb is the second city of the kingdom and its commercial and financial centre, with many important trade associations. It is also the headquarters of one of the five army provinces. The older part of the town, with narrow, winding streets, contains the 15th century Gothic cathedral and the bishop's palace, while the newer part, with wide streets, open squares, a park and botanical gardens, contains the business and industrial quarters. Here too are the palace of justice, the South Slavonic academy, the university, a synagogue, and a Protestant church. Roman Catholic schools and churches are numerous, and there is also a School of Music. Tobacco, leather, linen, carpets, war material, hats and caps, boots, paper, chemicals, varnish and oil-colours are made.

Recent excavations have shown that a settlement existed at Zagreb in Roman times, and though the Croats probably built a town there in the 7th century, the first written record of the city occurs in 1093 when King Ladislaus of Hungary made it the see of a bishop. The older part of Zagreb, known as the Kaptol, contains the bishop's palace and the 15th century Gothic cathedral surrounded by the towers of the 11th century fortress. In 1242 a walled town, now called the Upper Town, arose on a neighbouring hill, and was raised to the rank of a royal free town by King Bela of Hungary. For centuries a bitter feud raged between the Kaptol and the Upper Town, until these rivals were forced to join hands against the Turks.

Zagreb, already the political centre of Croatia-Slavonia, was selected as the capital in 1867. It suffered severely from earthquakes in 1880 and 1901. It is the home of an aristocracy and a seat of culture on a level with more famous European centres. Previously the centre of the Yugoslav movement, it is now particularist and Croat in sympathy. There were national disturbances in the town in 1912, and the two military courts of justice which sat here during the World War (1914–18) were considered too strongly Croat in sympathy by the authorities at Vienna and Budapest, so that in 1918 prisoners on trial for treason or military offences, were sent to Bratislava (Pressburg). In that year, when the Austrian empire was breaking up, an independent nationalist body assembled at Zagreb. In 1924 there was serious rioting between the Croat Nationalists and the Yugoslav Sokols at a

meeting of these patriotic athletic societies in the town.

ZAHAROFF, SIR BASIL (1850–), financier and politician, was born in Constantinople in 1850. His father was Russian and his mother Greek. Little is known of his early years except that he was educated in London and Paris. In fact a veil of mystery enshrouds most of his life. He is reputed to be one of the world's richest men, his fortune being built up from munition plants, shipbuilding, oil and other enterprises. He exerted a strong if indirect influence during the World War and at the Paris conference, being a close friend and political adviser of Lloyd George, Venizelos, Clemenceau and Briand. During this period he extended very considerable financial aid to the British and French governments, and later was honoured by these countries for his war services. He is said to have given Greece $2,500,000 a year during the Balkan War, and half that sum during the World War. To the American Near East Relief fund for refugee relief projects in Greece he contributed several thousand pounds and he gave 1,000,000 francs to France for the "save the franc fund." He established chairs of aviation at the universities of Paris, Petrograd, and London and endowed the Marshal Foch professorship of French literature at Oxford university and the Field-Marshal Haig chair of English literature at Paris university.

ZAHN, ERNEST (1867–), Swiss novelist and poet, was born at Zurich on Jan. 24, 1867. Long associated with his father in the management of the railway restaurant at Göschenen, at the entrance to the St. Gotthard tunnel, he became in turn councillor, judge and president of the diet of Canton Uri; but he has latterly devoted himself wholly to literature. His first book was *Kämpfe* (Zurich, 1893), a romance; his most popular novel is *Lukas Hochstrassers Haus* (Stuttgart and Leipzig, 1907). Other notable volumes are: *Blancheflur* (Stuttgart, 1924), *Frau Sixta* (Stuttgart, 1926), and two collections of short stories, *Helden des Alltags* (Stuttgart, 1906) and *Das Licht* (Stuttgart, 1912). *Herrgottsfäden* (Stuttgart, 1901), dealing with the St. Gotthard tunnel, has been translated into English under the title of *Golden Threads* (1908).

See a study by H. Spiero, *Ernest Zahn* (Stuttgart, 1927).

ZAILA or **ZEILA**, a town on the African coast of the Gulf of Aden, 124 m. S.W. of Aden. Zaila is the most western of the ports of British Somaliland. Pop. (1921) about 7,000, Somali, Arabs, Indians, Greeks, Jews and a few British. The town has the sea on three sides; landward the country is unbroken desert for some fifty miles.

Zaila owed its importance to its proximity to Harrar, the great entrepôt for the trade of southern Abyssinia. The trade of the port received, however, a severe check on the opening (1902) of the railway to Harrar from the French port of Jibuti, which is 35 m. N.W. of Zaila. Some trade with Harrar survived, and about 10% of the imports and 15% of the exports of British Somaliland pass through Zaila.

ZAÏMIS, ALEXANDER (1855–), Greek statesman, was born in Athens Oct. 28, 1855, and came of a family of politicians. Entering public life rather from duty than ambition, Zaïmis became the "utility man" of Greek politics; thus he was first appointed prime minister in Oct. 1897, to clear up the aftermath of the disastrous Graeco-Turkish War. Resigning in 1899, after having accomplished that task, he again became premier after the "Gospel Riots" had caused the fall of Theotokes in Nov. 1901, but succumbed to the majority which supported his uncle, Deliyannes, in 1902. In Sept. 1906 he was appointed high commissioner of the Powers in Crete, a post which he held until 1911. In 1913 he was appointed governor of the National Bank. He became premier for the third time in Oct. 1915, but returned to the Bank after a month's office, emerging, however, to resume the premiership in June 1916. He became for the fifth time premier in 1917, and announced to King Constantine the decision of the three Protecting Powers that he must abdicate. He then retired again to the National Bank, but was removed on the restoration of King Constantine. After the king's second abdication, Sept. 1922, Zaïmis refused a sixth premiership, and was talked of as a possible president. On Dec. 4, 1926, he became premier of an Oecumenical Government of three republican ex-premiers and the two Royalist leaders, and remained at the head of the two coalition cabinets, which succeeded it in Aug. 1927 and Feb. 1928.

(W. M.)

ZAIMUKHT, the name of a small Pathan tribe who inhabit the hills between the Miranzai and Kurram valleys.

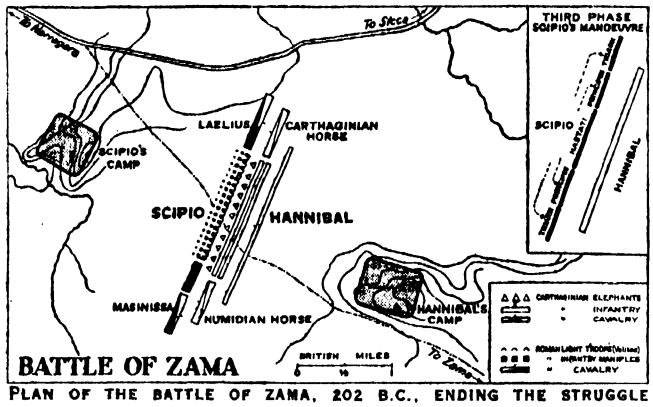
ZAIRE, a Portuguese variant of a Bantu word (*nzari*) meaning river, a name by which the river Congo was formerly known. In the 16th and 17th centuries the powerful native kingdom of Congo possessed both banks of the lower river, and the name of the country was in time given to the river also. Until, however, the last quarter of the 19th century "Zaire" was frequently used to designate the stream. It is so called by Camoens in the *Lusiads*. (*See* CONGO, river.)

ZAISAN ("Noble"). (1) A lake of Asiatic Russia, situated in a valley between the Altai range on the north-east and the Tarbagatai on the south, at an altitude of 1,355 feet. Its area is 707 sq.m., and its surface is dotted with islands; it is 60 to 65 m. long and 10 to 20 m. wide and receives the drainage of ten rivers, including the Black Irtysh and the Kendyrlyk; the White Irtysh forms the north-western outlet of the lake. Roach, perch, carp, trout, *nyelma* and sterlet abound during the fishing season, May to August. The lake has a depth of 50 ft. and is navigable for steamers; and barges ascend the Black Irtysh into Mongolia.

(2) A town in the Kazakstan A.S.S.R., in 47° 32′ N., 84° 56′ E., situated on a route into Mongolia, at an altitude of 2,200 feet. It lies south-east of Lake Zaisan and south of the Black Irtysh. Pop. (1926) 8,130. Its tanning and leather industry is important and it is a centre for trade between Kazakstan and Mongolia. Topolni Mis, on Lake Zaisan, acts as a port for it.

ZAKOPANE, a town of Poland in the province of Cracow, situated amid superb scenery in the heart of the Tatra mountains; a great health resort both in summer and winter, having a bobsleigh track and other facilities for winter sports; the most frequented holiday resort of Polish tourists and rock climbers. It has important thermal springs. The town lies 1,000 metres above sea-level and has an alpine climate.

ZALEUCUS, of Locri Epizephyrii in Magna Graecia (*fl. c.* 660 B.C.), Greek lawgiver, is said to have been the author of the first written code of laws amongst the Greeks. The story has some familiar features. The Locrians were distressed at their own lawlessness; they commissioned Zaleucus a slave, to draw up a code, and he did so under divine inspiration. The code was a severe one of the Draconic type which remained unchanged for centuries. The story ends with the episode (*cf.* Charondas) of the lawgiver committing suicide on discovering that he had inadvertently broken one of his own laws.



See Bentley, *Dissertation on the Epistles of Phalaris;* F. D. Gerlach, *Zaleukos, Charondas, Pythagoras* (1858); G. Busolt, *Griechische Geschichte* (1885–1904).

ZALMOXIS or ZAMOLXIS, a semi-mythical social and religious reformer, regarded as the only true god by the Thracian Getae. According to Herodotus (iv. 94), the Getae, who believed in the immortality of the soul, looked upon death merely as going to Zalmoxis. It is probable that Zalmoxis is Sabazius, the Thracian Dionysus or Zeus; Mnaseas of Patrae identified him with Cronus. In Plato (*Charmides*, 158 B) he is mentioned with Abaris as skilled in the arts of incantation. No satisfactory etymology of the name has been suggested.

ZAMA, BATTLE OF, 202 B.C. One of the most decisive battles in military history in its military result, Zama ranks above any, save perhaps Waterloo, for its decisive effect on the course of world history. For the defeat of Hannibal, the first and only true defeat in his career, left Carthage naked, and her surrender put an end to the long struggle between Rome and Carthage (*see* PUNIC WARS) for the mastery of the Mediterranean World.

The prologue to Zama had been the invasion of Africa by Scipio (*q.v.*), almost in defiance of the Roman senate which wished him instead to attack Hannibal, who still stood unconquerable in Southern Italy. In Africa Scipio's brilliant series of victories over less formidable generals had forced Carthage to sue for peace before Hannibal could answer the summons of recall. But while the peace negotiations were being conducted in Rome, Hannibal landed at Leptis, whereupon the Carthaginians broke the

truce, and Scipio's military position was gravely compromised—isolated on hostile soil and with part of his force detached to assist his ally Masinissa in securing his new kingdom of Numidia. Instead of awaiting Hannibal near Carthage, Scipio cut himself off from his base and marched on a divergent path into the interior. Security lies often in calculated audacity, and an analysis of the military problems makes it highly probable that his march inland

PLAN OF THE BATTLE OF ZAMA, 202 B.C., ENDING THE STRUGGLE BETWEEN ROME AND CARTHAGE FOR MASTERY OF THE MEDITERRANEAN WORLD

up the Bagradas valley was aimed, by its menace to the rich interior on which Carthage depended for supplies, to force Hannibal to push west to meet him instead of north to Carthage. By this clever move he threatened the economic base of Carthage and protected his own, also luring Hannibal away from his military base—Carthage. A complementary purpose was that this line of movement brought him progressively nearer to Numidia, shortening the distance which Masinissa would have to traverse with his expected reinforcement of strength.

It had the intended effect, for the Carthaginians sent urgent appeals to Hannibal to advance towards Scipio and bring him to battle, and within a few days he marched west, and arrived by forced marches at Zama. He then sent out scouts to discover the Roman camp and its dispositions for defence—it lay some miles farther west. Almost coincidently Masinissa arrived with 6,000 horse and 4,000 foot, and Scipio then broke up his camp and moved to a fresh site near the town of Narragara, his position being well chosen tactically, and having water "within a javelin's throw." Hannibal also moved his camp forward to meet him.

A parley between the two commanders led to no result, and both thereupon prepared to decide the issue by arms. The dispositions made by the rival leaders have several features of note. Scipio placed his heavy Roman foot—he had probably two legions—in the centre; Laelius with the Italian cavalry on the left wing; and on the right wing Masinissa with the whole of the Numidians, horse and foot. The heavy infantry were drawn up in the normal three lines: first, the *hastati;* then the *principes;* and finally, the *triarii.* But instead of adopting the usual chequer formation, with the maniples of the second line opposite to and covering the intervals between the maniples of the first line, he ranged the maniples forming the rear lines directly behind the respective maniples of the first line—thus forming wide lanes between each two cohorts.

The Carthaginian had eighty elephants, more than in any previous battle, and in order to terrify the enemy he placed them in front of his line. Supporting them, in the first line, were the Ligurian and Gallic mercenaries, intermixed with Balearic and Moorish light troops. In the second line were the Carthaginian and African levies, their combined strength probably exceeding that of the first line. Finally, Hannibal's own troops from Italy formed the third line, held back more than 200 yards distant from the others, in order evidently to keep it as an intact reserve. On the wings Hannibal disposed his cavalry, the Numidian allies on the left and the Carthaginian horse on the right. His total force was probably in excess of 50,000, perhaps 55,000. The Roman strength is less certain, but if we assume that each of Scipio's two legions was duplicated by an equal body of Italian allies, and add Masinissa's 10,000, the complete strength would be about 36,000.

The battle opened, after preliminary skirmishing, with Hannibal's order to the drivers of the elephants to charge the Roman line. Scipio promptly countered by a blast of trumpets along the whole line. The strident clamour so startled and terrified the elephants that many of them at once turned back on their own troops. This was especially the case on the left wing, where they threw the Numidians, Hannibal's best cavalry wing, into disorder just as they were advancing to the attack. Masinissa seized this golden opportunity to launch a counter-stroke, which inevitably overthrew the disorganized opponents. With Masinissa in hot pursuit, they were driven from the field, and so left the Carthaginian left wing exposed. The remainder of the elephants wrought much havoc among Scipio's *velites,* caught by their charge in front of the Roman line. But the foresight that had provided the "lanes" and laid down the method of withdrawal was justified by its results. For the elephants took the line of least resistance, penetrating into the lanes rather than facing the firm-knit ranks of the heavy infantry maniples. Once in these lanes the *velites* who had retired into the lateral passages, between the lines, bombarded them with darts from both sides. Their reception was far too warm for them to linger when the door of escape was held wide open. While some of the elephants rushed right through, harmlessly, and out to the open in rear of the Roman army, others were driven back out of the lanes, and fled towards the Carthaginian right wing. "It was at this moment that Laelius, availing himself of the disturbance created by the elephants, charged the Carthaginian cavalry, and forced them to headlong flight. He pressed the pursuit closely, as likewise did Masinissa." Both Hannibal's flanks were thus stripped bare.

In the meantime the infantry of both armies had slowly advanced on each other, except that Hannibal kept his third line back. At first the Gauls and Ligurians had the balance of advantage, through their personal skill in skirmishing and more rapid movement. But the Roman line remained unbroken, and the weight of their compact formation pushed the enemy back despite losses. Another factor told, for while the leading Romans were encouraged by the shouts from the rear lines, coming on to back them up, Hannibal's second line—the Carthaginians—failed to support the Gauls, but hung back in order to keep their ranks firm. Forced steadily back, and feeling they had been left in the lurch by their own side, the Gauls turned about and fled. When they tried to seek shelter in the second line they were repulsed by the Carthaginians, who deemed it essential to avoid any disarray which might enable the Romans to penetrate their line. In a short time the relics of the first line had dispersed completely, or disappeared round the flanks of the second line. The latter, however, showed their fighting quality by thrusting back the Roman first line—the *hastati.* In this they were helped by a human obstacle, the ground encumbered with corpses and slippery with blood, which disordered the ranks of the attacking Romans. Even the *principes* had begun to waver when they saw the first line driven back so decisively, but their officers rallied them, and led them forward in the nick of time to restore the situation. This reinforcement was decisive. Hemmed in, because the Roman formation produced a longer frontage and so overlapped their line, the Carthaginians were steadily cut to pieces. The survivors fled back on the relatively distant third line, but Hannibal continued his policy of refusing to allow the fugitives to mix with and disturb an ordered line.

The curtain now rose on what was practically a fresh battle. The Romans "had penetrated to their real antagonists, men equal to them in the nature of their arms, in their experience of war, in the fame of their achievements. . . ." Livy's tribute is borne out by the fierceness and the long uncertain issue of the subsequent conflict, which refutes the suggestion that Hannibal's "Old Guard" was but a shadow of its former power—in the days of Trasimenus and Cannae. The Romans had the moral advantage of having routed two successive lines, as well as the cavalry and elephants, but they had now to face a compact and fresh body of probably 24,000 veterans, under the direct inspiration of Hannibal. And no man in history has shown a more dynamic personality in infusing his own determination in his troops. The Romans, too, had at last

a numerical advantage, not large, however—the forces were "nearly equal in numbers" according to Polybius—and in reality still less than it appeared. For while all Hannibal's third line were fresh, on Scipio's side only the *triarii* had not been engaged, and these represented but half the strength of the *hastati* or *principes*. Further, the *velites* had been so badly mauled that they had to be relegated to the reserve, and the cavalry were off the field, engaged in the pursuit. Thus it is improbable that Scipio had at his disposal for this final blow more than 18,000 or 20,000 infantry, less the casualties these had already suffered.

His next step is characteristic of the man—of his cool calculation even in the heart of a battle crisis. He sounded the recall to his leading troops, and then, in face of an enemy at hardly more than a bow-shot distance, he not only reorganized his troops but reconstructed his dispositions. His problem was this: against the first two enemy lines the Roman formation, shallower than the Carthaginian phalanx and with intervals, had occupied a wider frontage, and so enabled him to overlap theirs. Now, against a body double the strength, his frontage was no longer, and perhaps less, than Hannibal's. His appreciation evidently took in this factor, and with it two others. First, that in order to concentrate his missile shock power for the final effort it would be wise to make his line as solid as possible and this could be done because there was no longer need for or advantage in retaining intervals between the maniples. Second, that as his cavalry would be returning any moment there was no advantage in keeping the orthodox formation in depth and using the *principes* and *triarii* as a direct support and reinforcement to his front line. The blow should be as concentrated as possible in time and as wide as possible in striking force rather than a series of efforts. He, therefore, made his *hastati* close up to form a compact centre without intervals. Similarly he closed each half of his *principes* and *triarii* outwards, and moved them forward to extend the flank on either wing. He now once more overlapped the hostile front. The rôle of Scipio's infantry in the final phase was to fix Hannibal's force ready for the decisive manoeuvre to be delivered by the cavalry. For this rôle violence and wideness of onslaught was more important than sustenance. Scipio made his redistribution deliberately and unhurriedly—the longer he could delay the final tussle, the more time he gained for the return of his cavalry. It is not unlikely that Masinissa and Laelius pressed the pursuit rather too far, and so caused an unnecessary strain on the Roman infantry and on Scipio's plan. For Polybius tells us that when the rival infantries met, "the contest was for long doubtful, the men falling where they stood out of determination, until Masinissa and Laelius arrived providentially at the proper moment." Their charge, in the enemy's rear, clinched the decision, and though most of Hannibal's men fought grimly to the end, they were cut down in their ranks. Of those who took to flight few escaped.

The completeness of the victory left no room for a strategic pursuit, but Scipio did not linger in developing the moral exploitation of his victory. An immediate move on Carthage achieved its object, a bloodless capitulation.

ZAMBEZI, the fourth in size of the rivers of Africa, and the largest of those flowing eastwards to the Indian ocean. Its length (taking all curves into consideration) is about 2,200 m. The area of its basin, according to Dr. Bludau, is 513,500 sq.m., or rather less than half that of the Nile. The main channel is clearly marked from beginning to end. The river takes its rise in 11° 21′ 3″ S., 24° 22′ E. The source lies in British territory in a depression of an undulating country 5,000 ft. above the sea, covered with bracken and open forest. The water, like that of all the rivers of the neighbourhood, issues from a black marshy bog. Eastward of the source the water-parting between the Congo and Zambezi basins is a well-marked belt of high ground, falling abruptly north and south, and running nearly east and west between 11° and 12° S.

The Upper River.—The infant Zambezi, after pursuing a south-westerly course for about 150 m., turns more directly south and, receives on either side numerous small tributaries. A few miles above Kakengi (in 12° 24′ S.), the Zambezi, narrow, picturesque and tortuous, suddenly widens from 100 to 350 yd. Below Kakengi are a number of rapids ending (13° 7′ S.) in the Suapuma cataracts. At this point the river flows tumultuously through a rocky fissure.

The first of its large tributaries to enter the Zambezi is the Kabompo, a left-hand affluent. It joins the main stream in 14° 26′ S. A little lower down (in 14° 18′ S.) the Zambezi receives from the west the waters of a much larger stream than the Kabompo, namely, the Lungwebungu. The land, from 5,000 ft. at the source, falls gradually to 3,600 ft. at Kakengi—a distance of 220 m. From this point until the Victoria Falls are reached—500 m.—the level of the Zambezi basin is very uniform, the fall being in this distance 600 ft. only. Twenty miles below the confluence of the Lungwebungu the country becomes flat, and in the rainy seasons is largely covered by floods. From the east the Zambezi continues to receive numerous small streams, but on the west is without tributaries for 150 m., when the great river formerly misnamed the Chobe, but known to the natives as Kwando or Linyante, joins it (in 17° 47′ S.).

The Middle Zambezi.—The Victoria Falls are reached some 60 m. below the Kwandó confluence. The surrounding country is formed of horizontal flows of basic lavas, which are traversed by two well marked sets of joints. Along these the river, following an extremely angular course, has eroded a great cañon, about 400 ft. deep and in many places, with vertical sides. (*See* Victoria Falls.) Into the cañon the river plunges over a vertical wall of rock. The narrow gorge can be traced more or less continuously along its course for about 40 miles. The middle course of the river may be said to extend for 800 m. below the Victoria Falls to the Kebrabasa Rapids, where the Zambezi crosses the great East African escarpment, and enters the coastal belt.

The Lower River.—The lower Zambezi—400 m. from Kebrabasa Rapids to the sea—presents no obstacles to navigation save the shallowness of the stream in many places in the dry season. This shallowness arises from the different character of the river basin. Instead of, as in the case of the middle Zambezi, flowing mainly through hilly country with well-defined banks, the river traverses a broad valley and spreads out over a large area. Only at one point, the Lupata Gorge, 200 m. from its mouth, is the river confined between high hills. Here it is scarcely 200 yd. wide. Elsewhere it is from 3 to 5 m. wide, flowing gently in many streams. The river-bed is sandy, the banks are low and reed-fringed. At places, however, and especially in the rainy season, the streams unite into one broad swift-flowing river. About 100 m. from the sea the Zambezi receives the drainage of Lake Nyasa through the river Shiré. On approaching the ocean, which it reaches in 18° 50′ S. the Zambezi splits up into a number of branches and forms a wide delta. Each of the four principal mouths—Milambe, Kongone, Luabo and Timbwe—is obstructed by a sand-bar.

Mileage of Navigable Water.—As a highway into the interior of the continent the Zambezi, like all other large African rivers, in greater or less degree, suffers on account of the bar at its mouth, the shallowness of its stream, and the rapids and cataracts which interrupt its course. Nevertheless its importance to commerce is great, as the following recapitulation of its navigable stretches will show: (1) From the sea to the Kebrabasa Rapids, 400 m. (2) From Chikoá (above Kebrabasa) to within 140 m. of the Victoria Falls, 700 m. (3) From the rapids above the Victoria Falls to the Katima Molilo Rapids, 100 m. (4) Above the Gonye Falls to the Supuma cataract, 300 m. (5) Above the Supuma cataract, 120 m. Thus for 1,620 m. of its course the Zambezi is navigable for steamers with a draught up to 28 in.

Several of the Zambezi affluents are also navigable for many miles. The Lungwebungu, which enters the upper river, is navigable for a long distance, thus supplying communication with the extreme north-west corner of the Zambezi basin. Parts at least of the Luena, Kafukwe, Loangwa and the Kwando tributaries are also capable of being navigated. The Shiré is also navigable for a considerable distance. The sum of such navigable reaches within the Zambezi basin as exceed 100 m. is nearly 4,000 m.

Exploration of the River.—The Zambezi region was known to the mediaeval geographers as the empire of Monomotapa and

the course of the river, as well as the position of Lakes Ngami and Nyasa, were filled in with a rude approximation to accuracy in the earlier maps. These were probably constructed from Arab information. The first European to visit the upper Zambezi was David Livingstone in his exploration from Bechuanaland between 1851 and 1853. Two or three years later he descended the Zambezi to its mouth and in the course of this journey discovered the Victoria Falls. During 1858–60, accompanied by Dr. (afterwards Sir) John Kirk, Livingstone ascended the river by the Kongone mouth as far as the Falls, besides tracing the course of its tributary, the Shiré and discovering Lake Nyasa. For the next 35 years practically no additions were made to our knowledge of the river system. In 1889 the entrance of vessels from the sea was much facilitated by the discovery by D. J. Rankin of the Chinde channel north of the main mouths of the river. Major A. St. Hill Gibbons and his assistants, during two expeditions, in 1895–96 and 1898–1900, ably continued the work of exploration begun by Livingstone in the upper basin and central course of the river. Of non-British travellers Major Serpa Pinto examined some of the western tributaries of the river and made measurements of the Victoria Falls (1878).

See David and Charles Livingstone, *Narrative of an Expedition to the Zambesi and its Tributaries* (1865); A. de Serpa Pinto, *How I Crossed Africa* (1881); D. J. Rankin in *Proc. R.G.S.* (March 1890); A. Sharpe, *ibid.* (December, 1890); H. S. Bivar, "Curso medio do Zambeze," *B.S.G. Lisboa*, vol. xxiv. (1906); G. W. Lamplugh in *Geo. Jnl.*, vol. xxxi. (1908); F. Coillard, *On the Threshold of Central Africa* (London, 1897), and A. St. H. Gibbons, *Africa from South to North through Marotseland* (2 vols., London, 1904). (F. R. C.)

ZAMBOANGA, a municipality (with administration centre and 52 *barrios* or districts) and capital of Zamboanga province, and an important port of entry, of Mindanao, Philippine Islands, situated at the south extremity of the Zamboanga peninsula on Basilian strait. Pop. (estimated, 1928) 43,832. It is an important commercial centre, the site of an army post and a post of the Philippine constabulary. Its climate is considered as among the best of any region in the Philippines, being considerably cooler than that of Manila. There is much valuable timber in the vicinity, and many agricultural products are raised, including rice, copra, abacá, sugar, tobacco and sweet-potatoes. There is also a considerable export, especially of copra and abacá. Good shipping facilities have been installed, as well as a modern water system and an electric lighting plant. It has a meteorological station. In 1918 it had 55 household industry establishments with output valued at 22,000 pesos. Of the 26 schools, 17 were public. There had long been a native settlement at this point, but the Spanish town was established in 1635. It early became the chief point for the Christians in their contest with the Moros.

ZAMIA, in botany, a genus of cycads (*q.v.*), comprising about 35 species of small fern-like plants, native to tropical and subtropical America. They have a turnip-like, mostly underground stem surmounted by a crown of leaves, 1 ft. to 2 ft. long, surrounding large fruiting cones. The crushed stems yield starch used for food. Two species, *Z. floridana* and *Z. pumila,* known as coontie or comfort-root, occur in southern Florida.

ZAMINDAR or **ZEMINDAR,** an Indian landholder (from Persian *zamin*-"land"). In official usage the term is applied to any person, whether owner of a large estate or cultivating member of a village community, who is recognized as possessing some property in the soil, as opposed to the ryot (*q.v.*), who is regarded as having only a right of occupancy, subject in both cases to payment of the land revenue assessed on his holding.

ZAMINDAWAR, a district of Afghanistan, situated on the right bank of the Helmund river to the north-west of Kandahar, bordering the road which leads from Kandahar to Herat via Farah. Zamindawar is a district of hills, and of wide, well populated and fertile valleys watered by important affluents of the Helmund. The principal town is Musa Kala, which stands on the banks of a river of the same name, about 60 m. N. of Girishk. The whole of this region is a well-known hotbed of fanaticism, the headquarters of the Achakzais, the most aggressive of all Durani tribes.

ZAMORA, an inland province of Spain, one of the three into which the former province of Leon has since 1833 been divided; bounded on the west by Portugal and Orense, north by Leon, east by Valladolid, and south by Salamanca. Pop. (1920) 266,215; area, 4,097 sq. miles. Zamora is traversed from east to west by the river Duero or Douro (*q.v.*); the Tormes also skirts the south-western boundary for some 25 miles. Except in the north-west, where it is entered by two outlying ridges of the Cantabrian mountains, the Sierra de la Culebra and Sierra de Peña Negra, the surface is a level or slightly undulating plateau; its lowest point is 1,070 ft. Its plains, especially the valley of the Esla, yield much grain and pulse; wine and flax are also produced; and on the higher grounds many merino sheep and goats are reared. Three railway lines, from Astorga on the north, Salamanca on the south, and Medina del Campo on the east, traverse the province and meet at the city of Zamora. The only towns with 5,000 inhabitants are Zamora (*q.v.*) and Toro (*q.v.*).

ZAMORA, an episcopal city, and the capital of the Spanish province of Zamora; on the right bank of the river Duero (Douro), and at the junction of railways from Salamanca, Medina del Campo and Astorga. Pop. (1920) 17,567. In the early period of the Christian re-conquest Zamora was a place of considerable strategic importance. Ferdinand I. of Castile and Leon in 1061 gave it to his daughter Doña Urraca. After his death in 1065 his son Sancho II. disputed possession with Urraca and laid siege to the city, but without success, although the famous Cid Ruy Diaz de Bivar was among his warriors. Zamora became subject to Alphonso VI. in 1073. Zamora occupies a rocky height overlooking the Duero, a little below its confluence with the Valderaduey. The river is crossed by a fine 14th-century bridge of sixteen pointed arches. The citadel of Zamora dates from the 8th century. The small but beautiful Romanesque cathedral, one of four 12th-century churches, was completed about 1175.

ZAMOYSKI, JAN (1541–1605), Polish statesman, was the son of Stanislaw, Castellan of Chelm, and Anna Herburtowna, a noble Polish lady. After completing his education at Paris, Strasbourg and at Padua, where as rector of the academy he composed his celebrated work *De senatu romano* (Venice, 1563), he returned home in 1565, one of the most consummate scholars and jurists in Europe, and at once entered politics. He played a leading part, after the the death of Sigismund II., in remodelling the Polish constitution and procuring the election of Henry of Valois. After the flight of that prince Zamoyski seems to have aimed at the throne himself, but quickly changed his mind and supported Stephen Báthory, whose election he prepared and whose foremost counsellor he became. Appointed chancellor on May 1, 1576, immediately after the coronation, as *wielki hetman,* commander-in-chief, in 1580, Zamoyski strenuously supported Stephen during his long struggle with Ivan the Terrible. He also enabled the king in 1585 to bring the traitorous Samuel Zborowski to the scaffold. On the death of Stephen, the Zborowski recovered their influence and did their utmost to keep Zamoyski in the background. At the election diet of July 9, 1587, however, Zamoyski triumphed over his rivals, and rejecting an offer from the Habsburgs of the title of prince, with the Golden Fleece and 20,000 ducats, procured the election of Sigismund of Sweden, son of Catherine Jagiellonica (Aug. 19). The opposite party immediately elected the Austrian Archduke Maximilian, but Zamoyski routed and captured the archduke at Byczyna (Jan. 24, 1588).

From the first there was a certain coldness between the new king and the chancellor, Sigismund desiring an alliance with the Habsburgs, which Zamoyski feared. Friction became acute when Sigismund appointed an opponent of Zamoyski vice-chancellor, and made other ministerial changes which limited his authority; though ultimately, with the aid of his partisans and the adoption of such desperate expedients as the summoning of a confederation to annul the royal decrees in 1592, Zamoyski recovered his full authority. In 1595 Zamoyski, in his capacity of commander-in-chief, at the head of 8,000 veterans dethroned the anti-Polish hospodar of Moldavia and installed in his stead a Catholic convert, George Mohila. On his return he successfully sustained in his camp at Cecora a siege by the Tatar khan. Five years later (Oct. 20, 1600) he won his greatest victory at Tirgoviste, over Michael the Brave, hospodar of Walachia and Moldavia. But

beyond securing the Polish frontier Zamoyski would never go. He refused to wage war with Turkey even under the most favourable circumstances, nor could he be drawn into the Holy League against the Ottomans in 1600, making conditions for Poland's co-operation which her allies could not possibly accept. Statesman though he was, Zamoyski cannot, with all his genius and valour, be called a true patriot. Sigismund was undoubtedly right when he attempted to reform the Polish constitution in 1605 by strengthening the royal power and deciding all measures in future by a majority of the diet. These reforms Zamoyski strenuously opposed. The last speech he delivered was in favour of the anarchic principle of free election. He died suddenly at Zamosc, June 3, 1605.

See *Vincent Laureo*, 1574–78, *et ses dépêches inédites* (Ital.) (Warsaw, 1877); Augustin Theiner, *Vetera monumenta Poloniae et Lituaniae* vol. ii. (Rome, 1862); Adam Tytus Dzialynski, *Collectanea vitam resque gestas J. Zamoyocii illustrantia* (Posen, 1881).

ZANESVILLE, a city of south-eastern Ohio, U.S.A., the county seat of Muskingum county; on the Muskingum river at the mouth of the Licking, 58 m. E. of Columbus. It is on Federal highway 40; and is served by the Baltimore and Ohio, the New York Central, the Pennsylvania, the Wheeling and Lake Erie and electric railways, motor-bus and truck lines and river packets to Parkersburg and Pittsburgh. Pop. (1920) 29,569 (90% native white). The city lies on both sides of both rivers, at an altitude of 700 feet. A "Y" bridge (the only one of the type in the United States) crosses the Muskingum, its two arms running on either side of the Licking. The present concrete structure (erected 1901) replaced a covered wooden bridge of the same plan which had stood for 68 years. Zanesville is one of the principal centres in the country for the manufacture of clay products, notably encaustic and mosaic tile, art pottery, laboratory porcelain, stoneware, white china, terra-cotta and brick. Other important manufactures are cement, glass containers, bottles and steel products. There are railroad shops employing 400 men, and a great variety of smaller industries. There were a few pioneers on the site of Zanesville when "Zane's Trace" was cut through from Wheeling (under an act of Congress of 1796) by Ebenezer and Jonathan Zane and Ebenezer's son-in-law, John McIntire, who received for this service three sections of land. Jonathan Zane and McIntire chose their sections at the point where the new road (now the national highway) crossed the Muskingum river. The town was planned in 1800, incorporated in 1814 and in 1850 was chartered as a city. It was made the county seat when Muskingum county was created in 1804, and from Dec. 1810, until May 1812, it was the capital of the State. Zanesville was an important station on the old national road. The population was 9,229 in 1860.

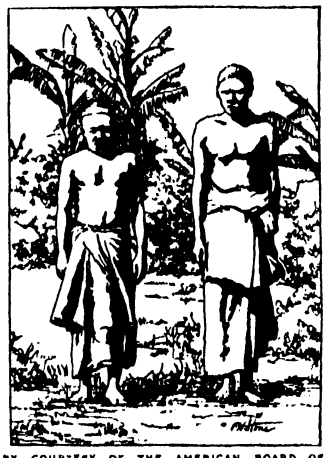
ZANGWILL, ISRAEL (1864–1926), Jewish man of letters, was born in London on Feb. 14, 1864. His early childhood was spent in Plymouth and at Bristol, where he received his first schooling. He was in his ninth year when his parents settled in Spitalfields, and he entered the Jews' Free School, where eventually he became a teacher, working at the same time for his university degree. He had written a clever fantastic tale entitled *The Premier and the Painter* with Louis Cowen, when he gave up teaching for journalism. He founded and edited *Ariel, The London Puck*, and did much miscellaneous work on the London press. He made his literary reputation with a novel, *The Children of the Ghetto* (1892), which was followed by *Ghetto Tragedies* (1893); *The Master* (1895); *Dreamers of the Ghetto* (1898); *The Mantle of Elijah* (1901); and other tales and novels of great interest dealing with Jewish life. *Children of the Ghetto* was produced as a play in New York with success in 1899, and has since been extensively played both in English and Yiddish. He was greater as a playwright than as a novelist, and did admirable work both in light comedy and in serious plays. *Merely Mary Ann* (Duke of York's, 1904) and *Too Much Money* (1917) represent his lighter gift; *The Melting Pot* (1908), *The War God* (1911) and *The Next Religion* (1914), banned by the censor, all deal with serious social problems. Zangwill was an outstanding personality in the Jewish world. He was at one time president of the Jewish Territorial Organization for the Settlement of Jews within the British Empire, and later an advocate of the Zionist movement. He died on Aug. 1, 1926.

ZANTE (anc. *Zacynthus*), southernmost of the Ionian Islands, west of Greece, in 37° 40′ N. lat. and 21° E. long.; 25 m. long, about 12 broad, and 64 m. round, with an area of 277 sq.m., and a population in 1923 of 39,988. Zante lies 8 m. S. of Cephalonia, forming with it, Leucas and Ithaca a crescent-shaped group, the crest of a submerged limestone ridge facing the Gulf of Patras. Zante is of somewhat irregular oval shape, indented by a deep inlet at its south end. A wide fertile central plain is skirted on the west by bare limestone hills 1,000 to 1,200 ft. high, which fall gently landwards, but with steep sea cliffs culminating northwards in Mount Skopos (ancient *Elatos*, 1,600 ft.). On the east the plain is also limited by a low ridge. These hills are still densely clothed to the summit with olives, figs, myrtles, laurels, oranges, aloes, vines and other sub-tropical plants. The central plain is an almost continuous stretch of gardens and vineyards, with a few cornfields and pastures. The peculiar dwarf vine, the "currant" (from Corinth) of commerce, is the staple export of Zante, as of the neighbouring mainland: it grows to 3 ft., begins to yield in seven years and lasts a century. Earthquakes are frequent and at times disastrous. During recent times the most destructive were those of 1811, 1820, 1840 and 1893. Other volcanic indications are the oil springs on the coast, and in the bed of the sea near Cape Skinari on the north, and especially the bituminous wells in a swamp near the coast village of Chieri, mentioned by Herodotus (iv. 195). These still yield pitch.

Zante, capital and seaport, on the east side, with a population in 1923 of 13,431, occupies the site of ancient Zacynthus, said to have been founded, like the neighbouring citadel of Psophis, by Zacynthus, son of Dardanus, a legendary Arcadian chief.

Traditionally Zacynthus belonged to Ulysses, king of Ithaca, and was peopled by settlers from Achaea or Arcadia. It figures occasionally in history as a base for belligerents. Thus during the Peloponnesian War and again in 374 B.C. the Athenians used it; in 357 it was the headquarters of Dion on his expedition against Syracuse; in 217 it was seized by Philip V. of Macedon. The Romans captured it in 211, but restored it temporarily to Philip; in 191, to keep it out of the hands of Greek powers, they annexed it themselves. In 86 it was raided by Mithradates' admiral Archelaus. Under the Roman Empire, Zante was included in the province of Epirus. In the 11th century it passed to the Norman kings of Sicily; after the Fourth Crusade it belonged at various times to the despots of Epirus, the emperors of Constantinople, and the Orsini counts of Cephalonia. After remaining from 1357 to 1482 in the hands of the Tocco family it became a Venetian possession. In 1797 it was ceded to France, and after a short occupation by the Russians was brought under British protection; in 1864 it was ceded with the other Ionian islands to Greece.

The long Venetian occupation is reflected in the appearance, character, and to some extent even the language and religion of the Zantiots. Nearly all the aristocracy claim Venetian descent; most of the upper classes are bilingual, speaking both Greek and Italian; and a considerable section of the population are Roman Catholics. Even the bulk of the people, although mainly of Greek stock, form in their social usages a connecting link between the Hellenes, whose language they speak, and the Western nations by whom they were so long ruled.



See B. Schmidt, *Die Insel Zakynthos* (Freiburg, 1899).

ZANZIBAR, a sultanate and British protectorate of East Africa. The sultanate, formerly of much larger extent (*see* p. 935, *History*) is now reduced to the islands of Zanzibar and Pemba, some adjacent islets and the nominal sovereignty of a strip of coastland—10 m. deep—forming the protectorate of Kenya (*see* KENYA COLONY). The islands of Pemba and Zanzibar have a collective area of 1,020 sq.m. and a population (1924 census), of 202,665; Zanzibar island, 115,016; Pemba island, 87,649.

Topography.—The island of Zanzibar lies at a mean distance of 20 m. from the mainland, between 5° 40′ and 6° 30′ S. Pemba (*q.v.*) to the north, and the more distant Mafia (to the south), form with Zanzibar an independent geological system, resting on a foundation of coralline reefs, and constituting a sort of outer

coast-line, which almost everywhere presents a rocky barrier to the Indian ocean. All three are disposed parallel to the mainland, from which they are separated by shallow waters, mostly under 30 fathoms, strewn with numerous reefs dangerous to navigation, especially in the Mafia channel opposite the Rufiji delta. (Mafia island is now part of Tanganyika Territory.) Some 6 m. N. of Zanzibar and forming part of the coral reef is the small, densely-wooded island of Tumbatu. Its inhabitants are excellent sailors.

Zanzibar island is 47 m. long and 20 m. broad at its greatest breadth. It has an area of 640 sq. miles. The island, called Unguja in Kiswahili, is not exclusively of coralline formation, several heights of reddish ferruginous clay rising in gentle slopes 400 to 450 ft. in the centre, and to double that height in the north. The forests which formerly covered the island have largely disappeared; the eastern half is now mostly covered with low scrub. The western part is noted for the luxuriance of its flora.

BY COURTESY OF THE AMERICAN BOARD OF FOREIGN MISSIONS

SWAHILI NATIVES OF ZANZIBAR

The great heat and excessive moisture of the atmosphere render the climate trying to Europeans. The year is divided into two seasons, according to the direction of the monsoons. The north-east monsoon sets in about the end of November, the south-west monsoon in April. The "hot season" corresponds with the north-east monsoon, when the minimum readings of the thermometer often exceed 80° F. In June to September the minimum readings drop to 72°, the mean annual temperature being about 80°. Rain falls in every month of the year. December, April and May are the rainiest months, August to October the driest. The average annual rainfall (18 years' observations) is 65 inches. (In 1859 as much as 170 in. were registered.)

Inhabitants.—On the east side of Zanzibar island the inhabitants, a Bantu-speaking race of low development, probably represent the aboriginal stock. They are known as Wahadimu and are noted as good fishermen, cattle raisers and skilled artisans. In the west, and especially in the capital (for which, *see* below), the population is of an extremely heterogeneous character, including full-blood and half-caste Arabs, Hindus, Goanese, Parsis, Persians, Baluchs, Swahili of every shade, and representatives of tribes from many parts of East Africa. The Arabs number about 16,500; the Indians and other Asiatics 14,000. The whites number (1921) 295. Besides the port of Zanzibar there are no large towns. Chuaka is a health resort facing the Indian Ocean.

Economic Conditions.—Up to about the end of the 19th century Zanzibar was the entrepôt for all the trade of East Africa, from Somaliland in the north to the Zambezi in the south. Its modern development dates from the occupation of the islands by the Muscat Arabs about 1830. Under the Seyyid Said the cultivation of the clove, now the staple product of both Zanzibar and Pemba, was made compulsory. But Zanzibar depended on its active transit trade in ivory, slaves, cotton goods and rice. Many merchants from India settled in Zanzibar and—apart from the traffic carried on by dhows with Arabia and the Persian gulf—trade fell largely into their hands, the Indian rupee becoming the standard currency. In 1872 a great cyclone destroyed the clove plantations in Zanzibar; a calamity which led the people of Pemba to grow cloves on a large scale. The Zanzibari, however, set about replanting, and in ten years the output exceeded the figures of 1872. In 1873 the highly profitable slave trade was declared illegal, though illicitly it was carried on for the next 25 years. Domestic slavery continued and it was by slave labour that the clove and other *shambas* (plantations) were worked by their Arab proprietors. In 1897 the legal status of slavery was abolished and slavery in the sultanate finally ceased in 1907. Many Arabs failed to adapt themselves to the new conditions and their shambas passed into the hands of natives; while in time the bulk of the labour was done by negroes from the mainland, chief among them the Wanyamwezi. Rates of pay are high, and in poor seasons profits are precarious, but with Government help, such as a bonus on bearing trees, free storage and better transport, the clove industry has continued to develop. Zanzibar and Pemba produce about 90% of the world's crop of cloves. All land suitable for cloves being under cultivation, the planting of the coconut received a new impetus, and in 1928 there were over 3,500,000 trees in the two islands. And, in spite of the competition of Mombasa, Tanga and Dar-es-Salaam, Zanzibar retained the local distributing trade. It is well served by many shipping lines, giving direct communication with Europe, India and South Africa.

The average clove crop for the 20 years ending 1924 was 512,000 fraslas; the crop for 1926–27 was over 825,000 fraslas. (A frasla equals 35 lb. avoirdupois.) For copra the average yield for ten years ending 1923 was 534,000 fraslas; in 1924 the yield was the highest recorded, being 988,000 fraslas. The copra, however, is generally of poor quality. Prices for cloves varied greatly; from 17·12 rupees per frasla in 1912–13 to 13·19 rupees in 1926–27; in 1896 the price had been 4·34 rupees. Imports consist mainly of cotton piece-goods, rice and other foodstuffs.

The loss of part of the transit trade was shown, not so much in any actual decrease in tonnage entering the port, which was 2,638,000 gross in 1927, as in the growth of the trade of the mainland ports, especially Mombasa. Imports were valued at £1,103,000 in 1913, at £2,223,00 in 1924, and at £1,771,000 in 1927. Exports in 1913 were valued at £1,048,000; in 1924, at £2,286,000; and at £1,828,000 in 1927. These figures include Government imports. Trade is mostly with India, Tanganyika and Great Britain. The chief source of revenue is the customs. Revenue increased from £275,000 in 1913 to £589,000 in 1923, and was £540,000 in 1927. Expenditure in 1913 was £248,000; in 1923, £480,000; and in 1927, £622,000.

Administration.—The virtual, if not the titular head of the administration is the British resident. There is an executive council of which the sultan is president, and a legislative council, over which the resident presides and on which sit nominated unofficial members. Mohammedan law is administered for Arabs and natives in the sultan's court. There is a British court for British and foreign subjects and for all cases where one of the parties is a non-native. Similar arrangements prevail in the area (the Kenya Protectorate) leased by the sultan on the mainland. Decrees of the sultan are binding when counter-signed by the resident.

HISTORY

From the earliest times of which there is any record the African seaboard from the Red sea to an unknown distance southwards was subject to Arabian influence and dominion. Egyptians, Chinese and Malays also appear to have visited the coast. At a later period the coast towns were founded or conquered by Persian and Arab Mohammedans who, for the most part, fled to East Africa between the 8th and 11th centuries on account of the religious differences of the times, the refugees being schismatics. Various small states thus grew up along the coast, Mombasa seeming to be the most important. These states are sometimes spoken of as the Zenj empire, though they were never, probably, united under one ruler. Kilwa (*q.v.*) was regarded as the capital of the "empire." The seaboard itself took the name of *Zanquebar* (corrupted to Zanzibar by the Indian traders), the Bilad ez-Zenj, or "Land of the Zenj" of the Arabs, a term which corresponds to the Hindu-bar, or "land of the Hindu," formerly applied to the west coast of India. By Ibn Batuta, who visited the coast in 1328, and other Arab writers the Zenj people are referred to in a general way as Mohammedan negroes; and they are no doubt still represented by the Swahili or "coast people," in whose veins is a large admixture of Asiatic blood. The Zenj "empire" began to decline soon after the appearance of the Portuguese in East African waters at the close of the 15th century. To them fell in rapid succession the great cities of Kilwa with its 300 mosques (1505), Mombasa the "Magnificent" (1505), and soon after Malindi and Mukdishu the "Immense" (Ibn Batuta). The Portuguese rule was troubled

by many revolts, and towards the end of the 16th century the chief cities were ravaged by the Turks, who came by sea, and by the Zimbas, a fierce negro tribe, who came overland from south of the Zambezi. On the ruins of the Portuguese power in the 17th century was built up that of the Imams of Muscat. Over their African dominions the Imams placed *valis* or viceroys, who in time became independent of their overlord. In Mombasa power passed into the hands of the Mazrui family. The island of Zanzibar, conquered by the Portuguese in 1503–08, was occupied by the Arabs in 1730, and in 1832 the town of Zanzibar, then a place of no note, was made the capital of his dominions by the Sayyid Said of Muscat, who reconquered all the towns formerly owing allegiance to the Imams, Mombasa being taken by treachery in 1837. On the death of Said in 1856 his dominions were divided between his two sons, the African section falling to Majid, who was succeeded in 1870 by his younger brother Bargash ibn Said, commonly known as sultan of Zanzibar. At that time besides the islands of Zanzibar, Pemba and Mafia, the sultan's dominions extended along the East African coast from Cape Delgado northwards to and including some of the Somali ports, with an undefined extension inland. Bargash, however, lived to witness the dismemberment of his dominions by Great Britain, Germany and Italy (*see* AFRICA) and in March, 1888, left to his successor, Sayyid Khalifa, a mere fragment of the territories over which he had once ruled. The mainland territories were divided, Italy acquiring the northern part, Great Britain the central part (now the Kenya protectorate) and Germany the southern part (now Tanganyika Territory) as well as Mafia island. The division was first by lease; subsequently Germany and Italy purchased the sovereign rights in their respective areas. The Sayyids Majid and Bargash acted largely under the influence of Sir John Kirk (*q.v.*) who from 1866 to 1887 was consular representative of Great Britain at Zanzibar. Had an offer by Bargash been accepted the whole of his mainland dominions would have been leased to a British company in 1877. By Sir John's efforts a treaty for the suppression of the slave trade in the sultanate was concluded in 1873.

British Protectorate.—On Nov. 4, 1890, what was left of the sultanate was proclaimed a British protectorate, in comformity with conventions by which Great Britain on her part ceded Heligoland to Germany and renounced all claims to Madagascar in favour of France. On the death of the then sultan, Sayyid Hamed bin Thwain, in Aug. 1896, his cousin, Sayyid Khalid, proclaimed himself sultan, and seized the palace. The British Government disapproved, and to compel Khalid's submission the palace was bombarded by warships. Khalid fled to the German consulate, whence he was removed to German East Africa, and Hamed bin Mohammed, brother of Hamed bin Thwain, was installed sultan by the British representative (Aug. 27, 1896). The Government was reconstituted under British auspices in Oct. 1891, when Sir Lloyd Mathews was appointed prime minister, a title afterwards changed to first minister. In 1897 after a long agitation the legal status of slavery was abolished, compensation being given to the slave owners, mostly Arabs, who had used slave labour for the clove plantations. In 1913 the control of the protectorate was transferred to the Colonial Office. At first the British agent and consul general in Zanzibar also administered the East Africa Protectorate (Kenya colony). This arrangement ceased in 1904; the Colonial Office (in 1913) made the governor of the East Africa Protectorate high commissioner for Zanzibar, local affairs being entrusted to a British resident, who took over the functions of first minister. But the governor had little time to spare for the sultanate and the office of high commissioner was abolished in 1925. Since then the British resident has been directly responsible to the Colonial Office. An advisory council was created but was replaced in 1926 by a nominated legislative council.

Although the administration was controlled by the British resident the sultan continued to exercise much authority. Sayyid Khalifa bin Harud (born 1879), who became sultan in 1911, was a great-nephew of Bargash. He worked in full agreement with the British and as the leading Muslim prince in East Africa his moderating influence did much to steady Muslim opinion in that part of Africa during the World War. The most dramatic incident of the war, for Zanzibar, was the sinking of the ancient British cruiser "Pegasus" by the German cruiser "Königsberg" on Sept. 20, 1914, the "Pegasus" being at the time at anchor in Zanzibar roadstead, undergoing repairs. During the War, in 1917, the Sayyid Khalid, who had lived in German East Africa since his attempt to seize the throne, surrendered to the British. He was deported to St. Helena, but in 1921 was allowed to live in Mombasa, where he died in 1927.

Pearce (sometime British resident), *Zanzibar, the Island Metropolis of Eastern Africa* (1920). *See* also the annual reports issued by the Colonial Office, London, and consult the bibliography under KENYA COLONY. (F. R. C.)

ZANZIBAR, an East African seaport, capital of the island and sultanate of the same name, in 6° 9′ S., 39° 15′ E. Population about 60,000. The town is situated on the western side of the island 26 m. N.E. of the mainland port of Bagamoyo. Zanzibar is built on a triangular-shaped peninsula, about 1½ m. long, which runs from east to west, forming a safe and spacious roadstead, with a minimum depth of water exceeding five fathoms. Harbour improvements were made, leisurely, between 1920 and 1929 which included a concrete wharf 800 ft. long, where ships can load and unload; 700 ft. of quay frontage for dhow traffic; and a clove depot and goods sheds. Viewed from the sea, the town—which has a thoroughly oriental aspect—presents a pleasant prospect with its mosques, white, flat-topped houses, barracks, forts and round towers. For the most part, Zanzibar consists of a labyrinth of narrow streets. Characteristic of the streets are the carved and massive wooden doors, whose blackness contrasts with the white stone of the houses, and the bright red of the acacias in the garden enclosures. The bazaar is a great centre of attraction. The Anglican cathedral (built 1873–79), a semi-Gothic coral building, occupies the site of the old slave market, which was closed in 1873. The Roman Catholic cathedral is a fine building in the Renaissance style.

The motley population of Zanzibar—the chief elements are Arab, Indian and negro—is indicative of the commercial importance of the city. Its geographical position made it the key of East Africa from Cape Guardafui to Delagoa Bay. "When you play on the flute at Zanzibar" (says an Arab proverb) "all Africa as far as the lakes dances." The Americans were the first among white merchants to realize the possibilities of the port, and a United States consulate was established as early as 1836. The name Merikani, applied to cotton goods and blankets on the east coast, is a testimony to the enterprise of the American trader. The city was the headquarters of the Arabs who ravaged East Africa for slaves and ivory during the major part of the 19th century, and was described by Henry Drummond in *Tropical Africa* (1888) as a "cesspool of wickedness oriental in its appearance, Mohammedan in its religion, Arabian in its morals." Nevertheless, Zanzibar in those days was the focus of all exploring and missionary work for the interior.

ZAPARAN, a group of tribes of South American Indians forming an independent linguistic stock. The Zaparos live in the region of the Peruvian-Ecuadorian border, on the Curary and Napo rivers and the lower Aguarico. They are a tall, robust people, rather light in skin colour, with prominent noses and are said sometimes to have blue eyes. The men wear a tree-bast poncho-like garment, ornamented with painted designs. The women wear only a small fringed apron. Their houses are merely thatched shelters with no sides. Their weapons are bows, spears and blowguns, poison being used on the darts for the latter and for their arrows. They depend mainly on hunting and fishing for food, although growing some sweet potatoes and bananas.

See A. Simpson, "Notes on the Zaparos," *Journ. Anthrop. Inst. Gr. Brit. and Ire.* vol. vii., pp. 502–510; G. Osculati, *Esplorazione delle Regioni Equatoriali etc.* (Milano, 1854); Reinburg, "Folkore amazonien," *J. Soc. Americanistes de Paris* (n.s.) vol. xiii. pp. 11–17.

ZAPOROZHE (formerly Alexandrovsk), a town of the Ukrainian S.S.R., in 47° 51′ N., 35° 10′ E., on the left bank of the

Dnieper river. Pop. (1926) 55,260. Its name means "beyond the rapids," and it is situated south of the falls on which the Dnepropetrovsk hydraulic station is being constructed (1928). Plans are in hand for widening the river so as to permit steamers to reach the town from the Black sea. There is a motor factory and five factories produce agricultural machinery; the town is also a railway junction. Zaporozhe is opposite to Khortitsa Island, a former camp of the Zaporozhian Cossacks and kurgans (tumuli) are numerous in the district.

ZAPOTEC, a south Mexican nationality, the most important of a group comprising also Mixtec and half a dozen other peoples, all speaking tonal languages, and occupying a territory roughly coterminous with the state of Oaxaca. The population in this area of the so-called Zapotecan family, of which the Zapotec proper held the south-eastern part, is still overwhelmingly Indian in blood and largely native in speech. The ancient Zapotec were an important people, who probably served as intermediaries of culture between the Maya and the Nahua, but also developed traits of their own. They excelled in finely modeled figure jars of pottery. Their calendar appears to have been that of the Maya and Aztec; their glyphs have not been read. Two important groups of ruins in Zapotec territory lie at Monte Alban and at Mitla. The former, which appear to be the earlier, comprise terraces and pyramids on a hill, and inscribed stelae and tablets. Mitla has long stone buildings, sunken or on low platforms, with stone columns, veneers of stone cut into geometric patterns, and pictographic frescoes. The population speaking Zapotec numbered 231,000 in 1895; that speaking idioms of Zapotec family, about 450,000.

ZARA, a town on the east coast of the Adriatic, formerly the capital of Dalmatia but now attached to Italy, and included in Venezia Giulia. Italian territory includes an adjacent belt with a total area of 42 sq.m., and a population of 18,623, of whom over 18,156 (1926) live within the town. Zara in this sense forms a small enclave on the coast of the Yugoslav *oblast* of Split. The town is placed on the north-west end of a small, low-lying peninsula separated by the Canale di Zara from the islands of Ugliano and Pasman. It is about 73 m. N.W. of Split and about 92 m. N. of E. from Ancona, with which it is connected by steamer. The space between the peninsula on which the town stands and the adjacent mainland forms a natural, deep-water harbour, the entrance to which was in Venetian times blocked by a chain. Surrounded on three sides by the sea the town was rendered still more secure, after its capture by the Venetians in 1409, by the digging of a deep ditch on the fourth side, so as to convert the tip of the peninsula into an island. When the fortifications were reconstructed by Sanmichele in the 16th century, a gate, the Porta di Terrafirma, was erected to guard the single entrance across the ditch on the landward side.

At the end of the 10th century Zara passed for the first time under Venice. For four centuries it was bandied about from Venice to Hungary and back again. Finally, in 1409 it was sold by the King of Hungary to the Republic and remained Venetian till the Republic ceased to exist. It was then ceded to Austria, passed temporarily into French possession, forming part of the short-lived Illyrian kingdom, till in 1814 the French were driven out and it remained Austrian till the end of the World War. Its transference to Italy, when the rest of Dalmatia became Yugoslav, was justified by the large Italian element in the population and the continuity of Latin culture and speech.

Of the churches one of the oldest is the secularized S. Donato, probably dating from the early 9th century, and recalling S. Vitale at Ravenna. The cathedral dates from the 13th century and its treasury contains some good examples of Dalmatian silver work.

See T. G. Jackson, *Dalmatia, the Quarnero and Istria* (1887) and G. Dainelli, *La Dalmazia* (with atlas, 1918).

ZARHON, a mountain in Morocco, altitude 3,600 feet, 9½ m. N. of Meknes; it is covered with olive-trees and vines, and has numerous villages; it is one of the most picturesque and smiling regions of Morocco. On the flanks of the Zarhon is the town Mulai Idrīs Zarhoon, so called after Mulai Idrīs I., the founder of the Moorish empire, who was buried there in A.D. 791. The whole town is considered as a sanctuary. Not far from Mulai Idrīs are the ruins of the Roman town of Volubilis (Oulili). *See* L. Chatelain, *Les fouilles de Volubilis* (Casablanca, 1915).

ZARIA, a province occupying a central position in the Northern Provinces of the British protectorate of Nigeria. It has an area of 23,695 sq.m. and a population (1926) of 1,031,567. The province was enlarged in 1926 by the transference to it of the Katsina emirate from Kano province (*see* KATSINA). The province, of which a great portion consists of open rolling plains, is watered by the Kaduna affluent of the Niger and its many tributaries, and is generally healthy. There is an area of high land (2,000 ft. and over) in the centre of the province which in the south consists of parksland—"orchard brush." In the north the country is more open and becomes semi-desert where the Katsina emirate adjoins the French Niger colony. The chief towns are Zaria, the capital of the emirate, 87 m. S.W. of Kano, and Kaduna, the capital of the Northern Provinces. Both Zaria and Kaduna are in direct railway communication with Kano, Lagos and Port Harcourt, the Western and Eastern railways of Nigeria having their junction at Kaduna. There is also a railway from Zaria to the Bauchi tin-fields, and another railway goes N.W. from Zaria towards Sokoto. There are over 1,000 m. of motor roads in the province. Cotton is very extensively grown.

The ancient state of Zaria, also called Zeg-Zeg by the geographers and historians of the middle ages, was one of the original seven Hausa states. It suffered all the fluctuations of Hausa history, and in the 13th and early 14th centuries seems to have been the dominating state of Hausaland. At later periods it submitted in turn to Kano, Songhoi and Bornu. At the end of the 18th century it was an independent state under its own Mohammedan rulers, but, like the rest of northern Hausaland, it was conquered in the opening years of the 19th century by the Fula. It remained a Fulani emirate up to the period of the British occupation of Nigeria. The emir of Zaria professed friendliness to the British, and in March 1902 the province was taken under British administrative control. It was found that, notwithstanding his friendly professions, the emir of Zaria was intriguing with Kano and Sokoto, then openly hostile to Great Britain, while he continued to raid for slaves and to perpetrate acts of brutal tyranny and oppression. He was deposed in the autumn of 1902, and after the Sokoto-Kano campaign of 1903, which assured the supremacy of Great Britain in the protectorate, another emir, Dan Sidi, was appointed to Zaria.

ZARLINO, GIOSEFFO (1517–1590), Italian musical theorist, surnamed from his birthplace ZARLINUS CLODIENSIS, was born at Chioggia, Venetia, in 1517 (not 1540, as Burney and Hawkins say). Studying in his youth for the Church, he was admitted to the minor orders in 1539 and ordained deacon in 1541 at Venice; but he soon devoted himself entirely to the study of music under the guidance of Adrian Willaert, then choirmaster at St. Mark's. Willaert, dying in 1562, was succeeded by Cipriano di Rore, on whose removal to Parma in 1565 Zarlino was elected choirmaster. Though now remembered chiefly as the earliest advocate of a system of equal temperament for fretted and keyed instruments and for his invaluable contributions to the theory of music, he was both a practical musician and a composer. His printed works consisted of a volume entitled *Modulationes Sex Vocum* (Venice, 1566) and a few motets and madrigals scattered through the collections of Scotto and other contemporary publishers, but he also produced and superintended the public performance of some important pieces in the service of the republic. The only example we possess of his compositions on a grand scale is a ms. mass for four voices, in the library of the Philharmonic Lyceum at Bologna. He died at Venice on Feb. 14, or, according to some Feb. 4, 1590.

Zarlino's first theoretical work was the *Istitutioni Armoniche* (Venice, 1558; reprinted 1562 and 1573). This was followed by the *Dimostrationi Armoniche* (Venice, 1571; reprinted 1573) and by the *Sopplimenti Musicali* (Venice, 1588). Finally, in a complete edition of his works published shortly before his death Zarlino reprinted these three treatises, accompanied by a *Tract on Patience*, a *Discourse on the True date of the Crucifixion of Our Lord*, an essay on *The Origin of the Capuchins*, and the *Resolu-*

tion of Some Doubts Concerning the Correction of the Julian Calendar (Venice, 1589).

The *Istitutioni* and *Dimostrationi Armoniche* deal, like most other theoretical works of the period, with the whole science of music as it was understood in the 16th century. The earlier chapters, treating chiefly of the arithmetical foundations of the science, differ but little in their line of argument from the principles laid down by Pietro Aron, Zacconi, and other early writers of the Boeotian school; but in bk. ii. of the *Istitutioni* Zarlino boldly attacks the false system of tonality to which the proportions of the Pythagorean tetrachord, if strictly carried out in practice, must inevitably lead.

Again, Zarlino was in advance of his age in his classification of the ecclesiastical modes. These scales were not wholly abolished in favour of our modern tonality in the 17th century. Eight of them, it is true, fell into disuse; but the mediaeval Ionian and Hypo-ionian modes are absolutely identical with the modern natural scale of C; and the Aeolian and Hypo-aeolian modes differ from our minor scale, not in constitution, but in treatment only. Mediaeval composers, however, regarded the Ionian mode as the least perfect of the series and placed it last in order. Zarlino thought differently and made it the first mode, changing all the others to accord with it. His numerical table, therefore, differs from all others made before or since, prophetically assigning the place of honour to the one ancient scale now recognized as the foundation of the modern tonal system.

These innovations were violently opposed by the apostles of the monodic school. Vincenzo Galilei led the attack in a tract entitled *Discorso Intorno alle Opere di Messer Gioseffe Zarlino,* and followed it up in his famous *Dialogo,* defending the Pythagorean system in very unmeasured language. It was in answer to these strictures that Zarlino published his *Sopplementi.*

ZAUSCHNERIA, in botany, a genus of North American plants of the evening-primrose family (Onagraceae), comprising several species native to California and adjacent Mexico. They are low, slightly shrubby perennials, with small narrow or ovate leaves and large scarlet, fuchsia-like flowers. *Z. californica,* known as California fuchsia and Mexican balsamea and found on mountain slopes, is planted in flower gardens.

ZEALAND (Dan. *Sjaelland*), the largest island of the kingdom of Denmark, 2,636 sq.m. in area, lying between Fünen (11 m. distant) on the west, and southern Sweden (only 3 m. distant at the Sound) on the east. The surface is undulating, but little above sea-level, and the outline very irregular. On the island are the old cathedral city of Roskilde, the Danish capital, Copenhagen, and the historic port of Helsingør (Elsinore). (For further information, *see* DENMARK.)

ZEBRA, the name for the African striped members of the horse tribe. The true or mountain zebra (*Equus zebra*) maintains a precarious foothold in the mountainous region of Cape Colony and also inhabits Angola. It stands about 4ft. at the shoulder, with fairly long ears, a tail scantily clothed with hair, and a short mane. The ground colour is white and the stripes, absent only on the abdomen and inside of the thighs, are black. The lower part of the face is brown. The stripes on the haunch do not reach the median dorsal stripe and there are a number of short stripes between the two. These are absent in Burchell's zebra (*E. burchelli*), which is a larger animal with smaller, more completely white ears, a longer mane and a fuller tail. Burchell's zebra extends from the plains north of the Orange river to north-east Africa. The ground-colour of the body is pale yellowish-brown, the stripes, which in the southern individuals do not extend on to the limbs and tail, dark brown or black. Grant's zebra (*E. b. granti*) is the northern, completely striped race which lacks the characteristic "ghost" stripes between the main ones. Grévy's zebra (*E. grevyi*) inhabits Abyssinia and Somaliland and is distinguished by its enormous ears and numerous, narrow, black stripes. The species known as quagga (*q.v.*) is now extinct. Zebras occur in large herds and are one of the staple articles of diet of the lion. Their stripes result in a camouflage effect, causing them to fade away against the background, particularly at night, when they principally feed. Zebras can be trained for driving and riding, but only with difficulty. (*See* HORSE.)

GRÉVY'S ZEBRA (EQUUS GREVI) DISTINGUISHED BY ITS BLACK STRIPES AND ASS-LIKE EARS

ZEBU (*Bos indicus*), an Indian species of ox, characterized by its light colour and the possession of a hump on the back. The sacred bulls of India belong to this species, which is much used for draught and farm work, and also supplies milk. (*See* CATTLE.)

ZEBULON, a tribe of Israel, named after the sixth son borne by Leah to Jacob (Genesis xxx. 20). The fertile territory occupied by the tribe lay roughly north-east of the plain of Jezreel, but the boundaries between it and the neighbouring territories of Naphtali, Asher and Issachar are ill-defined. The somewhat obscure text of Genesis xlix. 13 seems to imply that at one time Zebulon extended to the sea-coast and marched with Phoenician territory. The tribe appears to have furnished valiant warriors, and receives special mention in the Song of Deborah for its martial exploits (Judges v. 14, 18).

ZECHARIAH, the eleventh in order of the "minor prophets" of the Old Testament. He was associated with Haggai (*q.v.*) in stimulating the re-building of the temple at Jerusalem, begun in 520 (Ezra iv. 24) and completed in 516 (Ezra vi. 15). A previous attempt made by returned exiles in 537 (Ezra i. 1 *seq.*, iii. 1 *sqq.*) seems to have been checked by local opposition and not renewed owing to economic pressure. In 520, however, the political disturbances of the Persian empire (of which the Jewish community in Palestine was a negligible part) were interpreted by these two prophets as a sign that the Messianic expectations were now to be realized, and that the "Day of Yahweh" was at hand. Haggai gave the first impulse to the new attempt; two months later, Zechariah joined him in encouraging the faint-hearted. His prophecies, exactly dated in 520 (i. 1, 7) and 518 (vii. 1), are to be found in the first eight chapters of the book now bearing his name. Their central feature is a series of "night-visions" (i. 8, iv. 1), intended to show Yahweh's immediate and effective intervention on behalf of His people. They are arranged with literary art in connected sequence, beginning with the vision of horsemen who report that the expected Messianic crisis has not yet come (i. 11, *cf.* Hagg. ii. 21 *seq.*), and culminating in the vision of Yahweh's war-chariots despatched to execute His vengeance upon the heathen, especially on Babylonia (vi. 8). The six intervening visions (all the eight are ascribed to a single night) reveal in succession four horns, representing the heathen powers of the four quarters of the earth, cast down by four craftsmen (i. 18–21), a man with a measuring line, whose narrow ideas of the future city are replaced by the conception of a city without walls because of its great extent, to which Yahweh's protection will be a wall of fire (ii. 1–5), the formal acquittal and restoration of Joshua the high-priest, representing the community (iii. 1 *seq.*), the seven-branched lampstand, representing Yahweh's watchful eyes, with two olive-trees, representing Joshua and Zerubbabel (iv. 1–14, but see the commentaries), the flying roll which brings its ubiquitous curse on evil-doers (thieves and false-swearers), and so cleanses the land of moral evil (v. 1–4), the woman carried off in an ephah, representing the removal of guilt (v. 5–11). These visions are now prefaced by a call to repentance and the promise of forgiveness (i. 2–6), in which Zechariah's appeal to "the former prophets" (like the detail of an interpreting angel in the visions themselves) reminds us that the great prophetic period (8th–6th centuries) lies in the past, and that the conception of revelation itself has lost something of its original simplicity and spontaneity.

The "night-visions" are followed, two years later (vii. 1), by a divine oracle which directs that the fasts kept throughout the exile should now become festivals (viii. 18 *seq.*). The enquiry which led to the oracle (vii. 3) is made the occasion of warning against the externality of fasting, of appeal for true conduct, and of an idyllic picture of the happiness of the coming Mes-

sianic age (note especially viii. 4, 5). In this happy future the prophet expected that Zerubbabel would be the Messiah, and the bringing of an offering of gold and silver from Jews in Babylon led Zechariah to crown him symbolically in the name of Yahweh (vi. 9–15; *see* the commentaries for the original text). The darkness that falls on Jewish history with the completion of the second temple suggests that these words and deeds may have thrust Zerubbabel into a dangerous political prominence, leading to his removal by the Persian authorities, and the eclipse of Messianic expectations.

The remainder of the present book of Zechariah (ix.–xiv.) is of an altogether different character, and is now generally admitted to belong to a period later than the Persian (as indeed the direct reference to Greece in ix. 13 implies). This portion of the book is divided by the titles in ix. 1, xii. 1. ("The burden of the word of Yahweh"), into two distinct collections, each of which it seems necessary to divide again, so that we have four groups of prophecies, distinguished by their subject-matter. The first (ix.–xi. 3) deals with the recovery of Palestine by Yahweh's victories over Syria, Phoenicia and Philistia (ix. 1–8), the coming of the Messianic king to the restored and victorious Israel (ix. 9–17), the overthrow of the (foreign) "shepherds" or rulers, and the gathering of exiled Israelites (x. 1–12), closing with a figurative dirge over the fall of these "shepherds" (xi. 1–3). The second group (xi. 4–17, with the misplaced xiii. 7–9) describes the rejection of the prophet, representing a worthy shepherd, and the accursed doom of a worthless one, a purified third of the people alone remaining. The third (xii., xiii. 1–6) pictures an attack of the nations upon Jerusalem, in which Judah is first a foe and then a victorious friend to the mother city; this is followed by elaborate mourning for an unnamed martyr (xii. 10, R. V. mg.), and the cleansing of Jerusalem from idolatry and *prophecy*. The fourth division (xiv.) describes the delivery of Jerusalem from the heathen, that it may become the metropolis of religion for all the world. The last two of these divisions are of a markedly eschatological character, and even the first two could be so regarded (so Sellin). These writings are perhaps the most obscure of the Old Testament, chiefly because we have no sufficient clue to the historical allusions, such as the cutting off of three shepherds in one month (xi. 8), the pierced martyr (xii. 10) and the antagonism of Judah and Jerusalem (xii. 2, xiv. 14). By some scholars these chapters have been brought down as late as the Maccabean age, the events of which are supposed to explain these and other allusions. But the fact is that we are almost wholly ignorant of Jewish history during the earlier part of the Greek period (from 331 B.C.), to which these writings might equally well belong.

ZEDEKIAH, son of Josiah, and the last king of Judah (2 Kings xxiv. 17 *sqq.;* 2 Chron. xxxvi. 10 *seq.*). He was appointed king by Nebuchadrezzar after the capture of Jerusalem (597 B.C.) and held his position under an oath of allegiance. After three years he began an intrigue with Moab, Edom, Ammon, Tyre and Sidon, and it is possible that he was summoned to Babylon to explain his conduct. Nevertheless, relations were maintained with Egypt and steps were taken to revolt. The Babylonian army laid siege to Jerusalem in 588 B.C., and a vain attempt was made by Pharaoh Hophra to cause a diversion. After six months a breach was made in the city, Zedekiah was captured and taken to Nebuchadrezzar at Riblah. His sons were killed, and he was blinded and carried to Babylon in chains where his predecessor, Jehoiachin was already a captive.

ZEEBRUGGE, ATTACK ON: *see* BELGIAN COAST OPERATIONS.

ZEEHAN, a town of Montagu county, Tasmania, 225 m. N.W. of Hobart, on the Little Henty river. It is a railway centre and focus of the silver-lead mining of the neighbourhood.

ZEELAND, the most southerly North sea maritime province of the Netherlands, consists mainly of six deltaic islands between the Grevelingen (the southern sea-exit of the Waal-Maas) and De Hont or Western Schelde sea-channel, together with a strip of the Flanders mainland lying south of De Hont. Belgium borders it on the south; the Dutch provinces of North Brabant, east, and South Holland, north, are its other neighbours. It is 707 sq.m. in area, and of the other ten Dutch provinces only Utrecht is smaller. Very little of its entire surface is above sea-level. Formed of the accumulated alluvium from the great rivers and with little natural protection against the encroaching waves, its life has been marked by inundation catastrophes and by the long, slow winning back of territory in the lee of successive ranks of many miles of artificial dikes. (*See* NETHERLANDS: *Dikes.*)

Above a gateway of the old mint of the counts of Holland in Middleburg a sculptured lion of Zeeland rises through stone waves and his "Luctor et emergo" is one of the most apposite of the provincial mottoes. Its pop. (1926), 249,991, is, with the exception of Drente, the lowest in Holland and Drente is rapidly overhauling it, but its fertile soil favours the cultivation of cereals, wheat, rye and barley and of root crops. Its famous black and white cattle and dairy produce are important exports.

The constituent islands are Walcheren to the south-west with North Beveland and South Beveland in close proximity to the east. North of the fairly wide waterway Ooster Schelde, which at the eastern end has the significant name of Verdronken (Drowned) Land, are Schouwen-en-Duiveland (westward), and the smaller Tholen and still smaller St. Philipsland. All the islands preserve archaic customs and costumes. Walcheren, though not the largest island, is the most densely populated and nearest to England with which Flushing (Vlissingen), its largest town, has regular passenger and mail boat services *via* Harwich and Queenborough. Flushing (pop. 22,000) is not only a sea and canal port, but also a gay resort. It is the railhead for the line which in 1866 first crossed the great railway dam between Walcheren and South Beveland and now runs to Roosendaal (North Brabant) the great railway junction for Belgium, Germany and north Holland. The ship canal from Flushing divides Walcheren into two unequal parts and passes Middleburg en route for Veere, while steam trams connect Flushing and Middleburg with Domburg. Domburg is a small seaside resort built over and round a much older settlement with civic rights dating back to the 13th century; in addition, numerous Roman antiquities found locally suggest a still earlier origin. South-west of Domburg is the famous Westkapelle dike. Middleburg, the capital of the province, is but little smaller than Flushing. It is and has long been the real focus of Dutch life in Zeeland and has many interesting buildings.

The small industries of Walcheren include ship-building, distilling, brewing and spinning, but it deservedly ranks as the flower garden of Zeeland; in latter days it is cultivating a great variety of products from hemp to the opium poppy and its orchards are important. South Beveland and its small neighbour North Beveland are even more important for fruit which, in their case, is largely exported as jam. South Beveland has suffered much from inundations, particularly in the south-west; here, during the 16th century, the island of Borsselen was submerged but has been gradually recovered. North Beveland, destitute of ship canal or railway has no large settlements; it is intensively cultivated and shares with Schouwen and South Beveland an important oyster-breeding industry, Yerseke on the north-east coast of South Beveland being particularly famed. Goes (pop. about 8,000) is the largest town of North Beveland, Schouwen contains the greatest amount of elevated land in Zeeland and the well-wooded tract along the western seaboard introduces a less usual scenic feature. The former natural seaway between Schouwen and Duiveland has been closed by the damming of the Dykwater but a canal still follows its line. On this is the old port of Zierikzee which has probably retained more of its mediaeval features than any other Zeeland town; the Gothic church is represented

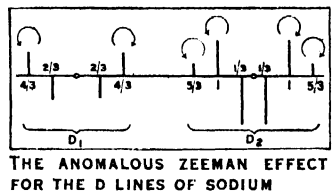
by a mutilated tower and many of the small Dutch houses of minute coloured bricks, and the old town gates belong to the period of the Spanish assault on Zierikzee in 1576.

In the north of Schouwen is Brouwershaven, established as a port by the brewers and wine merchants of Middleburg. Here the English supporters (under Jacquelin of Bavaria) were defeated by the troops of Philip of Burgundy. St. Philipsland is rather inaccessible and has little of interest; Tholen, only little easier of approach, has on its east coast a small ancient circular town of the same name, noted for oysters and onions. In the still smaller village of St. Martinsdyk little remains of its once mighty 14th-century castle—the home of the Borsseles—but the village church contains a tomb of Floris van Borssele. Stavenisse on the west coast is modern and ugly. The strip of Zeeland-Flanders gives the Dutch command of both banks of the Lower Schelde. Here the busiest town is Terneuzen at the sea-end of the canal (1825–27), running due south to Ghent; south-east of it lies Axel, formerly fortified but now noted only for the peculiar costumes of its peasant women.

ZEEMAN, PIETER (1865–), Dutch physicist, was born at Zonnemaire, Zeeland, on May 25, 1865. He studied at Leyden, where he held the following appointments: assistant in physics (1890–94), *Privat-dozent* (1894–97) and lecturer (1897–1900). In 1900 he was appointed professor of physics at Amsterdam, and in addition director of the Physical institute, Amsterdam, in 1908. Zeeman's best known work in physics is on the splitting up of spectral lines in a magnetic field, known as the Zeeman effect. The theoretical explanation was first given by Lorentz very soon after the effect was observed. The phenomenon has been used by astronomers for the detection of magnetic effects at the surface of the sun. More recently Zeeman has worked on the propagation of light in moving media. He made observations in water, quartz and flint glass, the bodies were given an oscillatory motion and instantaneous photographic methods were applied, making the exposure when the velocity was a maximum. It was found that the results agreed with Lorentz's formula rather than with that of Fresnel. The results of these observations are collected in *Archives Néerlandaises des Sciences Exactes* (vol. x., 1927). Zeeman is a member of many learned societies, including the Royal Society, and has been the recipient of many awards, including the Nobel Prize in 1902. He is the author of several books on magneto-optics, which have been translated into English and German.

ZEEMAN EFFECT, named after its discoverer, is the term used to describe the phenomena produced in spectroscopy (*q.v.*) by a magnetic field. When a substance, which emits a line spectrum, is placed in a strong magnetic field, every line is split up into several components each of which has a characteristic change of frequency and characteristic polarization and intensity. Magnetism produces many curious effects in matter (change of electrical resistance, "Hall" effect, etc.), but the Zeeman effect has an importance immensely greater than the rest because it has proved to be one of the most powerful means of discovering the nature of the forces in the atom. The first indication of a connection between light and magnetism was due to Faraday, who discovered the magnetic gyration of light in 1845; *i.e.*, when plane polarized light goes through transparent matter in a magnetic field the plane of polarization is rotated. With extraordinary insight he conjectured that there ought to be a corresponding effect in the emission of light, and almost the last experiment of his life was to seek for it. He failed to detect it since the technique both of spectroscopes and of magnetic fields was insufficiently developed, but modern theory entirely bears out the correctness of his conjecture. In 1896 Zeeman made a similar attempt and was successful. When a source of light, such as a metallic arc, was placed between the poles of a powerful electromagnet, the lines of its spectrum were split into components, some displaced to the red and some to the blue, and each of these was polarized in a characteristic way.

The experimental study of the Zeeman effect calls for little comment. Even in the strongest magnetic fields available (say 30.000 gauss) the extreme components into which a line is split are never more than about 1 Å. U. apart, and there may well be a dozen or so components between them, so that it is not only necessary to have a powerful magnet, but also a spectroscope of high resolving power. The consequent difficulties are very great, but are not peculiar to the Zeeman effect. The polarizations of the various components are shown by the ordinary methods used for polarized light, and their intensities by means of an opaque wedge according to the usual photometric practice, and only one point calls for comment. Light passing through a diffraction grating has its intensity differently affected according as it is polarized along or across the lines of the grating, and this might entirely vitiate the comparison of the intensities of lines polarized in these two ways. The difficulty is avoided by the use of a quartz plate, which rotates the planes of polarization so that both types are at 45° to the lines of the grating. It was only after this was done that it was found possible to obtain correct values for the intensities, with important consequences for the general theory of spectra.



The Normal Zeeman Effect.—Almost immediately after Zeeman had made his discovery, Lorentz showed how it would fit into the classical electric theory. His explanation has been superseded in the light of later knowledge, but it still furnishes a convenient description of the simpler features of the effect. It explains what is called the "normal effect," though, as so often happens with scientific nomenclature, it turns out that the normal effect is of rather rare occurrence and is not in fact the most primitive type. Lorentz supposed that the atom contains an electron which describes free vibrations about a centre. The restraining force is proportional to the distance from the centre and is the same for all directions, so that the free period is independent of the orbit of the electron. Such an electron will emit light of its own frequency and with polarization completely determined by its orbit. When there is no external magnetic field the orbits of the various atoms in the source are orientated at random, and their average effects give unpolarized light.

When an electron is placed in a magnetic field, it experiences a force at right-angles to the direction of the field and also at right-angles to its line of motion, and this force is to be superposed on the other forces acting on the electron. The effect is most conveniently described by Larmor's theorem which asserts that the field is equivalent to a rotation. This means that the actual motion of the electron in the field is the same as the apparent motion it would have without the field, but now as seen by an observer who is himself rotating at a suitable speed about an axis in the direction of the magnetic force. The angular velocity of the Larmor rotation is $eH/2mc$, where H is the strength of the field, e and m the charge and mass of the electron and c the velocity of light. Compared to ordinary standards this is a very high speed even for quite weak fields (for the earth's magnetic field is about a million rotations a second), but it is much smaller than the speed with which it is to be compared, the electron's motion in the atom.

The equivalence of magnetism and rotation is true whatever other forces may act on the electron. In our case the effect can best be seen by considering three special types of orbits; the general motion is merely a superposition of these. The first is a motion along the line of the magnetic field, and this is evidently unaffected by the rotation. The others are circular motions, both in a plane perpendicular to the field, but in opposite directions. The Larmor rotation must be added to one of these, and subtracted from the other. If the original frequency was ν there will now be three frequencies, ν and $\nu \pm eH/4\pi mc$, and we conclude that the magnetic field will split one line into three. Moreover each of the three will have a characteristic polarization, associated with the corresponding motion of the electron. These polarizations vary according to the position of the observer, and are most easily described by saying that the light-vector (electric force) behaves like the perspective view that the observer has of the motion of the emitting electron. Thus the light of frequency ν corresponds to the electron vibrating along the line of the field. Viewed from anywhere it appears to describe a straight line, and so the associated light is plane-polarized. From the poles (in the

direction of the magnetic field) the electron will appear motionless, and so no light is emitted in this direction. At the equator the apparent motion is a maximum and the light is polarized with vector in the same direction as the field; for this reason the component is called *parallel*. Next consider one of the circular motions; on the same principle it emits circularly polarized light towards the poles, and plane-polarized light towards the equator where the electron's motion is seen edgewise. From the direction of its polarization at the equator this component is called *perpendicular*. One of the first tasks of Zeeman was to examine the light in the polar direction, for, by finding whether the bluer component gives right- or left-handed circularly polarized light, it is possible to fix the sign of the Larmor rotation, and so to determine the sign of the electron's charge *e*. Once this is done it is most convenient to observe the effect from the equator, since in that direction all three components are plane-polarized, and this is much more convenient for investigation.

The Anomalous Zeeman Effect.—The experiments on some spectral lines (in particular on the chief cadmium lines which are used as fundamental standards of wave-length) entirely bore out Lorentz's theory and gave a measure of e/mc, which in magnitude and sign was in agreement with the value determined for free electrons. This result, however, proved to be quite exceptional; nearly all lines were found to give much more complicated splitting and this in many different ways, which are collectively referred to as the *anomalous Zeeman effect*. There are usually many more than the three lines of Lorentz's theory, and often none in the positions predicted by it; but the scale of the pattern is still proportional to the magnetic force and the polarizations still fall into the three classes described, the central ones being *parallel* and the outer *perpendicular* of the two types. Moreover the displacement always bears a simple numerical ratio to that given by the simple theory. The general rules are very complicated and we may be content to describe a single example, the yellow lines, D_1 and D_2, of sodium. These two lines break up into 4 and 6 components respectively, in the manner shown in figure. This is the simplest case of the anomalous effect, and theory now shows it to be the most primitive effect of all, much more so than the normal Lorentz triplet.

THE ANOMALOUS ZEEMAN EFFECT FOR THE D LINES OF SODIUM

The anomalous Zeeman effect is connected with another important phenomenon, called the Paschen-Back effect after its discoverers. As the magnetic field is increased, the components get further apart, and for a strong enough field those of D_1 and D_2 ought to overlap one another. This does not occur, but a complicated rearrangement takes place; some lines weaken in intensity and disappear, others melt together and finally, when the magnetic field is very strong indeed, a totally new pattern is observed in the form of a *single* Lorentz triplet. A trace of the original two lines remains, in that each component has a fine structure and is not a simple line. The actual transition to the Paschen-Back effect cannot be observed for the D-lines, because it would need quite unattainable strengths of field, but it is safely inferred from the behaviour of other lines of the same type which are originally much closer together. Though we have only described one particular example, it is universally true that in very strong fields every *multiplet* of a spectrum is replaced by a single Lorentz pattern.

The disentangling of the very complicated patterns was made possible by the quantum theory of spectra, according to which there is a spectrum of *levels* underlying the spectrum of lines. Every line is given in frequency by the difference in "height" between two levels, and the levels have much simpler characteristics than the lines. The analysis was worked out with the help of quasi-dynamical models, and its result was to express the displacement, polarization and intensity of every line algebraically in terms of the *quantum numbers* which describe the two associated levels. (*See* QUANTUM THEORY.) From this analysis it emerged that in the atom there are two kinds of system, one of which exhibits the Larmor rotation, while the other shows a rotation just twice as great. By the interaction of the two systems it is possible to explain both the anomalous Zeeman effect and the Paschen-Back effect. For some time the existence of this doubled rotation was mysterious, but it was finally traced to the electron itself; the electron in addition to its electric charge is a magnet and rotates in the magnetic field with twice the Larmor speed. Even this is not the last word, for it has been shown that it is only possible to make a picture of electrical phenomena which rigorously reconciles the quantum theory with the theory of relativity by endowing the electron with magnetism in just the way required for the Zeeman effect. Einstein's conception of relativity was developed to explain a totally different category of phenomena, and it is one of the most remarkable syntheses in the history of physics that it should be possible to make it responsible for the intricacies of the Zeeman effect.

We have described the most interesting aspect of the Zeeman effect, and need only touch on a few others. There is the *inverse Zeeman effect* where light is absorbed by matter in a magnetic field; this follows exactly the same rules as the direct effect. Faraday's magnetic gyration (*see* LIGHT) is another aspect of the same thing. The theory of the effect is still very incomplete for band spectra, and indeed for some classes of line spectra. In conclusion we may refer to a more practical use to which the Zeeman effect has been put: by its means it is known that there are very powerful magnetic fields in sun-spots, and also that the sun as a whole has a magnetic field like the earth.

BIBLIOGRAPHY.—A. Sommerfeld, *Atomic Structure and Spectral Lines* (1923); E. N. da C. Andrade, *The Structure of the Atom* (1927). For the magnetism of the electron, original papers must be consulted, of which there are a long series, culminating in P. A. M. Dirac, "The Quantum Theory of the Electron," in *Roy. Soc. Proc.* A. (1928).

(C. G. D.)

ZEITZ, a town in the extreme south of the Prussian province of Saxony, situated on the Weisse (White) Elster, 28 m. by rail S.S.W. of Leipzig on the line to Gera, and with branches to Altenburg and Weissenfels. Pop. (1925) 34,589. Zeitz is an ancient place of Slavonic origin. From 968 till 1028 it was the seat of a bishopric, afterwards removed to Naumburg, and styled Naumburg-Zeitz. In 1564 the last Roman Catholic bishop died, and his dominions were thenceforward administered by princes of Saxony. From 1653 till 1718 Zeitz was the capital of the dukes of Saxe-Zeitz. It thereafter remained in the possession of the electors of Saxony until 1815, when it passed to Prussia.

ZELLER, EDUARD (1814–1908), German philosopher, was born at Kleinbottwar in Württemberg on Jan. 22, 1814, and educated at the University of Tübingen and under the influence of Hegel. In 1840 he was *Privatdozent* of theology at Tübingen, in 1847 professor of theology at Bern, in 1849 professor of theology at Marburg, migrating soon afterwards to the faculty of philosophy as the result of disputes with the Clerical party. He became professor of philosophy at Heidelberg in 1862, removed to Berlin in 1872, and retired in 1895. His great work is his *Philosophie der Griechen* (1844–52). He was one of the founders of the *Theologische Jahrbücher*, a periodical which acquired great importance as the exponent of the historical method of David Strauss and Christian Baur. Like most of his contemporaries he began with Hegelianism, but later he saw the necessity of going back to Kant in the sense of demanding a critical reconsideration of the epistemological problems which Kant had made but a partially successful attempt to solve. None the less his merits as an original thinker are far outshone by his splendid services to the history of philosophy, in spite of the fact that his view of Greek thought is somewhat warped by Hegelian formalism. He died on March 19, 1908. Among his other works are: *Platonische Studien* (1839); *Gesch. d. christlich. Kirche* (1898); *Gesch. d. deutsch Philos. seit Leibniz* (1873, 1875); *Staat und Kirche* (1873); *Über Bedeutung und Aufgabe d. Erkenntniss-Theorie* (1862); *Über teleolog. und mechan. Naturerklärung* (1876); *Philosoph. Aufsätze* (1887).

The *Philosophie der Griechen* was translated into English (2 vols., 1881) under the editorship of S. F. Alleyne. The *Philosophie* appeared in an abbreviated form as *Grundriss d. Gesch. d. Griech. Philos.* (1883; 5th ed. 1898); Eng. trans. by Alleyne and Evelyn Abbott (1866), under the title, *Outlines of the Hist. of Gk. Philosophy.*

ZEMARCHUS (*fl.* 568), Byzantine general and traveller. The Turks, by their conquest of Sogdiana in the middle of the 6th century, gained control of the silk trade which then passed through Central Asia into Persia. But the Persian king, Chosroes Nushirvan refused to allow the old commerce to continue, and the Turks in 568 sent an embassy to Constantinople to form an alliance with the Byzantines and "transfer the sale of silk to them." The offer was accepted by Justin II., and in Aug. 568, Zemarchus the Cilician, "General of the cities of the East," left Byzantium for Sogdiana. The embassy was under the guidance of Maniakh, "chief of the people of Sogdiana," who had himself come to Byzantium to negotiate the "Roman alliance." On reaching the Sogdian territories the travellers were offered iron for sale, and solemnly exorcised; Zemarchus was made to "pass through the fire" (*i.e.*, between two fires), and strange ceremonies were performed over the baggage of the expedition. The envoys then proceeded to the camp of Dizabul (or rather of Dizabul's successor, he having just died) "in a hollow encompassed by the Golden Mountain," apparently in some locality of the Altai. They found the khan surrounded by astonishing barbaric pomp—gilded thrones, golden peacocks, gold and silver plate and silver animals, hangings and clothing of figured silk. They accompanied him some way on his march against Persia, passing through Talas or Turkistan in the Syr Darya valley.

Near the river Oëkh (Syr Darya?) he was sent back to Constantinople with a Turkish embassy and with envoys from various tribes subject to the Turks. Halting by the "vast, wide lagoon" (of the Aral sea?), Zemarchus sent off an express messenger, one George, to announce his return to the emperor. George hurried on by the shortest route, "desert and waterless," apparently the steppes north of the Black sea; while his superior, moving more slowly, marched 12 days by the sandy shores of "the lagoon"; crossed the Emba, Ural, Volga and Kuban (where 4,000 Persians vainly lay in ambush to stop him); and passing round the western end of the Caucasus, arrived safely at Trebizond and Constantinople. For several years this Turkish alliance subsisted, while close intercourse was maintained between Central Asia and Byzantium; but from 579 the friendship rapidly began to cool. All this travel does not seem to have corrected the misapprehension that the Caspian was a gulf of the Arctic ocean.

Beazley, *Dawn of Modern Geography*, i. 186–189 (1897). (C. R. B.)

ZEMGALS, GUSTAV (1871–), president of the republic of Latvia, was born in Courland on Aug. 12, 1871. He was educated in Riga and studied law at the University of Moscow. Up to the time of his election as president of the republic he was a well known lawyer and notarius publicus in Riga, and took an active part in the Co-operative movement. He was vice-president of the Latvian National Council in 1918, and this council was recognized by the Western European Powers as being the legitimate representative body of the Latvian nation. It was he who proclaimed the independence of Latvia on Nov. 18, 1918, in the absence of Monsieur Tschakste, the president of the Latvian National Council.

He was elected president of the republic of Latvia for three years on April 8, 1927, in succession to the late J. Tschakste, the first president of the republic of Latvia. President Zemgals was elected by a great majority, receiving about 80 votes out of a possible 100 in the Latvian parliament. He will hold office until April 8, 1930, and may then be re-elected by the parliament. He enjoys remarkable popularity among all classes of the population, as he is keenly interested in the life and the progress of the people of the country.

He was a member of the Constituent Assembly of Latvia and had a seat in the first parliament (Saeima). He was lord mayor of Riga and was minister of war from 1921–23.

ZEMUN, a town of Croatia-Slavonia, Yugoslavia (German *Semlin*), on the Danube opposite Belgrade. Pop. (1921) 18,524, the majority being Serbs, the remainder Croats, Jews, Germans, Magyars and Gipsies. Zemun is the seat of an Orthodox bishop; but most of the inhabitants are Roman Catholics. Zemun has an important transit trade in grain, fruit, livestock and timber. On a hill overlooking the Danube are the ruins of the castle of Hunyadi Janos, who died here in 1456. Until 1881 the town belonged to the military frontier of Austro-Hungary.

ZENÁGA, a Berber tribe of southern Morocco who gave their name to Senegal, once their tribal home. With other tribes under Yusef bin Tashfin, they crossed the Sahara and gave the Almoravide dynasty to Morocco and Spain. The Zeirid dynasty which supplanted the Fatimites in the Maghrib and founded the city of Algiers was also of Zenága origin. The Zenága dialect of Berber is spoken in southern Morocco and on the banks of the lower Senegal, largely by the negro population.

ZENATA or ZANATÀ, a Berber tribe of Morocco in the district of central Atlas. Their tribal home seems to have been south of Oran in Algeria, and they early claimed an Arab origin, though the Arabs called them descendants of Goliath, *i.e.*, Philistines or Phoenicians (Ibn Khaldun, vol. iii. p. 184 and vol. iv. p. 597). They were formerly a large and powerful confederation, and took a prominent part in the history of the Berber race. The Beni-Marin and Wattasi dynasties of Zenata origin, reigned in Morocco from 1213 to 1548.

ZEND-AVESTA, the original document of the religion of Zoroaster (*q.v.*), still used by the Parsees as their bible and prayer-book. The name "Zend-Avesta" has been current in Europe since the time of Anquetil Duperron (*c.* 1771), but the Parsees themselves call it simply *Avesta, Zend* (*i.e.*, "interpretation") being specially employed to denote the translation and exposition of a great part of the Avesta which exists in Pahlavi. The origin and meaning of the word "Avesta" (or in its older form, *Avistāk*) are alike obscure; it cannot be traced further back than the Sassanian period. The term is now applied both to the collection of writings and also to the language in which they are composed. The Avesta is a work of but moderate compass (comparable, say, to the *Iliad* and *Odyssey* taken together), but no single manuscript gives it in entirety.

Contents.—As we now have it, the Avesta consists of the following parts:—

1. The *Yasna,* the principal liturgical book of the Parsees, in 72 chapters (*hāiti, hā*), contains the texts read by the priests at the solemn yasna (Izeshne) ceremony, the general sacrifice in honour of *all* the deities. The arrangement of the chapters is purely liturgical, although their matter in part has nothing to do with the liturgical action. It falls into three sections of about equal length:—(*a*) The introduction (chap. 1–27) consists mainly of invocations. Yet it includes some interesting texts, *e.g.*, the *Haoma* (*Hom*) Yasht (9, 11) and the ancient confession of faith (12), which is of value as a document for the history of civilization. (*b*) The Gāthās (chap. 28–54) contain the discourses, exhortations and revelations of the prophet, written in a metrical style and archaic language. The Gāthās proper, arranged according to the metres in which they are written, fall into five subdivisions (28–34, 43–46, 47–50, 51, 53). Between chap. 34 and chap. 43 is inserted the so-called Seven-Chapter Yasna (*haptanghāiti*), a number of small prose pieces not far behind the Gāthās in antiquity. (*c*) The so-called Later Yasna (*Aparō Yasnō*) (chap. 5–72) consists mainly of invocations. Special mention ought to be made of the *Sraosha* (*Srōsh*) Yasht (57), the prayer to fire (62), and the great liturgy for the sacrifice to divinities of the water (63–69).

2. The *Vispered,* a minor liturgical work in 24 chapters (*karde*), is alike in form and substance completely dependent on the Yasna, to which it is a liturgical appendix. The name *Vispered,* meaning "all the chiefs" (*vispē ratavō*), has reference to the spiritual heads of the religion of Ormuzd, invocations to whom form the contents of the first chapter of the book.

3. The *Vendidad,* the priestly code of the Parsees, contains in 22 chapters (*fargard*) a kind of dualistic account of the creation (chap. 1), the legend of Yima and the golden age (chap. 2), and in the bulk of the remaining chapters the precepts of religion with

regard to the cultivation of the earth, the care of useful animals, the protection of the sacred elements, such as earth, fire and water, the keeping of a man's body from defilement, together with the requisite measures of precaution, elaborate ceremonies of purification, atonements, ecclesiastical expiations and so forth. Yet in spite of an exaggerated casuistry the whole of Zoroastrian legislation is subordinate to one great point of view: the war—preached without intermission—against Satan and his noxious creatures, from which the whole book derives its name; for "Vendīdād" is a modern corruption for *vī-daēvō-dātem*—"the anti-demonic Law." The three concluding chapters are devoted to sacerdotal medicine.

4. The *Yashts, i.e.*, "songs of praise," except those inserted in the Yasna, form a collection by themselves. They contain invocations of *separate* Izads, or angels, number 21 in all, and are of widely divergent extent and antiquity. The great Yashts—some nine or ten—are impressed with a higher stamp, and represent the religious poetry of the ancient Iranians. They resemble the Rig-Veda hymns, and are a rich source of mythology and legendary history. Side by side with full, vividly coloured descriptions of the Zoroastrian deities, they frequently interweave, as episodes, stories from the old heroic fables. The most important of all, the 19th Yasht, gives a consecutive account of the Iranian heroic saga in great broad lines, together with a prophetic presentment of the end of this world.

5. The *Khordah Avesta, i.e.*, the Little Avesta, comprises a collection of shorter prayers designed for all believers—the laity included—and adapted for the various occurrences of ordinary life.

There are also a considerable number of fragments from lost books, *e.g.*, the *Nīrangistān*, as well as quotations, glosses and glossaries.

The Larger Avesta and the Twenty-one Nasks.—In its present form, however, the Avesta is only a fragmentary remnant of the old priestly literature of Zoroastrianism. Native tradition, carrying us back to the Sassanian period, tells of a larger Avesta in 21 books called *nasks* or *nosks*, as to the names of which we have several more or less detailed accounts, particularly in the Pahlavi Dīnkard (9th century A.D.) and in the Rivāyats. From the same sources we learn that this *larger* Avesta was only a part of a yet more extensive *original* Avesta, which is said to have existed before Alexander. But even of the remains of the Avesta, as these lay before the author of the 9th century, only a small residue has survived to our time. Of all the nasks one only, the 19th, has come down on us intact—the Vendidad.

It would be rash summarily to dismiss this old tradition of the 21 nasks as pure invention. The number 21, being a sacred number, points, indeed, to an artificial arrangement of the material. In the enumeration of the nasks we miss the names of the books we know, like the Yasna and the Yashts. But we must assume that these were included in such or such a nask, as the Yashts in the 17th or *Bakān* Yasht; or, it may be that other books, especially the Yasna, are a compilation extracted for liturgical purposes from various nasks. Further, the author of the Dīnkard appears to have had before him the text of the nasks, or at all events of a large part of them: for he expressly states that the 11th nask was entirely lost, so that he is unable to give the slightest account of its contents. And, besides, in other directions there are numerous indications that such books once really existed. The numerous other fragments, the quotations in the Pahlavi translation, the many references in the *Bundahish* to passages of this Avesta not now known to us, all presuppose the existence in the Sassanian period of a much more extensive Avesta literature than the mere prayer-book now in our hands. The existence of a larger Avesta, even as late as the 9th century A.D., is far from being a mere myth, and we may well believe the Parsees themselves, when they affirm that their sacred literature has passed through successive stages of decay, the last of which is represented by the present Avesta.

Origin and History.—While all that Herodotus (i. 132) has to say is that the Magi sang "the theogony" at their sacrifices, Pausanias is able to add (v. 27. 6) that they read from a book. Hermippus, in the 3rd century B.C., is said by Pliny to have explained the doctrine which Zoroaster had composed in 20 times 100,000 verses. According to the Arab historian, Ṭabari, these were written on 12,000 cow-hides, a statement confirmed by Mas'ūdī, who further says that the book consisted of 21 parts, and that Zartusht, who invented "the writing of religion," wrote it in Old Persian. These assertions sufficiently establish the existence and great bulk of the sacred writings. Parsee tradition adds a number of interesting statements as to their history. According to the Dīnkard, there were two copies, of which one was burned, while the second came into the hands of the Greeks. One of the Rivāyats relates how after the villainy of Alexander, several high-priests collected all the fragments that could be found. As to this re-collection and redaction of the Avesta the Dīnkard gives various details. One of the Arsacid kings, Vologeses (I. or III.?), ordered the scattered remnants of the Avesta to be carefully preserved and recorded, and under several of the Sassanian kings in the 3rd and 4th centuries the new redaction was completed.

The Avesta, as we now have it, belongs to the Sassanian period, but it cannot be said to be of Sassanian origin. From the remnants and heterogeneous fragments at their disposal, the diasceuast or diasceuasts composed a new canon from the materials of the old. In point of detail, it is now impossible to draw a sharp distinction between that which they found surviving and that which they themselves added or revised. It may reasonably be supposed, not only that they constructed the external framework of many chapters, and also made some additions of their own, but also that they fabricated anew many formulae and imitative passages on the model of the materials at their disposal. All the grammatically correct texts, together with those portions of the Avesta which have intrinsic worth, the Gāthās and greater Yashts, especially the metrical passages, are indubitably authentic and taken *ad verbum* from the original Avesta. Opinions differ greatly as to the precise age of the original texts. According to some, they are pre-Achaemenian; according to Darmesteter's former opinion, they were written in Media under the Achaemenian dynasty; according to some, their source must be sought in the east, according to others, in the west of Iran. But it is more correct to say that the Avesta was worked at from the time of Zoroaster down to the Sassanian period. Its oldest portions, the Gāthās, proceed from the prophet himself. This conclusion is inevitable for every one to whom Zoroaster is an historical personality. The rest of the Avesta, in spite of the opposite opinion of orthodox Parsees, does not even claim to come from Zoroaster. As the Gāthās now constitute the kernel of the most sacred prayer-book, viz., the Yasna, they were the nucleus of a religious literature.

The Avesta now in our hands is but a small portion of the book as restored and edited under the Sassanians. The larger part perished under the Mohammedan rule and under the more barbarous tyranny of the Tatars, when through conversion and extermination the Zoroastrians became a mere remnant. The understanding of the older Avesta texts began to die away at an early period. The need for a translation and interpretation became evident; and under the Later Sassanians the majority of the books, if not the whole of them, were rendered into the current Pahlavi. For the interpretation of the older texts the Pahlavi is of great value where they are concerned with the fixed, formal statutes of the church. But when they pass beyond this narrow sphere, as particularly in the Gāthās, it becomes defective and unreliable. The Parsee priest, Neryosangh, subsequently translated a portion of the Pahlavi version into Sanskrit.

The manuscripts of the Avesta are, comparatively speaking, of recent date. The oldest is the Pahlavi Vispered in Copenhagen, dated 1258. Next come the four manuscripts of the Herbad Mihirāpān Kaī Khusro at Cambay (1323 and 1324), two Vendidads with Pahlavi in London and Copenhagen, and two Yasnas with Pahlavi in Copenhagen and Oxford. The earliest mss. are the best, though careful 17th and 18th century transcripts come from Kirman and Yazd in Persia.

The first European scholar to direct attention to the Avesta was Hyde of Oxford, in his *Historia Religionis Veterum Persarum eorumque Magorum* (1700), which, however, failed to awake any

lasting interest in the sacred writings of the Parsees. The merit of achieving this belongs to the enthusiastic orientalist Anquetil Duperron, the fruit of whose prolonged stay in India (1755–61) and his acquaintance with the Parsee priests was a translation (certainly very defective) of the Zend-Avesta. The foundation of a scientific exegesis was laid by Burnouf. The interpretation of the Avesta is one of the most difficult problems of oriental philology. Up to the present no kind of agreement has been reached by conflicting schools, even upon some of the most important points. Opinion is divided also as to the significance of the Avesta in the literature of the world. Upon the whole, the Avesta is a monotonous book. The Yasna and many Yashts in great part consist of formulae of prayer which are as poor in contents as they are rich in verbiage. The book of laws (*Vendidad*) is characterized by an arid didactic tone; only here and there the legislator clothes his dicta in the guise of graceful dialogues and tales, or of poetic descriptions and similitudes; and then the book of laws is transformed into a didactic poem. Nor can we deny to the Yashts, in their depiction of the Zoroastrian angels and their presentment of the old sagas, a certain poetic feeling, at times, and a pleasant diction. The Gāthās are quite unique in their kind. As a whole, the Avesta, for profundity of thought and beauty, stands on a lower level than the Old Testament. But as a religious book—the most important document of the Zoroastrian faith, and the sole literary monument of ancient Iran—the Avesta occupies a prominent position in the literature of the world. At the present day its significance is decidedly underrated. The future will doubtless be more just with regard to the importance of the book for the history of religion in general and even of Christianity. (For works on the theology of the Avesta *see* ZOROASTER.)

EDITIONS.—*Zend-Avesta*, ed. by N. L. Westergaard (Copenhagen, 1852–54), complete; F. Spiegel, *Avesta* (Vienna, 1853–58), only Vendidad, Vispered and Yasna, but with the Pahlavi translation; K. Geldner (Stuttgart, 1886–96). Translations.—Anquetil Duperron, *Zend-Avesta, Ouvrage de Zoroastre* (Paris, 1771); Fr. Spiegel (Leipzig, 1852–63), both completely antiquated. *Avesta* traduit par C. de Harlez, ed. 2 (Paris, 1881); *The Zend-Avesta, Part I. Vendidad, Part II. Sīrōzahs, Yashts and Nyāyish*, tr. by J. Darmesteter, *Part III. Yasna, Vispered*, etc., by L. H. Mills (Oxford, 1880–87), in the *Sacred Books of the East; Le Zend-Avesta*, traduction nouvelle par J. Darmesteter (Paris, 1892–93) (*Annales du Musée Guimet*).

ZENITH TELESCOPE, a form of telescope specially devised for the accurate determination of the latitude of a station. It is used both in geodetic surveys and also at fixed stations for measuring the variation of latitude. The usual form of instrument consists of a telescope which can be clamped at any angle to a vertical axis and rotated about the vertical. Two stars of known declination δ_1 and δ_2 are chosen which transit within a few minutes of one another, the one north and the other south of the zenith at nearly equal zenith distances. If ϕ is the latitude the respective zenith distances are $\delta_1-\phi$, north and $\phi-\delta_2$ south, so that the small difference between them is $\delta_1+\delta_2-2\phi$. Settings of a micrometer wire are made on each star in turn, the telescope being of course rotated from the north to the south direction between the two observations: the small distance that the wire has to be moved measures the quantity $\delta_1+\delta_2-2\phi$ and hence determines ϕ. This method, known as the Talcott method, depends on securing accurate rotation about the vertical; usually delicate spirit levels attached to the telescope are used to determine the correction for imperfect fulfilment of this condition. In a floating zenith telescope devised by B. Cookson and now employed for latitude variation at Greenwich observatory, rotation about the true vertical is obtained by floating the whole instrument in mercury. The observations are made photographically; the trails of the pair of stars are shown close together on the plate, and the distance between them (equivalent to $\delta_1+\delta_2-2\phi$) is measured with a suitable micrometer.

ZENO, East Roman emperor from 474 to 491, was an Isaurian of noble birth. Of his early life nothing is known; after his marriage to Ariadne, daughter of Leo I., in 468 he became patrician and commander of the imperial guard and of the armies in the East. In 471 he procured the assassination of Ardaburius, the Goth, who had tried to occupy in the East the position held by Ricimer in the West. In 474 Leo I. died after appointing as his successor Leo the son of Zeno and Ariadne; Zeno, however, succeeded in getting himself crowned also, and on the death of his son in the same year became sole emperor. In the following year, in consequence of a revolt fomented by Verina in favour of her brother Basiliscus, he was compelled to take refuge in Isauria, where he was obliged to shut himself up in a fortress. The growing misgovernment of Basiliscus ultimately enabled Zeno to re-enter Constantinople unopposed (476); his rival was banished to Phrygia, where he soon afterwards died. The remainder of Zeno's reign was disturbed by numerous other less formidable revolts. Since 472 the aggressions of the two Ostrogoth leaders Theodoric had been a constant source of danger. In 487 he induced Theodoric, son of Theodemir, to invade Italy and establish his new kingdom. Zeno is described as a lax and indolent ruler, but he seems to have administered ably the finances of the empire. In ecclesiastical history the name of Zeno is associated with the *Henoticon* or instrument of union, promulgated by him and signed by all the Eastern bishops, with the design of terminating the Monophysite controversy.

See J. B. Bury, *The Later Roman Empire* (1889), i. pp. 250–274; E. W. Brooks in the *English Historical Review* (1893), pp. 209–238; W. Barth, *Der Kaiser Zeno* (Basel, 1894).

ZENOBIA (Gr. *Ζηνοβία*), queen of Palmyra, one of the heroines of antiquity. Her native name was Septimia Bathzabbai, a name also borne by one of her generals, Septimius Zabbai. This remarkable woman, famed for her beauty, her masculine energy and unusual powers of mind, was well fitted to be the consort of Odainatti (*see* ODAENATHUS) in his proud position as Dux Orientis; during his lifetime she actively seconded his policy, and after his death in A.D. 266-267 she not only succeeded to his position but determined to surpass it and make Palmyra mistress of the Roman Empire in the East. Wahab-allath or Athenodōrus (as the name was Graecized), her son by Odainath, being still a boy, she took the reins of government into her own hands. Under her general-in-chief Zabdā, the Palmyrenes occupied Egypt in A.D. 270, not without a struggle, under the pretext of restoring it to Rome; and Wahab-allath governed Egypt in the reign of Claudius as joint ruler with the title of *βασιλεύς* (king), while Zenobia herself was styled *βασιλίσσα* (queen). In Asia Minor Palmyrene garrisons were established as far west as Ancyra in Galatia and Chalcedon opposite Byzantium, and Zenobia still professed to be acting in the interests of the Roman rule.

When Aurelian became emperor in 270 he quickly realized that the policy of the Palmyrene queen was endangering the unity of the empire. It was not long before all disguises were thrown off; in Egypt Wahab-allath began to issue coins without the head of Aurelian and bearing the imperial title, and Zenobia's coins bear the same. The assumption marked the rejection of all allegiance to Rome. Aurelian instantly took measures; Egypt was recovered for the Empire by Probus (close of 270), and the emperor himself prepared a great expedition into Asia Minor and Syria. Towards the end of 271 he marched through Asia Minor and, overthrowing the Palmyrene garrisons in Chalcedon, Ancyra and Tyana, he reached Antioch, where the main Palmyrene army under Zabdā and Zabbai, with Zenobia herself, attempted to oppose his way. The attempt, however, proved unsuccessful, and after suffering considerable losses the Palmyrenes retired in the direction of Emesa (now Homs), whence the road lay open to their native city.

The queen refused to yield to Aurelian's demand for surrender and drew up her army at Emesa for the battle which was to decide her fate. In the end she was defeated, and there was nothing for it but to fall back upon Palmyra across the desert.

Aurelian followed her in spite of the difficulties of transport, and laid siege to the well-fortified and provisioned city. At the critical moment the queen's courage seems to have failed her; she and her son fled from the city to seek help from the Persian king, they were captured on the bank of the Euphrates, and the Palmyrenes, losing heart at this disaster, capitulated (A.D. 272). Aurelian seized the wealth of the city but spared the inhabitants; to Zenobia he granted life; while her officers and advisers, among whom was the celebrated scholar Longinus, were put to death. Zenobia figured in the conqueror's splendid triumph at Rome, and by the most probable account accepted her fall with dignity and closed her days at Tibur, where she lived with her sons the life of a Roman matron. A few months after the fall of Zenobia, Palmyra revolted again; Aurelian unexpectedly returned, destroyed the city, and this time showed no mercy to the population.

Among the traditions relating to Zenobia may be mentioned that of her discussions with the Archbishop Paul of Samosata on matters of religion. It is probable that she treated the Jews in Palmyra with favour; she is referred to in the Talmud, as protecting Jewish rabbis (Talm. Jer. *Ter.* viii. 46 b).

The well-known account of Zenobia by Gibbon (*Decline and Fall*, i. pp. 302–312 Bury's edition) is based upon the imperial biographers (*Historia Augusta*) and cannot be regarded as strictly historical in detail.

See A. P. Caussin de Perceval *Essai sur l'hist. des Arabes*, ii. 28 f., 197 f. (3 vols., 1847–48); Tabari, i. 757 f. *See* further PALMYRA.

(G. A. C.; X.)

ZENOBIUS, a Greek sophist, who taught rhetoric at Rome during the reign of Hadrian (A.D. 117–138). He was the author of a collection of proverbs in three books, still extant in an abridged form, compiled, according to Suïdas, from Didymus of Alexandria and Lucillus of Tarrha. Zenobius is also said to have been the author of a Greek translation of Sallust and of a birthday poem (γενεθλιακόν) on Hadrian.

Editions by T. Gaisford (1836) and E. L. Leutsch-F. W. Schneidewin (1839), and in B. E. Miller, *Mélanges de littérature grecque* (1868); *see* also W. Christ, *Griechische Literaturgeschichte* (1898).

ZENODOCHIUM (Gr. ξενοδοχεῖον, ξένος, stranger, guest, δέχεσθαι, to receive), the name given by the Greeks to a building erected for the reception of strangers.

ZENODOTUS, Greek grammarian and critic, pupil of Philetas (*q.v.*) of Cos, was a native of Ephesus. He lived during the reigns of the first two Ptolemies, and was at the height of his reputation about 280 B.C. He was the first superintendent of the library at Alexandria and the first critical editor (διορθώτης) of Homer, in his recension of whom he undoubtedly laid a sound foundation for future criticism. Having collated the different mss. in the library, he expunged or obelized doubtful verses, transposed or altered lines, and introduced new readings. He divided the Homeric poems into books (with capitals for the *Iliad*, and small letters for the *Odyssey*), and possibly was the author of the calculation of the days of the *Iliad* in the Tabula Iliaca. He also lectured upon Hesiod, Anacreon and Pindar. He is further called an epic poet by Suïdas.

There appear to have been at least two other grammarians of the same name: (1) Zenodotus of Alexandria, surnamed ὁ ἐν ἄστει; (2) Zenodotus of Mallus, the disciple of Crates, who like his master attacked Aristarchus.

See F. A. Wolf, *Prolegomena ad Homerum*, s. 43 (1859 ed.); H. Düntzer, *De Zenodoti studiis Homericis* (1848); A. Römer, *Über die Homerrecension des Zenodotus* (Munich, 1885); F. Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit*, i. p. 330, ii. p. 14; J. E. Sandys, *Hist. of Class. Schol.* (1906).

ZENO OF ELEA, son of Teleutagoras, born probably towards the beginning of the 5th century B.C. The pupil and the friend of Parmenides, he sought to recommend his master's doctrine of the existence of the One by controverting the popular belief in the existence of the Many. In virtue of this method of indirect argumentation he is regarded as the inventor of "dialectic," that is to say, disputation having for its end not victory but the discovery of truth.

In Plato's *Parmenides*, Socrates, "then very young," discusses with Parmenides and Zeno, "a man of about forty." But it may be doubted whether such a meeting was chronologically possible. Plato's account of Zeno's teaching (*Parmenides*, 128 *seq.*), however, is presumably accurate. In reply to those who thought that Parmenides's theory of the existence of the One involved inconsistencies, Zeno tried to show that the assumption of the existence of a plurality of things in time and space, carried with it more serious inconsistencies. In early youth he collected his arguments in a book, which, according to Plato, was put into circulation without his knowledge.

Of the paradoxes used by Zeno to discredit the belief in plurality and motion, eight survive in the writings of Aristotle and Simplicius. They are commonly stated as follows: (1) If the Existent is Many, it must be at once infinitely small and infinitely great—infinitely small, because its parts must be indivisible and therefore without magnitude; infinitely great, because, that any part having magnitude may be separate from any other part, the intervention of a third part having magnitude is necessary, and that this third part may be separate from the other two the intervention of other parts having magnitude is necessary, and so on *ad infinitum*. (2) In like manner the Many must be numerically both finite and infinite—numerically finite, because there are as many things as there are, neither more nor less; numerically infinite, because, that any two things may be separate, the intervention of a third thing is necessary, and so on *ad infinitum*. (3) If all that is is in space, space itself must be in space, and so on *ad infinitum*. (4) If a bushel of corn turned out upon the floor makes a noise, each grain and each part of each grain must make a noise likewise; but, in fact, it is not so. (5) Before a body in motion can reach a given point, it must first traverse the half of the distance; before it can traverse the half of the distance, it must first traverse the quarter; and so on *ad infinitum*. Hence, that a body may pass from one point to another, it must traverse an infinite number of divisions. But an infinite distance (which the paradox does not distinguish from a finite distance infinitely divided) cannot be traversed in a finite time. Consequently, the goal can never be reached. (6) If the tortoise has the start of Achilles, Achilles can never come up with the tortoise; for, while Achilles traverses the distance from his starting-point to the starting-point of the tortoise, the tortoise advances a certain distance, and while Achilles traverses this distance, the tortoise makes a further advance, and so on *ad infinitum*. Consequently, Achilles may run *ad infinitum* without overtaking the tortoise. (This paradox is virtually identical with [5], the only difference being that whereas in [5] there is one body, in [6] there are two bodies, moving towards a limit. The "infinity" of the premise is an infinity of subdivisions of a distance which is finite; the "infinity" of the conclusion is an infinity of distance.) (7) So long as anything is in one and the same space, it is at rest. Hence an arrow is at rest at every moment of its flight, and therefore also during the whole of its flight. (8) Two bodies moving with equal speed traverse equal spaces in equal time. But, when two bodies move with equal speed in opposite directions, the one passes the other in half the time in which it passes it when at rest. These paradoxes are probably properly regarded as dilemmas advanced in refutation of specific doctrines attributed to the Pythagoreans.

Great as was the importance of these paradoxes of plurality and motion in stimulating speculation about space and time, their direct influence upon Greek thought was less considerable than that of another paradox—strangely neglected by historians of philosophy—the paradox of predication. We learn from Plato (*Parmenides*, 127 D) that "the first hypothesis of the first argument" of Zeno's book above mentioned ran as follows: "If existences are many, they must be both like and unlike (unlike, inasmuch as they are not one and the same, and like, inasmuch as they agree in not being one and the same [Proclus, *On the Parmenides*, ii. 143]). But this is impossible; for unlike things cannot be like, nor like things unlike. Therefore existences are not many."

When in the second decade of the 4th century the pursuit of truth was resumed, it was plain that Zeno's paradox of predication must be disposed of before the discussion of the problems of knowledge and the problem of being could be resumed. Accordingly, in bk. 7 of the *Republic*, Plato directs the attention

of studious youth primarily, if not exclusively, to the concurrence of inconsistent attributes; and in the *Phaedo*, 102 B–103 A, taking as an instance the tallness and the shortness simultaneously discoverable in Simmias, he offers his own theory of the immanent idea as the solution of the paradox. Simmias, he says, has in him the ideas of tall and short. Again, when it presently appeared that the theory of the immanent idea was inconsistent with itself, and moreover inapplicable to explain predication except where the subject was a sensible thing, so that reconstruction became necessary, the Zenonian difficulty continued to receive Plato's attention. Thus, in the *Parmenides*, with the paradox of likeness and unlikeness for his text, he inquires how far the current theories of being (his own included) are capable of providing, not only for knowledge, but also for predication, and in the concluding sentence he suggests that, as likeness and unlikeness, greatness and smallness, etc., are relations, the initial paradox is no longer paradoxical; while in the *Sophist*, Zeno's doctrine having been shown to be fatal to reason, thought, speech and utterance, the mutual *κοινωνία* of *εἴδη* which are not *αὐτὰ καθ' αὐτά* is elaborately demonstrated.

In all probability Zeno did not observe that in his controversial defence of Eleaticism he was interpreting Parmenides's teaching anew. While Parmenides had recognized, together with the One, which is, and is the object of knowledge, a Many, which is not, and therefore is not known, but nevertheless becomes, and is the object of opinion, Zeno plainly affirmed that plurality, becoming and opinion are one and all inconceivable. In a word, Parmenides's tenet "The Ent is, the Non-ent is not," was with Zeno a declaration of the Non-ent's absolute nullity. Thus, just as Empedocles developed Parmenides's theory of the Many to the neglect of his theory of the One, so Zeno developed the theory of the One to the neglect of the theory of the Many. With the severance of its two members Eleaticism proper, the Eleaticism of Parmenides, ceased to exist.

Russell, *Principles of Mathematics* (1903) and F. Cajou, *Hist. of Zeno's Arguments against Motion* (1915).

ZEOLITES, a family of minerals consisting of hydrated silicates of alumina with alkalis or alkaline earths or both. The water they contain is readily lost, and before the blowpipe it is expelled with intumescence; hence the name zeolite, from the Greek *ζεῖν* (to boil) and *λίθος* (a stone). In some other characters, as well as in their origin and mode of occurrence, they have points in common. Several species have been distinguished, of which the following are the more important:—

Heulandite Group	Heulandite	$H_4CaAl_2(SiO_3)_6+3H_2O$.
	Brewsterite	$H_4(Sr, Ba, Ca)Al_2(SiO_3)_6+3H_2O$.
	Epistilbite	$H_4CaAl_2(SiO_3)_6+3H_2O$.
Stilbite Group	Wellsite	$(Ba, Ca, K_2)Al_2Si_3O_{10}+3H_2O$.
	Phillipsite	$(K_2, Ca)Al_2(SiO_3)_4+4H_2O$.
	Harmotome	$H_2(K_2, Ba)Al_2(SiO_3)_6+5H_2O$.
	Stilbite	$CaAl_2(SiO_3)_6+6H_2O$.
	Gismondite	$CaAl_2(SiO_3)_4+4H_2O$.
	Laumontite	$H_4CaAl_2Si_4O_{14}+2H_2O$.
Chabazite Group	Chabazite	$(Ca, Na_2)Al_2(SiO_4)_2+4H_2O$, etc.
	Gmelinite	$(Na_2, Ca)Al_2(SiO_3)_4+6H_2O$.
	Levynite	$CaAl_2Si_4O_{10}+5H_2O$.
	Analcite	$NaAl(SiO_3)_2+H_2O$.
Natrolite Group	Natrolite	$Na_2Al_2Si_3O_{10}+2H_2O$.
	Mesolite	$(Ca, Na_2)Al_2Si_3O_{10}+2H_2O$.
	Scolecite	$CaAl_2Si_3O_{10}+3H_2O$.
	Edingtonite	$BaAl_2Si_3O_{10}+3H_2O$.
	Thomsonite	$(Na_2, Ca)Al_2(SiO_4)_2+2\frac{1}{2}H_2O$.

Some of the chemical formulae given above are only approximate, since in some species the composition varies between certain limits and can be best expressed by the isomorphous mixing of different molecules. They are all readily decomposed by hydrochloric acid, usually with the separation of gelatinous silica. By the action of various reagents several substitution products have been prepared artificially: thus, crystallized products, in which the alkalis or alkaline earths are replaced by ammonium or silver, etc., have been obtained.

The zeolites are often beautifully crystallized, and belong to several crystal-systems. The crystals usually show evidences of twinning, and when examined in polarized light they frequently exhibit optical anomalies and a complex structure. The hardness (3·5–5·5) and specific gravity (2·0–2·4) are comparatively low, and so are the indices of refraction and the double refraction.

The water of zeolites presents many points of interest. Laumontite loses water on exposure to air, and the crystals soon crumble to powder unless they are kept in a moist atmosphere. All the zeolites lose a portion of their "water of crystallization" in dry air (over sulphuric acid), and a considerable portion at a temperature of 100° C, increasing in amount to 200° or 300°; the actual amount lost depending not only on the temperature, but also on the tension of aqueous vapour in the surrounding atmosphere. In some species the remaining water is expelled only at a red heat, and is therefore to be regarded as "water of constitution." With the progressive loss of water there is a progressive change in the optical characters of the crystals. When a partially dehydrated and opaque crystal is exposed to moist air the water is reabsorbed, the crystal becoming again transparent and regaining its original optical characters. Not only may water be reabsorbed, but such substances as ammonia, hydrogen sulphide and alcohol may be absorbed in definite amounts and with an evolution of heat. The water of zeolites may therefore be partly driven off and reabsorbed or replaced by other substances without destroying the crystalline structure of the material, and it would thus seem to differ from the water of crystallization of most other hydrated salts.

Zeolites are minerals of secondary origin and in most cases have resulted by the decomposition of the felspars of basic igneous rocks: in fact their chemical composition is somewhat analogous to that of the felspars with the addition of water. Nepheline and sodalite are often altered to zeolites. They usually occur as crystals lining the amygdaloidal and other cavities of basalt, melaphyre, etc. Usually two or more species are associated together, and often with agate, calcite and some other minerals. Less frequently they occur in cavities in granite and gneiss, and in metalliferous veins (*e.g.*, harmotome); while only exceptionally are they primary constituents (*e.g.*, analcite) of igneous rocks. Several species have been observed in the Roman masonry at the hot springs of Bourbonne-les-Bains: and phillipsite has been dredged from the deep sea. (L. J. S.)

ZEPHANIAH, the ninth of the minor prophets in the Bible. His ancestry is traced to his great-grandfather Hezekiah, who may, in spite of 2 Kings xx. 18, xxi. 1, be the well-known king of Judah (*c.* 720–690). This would agree fairly with the title (i. 1) which makes the prophet a contemporary of King Josiah (*c.* 637), and this in turn appears to agree (*a*) with the internal conditions (i. 4–6, *cf.* 2 Kings xxiii. 4, 5, 12) which, it is held, are evidently earlier than Josiah's reforms (621); (*b*) with the denunciation of the royal household, but not of the (young) king himself (i. 8, iii. 3); (*c*) with the apparent allusion in ch. i. to the invasion of the Scythians (perhaps *c.* 626), and (*d*) with the anticipated downfall of Assyria and Nineveh (ii. 13, 612 B.C.).

Although one single leading motive runs through the book of Zephaniah there are abrupt transitions which do not depend on modern subjective considerations of logical or smooth thought, but are material and organic changes representing different groups of ideas. The instruments of Yahweh's anger (ch. i.) are not so real or prominent on the political horizon as, for example, in Isaiah, Jeremiah or Habakkuk. The Scythian inroad and its results for Judah and Philistia are less important when it is observed that the doom upon Philistia, the vengeance upon Moab and Ammon, and the promises for Judah (ch. ii.), belong to a large group of prophecies against certain historic enemies (Edom included) who are denounced for their contempt, hostility and intrusion. The prophecies are in large measure associated tradition-

ally with the fall of Jerusalem, and to some such calamity, and not to the inroad of the Scythians, the references to the "remnant" and the "captivity" refer. The anticipation of future events is of course conceivable in itself; but the promises (in ch. ii.) *presuppose* events other and later than those with which the Scythians were connected. On the other hand, a prophecy relating to Scythians may have been re-shaped to apply to later conditions, and on this view it is explicable why the indefinite political convulsions should be adjusted to the exile and why the gloom should be relieved by the promise of a territory extending from the Mediterranean to the Syrian desert (ii. 7, 9). After a period of punishment (*cf.* book of Lamentations) Yahweh's jealousy *against* the semi-heathen Judah has become a jealousy *for* his people, and we appear to move in the thought of Haggai and Zechariah, where the remnant are comforted by Yahweh's return and the dispersed exiles are to be brought back (*cf.* Zech. i. 14–17, viii. 2–17). But in ch. iii. other ideas are manifest. Israel's enemies have been destroyed, her own God Yahweh has proved *his* loyalty and has fulfilled *his* promises, but the city remains polluted (*vv.* 1–7, *cf.* Isa. lviii. *seq.*; Malachi). Once more doom is threatened, and once more we pass over into a later stage where Yahweh has vindicated *his* supremacy and Zion is glorified. Instead of the realities of history we have the apocalyptical feature of the gathering of the nations (*v.* 8); the thought may be illustrated from Zech. xii. 1.–xiii. 6, where Jerusalem is attacked, purged and delivered, and from Zech. xiv. where the city is actually captured and half the people are removed into captivity (*cf.* Zeph. iii. 11 purging, 15 removal of the enemy, 18–20 return of the captivity). The goal is the vindication of Israel and of Israel's God, and the establishment of universal monotheism (ii. 11, iii. 9 *seq.*). The foe which threatened Judah has become the chastiser of Ethiopia and Assyria (ii.) and the prelude to the golden age (iii., *cf.* Ezek. xxxviii. *seq.*).

If Jer. iv. 5–vi. 30 originally referred to the Scythians, it has been revised to refer to the Chaldeans; also in Ezek. xxxviii. *seq.* a northern foe becomes associated with the great world-judgment. Also, in Isaiah and Zechariah, notably, older and later *groups* of prophecies are preserved, whereas here the new preludes and new sequels suggest that the original nucleus has passed through the hands of writers in touch with those vicissitudes of thought which can be studied more completely elsewhere. It is not to be supposed that the elimination of all later passages and traces of revision will give us Zephaniah's prophecies in their original extent. In fact the internal religious and social conditions in i. 4–6 or iii. 1–4 do not compel a date before Josiah's reforms. The doom of Cush is still in the future in Ezek. xxx. 4; and if the impending fall of Nineveh (ii. 13) implies an early date, yet it is found in writings which have later additions (Nahum), or which are essentially later (Jonah, *cf.* Tobit xiv. 4 [LXX.], 8, 10, 15); *cf.* also the use of Assyria for Babylon (Ezra vi. 22) or Syria (Zech. x. 10). Historical references in prophecies are not always decisive (Ezek. xxxii., for example, looks upon Edom and Sidon as dead), and while the continued revision of the book allows the presumption that the tradition ascribing its inception to the time of Josiah may be authentic, it is doubtful how much of the original nucleus can be safely recognized.

ZEPHYRINUS, ST., bishop of Rome from about 198 to 217, succeeded Victor I. The controversies on doctrine and discipline that marked his pontificate are associated with the names of Hippolytus and of Calixtus, his principal adviser and afterwards his successor.

ZEPHYRUS, in Greek mythology, the west wind, son of the Titan Astraeus and Eos, the dawn. He was the husband of Chloris, the goddess of flowers, by whom he had a son, Carpus, the god of fruit (Ovid, *Fasti*, v. 197).

ZEPPELIN, FERDINAND, COUNT VON (1838–1917), German airship inventor, was born at Constance, Baden, on July 8, 1838. He was educated for the army and received a commission at the age of 20. He served, as a volunteer, in the Federal army during the American Civil War and whilst in America made his first balloon ascent. Returning to Germany he saw active service in the Austrian War of 1866 and in the Franco-German War of 1870. In 1891 he retired from the army with the rank of general and thenceforth devoted his energies to the study of aeronautics. In 1900 he built an airship, which rose from the ground and remained in the air for 20 minutes, but was wrecked in landing. In 1906 he made two successful flights at a speed of 30 m. an hour, and in 1907 attained a speed of 36 miles. From that time onwards his airship construction made steady progress and many Zeppelin airships took part in the World War, though with heavy losses under attack. (*See* AIRSHIP.) He died at Charlottenburg on March 8, 1917.

See *Eine Festgabe zu seinem 75. Geburtstag von Luftschiffbau Zeppelin* (Stuttgart, 1913).

ZERBST, a town of Germany, in the republic of Anhalt, situated on the Nuthe, 11 m. N.W. of Dessau and 27 m. S.E. of Magdeburg by railway. Pop. (1925) 19,469. Zerbst is an ancient town, mentioned in 949, which in 1307 came into the possession of the Anhalt family. It is still surrounded in part by old walls and bastions. It contains five churches, one of which (St. Nicholas), built in 1446–88, is a good example of the late Gothic style as developed in Saxony, with its spacious proportions, groined vaulting, and bare simple pillars. The town hall dates from about 1480, but it was disfigured by additions in the beginning of the 17th century. The palace (1681–1750) has been used as a depository of archives since 1872. There are several quaint old houses, with high gables, in the market-place, in the middle of which stand a Roland column, of about 1445, and a bronze figure known as the *Butterjungfer* (butter-girl), of uncertain origin and meaning. There were here formerly a Franciscan monastery, with fine cloisters, founded in 1250, a Cistercian nunnery of 1214, and an Augustinian monastery of 1390, a hospital since 1525.

ZERMATT, a mountain village (5,315 ft. above sea-level) at the head of the Visp valley and at the foot of the Matterhorn, in the canton of the Valais, Switzerland. In 1920 it had 740 permanent inhabitants, German-speaking and Roman Catholics. It is 22½ m. by rail from Visp in the Rhône valley, and there is also a railway from Zermatt past the Riffel inns to the very top of the Gornergrat (10,289 ft.). Formerly Zermatt was called "Praborgne," and this name is mentioned in the Swiss census of 1888. Its orginally Romance population seems to have been Teutonised in the course of the 15th century, the name "Matt" (now written "Zermatt," *i.e.*, the village on the meadows) first occurring at the very end of that century.

See E. Whymper, *Scrambles in the Alps* (1871).

ZERO, the figure o in the Arabic notation for numbers meaning nought, or cipher. The Sanskrit name for the figure was *śūnya* (void), and this term passed over into Arabic as *aṣ-ṣifr*, or *ṣṣifr*. The old Latin writers on arithmetic translated or transliterated the Arabic word as *zephyrum;* this in Ital. took on such forms as *zeuero, zepiro*, and became contracted to *zero*, borrowed by F. *zéro*, whence it came late into English. The Spanish form *cifra*, more closely resembling the original Arabic, gave O.Fr. *cifre*, mod. *chiffre*, also used in the sense of monogram, and English "cipher" which is thus a doublet. Although no character for zero is found in India before the 9th century, there is literary evidence for the belief that it was known much earlier. In the Maya inscriptions in Central America there appears a character for zero, but only in connection with the calendar.

ZEROMSKI, STEPHEN (1864–1925), Polish novelist, poet and dramatist, was born at Strawczyn on Nov. 14, 1864. Banished from Poland by the Russian Government early in his life, he first attracted attention by a collection of tragic tales entitled *The Ravens and the Crows are Picking us to Pieces* (1895, Eng. trans. 1906). In the publication of *The Homeless* (1900) Zeromski supplied a generic name for all his Polish heroes. His pessimistic philosophy finds expression in the novel *Aryman takes Revenge* (1904), while the triumph of evil over good is vividly treated in *The Story of Sin* (2 vol., 1906) describing the slow and terrible

downfall of a woman of culture. In his epic poem *Ashes* (2 vol., 1904) he delineates the minds of the Polish people after the Partition and their efforts to liberate their country by serving in the Napoleonic legions. During the World War Zeromski published his great trilogy *The Fight with Satan—The Conversion of Judas* (1916), *The Blizzard* (1918), *Charitas* (1919)—a kind of epilogue and synthesis of his previous work and at the same time an autobiography of his own life. After the achievement of national independence, Zeromski wrote his drama, *The Broken Spell* (1924) in which the hero dedicates himself to the services of a resuscitated Poland. He died on Nov. 20, 1925.

See S. Brzozowski, *O Stefan Zeromski* (Warsaw, 1905); W. Jampolski, *Stefan Zeromski, the Spiritual Leader of the Race* (Lwów, 1918).

ZETKIN, KLARA (1857–), German communist, was born on June 5, 1857, at Wiederan, Saxony, and educated at the university of Paris, becoming a school teacher. She presently became editor of *Gleichheit*, the organ of the Social Democratic Party for women. Klara Zetkin was a member of the Communist Party from its foundation in 1919, and was one of its most fiery and brilliant orators. She then spent some years in south Russia. She became a member of the Reichstag in 1920.

ZEUGLODON, the name given to a genus of extinct toothed whales from Eocene deposits. These remains, which are of an animal up to 40 ft. in length, are the oldest known fossils of the order Cetacea (*q.v.*).

ZEUS, the Greek counterpart of the Roman god, Jupiter (*q.v.* for the etymology of the name). It is probable that Zeus had already been conceived as a personal and pre-eminent god by the ancestors of the leading Hellenic tribes before they entered the peninsula, which became their historic home. In the first place, his pre-eminence is obviously pre-Homeric; for Homer attests for us the supremacy of Zeus in his day, say 950 B.C.; and appreciating how slow was the process of religious change in the earlier period, we shall believe that the god had won this position long before the Homeric age. In the next place, we cannot trace the origin of his worship back to any special stock or particular locality; his unquestionable association with Olympus and Thessaly is only what we should expect, seeing that many at least of the Greeks must have entered Greece that way.

To appreciate the Homeric Zeus, we must distinguish the lower mythologic aspect of him, in which he appears as an amorous and capricious deity lacking often in dignity and real power, and the higher religious aspect, in which he is conceived as the all-father (*see* GREEK RELIGION). In fact, later Greek religion did not advance much above the high-water mark of the Homeric, although the poets and philosophers deepened certain of its nobler traits. But Homer we now know to be a relatively late witness in this matter. Yet traces of a pre-deistic and animistic period survived here and there; for instance, in Arcadia we find the thunder itself called Zeus (Ζεὺς κεραυνός) in a Mantinean inscription, and the stone near Gythium in Laconia, on which Orestes sat and was cured of his madness, evidently a thunder-stone, was named itself Ζεὺς καπτώτας, which must be interpreted as "Zeus that fell from heaven" (Pausan iii. 22. 1.); we here observe that the personal god does not yet seem to have emerged from the divine thing or divine phenomenon.

The day is now past when scholars could discover in the ritual of Zeus *Lukaios* (*see* LYCAON), or the Dipolia, the cult of a wolf —or ox-totem—somehow blended with Zeus; but certainly a characteristic of his earliest ritual was human sacrifice. We find it again in the story of the house of Athamas and in the worship of *Zeus Laphustios* ("Zeus the Glutton"), of Thessaly (Herod. vii. 197), and other examples are recorded. The cruel rite had ceased in the Arcadian worship before Pliny wrote, but seems to have continued in Cyprus until the reign of Hadrian. It was found in the worship of many other divinities of Hellas in early times, and no single explanation can be given that would apply to them all. A hypothesis favoured by Frazer, that the victim is usually a divine man, a priest-king incarnating the god, may be well applied to the Athamantid sacrifice and to that of King Lycaon; for he derives his name from the divinity himself, and according to one version (Clemens, *Protrept* p. 31 P.) he offers his own child; and the legend presents one almost unique feature, which is only found elsewhere in legendary Dionysiac sacrifice, the human flesh is eaten, and the sacrifice is a cannibalistic-sacrament, of which the old Mexican religion offers conspicuous example. Yet it is in this religion of Zeus that we see most clearly the achievement of progressive morality; Zeus himself punishes and abolishes the savage practice.

We can now consider the special attributes of the anthropomorphic god. His character and power as a deity of the sky, who ruled the phenomena of the air, so clearly expressed in Homer, explains the greater part of his cult and cult-titles. More personal than Ouranos and Helios—with whom he has only slight associations—he was worshipped and invoked as the deity of the bright day (*Amarios*), who sends the rain, the wind and dew (*Ombrios, Huetios, Ourios*), and such a primitive adjective as *diipetēs* applied to things "that fall from heaven," attests the primeval significance of the name of Zeus. But the thunder was his most striking manifestation, and no doubt he was primevally a thunder-god, (*Keraunios, Astrapaios*). Much of his ritual was weather-magic; the priest of Zeus *Lukaios* in time of drought, was wont to ascend Mt. Lycaeum and dip an oak-bough in a sacred fountain, and by this sympathetic means produce mist (Pausan. viii. 38, 3). A god of this character would naturally be worshipped on the mountain-tops, and that these were very frequently consecrated to him is shown by the large number of appellatives derived from the names of mountains. But probably in his earliest Hellenic period the power of Zeus in the natural world was not limited to the sky. A deity who sent the fertilizing rains would come to be regarded as a god of vegetation, who descended into the earth and whose power worked in the life that wells forth from the earth in plant and tree. Homer calls the god of the lower world *Zeus Katachthonios* (*Iliad*, ix. 457), and the title of *Zeus Chthonios*, which was known to Hesiod, occurred in the worship of Corinth (Hesiod, *Works and Days*, 456; Pausan. ii. 2, 8).

A glimpse into a very old stratum of Hellenic religion is afforded us by the records of Dodona. A Dodonean liturgy has been preserved which, though framed in the form of an invocation and a dogma, has the force of a spell-prayer—"Zeus was and is and will be, O great Zeus: earth gives forth fruits, therefore call on Mother Earth" (Pausan. x. 12, 10). Zeus, the sky-god, is seen here allied to the earth-goddess, of whom his feminine counterpart, Dione (*q.v.*), may have been the personal form. And it is at Dodona that his association with the oak is of the closest. His prophet-priests, the *Selloi*, "with unwashed feet, couching on the ground" (Homer, *Iliad*, xvi. 233), lived about the sacred oak, which may be regarded as the primeval shrine of the Aryan god, and interpreted its oracular voice, which spoke in the rustling of its leaves or the cooing of its doves. Zeus, we may believe, long remained at Dodona such as he was when the Hellenic tribes first brought him down from the Balkans, a high god supreme in heaven and in earth.

We may also believe that in the earliest stages of worship he had already acquired a moral and a social character. The Homeric view of him as the all-father is a high spiritual concept, but one of which many savage religions of our own time are capable. The family, the tribe, the city, the simpler and more complex organisms of the Hellenic polity were specially under his care and direction. In spite of the popular stories of his amours and infidelities, he is the patron-god of the monogamic marriage, and his union with Hera (*q.v.*) remained the divine type of human wedlock.

He was also the tutelary deity of the larger organization of the phratria; and the altar of *Zeus Phratrios* was the meeting-point of the *phrateres*, when they were assembled to consider the legitimacy of the new applicants for admission into their circle (Demosth. *Contra Macartatum*, 1078, i.).

His religion also came to assist the development of certain legal ideas, for instance, the rights of private or family property in land; he guarded the allotments as *Zeus Klarios* (Pausan. viii. 53, 9), and the Greek commandment, "thou shalt not remove thy neighbour's landmark," was maintained by *Zeus Horios*, the god of boundaries, a more personal power than the Latin Iuppiter Terminus (Plato, *Laws*, 842 E).

His highest political functions were summed up in the title *Polieus*, a cult-name of legendary antiquity in Athens, and frequent in the Hellenic world.

His consort in his political life was not Hera, but his daughter Athena Polias. He sat in her judgment court ἐπὶ Παλλαδίῳ, where cases of involuntary homicide were tried (Corp. Inser. Attic. iii. 71 and 273). With her he shared the chapel in the council-hall of Athens dedicated to them under the titles of *Boulaios* and *Boulaia*, "the inspirers of counsel," by which they were worshipped in many parts of Greece (Antiphon vi. p. 789; Pausan. i. 3. 5; *cf. Corp. Inser. Attic.* iii. 683). The political assembly and the law-court were consecrated to *Zeus Agoraios*, and being the eternal source of justice he might be invoked as *Dikaiosunos* "The Just." As the god who brought the people under one government he might be worshipped as *Pandemos* (*Corp. Inser. Attic.* iii. 7); as the deity of the whole of Hellas, he became *Panhellenios*, perhaps about the time of the Persian wars, when thanksgiving for the victory took the form of dedications and sacrifice to "Zeus the Liberator" *Eleutherios* (Simonides, *Frag.* 140 [Bergk]; Strab. 412). Finally, in the formulae adopted for the public oath, where many deities were invoked, the name of Zeus was the master word.

It remains to consider briefly certain moral aspects of his cult. The morality attaching to the oath, so deeply rooted in the conscience of primitive peoples, was expressed in the cult of *Zeus Horkios*, the god who punished perjury (Pausan. v. 24. 9). The whole history of Greek legal and moral conceptions attaching to the guilt of homicide can be studied in relation to the cult-appellatives of Zeus. The Greek consciousness of the sin of murder, only dimly awakened in the Homeric period, and only sensitive at first when a kinsman or a suppliant was slain, gradually expands till the sanctity of all human life becomes recognized by the higher morality of the people; and the names of *Zeus Meilichios*, the dread deity of the ghost-world whom the sinner must make "placable," of *Zeus Hikesios* and *Prostropaios*, to whom the conscience-stricken outcast may turn for mercy and pardon, play a guiding-part in this momentous evolution.

But it was in the poets and philosophers that this evolution attained its end. Most of them were believers in a supreme power, present always and everywhere, and some of them—Empedocles, Aeschylus, Plato—gave to this supreme power the name of Zeus. "Zeus, whosoever he is,—if this name be pleasing unto him, by this name do I call him,—weighing all things in the balance, nought can I conjecture save only Zeus." (Aeschylus, *Agamemnon*, 160 *et seq.*; *cf.* frag. 70, Naucks 2nd ed.). He is the spirit of the world, the law of the universe, the universal reason, and all other gods are only parts or manifestations of him (*cf.* Diog. Laert. vii. 147). Moreover, as we may see from the "hymn" of Cleanthes (frag. 48), and from St. Paul's quotation from it or Aratus (Acts xvii., 28—Arat., phaen. 5), he was conceived by the Stoics as the father of the human race, who "alone of mortal things that live and move upon the earth" were created in his image.

ZEUXIS, one of the best known Greek painters, flourished about 420–390 B.C., and described himself as a native of Heraclea, probably the town on the Black Sea. He was, according to one account, a pupil of Demophilus of Himera in Sicily, the other statement being that he was a pupil of Neseus of Thasos. Afterwards he appears to have resided in Ephesus. His known works are—

1. Zeus surrounded by Deities.
2. Eros crowned with Roses.
3. Marsyas bound.
4. Pan.
5. Centaur family.
6. Boreas or Triton.
7. Infant Heracles strangling the serpents in presence of his parents, Alcmena and Amphitryon.
8. Alcmena, possibly identical with 7.
9. Helena at Croton.
10. Penelope.
11. Menelaus.
12. Athlete.
13. An old Woman.
14. Boy with grapes.
15. Grapes.
16. Monochromes.
17. Plastic works in clay.

In ancient records we are told that Zeuxis, following the initiative of Apollodorus, had introduced into the art of painting a method of representing his figures in light and shadow, as opposed to the older method of outline, with large flat masses of colour for draperies, and other details, such as had been practised by Polygnotus and others of the great fresco painters. The new method led to smaller compositions, and often to pictures consisting of a single figure, on which it was more easy for the painter to demonstrate the various means by which he obtained perfect roundness of form. The effect would appear strongly realistic, as compared with the older method, and to this was probably due the origin of such stories as the contest in which Zeuxis painted a bunch of grapes so like reality that birds flew towards it.

ZHITOMIR or **JITOMIR,** a town in the Ukrainian S.S.R., in 50° 19′ N., 28° 40′ E., on the Teterev river, a left bank tributary of the Dnieper, and at the terminus of a branch railway from Berdichev. The opposition to private trade has diminished its former prosperity as a Jewish merchant city and its population (1926) was 69,465 as against 80,787 in 1900. There are iron-smelting works, and a brewing industry, in connection with which a hop fair is held in early September. Its position on the road west from Kiev gave it early importance and it dates back to the time of the Scandinavian Askold and Dir (9th century). The Tatars plundered it in the 13th, 14th and 17th centuries. In 1320 it became part of Lithuania, but was afterwards annexed by Poland and when the Cossacks rose against their chief Bogdan Chmielnicki (1648) they sacked the town. Russia occupied it, along with the rest of the Ukraine, in 1778.

ZHOB, a valley and river in the north-east of Baluchistan, India. The Zhob is a large valley running from the hills near Ziarat first eastward and then northward parallel to the Indus frontier, till it meets the Gomal river at Khajuri Kach. Its importance is due to its being the shortest route between the North-West Frontier Province and Quetta; it dominates all the Pathan tribes of Baluchistan by cutting between them and Afghanistan. Up to the year 1884 it was practically unknown to Europeans, but the Zhob Valley Expedition of that year opened it up, and in 1889 the Zhod Valley and Gomal Pass were taken under the control of the British Government. The Zhob Valley was the scene of punitive British expeditions in 1884 and 1890. In 1890 Zhob was formed into a district or political agency, with its headquarters at Fort Sandeman. It was much disturbed during the third Afghan war of 1919. The district has an area of 9,626 sq.m.; pop. (1921) 56,668, mostly Pathans of the Kakar tribe.

See A. W. C. McFall, *With the Zhob Field Force* (1895); R. Bruce, *Forward Policy* (1900); T. H. Holdich, *Indian Borderland* (1901); *Zhob District Gazetteer.*

ZHUKOVSKY, VASILI ANDREYEVICH (1783–1852), Russian poet, born in the government of Tula, on Jan. 29, 1783, was the earliest of the Russian poets of the golden age of Russian poetry, and a precursor of Pushkin. The volume of his original work is small, consisting of a few beautiful lyrics and elegies. His greatest work was the opening up of the knowledge of English and German poetry in Russia by a series of translations. Brückner (*Gesch. v. Russ. Lit.*) calls him "the most original translator in the world's literature." He began by a translation of Gray's *Elegy;* he went on to the more famous poems of the English romanticists, and it has been asserted that in some cases his versions have greater poetic power than their originals. He turned Fouque's *Undine* into Russian verse. His last great work was a version of the *Odyssey* (1847). Zhukovsky was tutor to Alexander II., and he used his favour at court to help both Pushkin and Gogol. His last years were spent in Germany, and he died at Baden-Baden in 1852.

ZIEM, FÉLIX FRANÇOIS GEORGE PHILIBERT (1821–1911), French painter, was born at Beaune (Côte d'Or) in 1821. He studied at the art school of Dijon, where he gained the *grand prix* for architecture. In 1839 he went to Rome and

from 1845 to 1848 travelled in the south of France, Italy and the East, where he found the glowing sunlight and the rich colour peculiarly suited to his temperament. Many of his paintings are in American private collections, but two of his finest pictures, "The Doge's Palace in Venice" (1852), and a marine-painting, are at the Luxembourg museum, and a "view of Quai St. Jean, Marseilles" at the Marseilles gallery.

See *Félix Ziem*, by L. Roger-Milès (*Librairie de l'art*, Paris).

ZIETEN, HANS JOACHIM VON (1699–1786), Prussian general-field-marshal, began his military career as a volunteer in an infantry regiment. In 1741 Frederick the Great made him colonel of the newly formed hussar regiment, and his promotion was rapid. He served with distinction in the first Silesian War, and still more in the second. His hussars, reorganized in the short interval of peace, were considered the best of their arm in Europe. Zieten fought the brilliant action of Moldau Tein almost on the day he received his commission as major-general. In the next campaign he led the famous *Zietenritt* round the enemy's lines to deliver the king's order to a distant detachment. When the Seven Years' War broke out in 1756 Zieten had just been made lieutenant-general. At Reichenberg and Prag he held important commands. At the disastrous battle of Kolin (June 18, 1757) his left wing of cavalry was the only victorious corps of troops, while at Leuthen he was brilliantly successful. Almost the only error in his career of battles was his misdirection of the frontal attack at Torgau, but he redeemed the mistake by his brilliant assault on the Siptitz heights. At the peace, he retired, and died in 1786.

ZIGGURAT, in architecture, a common temple form in Chaldea and ancient Babylonia and Assyria, which consists either of a stepped pyramid or of a somewhat similar shape in which the flat terraces of the ordinary stepped pyramid are replaced by an inclined plane ascending spirally from the ground to the summit. Ziggurats were usually great mounds of sun-dried brick with the exterior walls faced with a coating of burned, glazed brick or tile. On the summit there was frequently a shrine to the deity to whom the temple was erected. It is probable that the ziggurat form originated in the attempt to obtain high observatories from which the stars, so important in Chaldean religion and magic, might be observed.

ZIGZAG, in architecture and the decorative arts, an ornament formed by a succession of chevrons. It usually takes the shape of a band, changing direction at points equidistant from each other by angles usually acute, in such a manner that alternate segments are parallel to each other. The zigzag is one of the most primitive ornamental forms, both on pottery and in textiles. In Egyptian work it is frequently used for tomb ceilings and walls, evidently imitating matting or cloth decorations. Its most important architectural use is in some of the Romanesque styles, especially the Norman work in France and England.

ZIMBABWE, a Bantu name, probably derived from the two words *zimba* ("houses") and *mabgi* ("stones"), given to certain ruins in south-east Africa. The mediaeval Portuguese applied it as a generic term for the capital of any considerable chief and to several distinct places. From about 1550 onwards the Zimbabwe generally referred to by Portuguese writers was at a spot a little north of the Afur district, not far from the Zambezi. Before this the capital of the Monomotapa was situated much farther south, and it may plausibly be identified with the extensive ruins near Victoria (Mashonaland), now generally called Zimbabwe.

These ruins, discovered by Adam Renders in 1868 and explored by Karl Mauch in 1871, became well known to English readers from J. T. Bent's account of the *Ruined Cities of Mashonaland*.

The explorations conducted in 1905 proved that the mediaeval objects were necessarily contemporaneous with the foundation of the buildings, and that there was no super-position of periods of any date whatsoever. The plan and construction of Zimbabwe are by no means unique, and this site only differs from others in Rhodesia in respect of the great dimensions and the massiveness of its individual buildings. It may therefore be dated to a period not earlier than the 14th or 15th century A.D., and attributed to the same Bantu people the remains of whose stone-fenced *kraals* are found between the Limpopo and the Zambezi.

The three distinct, though connected, groups of ruins at Zimbabwe are commonly known as the "elliptical temple," the "acropolis," and the "valley ruins." The first is doubly misnamed; it is not a temple and its contour is too unsymmetrical to be described properly as elliptical. It is an irregular enclosure over 800ft. in circumference, with a maximum length of 292ft. and a maximum breadth of 220ft., surrounded by a dry-built wall of extraordinary massiveness. This wall is in places over 30ft. high and 14ft. wide, but is erratic in outline and variable in thickness. On the south and south-east, the wall is decorated by a row of granite monoliths beneath which runs a double line of chevron ornament. The interior has been much destroyed by the ravages of gold-seekers and amateur excavators. The scheme was a combination of such a stone *kraal* as that at Nanatali with the plan of a fort like those found about Inyanga. The only unique feature is the occurrence of a large and a small conical tower at the southern end.

The "Acropolis" is a hill rising 200ft. to 300ft. above the valley, fortified with the minutest care and with extraordinary ingenuity. The principles of construction, the use of stone and cement, are the same as in the "elliptical" *kraal;* there is no definite plan, the shape and arrangement of the enclosures being determined solely by the natural features of the ground. Between this and the "elliptical" *kraal* are the "valley ruins," consisting of smaller buildings, perhaps the dwellings of traders who bartered the gold brought in from distant mines. Zimbabwe was probably the distributing centre for the gold traffic carried on in the middle ages between the Monomotapa and the Mohammedans of the coast.

Journal* (1906). *See* also Mauch's report in *Ausland* (1872), which is of bibliographical interest; Bent's *Ruined Cities of Mashonaland* (1892); R. N. Hall, *Great Zimbabwe* (1905); *Prehistoric Rhodesia* (1909).

ZIMMERMANN, ARTHUR (1859–), German diplomat was born May 8, 1859, at Frankenstein. After having been vice-consul at Shanghai and acting consul in 1900 at Tientsin, he entered the Foreign Office in 1902 and rose by 1910 to be a director of the political section. In 1911 he was appointed under-secretary, and in Nov. 1916 secretary of state in succession to Von Jagow. In this capacity he addressed to America the note of Jan. 31, 1917, on the subject of U-boat warfare. He was also the author of the invitation of Jan. 19, 1917, to Mexico to enter into alliance with Germany and to sound Japan as to her willingness to co-operate. For Mexico the price of this alliance was to be the American States of New Mexico, Texas and Arizona. This proposal, which was sent through the medium of Von Eckhardt, the German minister to Mexico, was intercepted in America and President Wilson was in a position to publish it on March 1, 1917. The disclosure was one of the primary causes resulting in America's declaration of war upon Germany. Zimmermann retired on Aug. 5, 1917, shortly after the resignation of Bethmann Hollweg.

ZINC, a metallic chemical element (symbol Zn, atomic number 30, atomic weight 65·38). Zinc as a component of brass had currency in metallurgy long before it became known as an individual metal. The word zinc (in the form *zinken*) was first used by Paracelsus, who regarded it as a bastard or semi-metal; but the word was subsequently used for both the metal and its ores. Moreover, zinc and bismuth were confused, and the word *spiauter* (the modern spelter) was indiscriminately given to both these metals. In 1597 Libavius described a "peculiar kind of tin" which was prepared in India, and of which a friend had given him a quantity. From his account it is quite clear that this metal was zinc, but he did not recognize it as the metal of calamine. It is not known to whom the discovery of isolated zinc is due; but we do know that the art of zinc-smelting was practised in England from about 1730. The first continental zinc-works were erected at Liége in 1807.

Occurrence.—Zinc does not occur free in nature, but in combination it is widely diffused. The chief ore is zinc blende, or sphalerite (*see* BLENDE), which generally contains, in addition to zinc sulphide, small amounts of the sulphides of iron, silver and

cadmium. It may also be accompanied by pyrites, galena, arsenides and antimonides, quartz, calcite, dolomite, etc. It is widely distributed, and is particularly abundant in Germany (the Harz, Silesia), Austro-Hungary, Belgium, the United States and in England (Cumberland, Derbyshire, Cornwall, North Wales). Second in importance is the carbonate, calamine (*q.v.*) or zinc spar, which at one time was the principal ore; it almost invariably contains the carbonates of cadmium, iron, manganese, magnesium and calcium, and may be contaminated with clay, oxides of iron, galena and calcite; "white calamine" owes its colour to much clay; "red calamine" to admixed iron and manganese oxides. Calamine chiefly occurs in Spain, Silesia and in the United States. Of less importance is the silicate, $Zn_2SiO_4{\cdot}H_2O$, named electric calamine or hemimorphite; this occurs in quantity in Altenburg near Aix-la-Chapelle, Sardinia, Spain and the United States (New Jersey, Pennsylvania, Missouri, Wisconsin). Other zinc minerals are willemite (*q.v.*), Zn_2SiO_4, hydrozincite or zinc bloom, $ZnCO_3{\cdot}2Zn(OH)_2$, zincite (*q.v.*) or red zinc ore, ZnO, and franklinite, $3(Fe,Zn)O{\cdot}(Fe,Mn)_2O_3$.

Production.—Until about 1833 the supply of zinc was almost entirely obtained from Germany, but in this year Russia began to contribute about 2,000 tons annually to the 6,000 to 7,000 derived from Germany. Belgium entered in 1837 with an output of about 2,000 tons; England in 1855 with 3,000; and the United States in 1873 with 6,000 tons. The last country now produces about one-half of the world's supply. The present state and general trend of the industry is shown by the following statistics for output of smelter and electrolytic zinc (in metric tons) for the chief producing countries and for the world's production.

	1920	1925	1926
Belgium	84,260	170,860	190,216
Canada	16,798	34,910	55,999
France	19,655	64,260	72,455
Germany	95,758	58,623	68,292
Great Britain	24,500	38,671	18,278*
Japan	15,745	14,100	17,000
Poland	5,361	114,341	124,094
Spain	9,647	15,122	16,061
U.S.A.	420,365	504,057	555,187
Total (all countries)	714,946	1,110,027	1,219,412

*Fall attributable to general strike and consequences.

Properties.—Zinc is bluish white, with a high lustre when fractured. It fuses at 419° C and under ordinary atmospheric pressure boils at 918° C. Its vapour density shows that it is monatomic. The molten metal on cooling deposits crystals belonging to the hexagonal system, and freezes into a compact crystalline solid, which may be brittle or ductile according to circumstances. If zinc be cast into a mould at a red heat, the ingot produced is laminar and brittle; if cast at just the fusing-point, it is granular and sufficiently ductile to be rolled into sheet at the ordinary temperature. According to some authorities, pure zinc always yields ductile ingots. Commercial "spelter" always breaks under the hammer; but at 100° to 150° C it is susceptible of being rolled out into a very thin sheet. Such a sheet, if once produced, remains flexible when cold. At about 200° C, the metal becomes so brittle that it can be pounded in a mortar. The specific gravity of zinc cannot be expected to be perfectly constant; according to Karsten, that of pure ingot is 6·915, and rises to 7·191 after rolling. The coefficient of linear expansion is 17×10^{-6} between 20° and 100°. The specific heat is 0·0929 from 18° to 100°. Compact zinc does not tarnish much in the air. It is fairly soft, and clogs the file. If zinc be heated to near its boiling-point, it catches fire and burns with a brilliant light into its powdery white oxide, which forms a reek in the air (*lana philosophica*, "philosopher's wool"). Boiling water attacks it appreciably, but slightly, with evolution of hydrogen and formation of the hydroxide, $Zn(OH)_2$. A rod of perfectly pure zinc, when immersed in dilute sulphuric acid, is so very slowly attacked that there is no visible evolution of gas; but, if a piece of platinum, copper or other more electro-negative metal be brought into contact with the zinc, it dissolves readily, with evolution of hydrogen and formation of the sulphate. The ordinary impure metal dissolves at once, the more readily the less pure it is. Cold dilute nitric acid dissolves zinc as nitrate, with evolution of nitrous oxide. At higher temperatures, or with stronger acid, nitric oxide, NO, is produced besides or instead of nitrous oxide. Zinc is also soluble in soda and potash solutions, but not in ammonia.

Applications.—Zinc is largely used for "galvanizing" iron, sheets of clean iron being immersed in a bath of the molten metal and then removed, so that a coat of zinc remains on the iron, which is thereby protected from atmospheric corrosion. For the same purpose zinc may be sprayed on to other metals, or it may be deposited electrolytically. It is also a constituent of many valuable alloys; brass, Muntz-metal, pinchbeck and tombac are examples.

Zinc forms only one oxide, ZnO, from which is derived a well-characterized series of salts. It is chemically related to cadmium and mercury, the resemblance to cadmium being especially well marked; one distinction is that zinc is less basigenic. Zinc is capable of isomorphously replacing many of the bivalent metals, *e.g.*, magnesium, manganese, iron, nickel, cobalt and cadmium, in certain salts.

Zinc Oxide, ZnO, is manufactured for paint by two processes —directly from the ore mixed with coal by volatilization on a grate, and by oxidizing the vapour given off by a boiling bath of zinc metal. The oxide made by the latter method has generally a better colour, a finer texture, and a greater covering power. It is an infusible solid, which is intensely yellow at a red heat, but on cooling becomes white. This at least is true of the oxide produced from the metal by combustion; that produced from the carbonate, if once made yellow at a red heat, retains a yellow shade permanently. Crystalline zinc oxide is obtained by heating the nitrate, or by heating the chloride in a current of steam. It is insoluble in water, but dissolves readily in all aqueous acids, with formation of salts. It also dissolves in aqueous caustic alkalis, including ammonia, forming "zincates" [*e.g.*, $Zn(OK)_2$]. Zinc oxide is used in the arts as a white pigment (zinc white); it has not by any means the covering power of white lead, but offers the advantages of being non-poisonous and of not becoming discoloured in sulphuretted hydrogen. It is used also in ointments, as a polish for glass, and in dental cements.

Zinc Hydroxide, $Zn(OH)_2$, is prepared as a gelatinous precipitate by adding a solution of any zinc salt to pure aqueous caustic potash. It is a white powder, is insoluble in water, but soluble in excess of alkali and in acids.

Zinc Peroxide, obtained from zinc sulphate and barium peroxide, or by electrolysis of neutral zinc chloride solutions in the presence of hydrogen peroxide, is a valuable antiseptic, being odourless and non-irritant; it is much used for skin troubles under various proprietary names (*e.g.*, dermogen), and as produced commercially contains about 50% of ZnO_2 together with hydroxide and moisture.

Zinc chloride, $ZnCl_2$, is produced by heating the metal in dry chlorine gas, or by heating a mixture of zinc sulphate and sodium chloride. It condenses as a white translucent mass, boiling at about 700°. Its vapour density at 900° C corresponds to $ZnCl_2$. It is extremely hygroscopic and is used in synthetical organic chemistry as a condensing agent. It dissolves in a fraction of its weight of even cold water and in any proportion of boiling water, forming a syrupy solution. A solution of zinc chloride is easily produced from the metal and hydrochloric acid; it cannot be evaporated to dryness without considerable decomposition of the hydrated salt into oxychloride and hydrochloric acid, but it may be crystallized as $ZnCl_2{\cdot}H_2O$. A concentrated solution of zinc chloride converts starch, cellulose and a great many other organic substances into soluble compounds; hence the application of the fused salt as a caustic in surgery and the impossibility of filtering a strong $ZnCl_2$ solution through paper. (*See* CELLULOSE.) The solution is also used as a flux in soldering.

Zinc chloride solution readily dissolves the oxide with the formation of oxychlorides, some of which are used as pigments, cements and for filling teeth in dentistry. A solution of the oxide in the chloride has the property of dissolving silk, and hence is employed for removing this fibre from wool.

Zinc sulphide, ZnS, occurs in nature as blende (*q.v.*), and is artificially obtained as a white precipitate by passing sulphuretted hydrogen into a neutral solution of a zinc salt. It dissolves in mineral acids, but is insoluble in acetic acid.

Zinc sulphate, $ZnSO_4+7H_2O$, or white vitriol, is prepared by dissolving the metal in dilute sulphuric acid, concentrating, and cooling the solution. The hydrated salt crystallizes out on cooling, forming colourless orthorhombic prisms, usually small and needle-shaped. They are permanent in the air. According to Poggiale, 100 parts of water dissolve respectively of ($7H_2O$) salt, 115·2 parts at 0°, and 653·6 parts at 100°. At 39° C the crystals lose one, and at 100° six of their molecules of water; the remaining molecule goes off at 250°. The anhydrous salt, when exposed to a red heat, breaks up into oxide, sulphur dioxide and oxygen. An impure form of the salt is prepared by roasting blende at a low temperature. In the arts it is employed in the preparation of varnishes, and as a mordant for the production of colours on calico. A green pigment known as *Rinmann's green* is prepared by mixing 100 parts of zinc vitriol with 2·5 parts of cobalt nitrate and heating the mixture to redness, to produce a compound of the two oxides. Zinc sulphate, like magnesium sulphate, unites with the sulphates of the potassium metals and of ammonium into crystalline double salts, $ZnSO_4{\cdot}R_2SO_4+6H_2O$, isomorphous with one another and with the magnesium salts.

Zinc Carbonate, $ZnCO_3$, occurs in nature as the mineral calamine (*q.v.*), but has never been prepared artificially, *basic carbonates,* $ZnCO_3{\cdot}xZn(OH)_2$, where x is variable, being obtained by precipitating a solution of the sulphate or chloride with sodium carbonate; the basic salt is used as a pigment.

Of zinc phosphates we notice the minerals hopeite, $Zn_3(PO_4)_2{\cdot}4H_2O$, and tarbuttite, $Zn_3(PO_4)_2{\cdot}Zn(OH)_2$, both found in Rhodesia.

Analysis.—From neutral solutions of its salts zinc is precipitated by sulphuretted hydrogen as sulphide, ZnS—a white precipitate, soluble, but by no means readily, in dilute mineral acids, but insoluble in acetic acid. In the case of the acetate precipitation is quite complete; from a sulphate or chloride solution the greater part of the metal goes into the precipitate; in the presence of a sufficiency of free HCl the metal remains dissolved; sulphide of ammonium precipitates the metal completely, even in the presence of ammonium salts and free ammonia. The precipitate, when heated, passes into oxide, which is yellow when hot and white after cooling; and, if it be moistened with cobalt nitrate solution and re-heated, it exhibits a green colour after cooling.

Zinc may be quantitatively estimated by precipitating as basic carbonate, which is dried and ignited to zinc oxide. It may also be precipitated as zinc ammonium phosphate, NH_4ZnPO_4, which is filtered on a Gooch crucible and dried at 105°. Volumetric methods have also been devised.

PHARMACOLOGY AND THERAPEUTICS

Zinc chloride is a powerful caustic, and is prepared with plaster of Paris in the form of sticks for destroying warts, etc. The salt is a corrosive irritant poison when taken internally. The treatment is to wash out the stomach or give such an emetic as apomorphine, and, when the stomach has been emptied, to administer demulcents such as white of egg or mucilage. Numerous other salts of zinc, used in medicine, are of value as containing this metal. Certain others are referred to in relation with the important radical contained in the salt. Those treated here are the sulphate, oxide, carbonate, oleate and acetate. All these salts are mild astringents when applied externally, as they coagulate the albumen of the tissues and of any discharge which may be present. In virtue of this property they are also mild haemostatics, tending to coagulate the albumens of the blood and thereby to arrest haemorrhage. *Lotio Rubra,* the familiar "Red Lotion," a solution of zinc sulphate, is widely used in many catarrhal inflammations, as of the ear, urethra, conjunctiva, etc. There are also innumerable ointments.

These salts are extensively employed internally especially in the treatment of the more severe and difficult cases of nervous disease. The sulphate is an excellent emetic in cases of poisoning, acting rapidly and without much nausea or depression. For these reasons it may also be given with advantage to children suffering from acute bronchitis or acute laryngitis. *See* also *Zinc peroxide* (above).

Gregory and Mrs. M. S. Burr) (1926); Smith, *The Zinc Industry* (1918); for statistics and technological advances, *see* G. A. Roush and A. Butts, *The Mineral Industry* (annually). (X.; A. D. M.)

ZINC PRODUCTION

The United States is the principal producer of both zinc ore and spelter. The Joplin area in Missouri has long been the principal mining region, but large deposits are worked in the Upper Mississippi region, Franklin Furnace (New Jersey) and, since the application of improved methods of zinc concentration, in the western States. Australia is next to the United States as a zinc producer, most of the ore being obtained from the Broken Hill district (New South Wales). Tasmania also has important deposits and occurrences are known in Australia.

In Canada, the most important deposits of the metal occur in British Columbia and Quebec, these two provinces sharing practically the whole of the Canadian production in the proportions of four-fifths and one-fifth respectively. The principal countries in Europe participating in the zinc industry are Germany, Italy, Poland and Spain. For many years Germany ranked second only to the United States. Her most important deposits were in Upper Silesia, which yielded about three-fourths of the total German production. Before the World War the European industry was almost wholly controlled by the German zinc convention.

In Italy the chief mines now worked are in Sardinia, though occurrences of ore are found in Lombardy, Piedmont and Tuscany. During the post-War period Poland produced more zinc ore than any other European country, her richest mines being situated in Silesia; her exports in 1923 amounted to 80,000 long tons. In Spain the chief zinc-mining centres are in the provinces of Santander and Murcia. The ores of Santander are mainly calamine, while those of Murcia are principally blende and galena. Mention should be made of the zinc-ores mined in the United Kingdom. These are almost invariably blende associated with galena, and occur chiefly in North Wales, the north of England, the Isle of Man and at Dumfries in Scotland.

In the following table the production of zinc in the principal countries of the world is set out for the three years, 1918, 1923 and 1925.

	Long Tons		
	1918	1923	1925
United States	462,435	455,745	511,559
Australia	9,444	41,153	45,698
Canada	11,227	26,972	34,358
Germany	232,000	39,400	57,705
Italy	1,169	3,622	6,374
Poland	..	90,000	112,507
Spain	15,644	10,746	140,300
United Kingdom	50,000	33,000	42,000
Belgium	9,096	144,677	179,130
France	18,052	48,541	70,000
Japan	39,203	13,671	14,000*
Netherlands	..	16,185	20,778
Yugoslavia	..	2,400	2,196†
Sweden	..	1,194	4,598
Norway	..	3,722	6,698

*Approximate. †Crude and refined zinc.

ZINCITE, a mineral consisting of zinc oxide (ZnO), crystallizing in the hemimorphic-hemihedral class of the hexagonal system. Distinct crystals are of rare occurrence; they have the form of a hexagonal pyramid terminated at one end only by a basal plane. There is a perfect cleavage parallel to the basal plane, and usually the mineral is found as platy foliated masses. The blood-red colour and the orange-yellow streak are characteristic features. The hardness is 4·5, sp.gr., 5·6. Some manganese is usually present replacing zinc. It is known only from Sterling Hill and Franklin Furnace in Sussex county, N.J.

ZINDER, a town on the northern margin of the central Sudan. Pop. 6,000. It forms part of the French colony of the Niger, of which the capital, at first Zinder, was in 1926 moved to Niamey. Its ruler was formerly subordinate to Bornu, but with the decline of that kingdom shook off the yoke of the sultan, and on the conquest of that country by Rabah (*q.v.*) seems to have maintained his independence. The country of which Zinder is the capital is known as Damerghu. It is semi-fertile, and supports considerable numbers of horses and sheep, besides troops of camels. By the Anglo-French agreement of June 1898 it was included in the French sphere. The explorer Cazemajou was assassinated there in 1897, but the town was occupied in July 1899, after a slight resistance. A French post (named Fort Cazemajou) was built outside the town on a mound of huge granite blocks. Zinder was the first point in the Sudan reached by F. Foureau after his great journey across the Sahara *via* Air in 1899. Subsequently Commandant Gadel, from his headquarters at Zinder, mapped and pacified the surrounding region, and sent out columns of *meharistes* (camel-corps) which occupied the oasis of Air and Bilma in 1906. Zinder is a large and fine town surrounded with high earthen walls, very thick at the base and pierced with seven gates.

(1901); E. Arnaud and M. Cortier, *Nos Confins Sahariens* (Paris, 1908); C. Jean, *Les Touareg du Sud-Est* (Paris, 1909).

ZINGARELLI, NICCOLO (1752–1837), Italian composer, was born at Naples on April 4, 1752, the son of Riccardo Tota Zingarelli, a singing-master and soloist. His first dramatic work, *I quattro Pazzi*, was produced at the conservatorio in 1768. He then gave violin lessons for a time, but in 1781 produced his first opera, *Montesuma*, at the San Carlo and afterwards in Vienna, where it was highly commended by Haydn. He finally settled in Milan, with introductions to the viceregal court, and over a period of eleven years produced a series of operas for the Scala, an oratorio of the Passion, and several cantatas. In 1789 he went to Paris to write an opera for the Académie royale de musique. This work, *L'Antigone*, for which Marmontel provided the libretto, was performed on April 30, 1790, but Paris was no place for Zingarelli during the Revolution, and he fled into Switzerland and returned to Milan early in 1791.

In 1792 he won the appointment, by open competition, of master of the chapel at the cathedral. He first achieved an international reputation by a series of comic operas, beginning with *La Secchia rapita* in 1793. His finest work was, however, *Romeo and Juliet*, played at the Scala in 1796. From 1794–1804 Zingarelli was master of the chapel at Loreto, and during this time, although he also wrote operas, he was chiefly inspired to compose sacred music, contributing largely to the enormous collection of manuscript works, the property of the church, known as the *Annuale di Loreto*. In 1804 he went to Rome as master (maestro di capella) of the Sistine chapel and in 1805 produced one of his most successful works, "The Destruction of Jerusalem," which held the stage for five years. His last opera, *Berenice*, received a hundred consecutive performances.

At the "King of Rome" celebrations, when Napoleon ordered a Te Deum to be sung in Rome, Zingarelli's principles did not allow him to undertake the performance, and on his refusal he was arrested and brought before the emperor in Paris. But Napoleon at once released him and provided him with a pension. Zingarelli's post in Rome had been taken by Fioravanti, but in 1813 he was appointed director of the Real Collegio di Musica at Naples and in 1816 maestro di capella at the cathedral. Zingarelli's gift for melody was remarkable. He was a deeply religious man and was rigorous in his exclusion of secular music from church performances. He died in 1837.

ZINNIA, in botany, a genus of the family Compositae, containing about a dozen species of half-hardy annual or perennial herbs or undershrubs, natives of the southern United States and Mexico. The numerous single and double garden forms are mostly derived from *Zinnia elegans*, and grow about 2 ft. high, producing flowers of various colours, the double ones being about the size of asters, and very handsome. The colours include white, yellow, orange, scarlet, crimson and purple. Zinnias do best in a rich deep loamy soil, in a sunny position. They should be sown on a gentle hotbed at the end of March and planted out early in June.

ZINOVIEV, GRIGORY EVSEEVICH (1883–), Russian politician, was born in Sept. 1883 at Elisavetgrad (Zinovievsk). He studied chemistry and later law at Bern. He was a revolutionary before he was 20, and in 1903 met Lenin. He joined the Left or Bolshevik wing of the Russian Social Democratic party, of which Lenin was head. He was head of the Bolshevik party in Bern and during 1903–4 started Bolshevik propaganda in South Russia. Apart from his activities abroad, he came into prominence in Russia during 1906–8 as a member of the Bolshevik St. Petersburg committee of the R.S.D.P., by his organization of the attempted Kronstadt rising after the dispersal of the first Duma, his editorship of the Bolshevik paper *Vpered* (Forward), and of *The Social Democrat*, the central organ of the party. In 1908 he was arrested and imprisoned but was released, the authorities being unaware of his identity. He then went abroad and did not return until the revolution in 1917.

During these nine years Zinoviev worked hard for his party. He was a member of the central committee, co-editor of the principal Bolshevik publications, and representative of the party at the Copenhagen congress of the International. In 1912 he went with Lenin to Galicia to control from the nearest possible point the growing labour movement in Russia. In Galicia he founded the foreign bureau of the central committee, which guided the party work in Russia and the activities of the Bolshevik group in the Duma. During the World War the conflict between the Bolshevik party and the Social Democrats increased. Zinoviev edited with Lenin *Against the Tide*, a work of propaganda against the World War; and at the Zimmerwald conference (1915) they began to organize the Communist International. On the outbreak of the March revolution (1917) they returned to Russia and began to prepare the way for the revolution. Zinoviev was co-editor of *Pravda* and, after its suppression, of *The Proletarian* and *The Worker*. He thus became one of the leading figures in Russia. In 1919 he was elected president of the Communist International, and after the death of Lenin in 1924 was one of the most zealous upholders of pure "Leninism." His influence lasted until 1926, but in June of that year he was expelled from the political bureau, and eventually from the Communist party. But he presently made his peace with the dominant section, and received a minor post. Zinoviev is best known in England by the controversy over the "Red Letter" to English communists alleged to be his, which was a factor in the British general election of 1925.

ZINOVIEVSK, a town of the Ukrainian S.S.R., in 48° 32′ N., 32° 18′ E., on the Ingul river. Pop. (1926) 64,502. Its industries include smelting, distilling, brewing, soap-making, brick-making, saw-milling and the manufacture of makhorka tobacco. The town is on the railway and is a collecting centre for the grain growing and sheep rearing district around it. It was founded in 1754 and named Elisavetgrad after the Empress Elizabeth. After the 1917 revolution it was re-named in honour of the Bolshevik leader, Zinoviev.

ZINZENDORF, NICOLAUS LUDWIG, COUNT OF ZINZENDORF AND POTTENDORF (1700–1760), German religious and social reformer, was born on May 26, 1700, at Dresden. Both

his parents belonged to the Pietist circle, and the lad had Philipp Jakob Spener for his godfather. His school days were spent at Halle amidst Pietist surroundings, and in 1716 he went to the University of Wittenberg, to study law and fit himself for a diplomatic career. Three years later he was sent to travel in Holland, in France, and in various parts of Germany. During a lengthened visit at Castell he fell in love with his cousin Theodora; but her mother objected to the marriage, and Theodora married Count Henry of Reuss. Zinzendorf took this rebuff as a call to special work for God, and he now resolved to settle down as a Christian landowner, spending his life on behalf of his tenantry at Berthelsdorf. His intention was to carry into practice the Pietist ideas of Spener.

The "band of four brothers" (Rothe, pastor at Berthelsdorf; Melchior Schäffer, pastor at Görlitz; Francis von Wattewille, a friend from boyhood; and himself) set themselves to create a revival of religion. From the printing-house at Ebersdorf large quantities of books and tracts, catechisms, collections of hymns and cheap Bibles were issued; and a translation of Johann Arndt's *True Christianity* was published for circulation in France. Zinzendorf seems to have doubted the wisdom of Spener's plan of not separating from the Lutheran Church, and began to think that true Christianity could be best promoted by free associations of Christians, which in course of time might grow into churches with no State connection. Zinzendorf offered an asylum to a number of persecuted wanderers from Moravia (*see* MORAVIAN BRETHREN), and built for them the village of Herrnhut on a corner of his estate of Berthelsdorf. The refugees who came to this asylum (between 1722 and 1732—the first detachment under Christian David) from various regions where persecution raged, belonged to more than one Protestant organization. Zinzendorf devoted himself to them.

Gradually Zinzendorf was able to organize his refugees into something like a *militia Christi*, based not on monastic but on family life. He established a common order of worship in 1727, and soon afterwards a common organization, which has been described in the article MORAVIAN BRETHREN. He travelled widely on behalf of the Moravians, visiting America in 1741–42 and spending a long time in London in 1750. Missionary colonies had by this time been settled in the West Indies (1732), in Greenland (1733), amongst the North American Indians (1735); and before Zinzendorf's death the Brethren had sent from Herrnhut missionary colonies to Livonia and the northern shores of the Baltic, to the slaves of North Carolina, to Surinam, to the negro slaves in several parts of South America, to Travancore in the East Indies, to the Copts in Egypt and to South Africa.

In 1752 Zinzendorf lost his only son, Christian Renatus, whom he had hoped to make his successor; and four years later he lost his wife Erdmute, who had been his counsellor and confidante in all his work. Zinzendorf remained a widower for one year, and then (June 1757) contracted a second marriage with Anna Nitschmann. He died on March 9, 1760, leaving John de Wattewille, who had married his eldest daughter Benigna, to take his place at the head of the community.

See A. G. Spangenberg, *Leben des Grafen von Zinzendorf* (Barby, 1772–75); L. von Schrautenbach, *Der Graf v. Zinzendorf* (Gnadau, 1871; written in 1782, and interesting because it gives Zinzendorf's relations to such Pietist rationalists as J. K. Dippel); F. Bovet, *Le Comte de Zinzendorf* (1860; Eng. trans. *A Pioneer of Social Christianity*, by T. A. Seed, 1896); B. Becker, *Zinzendorf im Verhältniss z. Philosophie u. Kirchenthum seiner Zeit* (Leipzig, 1886); H. Römer, *Zinzendorf's Leben und Werken* (Gnaudau, 1900), and other literature mentioned under MORAVIAN BRETHREN.

ZION, a city of Lake county, Illinois, U.S.A., on Lake Michigan, 45 m. N. by W. of Chicago. It is served by the Chicago and North Western and the Chicago, North Shore and Milwaukee railways. Pop. 5,580 in 1920, 20% foreign-born white, and was estimated locally at 6,500 in 1928. It is the centre of a fruit-growing, truck-gardening and dairying district, and has a variety of manufacturing industries. Zion City (as it was called at first) was founded in 1901 by John Alexander Dowie (*q.v.*) to be the headquarters of the "Christian Catholic Apostolic Church in Zion." It was chartered as a city in 1902.

ZION, originally the name of the Jebusite stronghold at Jerusalem captured by David (2 Samuel v.). This was probably on the southern part of the eastern hill. Above it was built the temple, and later the name was extended to the whole hill. Finally it became a synonym for the city of Jerusalem, whose inhabitants are personified as "the daughter of Zion." *See* JERUSALEM.

ZIONISM is the lineal heir of the attachment to Zion which led the Babylonian exiles under Zerubbabel to rebuild the Temple, and which flamed up in the heroic struggle of the Maccabees against Antiochus Epiphanes.

During the middle ages, though the racial character of the Jews was being transformed by their Ghetto seclusion, the national yearning suffered no relaxation. The nationalist spirit of the mediaeval Jews is sufficiently reflected in their liturgy, and especially in the works of the poet, Jehuda Halevi.

The strength of the nationalist feeling was practically tested in the 16th century, when a Jewish impostor, David Reubeni (*c.* 1530), and his disciple, Solomon Molcho (1501–1532), came forward as would-be liberators of their people. Throughout Spain, Italy and Turkey they were received with enthusiasm by the bulk of their brethren. In the following century the influence of the Christian Millennarians gave a fresh impulse to the national idea. Menasseh ben Israel (1604–1657) co-operated with English Millennarians to procure the resettlement of the Jews in England as a preliminary to their national return to Palestine. In 1666 a leader appeared at Smyrna, in the person of a Jew named Sabbatai Zevi (1626–1676), who proclaimed himself the Messiah. The news spread like wildfire, and despite the opposition of some of the leading rabbis, the Jews everywhere prepared for the journey to Palestine. Throughout Europe the nationalist excitement was intense. Even the downfall and apostasy of Sabbatai were powerless to stop it. The bulk of the people refused for a whole century to be disillusioned.

The reaction arrived in 1778 in the shape of the Mendelssohnian movement. The growth of religious toleration, the attempted emancipation of the English Jews in 1753, and the Judeophilism of men like Lessing and Dohm, showed that a new era was at hand. Moses Mendelssohn (1729–1786) sought to prepare his brethren for their new life as citizens of the lands in which they dwelt, by emphasizing the spiritual side of Judaism and the necessity of Occidental culture. His efforts were successful. The nationalist spirit showed signs of yielding before the hope or the progress of local political emancipation. In 1806 the Jewish Sanhedrin convened by Napoleon virtually repudiated the nationalist tradition. The new Judaism, however, had not entirely destroyed it. It had only reconstructed it on a different foundation. Mendelssohnian culture, by promoting the study of Jewish history, gave a fresh impulse to the racial consciousness of the Jews. From this race consciousness came a fresh interest in the Holy Land. It was an ideal rather than a politico-nationalist interest—a desire to preserve and cherish the monuments of the ancient national glories. It took the practical form of projects for improving the circumstances of the local Jews by means of schools, and for reviving something of the old social condition of Judea by the establishment of agricultural colonies. In this work Sir Moses Montefiore, the Rothschild family, and the Alliance Israélite Universelle were conspicuous. More or less passively, however, the older nationalism still lived on—especially in lands where Jews were persecuted—and it became strengthened by the revived race consciousness and the new interest in the Holy Land. Christian Millennarians also helped to keep it alive. Lord Ashley, afterwards Lord Shaftesbury, Col. Gawler, Walter Cresson, the United States consul at Jerusalem, James Finn, the British consul, Laurence Oliphant and many others organized and supported schemes for the benefit of the Jews of the Holy Land on avowedly Restoration grounds. Another vivifying element was the re-opening of the Eastern Question and the championship of oppressed nationalities in the East by the Western Powers. In England political writers were found to urge the re-establishment of a Jewish State under British protection as a means of assuring the overland route to India (Hollingsworth, *Jews in Palestine*, 1852). Lord Palmerston was not unaffected by this idea (Finn,

Stirring Times, vol. i. pp. 106–112), and both Lord Beaconsfield and Lord Salisbury supported Laurence Oliphant in his negotiations with the Porte for a concession which was to pave the way to an autonomous Jewish State in the Holy Land. George Eliot's *Daniel Deronda*, which appeared in 1876, was a striking illustration of the sympathy with which Jewish national aspirations were regarded by cultivated Western minds.

In the middle of the 19th century, Zionism, or what the next generation of Jews was to know as Zionism, was already being preached in western Europe by Moses Hess (1812–1875) and in eastern Europe by Hirsch Kalischer (1795–1874) and Perez Smolenskin (1842–1885). A powerful impetus was given to the movement by the rise and spread of anti-Semitism, which, in one form or another, began to harass the Jews and embitter their lives in nearly every part of Europe. In Russia it reached its climax in 1882, when murder and pillage raged unchecked through the Jewish pale of settlement. It was in this fateful year that the immediate precursor of Theodor Herzl, the founder of the Zionist organization, appeared in the person of Leo Pinsker of Odessa (1821–1871), whose "auto-emancipation" was a plea for the solution of the Jewish problem by the re-establishment of a Jewish nation living its own life on Jewish soil. The "back to Zion" movement soon began to assume a practical form. A society known as *Choveve Zion* ("Lovers of Zion") was formed for the purpose of promoting Jewish colonization in Palestine.

A new chapter opened in 1896 with the publication of a pamphlet entitled *The Jewish State* by Theodor Herzl (*q.v.*). In his "Jewish State" he elaborated in detail a scheme for the establishment of an autonomous Jewish commonwealth in Palestine under the suzerainty of the sultan.

The sultan of Turkey at first appeared to be favourably disposed. The Armenian massacres had inflamed the whole of Europe against him, and for a time the Ottoman Empire was in very grave peril. Dr. Herzl's plan provided the sultan, as he hoped, with a means of securing powerful friends. Through a secret emissary, the Chevalier de Newlinsky, whom he sent to London in May 1896, he offered to present the Jews a charter in Palestine provided they used their influence in the press and otherwise to solve the Armenian question on lines which he laid down. The English Jews declined these proposals, and refused to treat in any way with the persecutor of the Armenians. When, in the following July, Dr. Herzl himself came to London, the Maccabaean Society, though ignorant of the negotiations with the sultan, declined to support the scheme. None the less, it secured a large amount of popular support throughout Europe and in 1897 the first international Zionist congress met at Basle. The congress established the Zionist Organization for the purpose of giving effect to the following programme: "Zionism strives to create for the Jewish people a home in Palestine secured by public law. The congress contemplates the following means to the attainment of this end: (1) The promotion on suitable lines of the colonization of Palestine by Jewish agricultural and industrial workers. (2) The organization and binding together of the whole of Jewry by means of appropriate institutions, local and international, in accordance with the laws of each country. (3) The strengthening and fostering of Jewish national sentiment and consciousness. (4) Preparatory steps towards obtaining Government consent where necessary to the attainment of the aim of Zionism."

In 1901 and again in 1902 Dr. Herzl had audiences with the sultan, Abdul Hamid, but the negotiations led to nothing. He now sought from the British Government a grant of territory on an autonomous basis in the vicinity of the Holy Land, which would provisionally afford a refuge and a political training-ground for persecuted Jews. A site was suggested in the Sinai peninsula, but owing to the waterless character of the country the project was given up. Then Joseph Chamberlain suggested the uninhabited highlands of the East Africa Protectorate, and in 1903 the British Government made the Zionist Organization a provisional offer of an area of 6,000 sq.m. in the Guas Ngishu plateau. This offer was warmly appreciated as a mark of British goodwill, but it gave rise to sharp differences of opinion between a minority who urged its acceptance and a much larger body of Zionists who were alarmed at any suggestion of the diversion of Zionist energies from Palestine. In the end the project was shelved by the Seventh Zionist Congress (1905).

Meanwhile Zionism had suffered an irreparable blow by the death of Dr. Herzl (1904). He was succeeded by David Wolffsohn, a banker of Cologne. The movement was further shaken by the dissensions which followed the rejection of the East African project. Israel Zangwill led an influential minority which combined with certain non-Zionist elements to found a rival organization under the name of the ITO (Jewish Territorial Organization) with a view to taking over the East African offer or establishing an autonomous place of refuge elsewhere. On the other hand, the Zionist Organization had now dedicated itself irrevocably to Palestine, and under the auspices of Wolffsohn fresh negotiations were opened with the Porte. These, however, were rendered hopeless by the Turkish revolution, which postulated a united Ottoman nationality, and resolutely set its face against any extension of the racial and religious autonomies under which the integrity of the empire had already severely suffered.

A Zionist bibliography has been published by the Federation of American Zionists. Besides the works already cited in the body of this article, *see*, on the early nationalist movement Graetz, *Geschichte der Juden*, under the heads of the various pseudo-Messiahs and their adherents. Jewish agricultural colonies will be found discussed very fully in *The Jewish Encyclopedia*, vol. i. pp. 240–262. For early Zionist projects see *Publications of the American Jewish Historical Society*, No. 8, pp. 75–118; Laurence Oliphant, *Land of Gilead;* Mrs. Oliphant, *Life of Laurence Oliphant*, pp. 168 *et seq.* The Zionist movement since 1895 is fully recorded in its official organ, *Die Welt* (Vienna). For proceedings of the Congresses *see* the *Official Protocols* published for each year by the society, "Erez Israel" of Vienna; also Herzl, *Der Baseler Congress* (Vienna, 1897). On the movement generally, *see* Herzl's *Zionistische Schriften*, edited by Dr. Leon Kellner; *Ten Years of Zionism* (Cologne, 1907); Nordau, *Zionism, its History and its Aims* (1905); J. de Haas, *Zionism, Jewish Needs and Jewish Ideals;* also articles by I. Zangwill in *Cosmopolis* (Oct. 1897), *Contemporary Review* (Oct. 1899) and *Fortnightly Review* (April 1910); Dr. Gaster in *Asiatic Quarterly Review* (Oct. 1897); H. Bentwich in *Nineteenth Century* (Oct. 1897), and *Fortnightly Review* (Dec. 1898); Reich in *Nineteenth Century* (Aug. 1897); Lucien Wolf in *Jewish Quarterly Review* (Oct. 1904: "The Zionist Peril"). On the ITO *see* pamphlets and leaflets published by the Jewish Territorial Organization; also the *Report of the Commission on Cyrenaica* (1909). (L. W.; X.)

LATER PERIOD

As the prospects of obtaining a charter from the sultan gradually receded, sharp differences of opinion developed within the Zionist ranks. The "practical" Zionists, who included most of the Zionist leaders in Russia, pressed for an immediate start to be made in Palestine. The "political" Zionists, whose strength was in western and central Europe, still clung to the charter as an essential pre-requisite, protesting that Zionist resources should not be dissipated on petty colonization. The "practical" Zionists won their first important success in 1908, when a Zionist agency was established at Jaffa. The political field was not abandoned, but the movement now began to throw itself more and more vigorously into the actual settlement of Jews on the soil of Palestine. For this purpose its main financial instrument was the Jewish National Fund, which in 1914 owned property in Palestine to the value of £144,000, as compared with £35,000 in 1909 and £11,000 in 1907, when its active operations began. The marked quickening of the pace which dates from 1910 reflects the change in the direction of Zionist policy, though the resources of the movement were still small in comparison with those which were lavished upon the Jewish settlements in Palestine by Baron Edmond de Rothschild. It was Baron Edmond who came to the assistance of the struggling colonists in 1883, and it was due mainly to him that a number of Jewish agricultural colonies were already in existence in Palestine when his efforts began to be supplemented by those of the Zionist Organization. In 1914 Palestine had a Jewish population of about 90,000, including about 13,000 settlers in 43 agricultural colonies. The total number of Jewish immigrants between 1882 and 1914 has been estimated at about 45,000. In the period immediately before the World War, the Zionist Organization showed a growing tendency to interest itself in the revival of Hebrew culture in Palestine as well as in the settlement of

Jews on the land. In 1913 the Eleventh Zionist Congress, while approving an ambitious programme of rural colonization, also resolved that steps should be taken towards the early establishment in Jerusalem of a Hebrew university.

The outbreak of the World War, followed almost immediately by the intervention of Turkey on the side of the Central Powers, brought Zionist work in Palestine to a standstill and threatened the integrity of the Zionist Organization. The movement was essentially international, and its complicated constitution was unworkable in a world at war. At the end of 1914, a Zionist bureau was established on neutral soil at Copenhagen. Meanwhile, the American Zionists, acting on their own initiative, had already set up a "Provisional Executive Committee for General Zionist Affairs" under the chairmanship of Mr. (later Supreme Court Justice) L. D. Brandeis. This body remained active throughout the war and played a part of growing importance.

A new world was in the making, and it was now at least conceivable that the Zionists might secure something like the charter on which they had originally staked their hopes. Political Zionism was again in the ascendant. The initiative was taken by a group of Zionists in Great Britain, headed by Dr. Chaim Weizmann of Manchester university. The Zionists now proposed that Great Britain should make it an avowed part of her policy to provide in the peace settlement for the establishment in Palestine of a national home for the Jews.

By the beginning of 1916 the British Government had come to the conclusion that Zionism deserved to be taken seriously. In a memorandum dated March 13, 1916, the British ambassador in Petrograd (Leningrad) informed the then foreign minister, M. Sazonov, that "the attention of His Majesty's Government had recently been drawn to the question of Jewish colonization in Palestine," and that "a numerous and most influential section of Jewry in all countries would highly appreciate the proposal of an agreement concerning Palestine which would fully satisfy Jewish aspirations."

The Balfour Declaration.—Meanwhile, a new situation was developing in the Eastern theatre of war, and a British conquest of Palestine was becoming a possibility of the near future. At the same time, the hour of decision was approaching in the United States, where there was a Jewish population of over 3,000,000, while Russia, where the Jews were still more numerous, was steadily drifting into chaos. A declaration in favour of Zionism would help to rally Jewish opinion throughout the world to the side of the Allies. Further, the settlement in Palestine of a Jewish population attached to Great Britain by ties of interest and sentiment might well be of value in guaranteeing the permanent security of the approaches to the Suez canal. To these practical motives was added a genuine desire to contribute towards the solution of the Jewish problem, in which British statesmen had shown themselves sympathetically interested long before the war.

All these considerations played their part in bringing the British Government into closer relations with the Zionist leaders. With Sir Mark Sykes as the principal intermediary, an exchange of views began in Feb. 1917, with the result that on Nov. 2 the foreign secretary, Mr. Balfour, wrote to Lord Rothschild:—

"Dear Lord Rothschild—I have much pleasure in conveying to you on behalf of His Majesty's Government the following declaration of sympathy with Jewish Zionist aspirations, which has been submitted to and approved by the Cabinet: 'His Majesty's Government view with favour the establishment in Palestine of a national home for the Jewish people, and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine or the rights and political status enjoyed by Jews in any other country.' I should be grateful if you would bring this Declaration to the knowledge of the Zionist Federation."

The Balfour Declaration, as it has come to be called, was the act of Great Britain, but it was issued with the knowledge and concurrence of the Allied Powers. France formally associated herself with the Declaration in Feb. 1918, and Italy in the following May. As for the United States, President Wilson had personally intervened to make it clear that he would welcome a British pronouncement in favour of Zionism, and soon after the Declaration was issued, he publicly expressed his satisfaction. In 1922 resolutions associating the United States with the policy embodied in the Declaration were unanimously adopted by both Houses of Congress. At the instance of Great Britain, a Zionist delegation was given a hearing by the Peace Conference in Paris on Feb. 27, 1919, but it was not until April 24, 1920, that the Supreme Council of the Allies, at its meeting at San Remo, formally agreed that Palestine should be placed under a British mandate and that Great Britain should be responsible for carrying the Balfour Declaration into effect.

British Mandate for Palestine.—In Dec. 1920, the proposed terms of the Palestine mandate were submitted by the British Government to the League of Nations for confirmation by the Council. There was a succession of unforeseen delays, but a slightly modified draft was eventually approved by the Council at its meeting in London on July 24, 1922. A few weeks earlier, the British Government had issued a statement of British policy in Palestine, in which it interpreted the Balfour Declaration as meaning, "not the imposition of a Jewish nationality upon the inhabitants of Palestine as a whole, but the further development of the existing Jewish community, in order that it may become a centre in which the Jewish people, as a whole, may take, on grounds of religion and race, an interest and a pride." The mandate came into full operation on Sept. 29, 1923. In its final form, it recites the Balfour Declaration in the preamble, and includes among its provisions various articles dealing with Jewish immigration.

Although a Zionist commission was sent to Palestine with the approval of the British Government in the spring of 1918, little practical work could be done until well after the close of the war. The foundation stone of the Hebrew University of Jerusalem was laid on Mount Scopus in July 1918, but the Zionist commission was mainly pre-occupied with relief work in the liberated areas, where the Jewish settlements had suffered severely.

Zionism at Work.—The return to normal conditions was marked by the San Remo decision of April 1920, which was followed by the establishment in Palestine of a civil administration in the following July. Subject to the general control of the Government, the Zionist Organization was now for the first time in a position to bring in immigrants and to purchase land. Between 1918 and 1927 about 95,000 Jews immigrated to Palestine, of whom 33,801 entered in 1925. During the same period there were about 23,000 Jewish emigrants, of whom about half were post-war settlers, leaving a net immigration of about 72,000. The Jewish population, which was about 95,000 in 1914, was reduced during the war to about 55,000. It was returned at 84,000 at the census of Oct. 1922, was officially estimated at 108,000 in March 1925, and had risen to about 159,000 at the end of 1927. The area of land in Jewish possession rose from 177 sq.m. in 1914 to 390 sq.m. in 1927, and the population of the Jewish agricultural settlements from 13,000 to 30,000. With the exception of about 20 sq.m. of State and waste lands, all the land acquired since the war has been bought, often at inflated prices, in the open market, and in addition to the heavy expenditure in which they have thus been involved, the Jewish National Fund and other Jewish bodies have had to sink large amounts of capital in improvements, including in particular the drainage of marshes. There has been a considerable increase, which has been particularly marked since 1924, in the Jewish population of the three leading towns, Jerusalem, Jaffa and Haifa. In the neighbourhood of Jaffa, the Jews have built up the separate township of Tel Aviv, which had in March 1927 a population of 37,000, as compared with 13,000 in Dec. 1922, and 2,000 in Aug. 1914. The rapid growth of the towns is connected with the industrial development of Palestine, which in turn is largely due to the influx of private Jewish capital. In 1927 it was estimated that since 1920 513 industrial enterprises had been established in Palestine, representing in the aggregate an investment of £1,500,000, of which more than 90% was Jewish. An important factor in the industrial and general development of Palestine is the Palestine Electric Corporation, which has been largely financed from Jewish sources and which is already supply-

ing Jaffa and Haifa with electric light and power.

Education.—Since the war, the Zionist Organization has largely extended the scope of its educational work in Palestine. At the end of 1927 it controlled 222 schools of various grades, with 730 teachers and 18,611 pupils. A Jewish technical institute was opened at Haifa in Feb. 1925 and the Zionist Organization also maintains an agricultural institute at Tel Aviv. In April 1925, Lord Balfour formally inaugurated the Hebrew University of Jerusalem, consisting, in its first stages, of three research institutes, devoted respectively to chemistry, microbiology and tropical medicine and Jewish and oriental studies. In all these institutions the language of instruction is Hebrew, which has already become the Jewish vernacular in Palestine and is the mother-tongue of the whole of the new generation. An important branch of Zionist work in Palestine is that represented by the Hadassah Medical Organization, which at the end of 1927 maintained four hospitals and 39 clinics, five laboratories and a Röntgen institute.

The entire expenditure of the Zionist Organization is defrayed by voluntary contributions from Jews in all parts of the world. On Aug. 31, 1927 the total receipts of the Palestine Restoration Fund and the Palestine Foundation Fund since 1917 amounted to £4,000,269. During approximately the same period, the Jewish National Fund, which exists for the purchase of land in Palestine, raised independently a further £1,634,987, making a total of £5,635,256. Including the expenditure of other Jewish bodies, such as the Palestine Jewish Colonisation Association, and the investments of private individuals, the Jewish capital brought into Palestine since the War was estimated at the end of 1927 at a total of at least £10,000,000.

In giving the Zionist Organization a recognized status as the Jewish agency for Palestine, the mandate at the same time required the organization to take steps to secure the co-operation of all Jews who were willing to be associated with it in the establishment of the Jewish national home. With this end in view, the organization opened negotiations in 1923–24 with representative Jewish bodies in Great Britain, the United States and elsewhere. In 1925 the 14th Zionist Congress adopted a scheme for the reconstitution of the Jewish agency on a broader basis, and in 1927 a body known as the Joint Palestine Survey Commission was set up by agreement between the Zionist Organization and an influential group of American Jews not formally associated with the Zionist movement. The commission consisted of Sir Alfred Mond (later Lord Melchett), together with one German and two American colleagues. Its object was to survey the whole field of Jewish activities in Palestine and to frame a long-term programme of constructive work.

The appointment of the joint commission clearly foreshadowed closer co-operation between Zionists and non-Zionists and showed that Jews of all schools of thought were preparing to sink their differences in a concerted effort to further the development of Palestine and the establishment of the Jewish national home. While the commission was at work, the situation in Palestine itself took a marked turn for the better. The unexampled prosperity of 1925, when immigration reached its peak, was followed by a period of depression which continued for nearly two years and was reflected in unemployment on a scale which caused serious anxiety. Immigration came almost to a standstill and Jews began to emigrate. It was not until the beginning of 1928 that the clouds began to lift. Little by little the demand for labour increased. By the spring of 1928 work had been found for nearly the whole of the able-bodied Jewish unemployed, and it was clear that the worst was over. The new Palestine had been severely tested, but it had weathered the storm and was at length within sight of smoother waters.

(L. ST.)

ZIRCON, a mineral composed of zirconium silicate, sometimes used as a gem-stone. It is believed that the name comes from the Arabic *zargun,* and is essentially the same as "jargoon," the name given to certain varieties of zircon. The mineral crystallizes in the tetragonal system, generally in combinations of square prisms and square pyramids (figs. 48 and 49, CRYSTALLOGRAPHY). It is isomorphous with cassiterite and rutile, and like these may form geniculated twins. There is no distinct cleavage, and the mineral breaks with a conchoidal fracture. The hardness is about 7·5. The specific gravity has a very wide range, extending from 4·0 to rather more than 4·7, being thus greater than that of any other gem-stone. Rarely colourless, zircon is usually brown or red, sometimes orange, yellow, green or blue, and occasionally parti-coloured or zoned. Whilst common zircon is opaque, the gem-varieties are transparent.

The effect of heat on zircon is remarkable. Most coloured zircons, exposed to a high temperature, either change or lose their colour, but this loss is attended by a gain in brilliancy. The "Matura diamonds" of Ceylon are zircons which have been thus artificially decolorized. Certain zircons when heated in a Bunsen-flame glow with an orange incandescence, whilst others may emit an orange glow when ground on a copper-wheel fed with diamond-dust. Some zircons when heated undergo remarkable changes in specific gravity and refractive indices, and the suggestion has been made that there are at least three modifications of zirconium silicate. Zircon is used as a source of zirconia in various preparations, for incandescent gas-mantles, etc. It was in this mineral that zirconia was originally discovered by M. H. Klaproth in 1789, whilst it has been found to contain small amounts of hafnium.

When fit for use as a gem-stone it is often known as "noble" or "precious zircon." The red and orange stones are termed hyacinth (*q.v.*) and jacinth, whilst those of all other colours, as also the colourless transparent zircons, are called jargoons (*q.v.*). The gem varieties are found in detrital deposits, especially in Ceylon, New South Wales, Queensland and Siam, with sapphire, etc.

Zircon is an accessory constituent of many rocks, especially granite, and it forms an important constituent of the zircon-syenite of Norway. Being but little subject to alteration, it is common in secondary deposits, as in auriferous and other sands, occurring usually in small characteristic crystals.

ZIRCONIUM, a metallic chemical element, so-called from the identification of its oxide, zirconia, by Klaproth (1789) in the mineral zircon (symbol Zr, atomic number 40, atomic weight 91·2). It was first isolated by J. J. Berzelius in 1824, who heated potassium zirconifluoride, K_2ZrF_6, with potassium and obtained an iron grey powder, which was, however, impure.

Preparation.—Preparation of the pure metal is difficult, owing to the facility with which zirconium combines with hydrogen, oxygen, nitrogen, boron, carbon and silicon and forms alloys with such metals as aluminium and magnesium. Specimens containing more than 99·6% of zirconium were obtained by pressing the impure metal into rods which could be used as electrodes. When an electric arc was struck across such electrodes in an atmosphere of hydrogen or ammonia under 11 mm. pressure, the metal of the positive electrode fused and fell in iron grey drops on the negative electrode. This procedure is allied to the method for obtaining pure zirconium by heating its hydride or nitride *in vacuo*. By electrical heating of zirconium tetrachloride with sodium in an evacuated bomb, ductile metal was produced which when fashioned into rods gave a shiny surface on burnishing and a similar product was obtained in the reduction of zirconia by metallic calcium. Pure zirconium is deposited on a heated tungsten filament when the vapour of zirconium iodide is passed over the filament. Colloidal zirconium has been obtained by dialysis of the reduction product of potassium zirconifluoride with potassium. The melting point of zirconium has been variously given as 1,530° C and 1,700° C. Its specific gravity is 6·4.

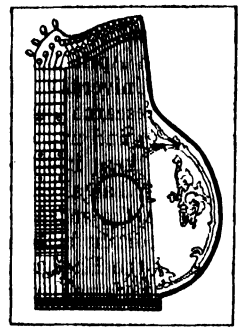
COMPOUNDS

Ferrozirconium (20% Zr), employed as a scavenger in steel castings, is made by heating zirconia and ferric oxide with aluminium in graphite crucibles. The addition of about 0·34% of zirconium to armour plating steel containing 3% of nickel adds to the tensile strength of the metal.

Hydrofluoric acid, even when dilute, hot concentrated sulphuric acid and aqua regia attack zirconium energetically, whereas hydrochloric and nitric acids dissolve it very slightly. It is oxidized on fusion with alkali hydroxides or nitre. At red heat zirconium reduces boric oxide, silica, titania and metallic oxides such as chromic oxide. Its great affinity for oxygen explains the employment of zirconium and its alloys as cleansing agents (scavengers for oxygen and nitrogen) in metallurgy. The commercially important zirconium minerals are (1) baddeleyite (brazilite), the native zirconia found in large quantities in Brazil (São Paulo and Minas Geraes); (2) zirkelite, a mixture of brazilite with zircon silicates, also found in Brazil; (3) zircon, $ZrSiO_4$, mined in Colorado. Following on their discovery of hafnium (*q.v.*) Coster and Hevesy report (1923) that most zirconium ores contain very appreciable quantities of this new element, the amount rising in certain instances to 10 or 20%.

Crystallised zirconia, ZrO_2, is obtained in colourless quadratic crystals by heating zirconium tetrafluoride with boric oxide. Owing to its refractory character and high melting point (given as 2,653±10° C or as 3,000° C) it has been recommended for furnace linings, crucibles, muffles and pyrometer tubes. It has also been used in enamels and in porcelain and opaque glasses. The first incandescent mantles made by A. v. Welsbach consisted principally of zirconia but this oxide is now superseded by thoria and ceria. In the Nernst lamp the incandescent body is chiefly zirconia (85%) with yttrium oxides (15%). Zirconium tetrafluoride, ZrF_4, obtained by heating zirconia with ammonium fluoride in highly refracting crystals, dissolves in water to form the hydrate, $ZrF_4,3H_2O$, and combines with alkali fluorides to yield several types of double fluorides employed in the isolation of the metal by reduction with potassium or sodium. The commonest type is exemplified by the potassium salt, K_2ZrF_6.

Zirconium tetrachloride, prepared by passing chlorine saturated with the vapour of carbon tetrachloride over zirconia heated in a silica tube at 600° C, is a white crystalline sublimate volatilising at 300° C and hydrolysed by water to zirconyl chloride, $ZrOCl_2$, which forms a crystalline octahydrate. Zirconium sulphate, $Zr(SO_4)_2,4H_2O$, forms colourless crystals prepared by dissolving zirconia in concentrated sulphuric acid and diluting slightly with water. It is also regarded as a zirconyl acid sulphate, $[ZrO(SO_4)_2]H_2,3H_2O$.



Other Salts.—Many other zirconyl salts are known including the nitrate which crystallises from aqueous solutions as $ZrO(NO_3)_2,2H_2O$. Zirconium tetra-acetylacetone, $Zr\{CH(CO\cdot CH_3)_2\}_4,10H_2O$, obtained by the interaction of zirconyl nitrate, acetylacetone and aqueous sodium carbonate, crystallises from alcohol or acetylacetone in anhydrous colourless prisms melting at 193–195° C. When zirconium tetrachloride reacts with acetylacetone, benzoylacetone or dibenzoylmethane in anhydrous media, compounds are obtained of the general formula $[ZrDk_3]Cl$, where Dk is the univalent diketone radical (G. T. Morgan and A. R. Bowen, 1924).

Zirconium carbide, ZrC, a hard metallic substance, produced from zirconium and carbon in the electric furnace (H. Moissan and Lengfeld, 1896) is used as an abrasive and for cutting glass. A mixture of this carbide (90%) with ruthenium (10%) has been suggested as a filament for incandescent lamps.

(G. T. M.)

ZITHER, a name applied in modern Germany to the ancient cithara (*q.v.*), to the cittern (*q.v.*), and to a derived instrument which is a kind of psaltery, consisting of a shallow, horizontal sound-chest with strings stretched above it which are plucked and thrummed, with plectrum and fingers, by the performer. (*See* illustration.) Zithers, which are made in various sizes, are the favourite instruments of the peasants in the Swiss and Bavarian highlands, and are sometimes heard also in the concert halls in Germany. The *Streichzither*, or bowed zither, is another variety of the instrument. There are four strings corresponding to those of the violin or viola, but the tone is nasal and glassy.

FROM GROVE, "DICTIONARY OF MUSIC" (MACMILLAN)

THE ZITHER, OR CITHARA, AN ANCIENT MUSICAL INSTRUMENT HAVING 36, 38 OR 42 STRINGS

ZITTAU, a town of Germany, in the extreme south-east of the republic of Saxony, on the left bank of the Mandau, near its confluence with the Neisse, by rail 48 m. E.S.E. of Dresden and at the junction of lines to Reichenberg, Hermsdorf, Görlitz, Oybin and Löbau. Pop. (1925) 38,353. Zittau is of Wendish origin (Chytawa is its Wendish name), and was made a town by Ottocar II. of Bohemia. It was one of the six towns of the Lusatian League (1346), at which period it belonged to Bohemia. It suffered severely in the Hussite wars and in the Thirty Years' War.

ZIWAR, AHMAD PASHA (1864–), G.C.M.G. (1925), Egyptian statesman, was born at Alexandria on Nov. 14, 1864, the son of Ziwar Bey. He was educated at the college of Lazarists, Alexandria, and at the Jesuit university of St. Joseph, Beirut. He studied law at Aix-en-Provence, and held office as supreme judge at the Cairo court of appeal from 1899 to 1913, when he became governor of Alexandria. From 1918 to 1924 he held various government offices, being for a time minister of education and also minister plenipotentiary in Rome.

At the end of 1924 Ziwar Pasha formed a ministry in succession to the Zaghlul ministry, which had been compelled to resign in November after the murder of Sir Lee Stack. Ziwar Pasha re-established good relations with Great Britain and took action to prevent political agitation among young students. He also came to an agreement with the British government on the rights of Egypt in the waters of the Blue Nile. In the elections of February-March, 1925 the parties opposed to Zaghlul obtained a very small majority of 6, and Ziwar Pasha then formed a coalition cabinet, which proved to be short-lived, for the new chamber immediately chose Zaghlul as its president. Ziwar Pasha thereupon immediately resigned and advised the king to dissolve parliament. But the elections had to be postponed owing to the need of framing a new electoral law. Ziwar withdrew his resignation, and continued to direct the government. He spent some months in Europe, and on his return proceeded to reconstruct his cabinet. Ziwar resigned on June 5, 1926.

ŽIŽKA, JOHN (*c.* 1376–1424), Bohemian general and Hussite leader, was born at Trocnov in Bohemia. He lost an eye in the civil wars under Wenceslaus IV. Connected with the court from his youth, he held the office of chamberlain to Queen Sophia. The Hussite movement first brought him into prominence. When a temporary armistice was concluded between the partisans of King Sigismund and the citizens of Prague, Žižka joined the advanced Hussites at Tabor, helped to organize the new military community and became one of the four "captains of the people" (*hejtmane*) at its head. On receiving an appeal from the citizens of Prague to help against Sigismund, king of the Germans and king of Hungary, who had invaded Bohemia, claiming the crown as the heir of his brother Wenceslaus, the Taborites marched to Prague and on July 14, 1420, largely through Žižka's heroism, repulsed an attack by Sigismund's forces, on their position on the Vitkov hill, where the suburb of Žižkov now stands, forcing Sigismund to raise the siege. On Aug. 22, 1420, the Taborites left Prague and returned to Tabor.

Žižka was now engaged in constant, and invariably successful, warfare with the partisans of Sigismund, particularly with the powerful Romanist, Ulrich of Rosenberg. At the meeting of the Estates of Bohemia and Moravia at Caslav (June 1, 1421), Žižka was elected member for Tabor to the provisional government. He summarily suppressed some disturbances by the

Adamite sect, continued his campaigns against the Romanists and adherents of Sigismund, and, having captured a small castle near Litoměřice (Leitmeritz), retained possession of it—the only reward for his great services that he ever received or claimed. According to Hussite custom, he gave the biblical name of "Chalice" to this new possession, and henceforth adopted the signature of "Žižka of the Chalice." In 1421, while besieging the castle of Rábi, he lost the use of his remaining eye. Though now totally blind, he retained his command, and on Jan. 6, 1422, severely defeated Sigismund at Nebovid, Kutna Hora, and again at Německy Brod (Deutschbrod) on Jan. 10. Early in 1423 internal dissensions among the Hussites led to civil war. Žižka, as leader of the Taborites, defeated the men of Prague and the Utraquist nobles at Hŏric on April 27, and when the armistice of Konopist (June 24) was followed by renewed civil war, he once again defeated the Utraquists, under Borek, at Strachov, near Králové Hradec (Aug. 4, 1423).

Žižka now made a brilliant, although unsuccessful attempt to invade Hungary, which was under the rule of his old enemy King Sigismund. In 1424, civil war having again broken out in Bohemia, Žižka decisively defeated the Praguers and Utraquist nobles at Skalic (Jan. 6), and at Malesov (June 7). In September he marched on Prague, but on the 14th of that month peace was concluded between the Hussite parties who agreed to make a combined attack on Moravia, part of which was still held by Sigismund's followers. Žižka was given the command, but before reaching the frontier, he died of the plague at Pribyslav (Oct. 11, 1424).

See Count Lützow, *Bohemia: an Historical Sketch* (1896); Louis Léger, *Jean Žižka* in *"Nouvelles études Slaves," deuxième série* (1886).

ZLATOUST, a town in the Uralsk Area of the Russian S.F.S.R., 1,925 ft. above sea-level on the Ai, a tributary of the Ufa river, in 55° 10′ N., 59° 40′ E., on the Ufa-Chelyabinsk railway. Pop. (1926) 47,707. The town has smelting works and manufactures machinery; there is a meteorological and magnetic observatory.

ZLOTY, the new monetary unit of Poland. Following the collapse of the Polish mark, instituted immediately after the World War, the zloty was substituted in 1924. It was then made equivalent to the old franc, at a parity of 25·22 zlotys to the pound sterling, and was backed partly by gold and gold exchange, and partly by other forms of security. Events soon showed that the new currency had been introduced before the country was ready to support it, and during 1925 and 1926 renewed depreciation set in. In 1927 a second attempt at stabilization was made. A foreign stabilization loan was issued, and the proceeds used to give a gold exchange backing to the new zloty. This second attempt proved successful, and the zloty has been maintained at its par value (*see* CURRENCY).

ZNAIM: *see* ZNOJMO.

ZNOJMO (*Znaim*), in Moravia, Czechoslovakia, on the Dyje. A settlement is believed to have existed here from prehistoric time. The present town was founded in 1226 on the site of the old capital, destroyed in 1145. Lying at the junction of old granites and tertiary strata Znojmo manufactures clay products and stoneware. It is also famous for its extensive fruit and vegetable farms, which supply bottling factories. Among its old buildings are a 12th century Romanesque castle chapel (the Heiden-Tempel) a 14th century Gothic church and a 15th century town hall with Gothic tower (250 ft.). Pop. (1921) 21,197.

ZOBEIR RAHAMA (1830–1913), Egyptian pasha and Sudanese governor, came of the Gemaab section of the Jaalin, and was a member of a family which claims descent from the Koreish tribe through Abbas, uncle of Mohammed. He was the most energetic and intelligent of the Arab ivory and slave traders who about 1860 established themselves on the White Nile and in the Bahr-el-Ghazal. Nominally a subject of Egypt, he raised an army of several thousand well-armed blacks and became a dangerous rival to the Egyptian authorities. At the height of his power Zobeir was visited (1871) by Georg Schweinfurth, who found him "surrounded with a court which was little less than 1869 an expedition sent from Khartum into the Bahr-el-Ghazal was attacked by Zobeir and completely defeated, its commander being slain. Zobeir represented that he was blameless in this matter, received a "pardon," and was himself appointed governor of the Bahr-el-Ghazal, where he was practically independent. In 1873 he attacked the sultan of Darfur, and the khedive Ismail gave him the rank of bey and sent troops to co-operate. After he had conquered Darfur (1874), Zobeir was made a pasha, but he demanded the governor-generalship of the new province, and went to Cairo in the spring of 1876 to press his title. The Egyptian authorities prevented his return, though he was allowed to go to Constantinople at the outbreak of the Russo-Turkish War. In 1878, however, his son Suleiman, having got possession of the Bahr-el-Ghazal, defied the authority of General Gordon, the new governor-general. Gordon sent Romolo Gessi against Suleiman and his ally Rabah (*q.v.*), who was subdued after an arduous campaign and executed.

During the campaign Zobeir offered, if he were allowed to return to the Sudan, to restore order and to pay a revenue of £25,000 a year to the khedive. Gordon declined this help, and subsequently, for his instigation of the revolt, Zobeir was condemned to death, but the trial was a farce, the sentence was remitted, and he remained at Cairo, now in high favour with the khedival court. In March 1884, Gordon, who had been sent to Khartum to effect, if possible, the relief of the Egyptian garrisons in the Sudan, astonished Europe by requesting that Zobeir, whose son he had overthrown and whose trade he had ruined, should be sent to Khartum as his successor. Zobeir, described by Sir Reginald Wingate, who knew him well, as "a quiet, far-seeing, thoughtful man of iron will—a born ruler of men" (*Mahdiism and the Egyptian Sudan,* book v.), might have been able to stem the mahdist movement. But to reinstate the notorious slave-dealer was regarded in London as too perilous an expedient, even in the extreme circumstances then existing, although Colonel Stewart (Gordon's companion in Khartum), Sir Evelyn Baring and Nubar Pasha in Cairo, and Queen Victoria and Mr. Gladstone, all favoured such a course. In March 1885 Zobeir was arrested in Cairo by order of the British government for treasonable correspondence with the mahdi and other enemies of Egypt, and was interned at Gibraltar. In August 1887 he was allowed to return to Cairo, and after the reconquest of the Sudan was permitted (1899) to settle in his native country. He established himself on his estates at Geili, some 30 m. N. of Khartum, where he died on Jan. 5, 1913.

See GORDON, CHARLES GEORGE, and the authorities there cited.

ZODIAC, in astronomy and astrology, a zone of the heavens within which lie the paths of the sun, moon and principal planets (ὁ ζωδιακὸς κύκλος from ζῴδιον "a little animal"). It is bounded by two circles equidistant from the ecliptic, about 18 degrees apart; and it is divided into 12 signs, and marked by 12 constellations. These 12 constellations, with the symbols of the signs which correspond to them, are as follows:—

Aries, the Ram	♈	Libra, the Balance	♎
Taurus, the Bull	♉	Scorpio, the Scorpion	♏
Gemini, the Twins	♊	Sagittarius, the Archer	♐
Cancer, the Crab	♋	Capricornus, the Goat	♑
Leo, the Lion	♌	Aquarius, the Water-carrier	♒
Virgo, the Virgin	♍	Pisces, the Fishes	♓

In the technical sense of the word the 12 "signs" are geometrical divisions 30 degrees in extent counting from the position of the sun at the vernal equinox. In the time of Hipparchus the signs corresponded fairly closely with the constellations; that is to say, the first sign (called Aries) corresponded with the constellation Aries. Owing to precession there is now a discrepancy amounting to the breadth of a whole sign, so that the sign Aries is occupied by the constellation Pisces. (*See* CONSTELLATION.)

ZODIACAL LIGHT, a faint illumination of the sky, surrounding the sun and elongated in the direction of the ecliptic on each side of the sun. It is lenticular in form, brightest near the sun, and shades off by imperceptible gradations, generally be-

time it was never observed except in or near the zodiac; hence its designation. The most favourable time for evening observation in the northern hemisphere is during the months of February and March. In the tropics, where the ecliptic is nearly perpendicular to the horizon, it may be seen after the end of twilight on every clear evening, and before twilight on every clear morning, unless blotted out by moonlight. It then presents a nearly vertical wedge-shaped form, the base of which extends 15° or 20° on each side of the point at which the ecliptic intersects the horizon. The point of the wedge is quite indefinite, the extremely diffuse light gradually fading into invisibility at a height which may range from 50° to 70° or even more, according to the keenness of the observer's vision.

It is clear that the light proceeds from a region surrounding the sun, lenticular in form, the axis of the lens being nearly perpendicular to the ecliptic, while the circumference extends at least to the orbit of the earth. The hypothesis which best explains all the phenomena is that the light is that of the sun reflected from an extremely tenuous cloud of particles having the form and extent described, and becoming more and more tenuous as the earth's orbit is approached until, immediately outside the orbit, it fades into complete invisibility. It has been shown by Fath that the spectrum is identical with that of sunlight.

Intimately connected with the zodiacal light is the *Gegenschein*, or counter-glow, a faint illumination of the sky in the region opposite the sun, which may generally be seen by a trained eye when all the conditions are favourable. The Milky Way renders it invisible during the months of June, July, December and January. Its light is so faint and diffuse that it is impossible to assign dimensions to it, except to say it covers a region of several degrees in extent. Barnard, the most successful observer, assigns diameters of 5° or even 10° or more. The explanation is uncertain.

ZOFFANY, JOHANN (1733–1810), British painter, whose father was architect to the prince of Thurn and Taxis, was born in Frankfort-on-Main. He ran away from home at the age of 13 and went to Rome, where he studied art for nearly 12 years. In 1758 he left for England, and after undergoing some hardships was brought into fashion by royal patronage, and in 1769 was included among the foundation members of the Royal Academy. He went to Florence in 1772 with an introduction from George III. to the grand duke of Tuscany, and remained until 1779. He lived (1783 to 1790) in India, executing some of his best-known paintings; but the last 20 years of his life were spent in England. He died in 1810 and was buried in Kew churchyard.

ZOGU, AHMED (1893–), King of the Albanians, was head of the Zogolli, one of the four ruling families of the Mati district and was educated at a Monastic school in Constantinople. He first distinguished himself as a supporter of the prince of Wied in 1914. During the World War he fought for the Austrians. He became minister of the interior (Jan.–Nov. 1920), and organized resistance to the Yugoslav incursions during the autumn. He was minister for war in the "Sacred Union" cabinet (Oct.–Dec. 1921), and again distinguished himself against the Yugoslavs. As minister of the interior in Djafer Ypi's cabinet (Dec. 1921–Dec. 1922), he suppressed a serious irredentist movement in March 1922, and succeeded in disarming the lowlanders. Becoming prime minister in Dec. 1922, he governed with ability, pursuing a sound anti-irredentist and constructive policy. Towards the end of 1923, however, he was accused by the Democratic party of obstructing in the interests of the landowners' various progressive and agrarian reforms. Following an attempt upon his life he resigned in Feb. 1924, but his influence remained. A revolt against him and his colleagues took place in June, and he sought refuge in Yugoslavia. But skilfully turning to his advantage Yugoslavian policy, he returned to Albania in Dec. 1924 and ousted his successor, Archbishop Fan Noli. His election as president of the Albanian republic on Feb. 1, 1925, ushered in a period of internal tranquillity. By his obvious patriotism and conciliatory attitude towards his political opponents he eventually gained the support of all but the extreme reactionaries and he was proclaimed king at Tirana on Sept. 1, 1928, to be crowned a year later. (*See* ALBANIA.) (J. Sw.)

ZOÏLUS (*c.* 400–320 B.C.), Greek grammarian of Amphipolis in Macedonia. Zoïlus appears to have been at one time a follower of Isocrates, but subsequently a pupil of Polycrates. Zoïlus was chiefly known for the acerbity of his attacks on Homer (which gained him the name of Homeromastix, "scourge of Homer"), chiefly directed against the fabulous element in the Homeric poems. Zoïlus also wrote against Isocrates and Plato, who had attacked the style of Lysias of which he approved. The name Zoïlus came to be generally used of a spiteful critic.

See U. Friedländer, *De Zoilo aliisque Homeri Obtrectatoribus* (Königsberg, 1895); J. E. Sandys, *History of Classical Scholarship* (2nd ed. 1906).

ZOISITE (named after Baron Zois who first observed it), a rock-forming mineral of the composition of $HCa_2Al_3Si_3O_{13}$, crystallizing in the rhombic system. Crystals are usually prismatic, deeply striated parallel to their length and have a perfect 010 cleavage. Two varieties are optically distinguishable; in α-zoisite the plane of the optic axes is parallel to the cleavage (010), while in β-zoisite it is normal to this plane. The resemblance to the monoclinic clinozoisite of the same chemical composition (*see* EPIDOTE) is revealed when the crystallographic orientation of zoisite is adjusted so that the plane of cleavage is basal (001) and the zone of elongation and striation the *b* axis. The colour of the mineral is white or grey, but a manganiferous variety (thulite) is pink and pleochroic. The hardness is 6·5 and the sp.gr. 3·3.

Zoisite is characteristically a product of dynamic metamorphism and is an essential constituent of saussurite, the zoisite of this aggregate being derived from the anorthite molecule of plagioclase. It is chiefly developed in crystalline schists.

Thulite occurs with blue vesuvianite at Telemarken in Norway and with withamite gives the red colour to the well known *porfido rosso antico* or hornblende-porphyrite of Djebel Dokhan in Egypt. Zoisite has not been prepared synthetically. (C. E. T.)

ZOLA, ÉMILE ÉDOUARD CHARLES ANTOINE (1840–1902), French novelist, was born in Paris on April 2, 1840, his father being an engineer, part Italian and part Greek, and his mother a Frenchwoman. The father seems to have been an energetic, visionary man, who, dying while his only son was a little lad, left to his family no better provision than a lawsuit against the municipality of the town of Aix. It was at Aix, which figures as Plassans in so many of his novels, that the boy received the first part of his education. Thence he proceeded, in 1858, to Paris. His first book, *Contes à Ninon*, appeared on Oct. 24, 1864, and attracted some attention, and in Jan. 1866 he determined to abandon clerking and take to literature. Vigorous and aggressive as a critic, his articles on literature and art in Villemessant's paper *L'Événement* created a good deal of interest. So did the gruesome but powerful novel, *Thérèse Raquin* (1867). Meanwhile, with characteristic energy, Zola was projecting something more important: the creation of a world of his own, like that of Balzac's *Comédie Humaine*—the history of a family in its various ramifications during the Second Empire. The history of this family, the Rougon-Macquart, was to be told in a series of novels containing a scientific study of heredity—science was always Zola's *ignis fatuus*—and a picture of French life and society. The first novel of the series, *La Fortune des Rougon*, appeared in book form at the end of 1871. It was followed by *La Curée* (1874), *Le Ventre de Paris* (1874), *La Conquête de Plassans* (1875), *La Faute de l'Abbé Mouret* (1875), *Son Excellence Eugène Rougon* (1876)—all books unquestionably of immense ability, and in a measure successful, but not great popular successes. Then came *L'Assommoir* (1878?), the epic of drink, and the author's fortune was made. Edition followed edition. He became the most discussed, the most read, the most bought novelist in France—the sale of *L'Assommoir* being even exceeded by that of *Nana* (1880) and *Le Débâcle* (1892). From the *Fortune des Rougon* to the *Docteur Pascal* (1893) there are some 20 novels in the *Rougon-Macquart* series, the second half of which includes the powerful novels *Germinal* (1885) and *La Terre* (1888). In 1888 Zola departed from his usual vein in the idyllic story of *Le Rêve*. Zola also wrote a series of three romances on cities, *Lourdes*, *Rome*, *Paris* (1894–98), novels on the "gospels"

of population (*Fécondité*) and work (*Travail*), a volume of plays, and several volumes of criticism.

Zola played a very important part in the Dreyfus affair, which convulsed French politics and social life at the end of the 19th century. At an early stage he came to the conclusion that Dreyfus was the innocent victim of a nefarious conspiracy, and on Jan. 13, 1898, with his usual intrepidity, he published in the *Aurore* newspaper, in the form of a letter beginning with the words *J'accuse,* a terrible denunciation of all those who had had a hand in hounding down that unfortunate officer. Zola's object was a prosecution for libel, and a judicial inquiry into the whole *affaire,* and at the trial, which took place in Paris in February, a fierce flood of light was thrown on the case. The chiefs of the army put forth all their power, and Zola was condemned. He appealed. On April 2, the Cour de Cassation quashed the proceedings. A second trial took place at Versailles, on July 18, and without awaiting the result Zola, by the advice of his counsel and friends, and for reasons of legal strategy, abruptly left France and took refuge in England. Here he remained in hiding, writing *Fécondité,* till June 4, 1899, when, immediately on hearing that there was to be a revision of the first Dreyfus trial, he returned to Paris.

On the morning of Sept. 29, 1902, Zola was found dead in the bedroom of his Paris house, having been accidentally asphyxiated by the fumes from a defective flue. He received a public funeral, at which Captain Dreyfus was present. Anatole France delivered an impassioned oration at the grave. At the time of his death Zola had just completed a novel, *Vérité,* dealing with the incidents of the Dreyfus trial. A sequel, *Justice,* had been planned, but not executed. Zola's literary position would have more than qualified him for the French Academy. He was several times a candidate in vain. (F. T. M.)

See *Émile Zola, Novelist and Reformer* (1904), giving a full account of his life and work, by E. A. Vizetelly, who translated and edited many of his works in English; also P. ZOLLVEREIN, a certain form of Customs Union, but denoting specially the system in force among the German states between 1819 and 1871 (*see* CUSTOMS UNION, TARIFF, and GERMANY: *History*). The name is the Ger. *Zoll,* toll, customs, and *Verein,* union.

ZONARAS, JOANNES (JOHN), Byzantine chronicler and theologian, flourished at Constantinople in the 12th century. Under Alexius I. Comnenus he held important official positions, but in the succeeding reign he retired to Hagia Glykeria (one of the Princes' Islands), where he reluctantly yielded to the pressure of his friends to compose a profane history. This work, Ἐπιτομὴ Ἱστοριῶν (compendium of history), in eighteen books, extends from the creation of the world to the death of Alexius (1118). Zonaras is chiefly valuable for preserving in his work the first twenty-one books of Dio Cassius (Zon. 7–8).

Complete edition in Migne, *Patrologia Graeca,* cxxxiv. cxxxv. cxxxvii. Translation in Cary's *Dio Cassius,* Loeb Classical Library.

ZONE, EQUISIGNAL, a term in radio denoting the region in which the two distinctive signals from an equisignal radio beacon (*q.v.*) are received with equal intensity.

ZONING. The zoning of cities has had considerable influence on their architecture and on the preservation of their amenity. As practised in modern times it is a new movement and is still in the experimental stage.

Zoning in Europe.—What has come to be called zoning in English-speaking countries had its first inspiration and derived its name from the building regulations applied in Central Europe before 1909. Since 1875 German and Swedish cities have applied zoning regulations to the zones around their built areas, with a view to controlling the heights and densities of buildings in town extensions. The effect of the German laws, and of the fairly rigid control exercised under them, has been to procure a greater spaciousness and uniformity of development than would have occurred under ordinary building regulations.

When the Town Planning Act was passed in England in 1909, it had for its general object the control of the development of land likely to be used for building purposes. In so far as it provided for regulation of heights, densities and uses of buildings it related primarily and almost solely to entirely new building development. The fact that it is so limited has prevented it from being an effective instrument in procuring architectural control. But part of its object is to provide such control over new developments. Section 59 (2) in the original Act of 1909 was as follows:

"Property shall not be deemed to be injuriously affected by reason of the making of any provisions inserted in a town planning scheme, which, with a view to securing the amenity of the area included in the scheme or any part thereof, prescribe the space about buildings or limit the number of buildings to be erected, or prescribe the height or character of buildings, and which the Ministry of Health, having regard to the nature and situation of the land affected by the provisions, consider reasonable for the purpose."

It is noteworthy that the purpose for which the restrictions in an English scheme are imposed is to secure the "amenity of the area." For the reason given, the law has not influenced the redevelopment of built-upon areas. Being primarily intended to regulate residential buildings it has had little effect also on the architecture of other buildings. It has introduced into England a spacious type of development for the cottages of the working classes. On the whole, it has improved cottage architecture and introduced a better arrangement and grouping of buildings.

In town planning schemes public authorities may take power to approve or disapprove the elevation of, and the materials to be used in, buildings. For the purpose of exercising this power the authority must constitute a special advisory committee of those members of which one shall be an architect nominated by the Royal Institute of British Architects.

Zoning in the United States.—Contrary to what has happened in England zoning in the United States has been too limited in its application to undeveloped areas and has been chiefly applied to areas already built upon.

In New York zoning has exercised a greater influence on architecture than in any other city. New York was the first city in the western continent to impose zoning regulations. Its Zoning Resolution was passed in 1916 and had for its object the restriction of the height and bulk of buildings and the regulation of their uses. It did not directly attack the problem of density, except by restricting height and bulk.

New York was zoned just when the steel frame and the elevator had begun to have a profound influence on building and architecture (*q.v.*). During the 12 years since the passing of the Act (1916–28) enormous changes have taken place in the city, and an extensive rebuilding programme has been carried out.

The zoning law in New York is intended to relieve street congestion, for, other things being equal, it is obvious that such congestion is directly proportionate to the bulk of the buildings flanking the street. The Paris law limits the straight vertical height to 20 metres; above that, additional storeys must remain within the arc of a circle of fixed radius. The London regulations permit of 80 ft. vertical height and two supplementary storeys which must remain behind a sloping line of 75 deg. from the horizontal. In New York the vertical height is now determined by the width of the street, but varies according to the "zone" or district in which the given property is situated. These districts are classified as follows: "One-time" districts, "one-and-one-half-time" districts, "two-time" districts and "two-and-one-half-time" districts. That is to say, the straight vertical height may be equal to the width of the street in residence zones; it may be one-and-one-half times the width of the street in certain residence and business zones; twice the width in the principal business centres and two-and-one-half times in the Wall Street financial section. For the purpose of the law, no street is considered less than 50 ft. or more than 100 ft. wide. Additional storeys above the vertical

height must remain back of a line drawn from the centre of the street through a point on the top front of the vertical height.

The salient feature of New York is its towers, and it was considered wise, in framing the zoning law, to permit the erection of a tower, which may rise to an indefinite height (limited only by structural possibilities and economic conditions), upon 25% of the total lot area. This has resulted in a very surprising and interesting form of architecture (*q.v.*). In Paris certain buildings of a monumental nature, either religious or governmental, may exceed the height limit. In London, towers purely for architectural embellishment but not for human occupancy, may pass the legal height. In New York no restriction is made as to occupancy of the tower provided that the building remains within the given "envelope." Furthermore, the so-called "dormer" permit allows certain portions of the front of each building to rise slightly in excess of the maximum vertical height to give variety of outline. Above this the buildings are usually stepped back, forming a pyramidal series of terraces which vie with the storeyed magnificence of the hanging gardens of Babylon. The law has produced two other interesting results: first, the virtual elimination of interior light courts, these being cut in the side in order to preserve a base for the central tower; second, the tendency to assemble larger and larger plottage so that the 25% tower will be large enough to warrant construction of a great number of tower storeys.

The example of New York has been followed in hundreds of American cities, where no part of city planning has been so popular as zoning. No effect of zoning has impressed itself on the public consciousness more than its effect on the architectural treatment of buildings.

The important needs in connection with the further development of zoning, as a means of promoting art and amenity in connection with city building, whether directly owing to extended power under restrictive legislation, or indirectly by further use of existing powers, are: the inclusion of zoning as part of comprehensive city plans so that it will deal constructively with building expansion and reconstruction of complete urban areas comprising all parts of a city or a region; the further extension of zoning in regard to restriction of density, parallel with further strengthening of provisions in regard to heights and uses, so as to secure more light and air in buildings, a better display of buildings and less congestion on adjacent streets than at present. Further restriction on height should be based on the principle that the primary need is to obtain adequate spaces about buildings of all heights, and not to obtain lower buildings as an object in itself. (*See* also TOWN PLANNING.)

ZOOLOGICAL GARDENS (ZOOLOGICAL PARKS), institutions in which wild animals are kept in captivity. The first zoological garden of which we have information was founded in China by the first emperor of the Chóu dynasty, who reigned about 1100 B.C. This was called the "Intelligence Park," and appears to have had a scientific and educational object. The ancient Greeks and Romans kept in captivity large numbers of leopards, lions, bears, elephants, antelopes, giraffes, camels, rhinoceroses and hippopotami, as well as ostriches and crocodiles, but these were destined for slaughter at the gladiatorial shows. In later times royal persons and great feudal magnates frequently kept menageries of wild animals, aviaries and aquaria, and it is from these that the modern public gardens have taken their origin. Henry I. (1100–35) established a menagerie at Woodstock, Oxfordshire, England. This was transferred to the Tower of London apparently in the reign of Henry III., and kept up there until at least 1828. Philip VI. had a menagerie in the Louvre at Paris in 1333, Charles V. maintained collections at Conflans, Tournelles and in Paris, and Louis XI. formed a menagerie at Plessis les Tours in Touraine, which after his death was re-established at the Louvre in Paris and enlarged by collections obtained in North Africa. It was destroyed by Henry III. Henry IV. had a small collection, which included an elephant. Louis XIII. kept some animals at Versailles, whilst his son Louis XIV. founded the famous "Ménagerie du Parc" at Versailles, which received many animals from Cairo, was maintained for over a century, and furnished much valuable material to French naturalists and anatomists. It gradually decayed, however, and was almost extinguished by the mob in 1789. In 1793, the Paris museum of natural history was re-established by law, and Buffon's idea of attaching to it a menagerie was carried out; the latter, as the collection in the Jardin des Plantes, still survives. In Germany the elector Augustus I. founded a menagerie at Dresden in 1554. In the New World, according to Prescott, King Nezahualcoyotl had zoological gardens at Tezcuco in Mexico in the middle of the 15th century, whilst in the next century Cortes found aviaries and fishponds at Iztapalapan, and Montezuma II., emperor of Mexico in the beginning of the 16th century, maintained large collections of animals.

Africa.—The zoological gardens at Giza, Cairo, a government institution, are beautifully laid out and particularly rich in African animals. The Khartum zoological gardens are free to the public and are under the control of the municipality, but the collection of animals is under the game preservation department. The Transvaal zoological gardens at Pretoria are a government institution.

America, North.—The zoological park at Bronx Borough, New York, opened in 1899, is one of the largest in the world. It is controlled by the Zoological Society of New York, with representatives of the municipality of the City of New York, is financed largely out of municipal funds, and is open free to the public five days a week. The park occupies nearly 300ac. and contains many fine buildings, but its special feature is a series of spacious enclosures for large herds of bison and deer. The national zoological park at Washington (D.C.), was founded by Congress in 1889–90 "for the advancement of science and the instruction and recreation of the people." The site was purchased by the United States Government, and all the expenses come from national funds, the management being vested in the Smithsonian Institution. The park consists of about 265ac. of undulating land with natural woods and rocks, traversed by a gorge cut by Rock Creek, a small tributary of the Potomac. The zoological gardens in Fairmount park, Philadelphia, resemble the gardens of the Zoological Society of London, on which they were modelled. They are controlled by the Zoological Society of Philadelphia, founded in 1859. There are many other good collections in the United States and several in Canada.

America, South.—The zoological gardens at Buenos Aires are supported by the municipality. At Para, Brazil, is a good collection attached to the Museum Goeldi, and there are less important collections at Rio de Janeiro, Lima and Bahia.

Asia.—There are many small collections in different parts of Asia, but the only garden of great interest is at Alipore, Calcutta, supported chiefly by gate-money and a donation from the Government, and managed by an honorary committee. It was established in 1875 by the government of Bengal.

Australia and New Zealand.—There are zoological gardens at Melbourne (founded 1857), Adelaide, Sydney and Perth, and small gardens at Wellington, New Zealand.

Europe.—There are a large number of zoological gardens in Europe, but those of real importance are not numerous. The garden and large menagerie of the Royal Zoological Society of Antwerp were founded in 1843, and have been well maintained. The gardens of the Zoological Society of London in Regent's park, founded in 1826, extend to only about 35ac., but the collection, if species and rare animals be considered rather than the number of individuals, has always been the finest in existence. It has been a pioneer in modern methods, such as radiant heat, artificial sunlight and adequate ventilation. It has purchased a property of nearly 500ac. in the Chilterns, 30m. from London, to develop as an open air "Zoo." The Royal Zoological Society of Ireland, founded in 1830, maintains a fine collection in the Phoenix park at Dublin, and has been specially successful in the breeding of lions. The Bath, Clifton and West of England Zoological Society owns zoological gardens, well situated on the edge of Clifton Downs. The new zoological park near Edinburgh occupies an extensive and beautiful site and has specialized in open air displays. The Zoologisk Have at Copenhagen, founded in 1859, con-

tains a good collection, with a specially well-designed monkey-house. At Lyons and at Marseilles in France there are beautifully situated gardens with small collections, in each case owned and controlled by the municipalities. In Paris there are two well-known gardens. That of the Jardin des Plantes founded in 1793, is under the control of the museum authorities. It is open free to the public and generally contains a good collection of mammals. The larger and better known Jardin d'Acclimatation in the Bois de Boulogne is owned and conducted by a private company, but since the World War has fallen into decay. Germany contained in 1914, 20 zoological gardens, most of which have recovered prosperity since the World War. The Tiergarten at Berlin was founded in 1844, and belongs to a private company. The collection is extremely good. The gardens at Cologne, founded 1860, contain many interesting features, in particular one of the finest aviaries in Europe. The gardens of the Zoological Society of Hamburg, founded in 1863, contain a fine collection and display many ingenious devices for the housing of the animals. More recently C. Hagenbeck constructed a remarkable zoological park at Stellingen. The best-known gardens in Holland are at Amsterdam, owned by the society "Natura Artis Magistra." In addition to the menagerie, founded in 1838, the society owns a fine aquarium, and supports a museum and library. The garden at Rotterdam is also of high interest.

MANAGEMENT OF ZOOLOGICAL GARDENS

Supply of Animals.—A certain number of wild animals are born in captivity and from time to time the possession of a successful stock enables one collection to supply many others. At one time London was able to supply many Continental gardens with giraffes, and Dublin and Antwerp have had great successes with lions, whilst antelopes, sheep and cattle, deer and equine animals are always to be found breeding in one collection or another. But wild animals have to be obtained to replenish the stock. The conditions of success are that the wild creatures should be obtained as young as possible, kept in their native localities until they have become accustomed to man and to such food as they can be given at their ultimate destinations.

Area and Site.—The areas occupied vary from about 300ac. (New York) to about 8ac. (Clifton, England). In the larger gardens, however, the greater part of the space is engaged by a few extensive enclosures for numerous herds of herbivorous animals. With regard to situation, the ideal would be to have the collection placed in the open country, far from centres of population. But as menageries are supported for the public and in most cases by the public, such a site is impractical, and if the soil, drainage and exposure are reasonably good, experience shows that a thriving collection may be maintained near a large town.

Hygiene.—The first requisite is strict attention to cleanliness. A collection of animals must be compared with public institutions such as barracks or infirmaries. There must be an abundant supply of fresh air and of water, and a drainage system as complete as possible. The buildings should be constructed on the most modern hospital lines, with smooth walls and rounded corners, so that complete cleansing and disinfecting is possible. Sunlight is even more important than warmth and the London zoological society has led the way in the use of glass transparent to ultra-violet rays, and of powerful electric light when there is no sun. New arrivals should be quarantined, until it is certain that they are in a satisfactory condition of health.

Feeding.—The food must be as varied as possible, and special attention should be given to the frequency and quantity of the supply. It is important that no more should be supplied at a time than is necessary, as most animals rapidly foul their food, and except in a few special cases, wild animals are peculiarly liable to the evil results of stale or putrid substances. Quantities can be learned from experience, and from watching individual cases; frequency varies within very wide limits, from reptiles which at most may feed once a week and fast for long periods, to the smaller insectivorous birds which require to be fed every two or three hours, and which in the winter dark of northern latitudes must be lighted up once or twice in the night to have the opportunity of feeding. Knowledge of the habits of animals and experience are the best guides. Many authorities attempt to restrain visitors from feeding the animals in their charge, but such a restriction, even if practicable, is not all gain, for animals in captivity are less inclined to mope, and are more intelligent and tamer, if they become accustomed to regard visitors as pleasant sources of tit-bits. (*See* also AVIARY, AQUARIUM.)

ZOOLOGICAL NOMENCLATURE is the system on which names are given to the various divisions of the animal kingdom. Those divisions range from the great branches or Phyla, through Classes, Orders, and Families, with occasional intermediate groupings, down to Genera and Species. For the meanings of those terms, *see* ZOOLOGY. It can hardly be said that any system governs the names of categories higher than Families; essentially the existing system relates to genera and species. The system arose in response to three needs: first, to have a name intelligible in all countries; second, to fix on a single name for each kind or species of animal, and thus to avoid the confusion due either to the application of the same name to quite different kinds, or to a multiplicity of names for a single kind (there are 136 English names for the salmon and sea-trout); third, to provide names for the many thousands of newly-discovered species existing now or in past ages, and without a name in any language.

The starting point may be said to have been the binary system of nomenclature adopted by Linnaeus in the 10th ed. of his *Systema Naturae* (1758). In order to meet difficulties, a code, drawn up by H. E. Strickland and a committee, was accepted by the British Association for the Advancement of Science in 1842, and held the field till 1881. Increasing difficulties then led to the promulgation of other codes by various societies and individuals, until the consequent diversity of practice forced the need for agreement on the notice of the International Congress of Zoology (Paris, 1889), and it requested R. Blanchard to report. The difficulties not having been overcome, the third congress (Leyden, 1895) appointed an international commission with C. W. Stiles as secretary. This eventually submitted a unanimous report at Berlin (1901); the rules were adopted and published by the congress (1902). At subsequent congresses, down to that in Budapest (1927), slight amendments have been made, and the rules as they now stand have been separately issued by the Biological Society of Washington. A series of "opinions" delivered by the Commission, interpreting the rules and applying them to doubtful cases, has been published by the Smithsonian Institution, Washington.

The basis of the rules is the law of priority: "The name of a genus or species can only be that name under which it was first designated." Nearly all the other rules lay down the conditions to which the application of this law must conform. Since the rigid application of the law would sometimes lead to confusion, and since the Commissioners sometimes cannot agree whether an author has conformed to the conditions or no, the congress has decided that in rare cases the rules may be suspended and an arbitrary decision given.

The chief difficulty has been that of deciding precisely for what genus or species an author proposed a certain name. Only when an author gives a differential diagnosis, and fixes on a single specimen (holotype) as the standard of his new species, or a single species (genotype) as the standard of his new genus, can subsequent workers be sure of his meaning. These practices are now followed by every competent systematist, and the International Congress has decided that no generic or specific name published after Dec. 31, 1930, shall be valid unless it is accompanied by an adequate descriptive diagnosis and, in the case of a generic name,

by the designation of a well defined genotype.

Modern practice constructs family names by adding *idae* to the root of the name of a contained genus, and sub-family names by adding *inae, e.g.,* Felidae and Felinae from *Felis*. The name of a subgenus is placed in () after the generic name, e.g., *Vanessa* (*Pyrameis*) *cardui*. A subspecies is denoted by a second trivial name added to the specific name, e.g., *Rana esculenta marmorata*. Trivial names are written with a small initial letter; generic and subgeneric, with a capital initial. A proper name following the trivial name is that of the first proposer of that name; if his name be in (), it indicates that by him the species was placed in some other genus, e.g., *Psittacus linnaei* (Wagler).

BIBLIOGRAPHY.—The publications mentioned above deal with the Rules. For indexes to names, see *Zoological Record* (1865, in progress, London, Zool. Soc.); S. H. Scudder, *Nomenclator Zoologicus* (1882–84, U.S. Natl. Mus., Washington); C. D. Sherborn, *Index Animalium* (1902, in progress, Cambridge University and British Museum); *Nomenclator Animalium Generum et Subgenerum* (1926, in progress, Berlin, Preuss. Akad. Wiss.). (F. A. B.)

ZOOLOGICAL REGIONS. Zoological distribution, also known as zoo-geography, is the science dealing with the distribution of animals over the surface of the globe. It is concerned not only with present conditions but also with those of former geological periods and with the mode in which the present arrangement has arisen. The study of the present distribution of animals may be of two extreme types, whose fields overlap. It is possible to investigate the details of the occurrence of a species in a small district, relating the facts discovered not only to the physical and chemical conditions of its environment but also to its neighbours both plant and animal. Such a study (still very undeveloped) is called ecology (*q.v.* and *see* also DISTRIBUTION OF ANIMALS). On the other hand, it has long been known that it is possible to divide the land of the world into regions separated from other land masses either entirely, as in the case of Australia and New Zealand, or very nearly, as in the case of Africa. Such regions may possess characteristic faunas and the investigation of the nature of these and an elucidation of the resemblances and differences which they present, form the subject matter of that aspect of zoological distribution dealt with here.

To those early naturalists who believed in the independent creation of all the species of animals, their irregular distribution over the world must either have presented no problem or have been inexplicable. When, however, Charles Darwin showed that the existing distribution received a ready explanation on the theory of the evolutionary origin of species, and that its details might be used to throw light on the mechanism that had brought about evolution, the whole subject acquired a new interest and within a few years the main lines of the accepted division of the world into zoological regions were established by P. L. Sclater and his followers.

The differences which separate the faunas of the zoological regions are not dependent on climate or temperature. For example, the mammal fauna of North America is, on the whole, very similar to that of northern Asia and Europe, whilst the faunas of Patagonia and Australia, which present a similar range of climatic conditions, differ completely not only from those of the northern areas but also from each other. Furthermore, the mammal fauna of South America is a unit, although that continent stretches throughout the Tropics and into the Antarctic regions of Tierra del Fuego. Thus the factors which have led to the distribution of existing animals into regions are not discoverable in present day conditions but must lie in the past, and they can only be discovered by an investigation of the history of the animals which composed the fauna, and of the changes in the distribution of land and water, which have taken place during geological time.

The zoo-geographical regions at present recognized are as follows:—

1. Palaearctic, including Europe with Iceland; Asia, including Japan, north of the Himalayas and of the Yangtze-kiang watershed; Persia and Asia west of the Indus; and Africa north of the Sahara, including the Azores.

2. Nearctic, comprising the whole of America north of Mexico.

Geological Time of Fauna

Tertiary or Cainozoic Period	Recent series Pleistocene series Pliocene series Miocene series Oligocene series Eocene series
Secondary or Mesozoic Period	Cretaceous system Jurassic system Triassic system
Primary or Palaeozoic Period	Permian system Carboniferous system Devonian system Silurian system Ordovician system Cambrian system
Archaean	

These two regions are conveniently grouped as Holarctica.

To the south of Palaearctica lie two distinct regions, each a peninsula projecting from the great northern land mass into the wide seas of the southern hemisphere. They are:

3. The Ethiopian region, comprising the whole of Africa south of the Sahara, with Madagascar and the Mascarine islands.

4. The Oriental region, comprising India and Ceylon, Siam and southern China, and the Malay archipelago.

Bearing a somewhat similar relation to the Nearctic region is:—

5. The Neotropical region, comprising the whole of America from Mexico southward, and the Antilles.

Finally more isolated than any is:—

6. The Australasian region, including Australia with Tasmania and New Guinea, New Zealand and the islands of the Pacific.

Many minor modifications of these regions have been suggested which, although they may be useful, especially in the study of certain groups, are not of great significance. Max Weber has grouped these six regions into three main realms, as follows:—

1. Arctogaea comprising Holarctica, the Ethiopian and Oriental regions.

2. Neogaea, comprising the Neotropical region.

3. Notogaea, comprising the Australian region.

This arrangement has the merit of emphasizing the distinctness of the two last faunas.

NOTOGAEA AND NEOGAEA

Notogaea.—Notogaea is by far the most distinct of the three realms. That portion of the area which alone is inhabited by mammals (New Guinea, Australia and Tasmania) is the home of the only monotremes which are known; *Proechidna* restricted to New Guinea, and *Echidna* and *Ornithorhynchus* in the other two areas. The great bulk of the other mammals are marsupials belonging to the two great divisions Polyprotodonta and Diprotodonta. Polyprotodont marsupials still exist in South America in several genera of the Didelphidae, and one species (the Virginian opossum) extends northwards into Canada. The other group, the Diprotodonta, have no representatives outside Notogaea. *Coenolestes* from South America, which was at first regarded as a diprotodont, has now been shown by a complete investigation of its anatomy to be nothing but a peculiarly modified didelphid. The only eutherian mammals found in Notogaea are rodents and bats, together with a pig in New Guinea, the native dog or dingo in Australia, and man himself throughout the realm. There is every reason to believe that the pig and dog were introduced by man and may be disregarded in considering the earlier history of the region. The bats present no special features; some of them indeed belong to forms with a world-wide range. The rodents on the other hand are often of peculiar genera not found elsewhere, but are all members of the Muridae, which have unusual powers of dispersal.

Thus Notogaea so far as its mammal fauna is concerned is remarkable not only for the presence of many animals entirely peculiar to it, but also by the absente of all representation of the higher eutherian orders. There are no insectivores, carnivores, edentates, ungulates or primates, orders whose members are to be

found in all other regions. The absence of these forms receives a simple and complete explanation if Notogaea has been separated from all other land-masses since a period which preceded the evolutionary development of these orders, or indeed of the basal eutherian stem from which they arose. Existing palaeontological evidence suggests that this period cannot have been later than the end of the Cretaceous times, and may be pushed back at least as far as the end of the Lower Cretaceous if certain Mongolian discoveries be correctly interpreted.

The Australian polyprotodonts form a series, the more primitive of which are small mammals of insectivorous and commonly

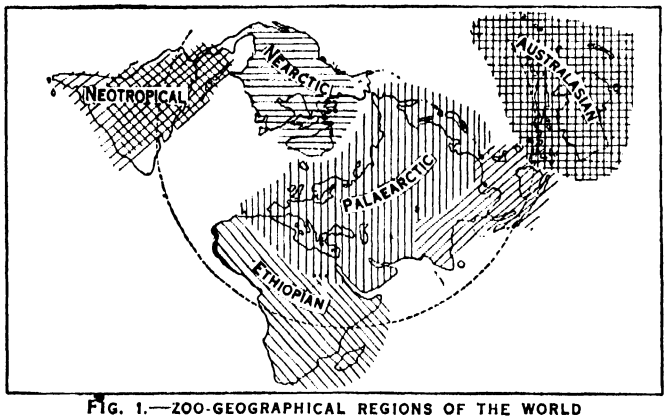

FIG. 1.—ZOO-GEOGRAPHICAL REGIONS OF THE WORLD

arboreal habits. These forms have their headquarters in Australia, in which the majority of forms are found, but some of them extend on into New Guinea and into the Aru and neighbouring islands. From this primitive group have arisen forms (*Myrmecobius*), which have very small teeth and are committed to a diet of ants; others (the bandicoots), which are in part herbivorous, although they certainly also eat animal food. One of them is a little hopping animal, superficially recalling the jerboas. On the other hand there is a series of forms which become progressively more and more highly specialized for a carnivorous diet, resulting finally in *Thylacinus*, an animal as large as the collie-dog, capable of killing and eating sheep. Other representatives of the Polyprotodonta occur in South America and as far north as Canada, but these belong to two living families, one which is closely similar to the native cats of Australia, whilst the other represents an aberrant side-branch of South American origin, which parallels superficially the Diprotodonta. During early Tertiary times, opossums similar to those now living in North America ranged over North America and Europe, and a perfectly typical member of the same family is known from the Upper Cretaceous rocks of the United States. Thus the possession in common of Polyprotodonta by Arctogaea and Neogaea on the one hand and Notogaea on the other, does not necessarily imply that these realms were connected with one another after the end of the Cretaceous. The fact that the polyprotodonts of Notogaea have radiated into such diverse forms whilst those of Arctogaea are restricted essentially to one type, may be explained by the absence of the competition of eutherian mammals in one case, and its presence in the other.

The diprotodont marsupials are peculiar to Notogaea. The diprotodonts as a group are herbivorous. The most primitive family, that of the phalangers, contains many animals all essentially arboreal in habit, varying in size from that of a mouse to that of a cat. They take in Australia much the same place that is occupied by the squirrels and monkeys in other parts of the world, and they often present, as in the development of a flying or rather gliding habit, a remarkable parallel to certain squirrels and to the flying "lemur" *Galeopithecus*. One interesting derivative of the phalangers is the koala or native bear, a large animal which lives entirely on the leaves of the eucalyptus trees. From the same group has arisen the wombat, a large, very powerfully-built, burrowing animal, strictly herbivorous in habit, with a remarkable dentition paralleling that of the larger rodents such as the capybara, in its adaptations. Finally the kangaroos and their allies form a very distinct group of terrestrial animals fitted by their elongated hind-legs and long tail for a progression by a series of jumps. Their dentition is so arranged as to allow them to crop grass as do the artiodactyls and as they occur in large numbers in relatively open country, they are similar to this group in their general diet and habits.

Thus the Australian marsupials have experienced an adaptive radiation which has fitted them for most of the modes of life known amongst eutherian mammals and the fact that no diprotodont, either living or extinct, is known from any other part of the world, is a clear indication that the evolution of the group took place in Australia and that it was made possible by the absence of the competition of higher mammals.

It should be possible to establish the truth of the above view by studies of the Australian fossil marsupials. At present, however, except for a single specimen, which is clearly a diprotodont marsupial, and probably a phalanger, from the Upper Miocene of Wynyard, Tasmania, no pre-Pleistocene mammals are known. The Pleistocene mammals include an interesting human skull presenting the characters of the living Australian aborigines, the dingo, some rodents of Australian type and a very large series of marsupials, including representatives of extinct animals. It is an interesting feature that in Pleistocene time the large carnivorous Tasmanian wolf and Tasmanian devil, at present restricted to Tasmania, occurred widely spread in Australia, and it is customary to attribute their disappearance on that continent to competition with the dingo, that animal having never reached Tasmania.

The large carnivorous marsupial, *Thylacoleo* found in Pleistocene deposits all over Australia is remarkable in that it is related not to the carnivorous polyprotodonts but to the otherwise exclusively herbivorous diprotodonts. Of this order several gigantic forms are found, a kangaroo, *Macropus titan*, perhaps 12 feet in height, *Diprotodon* and its allies, not closely related to any living forms, but as large and heavily built as a rhinoceros, and the giant wombat *Phascolonus*, which attained a similar size. Thus what little is known of their fossil history emphasizes still more the peculiarity of the Australian marsupials.

It is clear that man did not arise in Australia and that he is as certainly an immigrant into that continent as he is in those Pacific islands, where the date and manners of his coming are recorded. From the occurrence of a fossil human skull in the Pleistocene of Queensland, we know that the human immigration took place as early as Pleistocene times, and from the fact that this skull belongs to the species *Homo sapiens*, which is not known in the early or indeed the middle Pleistocene, it follows that the human immigration was in late Pleistocene times.

With the exception of a rat, of the genus *Mus*, the Australian rodents belong to genera not found elsewhere, but all are members of the family Muridae, which is not geologically ancient. It is certain that they represent the result of the evolution *in situ* of some immigrant form, but it is impossible to determine the time at which their introduction took place: it is, however, exceedingly unlikely that it was earlier than the Pliocene. The absence of larger eutherian mammals shows that they cannot have entered over a continuous land-bridge but must have crossed by some other mode not available to larger forms. On the other hand, one at any rate, of the diprotodont marsupials of Australian origin has migrated out of the region, *Phalanger* itself being found in Timor and even as far as Celebes. It also must have crossed by some accidental mode of transport, for which, being arboreal it is peculiarly well fitted.

Neogaea.—The mammal fauna of Neogaea, that is of South America, is less peculiar than that of Notogaea. It contains no monotremes but there are many living marsupials, the most abundant being the opossums of the family Didelphidae; the other forms, belonging to two genera of which *Coenolestes* is the more important, have ancestors in the Miocene deposits of South America and were certainly evolved in that region and have never spread beyond it. Except for certain shrews in Central America, no insectivores are found on the South American continent, but one peculiar family, the Solenodontidae, is restricted to certain islands of the West Indies. It belongs to the sub-order Zalambdodonta, which has living representatives in Africa and Madagascar and

has been found fossil in a perfectly typical form in the Basal Eocene of North America. The most characteristic South American mammals are, however, the "edentates" belonging to the group Xenarthra. These fall into three groups, the sloths, the ant-eaters and the armadillos, none of which, except for the occurrence of an armadillo in Texas, is now living outside the region. The rodents of South America, which are numerous, belong in the main to peculiar families; the cavis, chinchillas and agoutis are not found elsewhere, whilst another important group, the octodonts are represented by forms both in South America and in Africa. There are also representatives of the Myomorpha and tree-porcupines. The Carnivora include dogs, bears and cats, together with many raccoons peculiar to the area. The perissodactyls are represented only by the tapir, whilst the artiodactyls include the peccaries and llamas which are peculiar to South America, together with certain deer related to North American forms. The Primates are represented by the group Platyrrhina which is restricted to South America, and by man.

It is clear from this account that the South American mammal fauna is sharply marked off from all others by the possession of groups of animals peculiar to it, but that it is linked with the North American fauna by the presence of deer, bears, cats and dogs. The condition of South America differs from that of Australia in the increased number and variety of those animals which may be regarded from the existence of their relatives elsewhere, as immigrants into an area which has long been separated. The abundance and varied nature of those mammal groups peculiar to South America, such as the Xenarthra and Platyrrhina, would suggest that these animals had undergone their evolution in isolation as had the Australian marsupials. It is possible to test the truth of this idea by an investigation of the fossil history of these and other forms, and in South America, unlike Australia, it is possible to do this not only for one horizon but for the whole Tertiary period.

In Pleistocene times South America was inhabited by a fauna far more varied in character and including much larger animals than those now living there. Of the groups which appear to be of South American origin, the Xenarthra were represented not only by armadillos of modern type, but also by the giant armoured glyptodonts and the enormous ground-sloths; each of these groups being sufficiently varied to be divided into three families. The rodents are of the same types as those now living and the Platyrrhina are present. Extinct groups of hoofed mammals are found, falling within the Notoungulata and including most varied animals. There are the following sub-orders: *Typotheria,* the Pleistocene form being an animal about as large as a pig with a gnawing dentition; and *Toxodontia,* with a skull two feet in length and a dentition not unlike that of the typotheres; and the order Litopterna with one Pleistocene form about as large as a camel but possibly of aquatic habits.

Living alongside these autochthonus animals were carnivores including not only the ancestors of those forms which still exist but also a sabre-toothed tiger, *Smilodon;* and a bear, *Arctotherium,* now extinct. The perissodactyls include horses, in part belonging to the modern genus *Equus,* and in part to four extinct genera. Proboscidea are represented by several forms less advanced in structure than true elephants and commonly referred to as mastodons.

Thus except that it is richer both in the number of groups represented and in the size of the individuals, the Pleistocene fauna of South America resembles the recent one in that it contains a mixture of mammals which had originated *in situ* with immigrants from the north. When we pass backwards to Miocene times, as represented in the Santa Cruz beds, we find an even fuller and more varied representation of the true South American groups, and a complete absence of those which we had assumed to be immigrants. It is natural to believe that the continents of North and South America became connected by a land-ridge sometime between the Miocene and the Pleistocene, and the truth of this conclusion is established by the fact that giant ground sloths and glyptodonts first appear in the North American fauna in Pliocene times.

The mammal fauna of the Miocene of South America contains the following elements. The marsupials include not only opossums essentially of modern type, but also a variety of carnivorous animals closely similar to the Tasmanian wolf, but some like *Borhyaena,* greatly exceeding that animal in size. Relatives of the living *Coenolestes* occur. There is an animal *Necrolestes,* which is supposed to be an insectivore related to the Zalambdodont golden moles of South Africa. All the rodents, which are extremely numerous and varied, belong to the South American families of tree-porcupines, cavies, chinchillas and agouties. There are a few unmistakable platyrrhine monkeys. Amongst the edentates, no representatives of the living sloths and ant-eaters have been found, probably because these animals are restricted to tropical forests and the known mammal fauna is that of the more open, less well watered and considerably colder plain. The armadillos are very varied; the glyptodonts, small compared with their descendants of Pleistocene times, to some extent bridge the gap between the normal armadillos from which they sprang and the later glyptodonts. The ground-sloths, of relatively small size, include the ancestors of the later forms and the three families into which these creatures are divided can already be recognized. The Notoungulata include an immense range of animals adapted to very varied habits. The Typotheria, then small forms which filled the place occupied at present by rabbits, fall into three distinct families, whilst the Toxodontia include an abundance of forms smaller than their Pleistocene successors. The Entelonychia include a remarkable animal, *Homalodontotherium,* with stilted fore-legs and digging claws. The Litopterna, another extinct family represented by a single type in Pleistocene times included forms which parallel the horses in the reduction of the toes in foot and hand to one. Yet another extinct order, Astrapotheria, includes gigantic creatures unlike any other forms.

This then is the true fauna of Neogaea, made up entirely of animals which arose within the area and whose evolutionary history can to some extent be traced in still earlier Tertiary horizons. It includes three groups which have been believed to have had relatives in other parts of the world. These are *Necrolestes,* originally described as an insectivore, but really of uncertain affinities. *Coenolestes* and its allies supposed to be diprotodont marsupials but which are certainly aberrant didelphids; and the carnivorous marsupials such as *Borhyaena,* which present a remarkable resemblance to the Tasmanian wolf. It has been held by many writers that these forms are indeed closely allied and that their occurrence in such widely separated localities is to be explained by the former existence of a practicable land-bridge over the Antarctic continent. Additional evidence in support of this view will be discussed at a later stage in this article, but it seems on the whole most probable that *Borhyaena* represents the result of a course of evolution starting from a didelphid which has been remarkably parallel to the independent process which produced *Thylacinus* from a dasyurid stock.

MODERN ARCTOGAEA

The remaining realm, Arctogaea, is much more extensive and less compact than those which we have considered, and it is most convenient to begin its discussion by a consideration of the existing distribution of animals in the various regions of which it is composed.

Nearctic Region.—Covering as it does the whole of North America except the lowlands of Mexico, the Nearctic region exhibits extreme variations in geographical qualities. In the extreme north there is a completely snow-covered arctic area, to the south of which there is a continuous belt of coniferous forest extending from Alaska to New England. In the extreme south lies the Sonoran region which has a warm temperate climate and is largely composed of great tree-less plains, although at the mouth of the Mississippi it includes much forest, and in California passes into deserts where the day temperature may be extraordinarily high, reaching in the Mohave desert 120° F.

In the Arctic zone there are polar bears, arctic foxes, musk oxen, reindeer, lemmings and arctic hares, all of these animals extending round the North Pole over the northern lands of Asia

and Europe as well as those of North America.

The wooded region includes shrews and the American moles among insectivores; the Canadian porcupine, chipmunks, musk-rats, woodchucks, lemmings, beavers and tail-less hares amongst rodents. The carnivores are represented by pumas and lynx, the grey wolf, foxes, bears, otters, skunks, raccoons, wolverines, marten, weasels and the American badger. The artiodactyls are

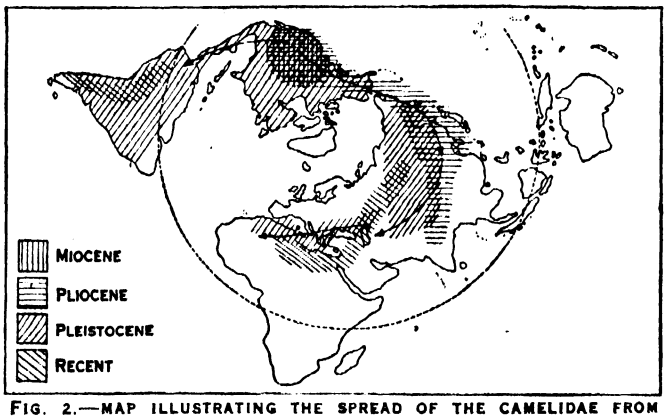

FIG. 2.—MAP ILLUSTRATING THE SPREAD OF THE CAMELIDAE FROM THEIR EVOLUTIONARY HOME IN NORTH AMERICA

deer of types found in Asia and in Europe—the wapiti, moose and woodland reindeer; mountain sheep, and the peculiar Rocky Mountain goat; bison extremely close to those of Europe, and in certain regions the American deer.

The Sonoran region of the south includes opossums and armadillos, which are immigrants from South America. American types of shrews and moles represent the Insectivora. The rodents include prairie dogs, pocket gophers, cotton rats and kangaroo rats, true and flying squirrels, whilst ground squirrels and rabbits occur throughout the region. Amongst the Carnivora are pumas, lynx, bears, American badgers, raccoons, skunks, coyotes, timber wolves, etc. The characteristic artiodactyls are pronghorned antelopes, plains bison, and American deer, together with peccaries. The region is characterized by the absence of all perissodactyls, Proboscidea, and Primates, of "edentates" and marsupials (other than the few immigrants from South America), of antelopes, true pigs and hippopotami.

Palaearctic Region.—The Palaearctic region greatly resembles the Nearctic in the general character of its mammalian fauna. It contains no monotremes, marsupials, edentates, hyracoids, Proboscidea, or Primates over the greater part of its area, though representatives of the last three groups occur in the Mediterranean region, which forms a transition between the Palaearctic and the Ethiopian regions. The following groups of animals are common to Palaearctic and Nearctic areas:—hares and picas, beavers, marmots, susliks, voles and lemmings; martens and weasels, wolverines, brown bears, wolves and foxes; elk, reindeer, wapiti, bison, big-horned sheep and musk ox either in identical or closely allied species. On the other hand the Palaearctic area includes certain wild sheep, goats, saiga antelope, chamoix, many peculiar deer, camels and true pigs, which are not known in America. It possesses also a number of horses and asses, though no other perissodactyls. The desmans and some other insectivores are peculiar to the Old World, as are the dormice, hamsters and jerboas amongst the rodents, and the tiger and panda amongst the carnivores.

Africa.—The fauna of Africa is on the whole strikingly unlike that of the Palaearctic region, and the intervening Mediterranean area does comparatively little to bridge the gap. The mammal fauna is remarkable in that it includes a great variety of species and probably a greater number of individuals of large animals than that of any other region. There are no monotremes or marsupials. The aard-vark and the pangolin (*Manis*) are curious forms, often classified as edentates, but probably not closely related to one another nor to the South American forms included in that order. The Insectivora include amongst the Zalambdodonta the golden moles and the Potamogalidae known from no other regions of the world, and also the elephant shrews and the Macroscelididae, representative of a group, the Menotyphla, of which the other forms are the tree-shrews of the Malayan sub-region. There are many peculiar rodents, jumping hares (*Pedetes*), mole-rats (*Bathyergidae*), crested rats (*Lophiomys*) and cane-rats, together with many members of the Muridae and true hares. The Carnivora include true dogs, the hunting dog (*Lycaon*) and the long-eared fox (*Otocyon*), spotted hyaenas and the Manhaar jackal (*Proteles*), etc. There are several mongooses and civets. The cats are represented by the lion, leopard and cheetah in addition to very numerous smaller forms; ratels, zorillas and otters represent the Mustelidae. There are elephants belonging to the sub-order Loxodon, and hyraxes, of two genera which spread northwards into Syria but are otherwise exclusively Ethiopian. The perissodactyls are represented by zebras and wild asses, together with two species of rhinoceroses. Amongst the artiodactyls there are found true pigs together with the forest and wart-hogs. The hippopotamus is widely distributed throughout the region, whilst a dwarf form is restricted to the west coast in the neighbourhood of Liberia. The Giraffidae, including true giraffes and okapis, are restricted to the region; the chevrotains of the genus *Dorcatherium* are similar to those found in Madagascar. Deer are completely absent but the hollow-horned ruminants include not only buffaloes but also an extraordinary number of peculiar genera of antelopes. Sheep and goats penetrate into the region only in the mountains of Abyssinia.

The Primates of the Ethiopian region include lemurs belonging to two groups, the Lemuriformes, which are restricted to Madagascar and the Lorisiformes, which do not occur there but are represented by the galagos and pottos, allied to animals living in the Oriental region. Monkeys belonging to the two sub-families of Cercopithecinae and Semnopithecinae occur throughout the forested regions. The most characteristic members of the latter are the typical baboons with short tails and elongated muzzles; these animals are terrestrial in habit and usually live in large tribes; they are at present confined to Africa and Arabia. The dense forests of western equatorial Africa are the home of the giant apes, the chimpanzee and gorilla which are restricted to the region.

Oriental Region.—The Oriental region proper includes the whole of India except the Punjab, Ceylon, Malaysia and the Malay archipelago, including Java, Sumatra and Borneo, but not Celebes, which forms a transition with Notogaea. The region contains no monotremes or marsupials. The "edentates" are represented by the single genus *manis*. The Zalambdodont insectivores are unrepresented, whilst the dilambdodonts include as special forms *Gymnura* and *Hydromys* which are essentially spineless hedgehogs, and a variety of shrews of the genus *Soriculus*. The Menotyphla are represented by tree-shrews, *Tupaia* and *Ptilocercus*. Galaeopithecus represents a distinct order. The rodents include amongst many forms of wide distribution certain endemic genera of which the flying squirrels are perhaps the most striking. The carnivores include lions, leopards, tigers, cheetahs and many smaller cats; bears, wolves, foxes and dholes; striped hyaenas, civets and mongooses. The perissodactyls include a single horse, two species of rhinoceroses belonging to different genera to those which occur in Africa, and a tapir restricted to the forests of the Malayan sub-region. Pigs belonging to several species, and chevrotains of the genus *Tragulus* are not found elsewhere. There are certain deer belonging to genera peculiar to the region, a few antelopes, the nilghai and black buck, also many and unusual forms of oxen, the buffalo, the gaour, and in Celebes alone the very primitive form, *Anoa*. In the mountains the tahr (*Cerorus*), gorals and takin are curious forms whose relatives are to be met with in the Palaearctic region and possibly in the Rocky Mountain goat of North America. Two groups of lemurs occur within the area, the Lorisiformes, including the slender and slow lorises; and the Tarsiformes with the single living genus, *Tarsius*. Semnopitheces and cercopitheces are widely distributed, though baboons are absent from this region.

The gibbons (*Hylobates*) are found only in the Malayan sub-region and the orang occurs in Borneo.

ANCIENT ARCTOGAEA

Inspection of the foregoing lists which represent the existing fauna of the various zoo-geographical regions, will show that although they are distinct from one another and mingle only incompletely in the transition regions, certain animals such as the tapirs, may occur in widely separated areas not now connected by a practicable land-bridge. The whole distribution of these mammals is inexplicable on the basis of the present distribution of land, water and mountain ranges; it can only be understood in the light of the history of the evolution of mammals, now known through the work of three generations of palaeontologists in very considerable detail. Perhaps the simplest method of explaining this history is to take the mammalian orders in succession and discuss the time and place of origin of their more important families and genera.

Monotremata.—It is clear that the monotremes are a group of very ancient origin, probably Triassic, but that the existing forms are highly specialised and closely related to one another. The only fossil forms known are Pleistocene and belong to the existing genera.

Marsupialia.—Polyprotodont marsupials of the family Didelphidae occur in the Upper Cretaceous of North America. Their remains are found in Eocene, Oligocene and Miocene of North America and Europe and they have inhabited South America throughout the Tertiary. The South American carnivorous borhyaenids appear to be autochthonous, whilst the Australian dasyurids have no relatives outside Notogaea. The pseudo-diprotodonts, the coenolestids, are represented in South America from the Oligocene to the present day, and have no other relatives. The true diprotodonts have always been Australian; *Wynyardia* from the Middle Miocene of Tasmania is the oldest known form.

Edentata.—The group Edentata includes three completely distinct orders which have probably no close relationship with one another. These are the Xenarthra, the Tubulidentata and the Pholidota. The earliest certainly known members of the Xenarthra occur in the Colpodon beds of South America, perhaps Oligocene, and in the Notostylops beds of the Eocene. Very important is the occurrence in the Lower and Middle Eocene of North America of animals (*Metacheiromys*) which are plausibly regarded as aberrant armadillos without body armour. In the Basal Eocene and in the Lower and Middle Eocene of West and North America there occur animals, the Ganodonta, which may be ancestral to the Gravigrada, the giant ground sloths. If these relationships be substantiated it will follow that North and South America were connected by a land-bridge at the beginning of Tertiary time. It is none the less certain that the later evolution of the Xenarthra took place in an isolated South America not again connected with the northern hemisphere until Pliocene times.

The Tubulidentata include only the single genus *Orycteropus*, which on grounds of its comparative anatomy is probably of ungulate derivation. Extinct species of this genus, or of one closely allied, occur in Pontian (Lower Pliocene) rocks in Persia, Samos, Greece and the south of France, but no earlier forms are certainly known, a humerus from the Oligocene of France being not really determinable.

The Pholidota, including the genus *Manis*, are represented as fossils only by certain very doubtfully determined fragments from the European Oligocene and Miocene.

Insectivora.—The order Insectivora includes a large number of forms only distantly related to one another. The Menotyphla at present represented by the elephant shrews of Africa and the tree-shrews of Malay, probably also covers a number of forms whose remains are found in Europe, Mongolia, and North America in rocks of various ages from the Basal Eocene into the Oligocene. It must be admitted however, that the evidence on which these forms are referred to the group, is very slender.

The Zalambdodontidae including the solenodons of the Antilles, *Potamogale* and the golden moles of Africa, together with the Madagascan tenrecs include not only a perfectly characteristic skull from the Basal Eocene of North America but other forms extending as high as the Oligocene. *Xenotherium* from the Oligocene of North America is supposed to be a golden mole, and *Necrolestes* from the Upper Miocene of Patagonia has also been placed in the neighbourhood of that group; in neither case however is the systematic position quite certain. At any rate the group is of such antiquity that its members have had the whole Tertiary period in which to wander over the world and may hence reach any part of it which has been connected by land within that period.

The remaining insectivores, the Dilambdodonta, are first found in the Lower Eocene; the living families are of comparatively modern introduction. The erinaceoids first appear in the Oligocene of Europe, North America and Mongolia. The shrews and moles have a similar distribution, whilst the primitive family of lepticids is confined to the Oligocene and Eocene of North America. Thus the Dilambdodonta appear originally to have been of northern origin, occurring throughout the whole of Arctogaea and entering the southern peninsulas at some late period. *Galeopithecus* has perhaps ancestors in the Eocene of North America and of Europe.

Carnivora.—In Basal Eocene times Europe and North America were inhabited by primitive carnivores belonging to sub-orders the majority of which were not related to any living form. These extinct groups, the Acreodi and pseudo-Creodi, are represented in Europe, Mongolia, and North America in the Eocene and Oligocene, and one or two members of the latter group reached northern Africa in Oligocene times. One form at any rate lived on in India to the Miocene but none ever reached South America. The ancestors of the true carnivores, which fall within the family Miacidae, occur in Basal Eocene and Eocene rocks in Europe, Mongolia and North America. From this family there arose a whole series of forms from which the civets (Viverridae), raccoons (Procyonidae), dogs (Canidae) and Mustelidae arose.

The Viverridae are represented in the Eocene of Europe although not in that of America. They have a long history in the European Tertiary and appear in the Upper Miocene and later deposits of northern India: from a viverrid stock the Hyaenidae seem to have originated. The first forms known, both of the existing genus itself and of the intermediate genus *Ictitherium*, occur in the Pontian Lower Pliocene fauna, which stretches with minor modifications in its character from China to Portugal: no member of the group reached America.

The mustelids first appear in exceedingly similar forms of weasels in the Oligocene of Europe, Mongolia and North America. During its later history the group appears to have been European

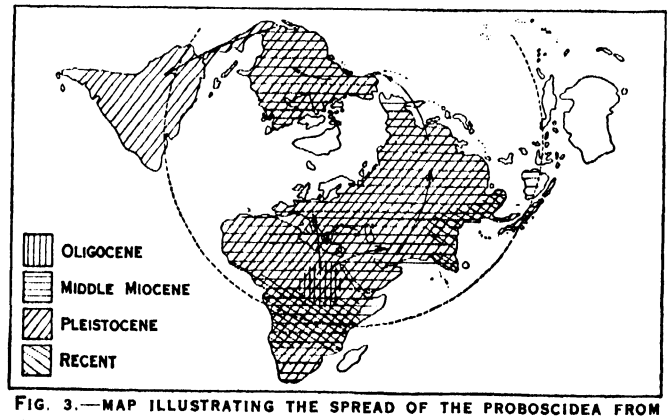

FIG. 3.—MAP ILLUSTRATING THE SPREAD OF THE PROBOSCIDEA FROM THEIR ORIGINAL HOME IN AFRICA

and North American, the otters and badgers being Old World and occurring in late Miocene or Pontian times in the Oriental region.

The Canidae (dogs) have a long, very elaborate and still incompletely understood evolutionary history both in the Old and New Worlds. One interesting feature is an early separation of the dhole-like dogs from the others, dating from Oligocene times. The Oligocene forms of this group are entirely North American, but a single member at any rate seems to occur in the Upper Miocene of Europe. The living representatives are

South American, African and Oriental, regions which were certainly not inhabited by members of this group until late Tertiary times.

The Procyonidae are first represented by Lower Miocene forms in North America, and no members of the group appear to have reached Mongolia or Europe. An apparent exception is provided by two animals, *Aelurus* (the panda), now living in the Himalaya, first known from Upper Pliocene deposits in west Europe, and *Aeluropus* (the giant panda), living in Tibet, found fossil in the Pleistocene of Burma. The ancestry and affinities of these forms are however still uncertain.

The amphicyonine dogs, which are represented in the Oligocene of North America, occur during Miocene times in both Europe and North America; from this group the Ursidae (bears) appear to have arisen, *Ursavus* being from the Middle Miocene of France and possibly related forms occur in Europe, India, China and North America. They first appear in South America in Pleistocene times.

The Felidae (cats) belong to two independent groups, the Machaerodontinae (sabre-tooth cats) and the Felinae (true cats). Both families occur in the Oligocene of North America and Europe, and their descendants are found in these localities at every horizon between that and the Pleistocene. At this stage the former became extinct, whilst the latter has living representatives in both sub-regions. The Middle Miocene of central Africa contains the remains of a feline, and the Oriental region has been inhabited by both sabre-tooth and true cats since Miocene times. Cats of both types first appear in South America in Pliocene deposits. The group appears to be of northern origin and to have colonised the southern projections of Arctogaea during the Miocene at a time when many migrations were taking place.

The Proboscidea first appear in Upper Eocene rocks in Egypt as a small animal, *Moeritherium*, which presents the first traces of their characteristic specialisations. In the Lower Oligocene of Egypt this animal is still found and is there accompanied by its descendant *Palaeomastodon*. This genus gave origin to the later Proboscidea, its immediate descendants being included under the somewhat vague term "mastodon." Mastodons appear in the Lower Miocene of North Africa, Baluchistan and Europe and by Mid-Miocene times had reached China and North America. Subsequently in Upper Pliocene times mastodons of special type migrated southwards and lived on into Pleistocene times in South America.

The true elephants arose from the mastodons, and their earliest representatives are found in the Pliocene of India. Thence they migrated outwards, reaching Europe in the Pliocene and North America in Pleistocene times, but they never reached South America.

All the Holarctic members of the order died out at the end of Pleistocene times, one of them, the mammoth, which became adapted to Arctic conditions, living along the front of the great ice-cap which covered northern Europe and North America, until the ice finally disappeared, perhaps about 8000 B.C.

Hyracoidea.—The Lower Oligocene rocks of Egypt which contain the remains of *Palaeomastodon* yield also several genera of large hyracoids. The next representatives of this order are very small animals found in Middle Miocene rocks near Victoria Nyanza, and in South West Africa. In the Lower Pliocene Pontian fauna of Samos and Pikermi near Athens, they are rarely represented by a very large form. The existing animals are Ethiopian, except for a few individuals found in Syria and Arabia. The order thus appears to have arisen and carried out its evolution in Africa. The Lower Oligocene of Egypt also contains the remains of two orders, the Barytheria and Embrithopoda, no representatives of which are found elsewhere. Its fauna is therefore very isolated and contains only certain creodonts and anthracotheres of northern origin.

Notoungulata.—This extinct order of herbivorous mammals was until recently known only from South America, where it exhibits a number of evolutionary series. Most of these series can be traced upwards from the Eocene (Notostylops beds) of Patagonia into the Miocene or Pleistocene, although it has to be recognised that most of such series are only approximate. A single lower jaw of a member of this order has been found in the Lower Eocene of North America, and more abundant remains of a different genus occur in rocks (the Gashato beds in Mongolia) whose age is not certainly known but is probably Basal Eocene. This animal appears to be the most ancient member of the family yet discovered, and suggests that the group was of northern origin, although its later evolution took place entirely in Neogaea.

Condylarthra.—The Basal Eocene of North America contains numerous remains of small animals which appear to represent a primitive group from which other ungulates have arisen. The descendants of some of these forms lived on into the Lower Eocene and in a modified form, as the Amblypoda, even to the Upper Eocene. These latter forms had their headquarters in North America, but a single representative of them, of Upper Eocene age, has been found in Mongolia. The Basal and Lower Eocene of Europe contain a few animals which are probably condylarthrans, and the earliest Eocene members of the Litopterna (a group restricted to South America) are essentially identical in structure. Thus this group gives a further indication of the uniformity of the Basal Eocene fauna throughout the Palaearctic region, and of the probable derivation of the South American fauna from members of this widespread group of animals, which, becoming isolated about the beginning of Tertiary time, and not being exposed to the competition of the northern groups, carried on an adaptive radiation, leading to the evolution of many very peculiar groups.

Perissodactyla.—Perissodactyls first appear at the bottom of the Lower Eocene in Europe and North America as small animals, presenting a very uniform structure and including the ancestors of the half-dozen families into which the group becomes divided.

The first of these, the Equidae (horses), is represented in North America at every stage of the Tertiary from the Lower Eocene to the Pleistocene. The remains of these animals provide the longest and most complete evolutionary series known; certain peculiarities, however, show that it is not entirely genuine but is built up from a series of forms constantly migrating into the area from northern Asia. It is therefore very remarkable that no remains of horses have been found below the Lower Pliocene in Mongolia and China. Horses extremely similar to those of North America, but forming a less complete evolutionary series, are found in Lower, Middle and Upper Eocene rocks in western Europe, and this region possesses the only representatives of a small group, the palaeotheres, which, derived from a horse-stock, reached a large size and very peculiar structure as early as the Upper Eocene, becoming extinct in Lower Oligocene times.

No representatives of the true horses are found in Europe in the Oligocene, and the single form, *Anchitherium*, which occurs in the Middle and Upper Miocene, belongs to an aberrant group of forest animals which is also represented from the Middle Miocene to the Lower Pliocene in North America and in the Lower Pliocene of China. Only in the Lower Pliocene Pontian fauna from China to Portugal and in India, do we again meet with typical members of the horse family in individuals of the genus *Hipparion*. The living genus *Equus*, which is not a descendant of *Hipparion*, appears suddenly in the Upper Pliocene of India and western Europe. South America received its horses in Pliocene times from North America, the peculiar genera of that continent having arisen from a North American Pliocene genus.

The Tapiridae have a probable ancestor in the Lower Eocene of North America and unquestionably ancestral tapirs occur in the Oligocene of Europe and North America. The group appears to have survived in North America until Pleistocene times, reaching South America after the two continents became connected in the Pliocene. In Europe and Japan a Lower or Middle Miocene form is known, and the living genus is represented in Upper Miocene and Lower, Middle and Upper Pliocene deposits. A gigantic form twice the size of the existing ones occurs in the Pleistocene of China. No representatives of this family appear

to have been discovered in the Tertiary rocks of India, but it is clear that the existing Bornean form must have reached that region from the Palaearctic region.

The lophiodonts, a group allied to the tapirs but restricted to Eocene and Oligocene times, include cursorial forms, and occur not only in North America and Europe but also very abundantly in Mongolia.

The rhinoceroses present a very complicated evolutionary story not yet fully understood. One primitive group of animals, the amynodonts, somewhat hippopotamus-like in their adaptations, occur in Eocene and Oligocene rocks in Europe, Mongolia, Burma and North America. The cursorial hydracodonts are known only from the Eocene and Oligocene of North America and Mongolia, whilst their associates of such genera as *Diceratherium* occur both in Europe and North America. The evolution of the more normal rhinoceroses is still so little understood that it is impossible to discuss their migration; it is however clear that creatures essentially ancestral to the living Sumatran rhinoceroses occur widely spread in the Upper Pliocene and Pleistocene of Europe, in association with forms allied to the African rhinoceroses. The living Indian rhinoceros has apparently been derived from forms present in that area in Pliocene times. One remarkable extinct rhinoceros, *Elasmotherium*, found in the Lower Pleistocene of Russia and Siberia, and very rarely in Germany, has an ancestor in the Pliocene of China.

The Titanotheriidae is a small family of perissodactyls whose first representatives are found at the top of the Lower Eocene of North America. They underwent a very rapid evolution in that continent, soon attaining a gigantic size and a very highly specialised character. In the Middle Eocene of Transylvania a single lower jaw has been found. In the Upper Eocene of Mongolia typical members of American genera of similar age are to be found; fragments of very nearly allied animals have been described from Upper Eocene rocks in Burma, and in the Lower Oligocene of North America and Mongolia their remains are abundant. A few fragments have occurred in presumably Oligocene rocks in Eastern Europe, but none have been found in the thoroughly explored deposits of this age in western Europe.

The only remaining group of perissodactyls, the chalicotheres, has a possible ancestor in the Middle Eocene of the United States. It then occurs in the Oligocene both of Europe and North America, is found in Middle Miocene times in India, and is a member of the Pontian fauna of southern Europe. It occurs in the Pleistocene of Central Africa after it had died out in other parts of the world.

The history of the Perissodactyla is of very great importance for the study of geographical distribution as so many fossil forms of the group are well known that relationships existing between the various members can be established with greater certainty than is the case in any other order of mammals. Furthermore many of its members were strange looking animals whose abundant and unmistakable fossil remains make the evidence with regard to its distribution during past times of peculiar reliability. Judging solely from the perissodactyls, it would appear that in Lower Eocene times Europe, Mongolia and North America formed a continuous land-surface, presenting such a variety of vegetation as to allow of the free passage of forest as well as of plain animals. In Upper Eocene times Europe became partially separated from North America, so that certain groups, the palaeotheres and the titanotheres, which are swamp and forest forms, were unable to migrate freely from one region to the other. Horses however still occurred in very similar forms in the two regions. In Oligocene times this differentiation of fauna became exaggerated, the two areas becoming completely separated from one another. The intense earth movements of Miocene times so altered the geography of the world as to re-unite the Palaearctic and Nearctic regions and many forms are common to the two regions at this period. In the succeeding Lower Pliocene rhinoceroses are very abundant and varied in the Palaearctic and Oriental regions, whilst they are much more seldom found in America. Oligocene Africa had no perissodactyls but by mid-Miocene times a rhinoceros had reached that continent. South America was colonized by horses and tapirs in Upper Pliocene times, but no member of the group ever reached Notogaea.

Artiodactyla.—General discussion of the past distribution of the artiodactyls is rendered difficult by the uncertainty which exists as to the classification of that group.

In the Lower Eocene of North America and Europe occur the most primitive forms, and their successors in the Middle and

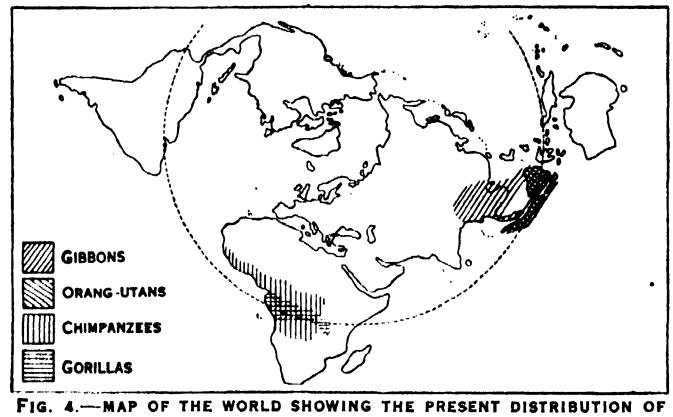

FIG. 4.—MAP OF THE WORLD SHOWING THE PRESENT DISTRIBUTION OF THE GREAT APES

Upper Eocene are similar in these two regions, but in Upper Eocene times certain special groups make their appearance which are restricted to one or other of the two continents. In North America the ancestors of the camels are found at this time and the entirely American family of the oreodonts is represented. In Europe the Anoplotheriidae take the place of these latter forms, and the long-lived family of the Anthracotheriidae appears as small animals.

In the Oligocene the descendants of all these groups are found and a strange creature *Elotherium*, resembling a gigantic long-legged pig, is represented by very similar forms from both sides of the Atlantic. In this period both in Europe and North America there are peccary-like creatures, and perhaps true pigs in Europe: the anthracotheres reached America at this time but only one of the very large number of European and Indian genera ever reached that continent.

In the Lower Miocene in Europe and Baluchistan there was an amazing variety of anthracotheres ranging from forms as small as a sheep to great creatures as big as a hippopotamus. The last representative of the anthracotheres occurs in rocks of probable Upper Pliocene age in India and Tunis.

It is quite possible that the hippopotamus arose from the anthracotheres. The animal is clearly of Oriental origin, reaching north Africa and Europe in the Upper Pliocene, and being widespread over Java, India, Europe, Africa and Madagascar in Pleistocene times.

The camels carried out the whole of their evolution in North America in which they are now extinct. They first left that continent in Lower Pliocene times, a large member of the group occurring in the Lower Pliocene of China, and in India in rocks perhaps of somewhat later date. The llamas reached South America in the Pliocene and a llama-like form survived in North America into Pleistocene times.

The higher artiodactyls (Pecora) are represented in the Upper Eocene of Europe and North America by small animals resembling the existing tragulines. This group of primitive artiodactyls includes one animal *Archaeomeryx* from the Upper Eocene of Mongolia, which is the earliest known form capable of being regarded as a direct ancestor for the Pecora. In Oligocene deposits in Europe, and in Lower Miocene times in Europe and North America occur the remains of animals which are more certainly deer. Deer have a continuous representation in both continents from that time to the present day but the earlier American forms appear to be related to the Virginian deer and its allies, the typical genera being of Asiatic and European origin. The antelopes and their allies first appear in the Lower Miocene of Europe, and the group appears to be definitely of Old World origin. It is abun-

dantly represented in the Pontian fauna from China to Spain and is now the most conspicuous element in the Ethiopian region. Antelopes first appear in North America in the Upper Miocene, but are extremely rare there. The history of the group is however still uncertain. The true oxen are clearly derivatives of the antelopes, and the earliest known and most primitive forms occur in the Lower Pliocene of India: they reached Europe in Upper Pliocene times and America only in the Pleistocene. The ancestry of the goats and sheep is still uncertain but the first definite members of the group appear in the Pliocene of India. In North America from the Middle Miocene to the present day there occurs a distinct family of Pecora, the Antilocapridae, represented now only by the prong-horned antelope. No member of the group has ever been found elsewhere.

According to Pilgrim, the earliest known relative of the giraffe is found in the Lower Miocene of Baluchistan: in the Lower Pliocene the group is represented by very varied forms, some gigantic, some indistinguishable from the living giraffes and others nearly similar to the okapi. These occur throughout the entire distribution of the Pontian fauna from China, Persia, South Russia, Samos and Pikermi. Their remains are not found in German deposits of the same age. No fossil giraffes are known from Africa, the only continent at present inhabited by the family, nor did any member of the group ever reach North America.

Primates.—The lowest division of the Primates, the Lemuroidia, is first recognised with certainty in rocks of Lower Eocene age in North America and Europe. These remains belong to two very distinct groups, the Lemuriformes, with a complete dentition and a comparatively elongated face, and the Tarsiiformes, in which the tooth-row is shortened, the eyes are large, the olfactory region and face very small, and the lower jaws meet in front at an acute angle. Representatives of these two groups are found in the Middle and Upper Eocene in Europe and America, and both continue in the Oligocene of Europe, but disappear at this period in North America. The two groups are then unknown in the northern hemisphere, but the Lemuriformes reappear in the Pleistocene of Madagascar in a most varied series of forms, and the Tarsiiformes are represented by the single living genus *Tarsius* in the East Indies. Nothing is certainly known of the remaining group of lemurs, the Lorisiformes, but it is conceivable that *Pronictycebus* from the Upper Eocene of France represents their ancestor.

The higher Primates fall into two completely separate divisions: the platyrrhine and catarrhine apes respectively. Of these the platyrrhines are first found in the Miocene of Patagonia, and none of them occur outside that continent. The first catarrhine is *Parapithecus* from the Egyptian Oligocene, a primitive form presenting distinct points of resemblance to the tarsioids. Associated with this animal is *Propliopithecus*, which is beyond question a member of the highest family, the anthropoid apes. The earliest members of the lower families of Old World apes occur in the Lower Pliocene throughout the range of the great Pontian fauna. Their distribution presents one or two points of interest, *e.g.*, the typical baboon is known from the Pleistocene of India, and another strange form closely allied to the living gelada has been found in the east African Pleistocene. The giant apes have a more complete representation as fossils, a fact which is remarkable when the relative rarity of the living groups is taken into account. *Pliopithecus* from the Middle and Upper Pliocene of Europe appears to be essentially an ancestor of the gibbons, whilst the genus *Dryopithecus* has a wide distribution in Europe and Asia in the Middle Miocene and in somewhat later rocks. The closely allied *Sivapithecus* has been claimed as a human ancestor but really presents no definite evidence of such affinities. From *Dryopithecus* and its immediate allies the living giant apes certainly arose, and such evidence as exists is consonant with the view that man also came from the same stock.

CONDITIONS OF DISTRIBUTION

The outline of the history of land-mammals contained in the preceding pages shows that the present distribution of a mammal may tell us nothing whatsoever about the place of its origin, or the time at which it came into its existing habitat. All the great land-masses of the world except Australia and Madagascar have been continuous with one another at some time during the Tertiary period and representatives of all the higher orders have been enabled to cross the bridges between them. The fact that each continent none the less has a distinctive fauna, is due to the extinction which has overtaken the members of every group in some portions of its former range, the differences in the period at which the union of the continents took place, and the peculiarities in the geographical conditions of the bridges which made them available to certain forms whilst they could not be crossed by others. The geographical conditions which may act as barriers to the free migration of mammals are very varied. A wide strait of sea cannot be crossed by most mammals but there is evidence that certain creatures have in fact reached islands by some rare and casual mode of distribution not available to most forms.

Madagascar.—Perhaps the best evidence of the possibility of such transference is afforded by Madagascar. Taking the Pleistocene and recent faunas of that island together, we find that it is inhabited by very many genera of lemuriform lemurs, varying in size from animals no bigger than a squirrel to a form with a skull more than a foot in length. Although all the living and the majority of the extinct forms are strictly arboreal some of the larger lemurs were terrestrial and even perhaps aquatic in their habits. There is however no doubt that all these forms despite their very varied appearances are extremely closely related and that they may all have arisen from a form resembling *Lemur* itself.

The only other important element in the Madagascan fauna is the group of many genera included in the zalambdodont insectivores. All these belong to the single family Centetidae and may have arisen from a single form. The carnivores are represented by a few genera of Viverridae, all extremely peculiar in their structure; the largest and most interesting is the fossa, an animal whose true relationships are obscure. There is another viverrid, *Eupleres*, with very small widely-separated teeth like those of an insectivore, and finally there is a much more typical viverrid, perhaps belonging to *Viverrus* itself. The rodents are included in the single family Nesomyidae, peculiar to the island. The only other forms are bats, including the fruit-bat *Pteropus* not found in Africa, a pig of the genus *Potamochoerus* and a pigmy hippopotamus now extinct.

This fauna is clearly quite different from that of any other part of the world and gives a sound basis for the establishment of Madagascar as an independent region. We know that *Hippopotamus* only came into existence about at the end of the Miocene times and that it first reached Africa in the Pliocene: it is therefore clear that it must be a relatively recent immigrant. If it had crossed over a land-bridge it would necessarily have been accompanied by those other elements of the African fauna which live in close association with it. We should in fact expect to find in Madagascar representatives of those antelopes which live in the forests or swamps which border rivers, the Cape buffaloes and elephants, true monkeys, and an assemblage of carnivores which prey upon them. The complete absence of such forms implies that the hippopotamus did not cross on dry land and it is probable that it reached Madagascar by swimming. The pig is also a water-loving form and may also have swum across. It is clear from their many peculiarities that the viverrids have lived longer in Madagascar: they cannot have crossed on land because of the absence of any associates, and it is most improbable that they swam. The lemurs represent a group well established in Eocene times and their wide radiation again implies a long residence. Finally the centetids are known to have existed in North America in the Basal Eocene. Neither group could have crossed land-bridges without bringing with them other forms, so that it seems clear that they were transported by some other method, the only plausible suggestion is that they crossed on rafts of tangled vegetation washed down from the great rivers, fore-runners of the Limpopo and Zambezi, which drained Africa throughout Tertiary times.

Madagascar, in the absence from its fauna of most ungulates and carnivores, is representative of all those islands which have never been connected with the great northern land-masses during Tertiary times. Of such "oceanic islands" the next largest is New Zealand, which possesses no mammals whatsoever except two bats, each the sole representative of a peculiar genus. New Caledonia and most of the Pacific islands are of the same type, whilst the islands of the Malay archipelago have a fauna derived from that of Asia, modified by the occasional influx of a few marsupials from the Australian region.

The foregoing discussion will have shown that only when the history of the animals involved is known in detail, is it possible to interpret an existing geographical distribution, and as this condition is only fulfilled in the case of the mammals and there imperfectly, it is unnecessary to discuss the distribution of other groups in detail. There are, however, certain features of general interest presented by individual members of other groups.

Birds.—Amongst the birds, the large cursorial and flightless forms belonging to the Ratitae, are represented by the emus and cassowaries of Notogaea, the rheas of South America and the ostrich of Africa and Arabia. Extinct ostriches were abundant in Pleistocene times in China and Mongolia, and have been found in the Upper Tertiary of India and the Lower Pliocene of Samos, in association with that great fauna which we have seen to include the ancestors of the living African animals. In addition, in the Pleistocene of Madagascar, there is a series of birds (*Aepyornis*) one of which is the largest known bird, standing some 12 ft. high, with an egg with a capacity of 2 gal. A similar group of forms, very variable as to size and proportions, lived in New Zealand long enough to be hunted by the Maoris, and filled in that island the rôle more normally assumed by ungulates. The occurrence of these giant flightless birds in continental areas is interesting because flightless representatives of other groups are generally restricted to islands where they were not exposed to the attacks of carnivorous mammals: of such forms the most familiar is the dodo, probably allied to the pigeons, and formerly living in Mauritius, whilst a similar form occurred in Rodriguez. The Chatham islands were inhabited by a whole series of flightless rails.

Reptiles.—The reptiles present an example of a group of animals whose distribution is limited by temperature. The body-temperature is not uniform, but varies with the surroundings and is kept very slightly above by muscular activity. As the rate of the heart-beat alters with the temperature, being greatest when warm and becoming very slow as freezing point is approached, it is clear that reptiles can only exhibit much activity in warm climates. In most reptiles an egg, similar to that of a bird, is laid in the ground and incubated not by the warmth of the mother's body but by the sun or by decaying vegetation. As development proceeds at a negligible rate at low temperatures, reptiles are only capable of reproducing their kind within a belt of the earth's surface where the summer temperature is fairly high. The British Isles are very nearly at the extreme northern limit of reptile existence, and are inhabited by very few forms; the mud tortoise, *Emys*, which lives in Belgium, being incapable of maintaining itself in England. Even within this belt the distribution of certain forms is restricted to the warmer regions. The crocodiles, for example, are in the main tropical, although they reach as far north as the Mississippi in North America and the Yellow river in China.

Amphibia.—The distribution of Amphibia presents some interesting and puzzling features. The Gymnophiona, probably the most archaic group, are strictly confined to the Tropics and occur in the Neotropical, Ethiopian and Oriental regions. The Urodela, a very ancient group, are not now represented in Notogaea, an area which it seems certain they must once have reached. They are at present most abundant and varied in the temperate zone of eastern Asia and North America. The distribution of frogs cannot be intelligently discussed owing to our lack of knowledge of the history of the group.

Freshwater Fishes.—The distribution of freshwater fish does not fall easily into the zoo-geographical regions established for the mammals, a fact which is remarkable because the bony fish are in the main a Cretaceous and Tertiary group. The most archaic of living vertebrates, the lung-fish *Neoceratodus*, now lives solely in two small rivers in southern Queensland, but remains of the same genus have been found in the Pleistocene of South Australia. *Ceratodus* itself is a Triassic form found widely spread all over the world in fresh-water deposits. It is clear that the present restricted distribution has resulted from the extinction of this fish over the greater portion of its former range. The other two dipnoans, *Lepidosiren* of South America and *Protopterus* of tropical Africa, are very closely related to one another, but differ materially from *Ceratodus*. A specimen of *Protopterus* has been found in the Oligocene of Egypt, proving that the group is an ancient one, and its present distribution must depend on factors incapable of analysis. *Polypterus* and its close relative *Calamoichthys*, which are the much modified descendants of the Palaeozoic Palaeoniscidae, are now restricted to tropical Africa, but isolated scales perhaps of the same type occur in the Eocene of Egypt. The sturgeons, belonging to a group which first appears in the Lower Jurassic, are remarkable for their restriction to the temperate waters of the northern hemisphere, where are found all the members of the two existing families. That the only two other living ganoids, the bowfin and the garfish, live in temperate parts of North America, and that both are known from the Eocene of Europe, shows yet again how present distribution may give no clue to former extent of range.

One peculiar family of bony fish, the cichlids, extraordinarily abundant in the great lakes of equatorial Africa, is represented in equal numbers in tropical America, a phenomenon which with the similar distribution of lungfishes and octodont rodents has led to a belief that South America and Africa were connected by a land-bridge until late in Tertiary times. The distribution of mammals makes this view untenable, and when the fossil history of the cichlids comes to be known, it will probably be found either that they once occurred in the northern hemisphere or that the African and American forms are not really closely related. It is impossible to deal in this article with the distribution of invertebrates but the matter is dealt with in the articles dealing with individual groups.

Marine Animals.—The distribution of marine animals depends on many factors. To a considerable extent it is controlled by temperature, many marine forms being capable of life and reproduction only within a narrow range of temperature variation. The seas may be divided into the open oceans and the shallow waters into which detritus derived from the land is carried by rivers.

In the ocean, animals may inhabit three regions; they may live in the surface layers (40 fm.) to a depth where the light intensity becomes negligible and growths of plants is no longer possible: or they may inhabit the mid-waters (roughly 40–2,000 fm.) depending ultimately for their food-supply on the remains of dead animals and plants from the surface: or they may live on the ocean bottom even at depths approaching 3,000 fathoms. The fauna of the sea-bottom lives under remarkably uniform conditions; light is absent, the temperature is not far above freezing point, all the food which reaches this region has fallen from the surface of the sea and the bottom is usually soft mud. The abyssal fauna is nearly uniform over the whole world: it includes the great majority of known species of the primitive hexactinellid sponges, and most of the phyla of the animal kingdom are represented, often by forms peculiar in structure and belonging to groups restricted to deep water. Although a more detailed study shows that species and genera may range over only comparatively small areas of the ocean floor, the abyssal fauna is nevertheless remarkably distinct from all others, nearly all its members being recognizable as such at sight.

The free-swimming fauna of the mid-water includes certain radiolarians and medusae. The Crustacea are represented by many forms of prawns, usually bright red in colour, and by a gigantic ostracod. The Mollusca include pteropods and cuttle-fish, but the most abundant forms are fish, very characteristic in their possession of light-producing organs, their black, and in

shallower water, silvery colour, and the presence of very large or excessively small eyes.

The pelagic fauna of the surface layers of the ocean, consists mainly of transparent animals of delicate structure; it includes the foraminiferan *Globigerina* and many radiolarians, innumerable representatives of the dinoflagellates, some brilliantly phosphorescent, medusae and the floating siphonophores, familiar as

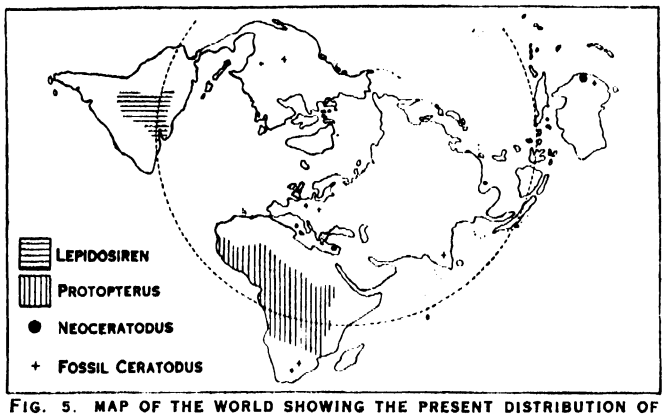

FIG. 5. MAP OF THE WORLD SHOWING THE PRESENT DISTRIBUTION OF THE DIPNOI AND THE PLACES OF EXTINCT MEMBERS OF THE GENUS CERATODUS

the "Portuguese man-of-war." The arrow-worm *Sagitta* is often abundant and certain polychaet worms are of universal occurrence. The Crustacea include immense numbers of copepods, usually very small forms living on diatoms. Other small Crustacea belonging to the Ostracoda are plentiful, whilst of the higher Crustacea, the schizopods may form a large proportion of the catch. The pelagic molluscs belong largely to the pteropods: lamellibranchs are absent and gastropods represented by a few special forms. Cephalopods probably form an important element in the pelagic fauna and tunicates belonging to the appendicularians, salps and *Pyrosoma* occur abundantly. The oceanic surface fishes include forms allied to the herrings, with many representatives of the mackerels, flying-fishes and gar-fishes.

The distribution of those animals living near the coast depends very largely on local features such as the nature of the bottom, the salinity, the acidity of the water, the temperature and temperature range, the nature of the currents, and other factors which can only be determined in each individual case. It is therefore impossible to deal with them in this article, but an account will be found in the article DISTRIBUTION OF ANIMALS.

In the foregoing account it has been assumed that the great continents have been stable in the sense that they contain within themselves great areas, such as Mongolia, Eastern Canada, West Australia and South and Central Africa, which have been dry land for a period vastly greater than that within which the adaptive radiation and distribution of the mammals has taken place. The truth of this assumption is abundantly demonstrated by geological observations, but the further belief that these old land masses have always occupied the same positions with respect to one another and to the poles has been seriously questioned by A. Wegener.

Wegener holds that in Upper Carboniferous times the whole of the dry land of the world was concentrated into one great continent, subdivided to some extent into independent areas by shallow seas, but essentially continuous. The south pole lay within this land mass in what is now Portuguese West Africa.

The present continents have arisen from this mass by an actual horizontal displacement, the present coasts, or more accurately the margins of the continental shelfs which face one another across the Atlantic and Indian oceans having formerly been in actual contact. By such drift not only have the Americas become torn away from the western coast of Europe, Africa and Antarctica and Asia from its eastern coast, but the island festoons, New Zealand, the Antilles, Madagascar, etc., have been detached from the neighbouring coast of a continent. These great movements naturally produced great pressures on those continental margins which lay in the direction of motion, and led to the uprising of the coastal mountain ranges which are a marked feature of the earth's morphology.

The continental drift did not take place freely, the large land masses twisted round with respect to one another and became deformed, so that their margins in many cases no longer fit accurately, and small land bridges between the continents persisted long after the main masses had become widely separated.

This remarkable view has been accepted by some geologists and has a great mass of geological evidence behind its basal assumption.

Wegener was first led to the investigation of its possibility by a consideration of the evidence from the distribution of animals for the former existence of a land bridge between Africa and Brazil. Wegener's view has the very great merit of explaining simply the remarkable facts of the distribution of that peculiar flora, the Glossopteris flora, which in South America, the Falkland Islands, South Africa, Madagascar, India and Australia occurs in late Carboniferous and Permian rocks, usually in association with boulder clays and other evidences of an ice-bound land and arctic climate. It accounts satisfactorily for the occurrence of the little fresh-water reptile Mesosaurus in Brazil and South Africa, and for similarities in the Triassic reptilian faunas of those regions and the extreme resemblance between the land and shallow sea faunas of North America and Europe in Carboniferous times.

But a continuation of these and other land bridges into late Tertiary times which has been suggested on the evidence of the present distribution of land snails, earthworms and similar groups, seems to be negatived by the distribution of mammals, where, as W. D. Matthew has shown, the existing distribution of land masses together with a few former land bridges, such as that which connected Asia and America through the Aleutian Islands, are sufficient to account for all the observed facts. The evidence of mammals far outweighs in value that of every other group, because for them alone have we any considerable knowledge of the history of the individual groups. (D. M. S. W.)

ZOOLOGY, the science which is concerned with the study of animals. Its scope embraces all conceivable modes of study, not only of individual animals, but of entire faunas and of the relation of animals with one another, with plants and with the non-living environment.

The number of animals, both living and extinct, which has been investigated is very great, perhaps approaching two million separate forms. It is, therefore, necessary to provide every different kind of animal with a name by which it can be recognized by zoologists in all countries, and to establish a classification by which the name of any animal may be determined.

The more obvious and easily discovered characters which distinguish animals from one another are those of their external appearance; body shape, nature of appendages, sense organs, character of the skin and its derivatives, colour and size, enable the ordinary man to identify the animals with which he is brought into contact, either as enemies, or as the objects of his sports and the source of his food supplies, or from the interest of their attractive appearance and habits.

The earliest attempts to name and classify animals were based exclusively on these characters, and the smaller divisions of a classification are still necessarily founded on them.

But it soon became obvious that, from external appearance alone, it was impossible to provide a key to the whole animal kingdom, and zoologists were driven to a study of the internal structure of animals.

The necessary beginning of such studies is an investigation of the anatomy of individual animals. The French anatomists of the 18th century published a series of works, each dealing with the anatomy of a single specified individual, and disclaimed any belief that the facts that they recorded would necessarily be true for any other individual, even though it was apparently of the same kind.

Anatomical investigations of this character were carried out at first entirely by dissection of the animal's carcass with knives, scissors and other implements, a technique which, in skilful hands, can yield an astonishing amount of accurate information, but which is necessarily incapable of revealing many structures, either because they are too small to be seen or otherwise undiscoverable. The progress of anatomy has depended very largely on advances in methods of investigation.

The most important of all such is that which came from the introduction of the microscope. The possibility of magnifying an animal at once greatly extended the scope of zoology, because it enabled the structure of very small animals to be investigated and, indeed, revealed an immense variety of forms, previously unknown because they were too small to be seen with the naked eye. At the same time microscopical examination showed that the organs of which an animal was composed were themselves complex, each consisting of a variety of tissues themselves constructed of smaller units, the cells. Work along all these lines is still continuing; each year sees the publication, though in decreasing numbers, of accounts of the structure of additional animals, and corrections of former accounts of anatomical detail, so that zoologists have now reliable accounts of the structure of an immense number of animals from all regions of the animal kingdom.

These accounts are, in part, based on dissection, but in most cases depend on microscopical investigations made by many methods. The fact that the cells which compose animals, and the various substances of which they are formed, have different chemical and electrical affinities for dyes, makes it possible to differentiate between them by staining animals, or parts of animals, before subjecting them to microscopical examination. The application of this method was made possible by the discovery of processes by which an animal may be cut into a series of slices, sections often only one-hundredth of a millimetre thick. From a study of such a series of sections it is possible to reconstruct the whole anatomy of a microscopic animal in very great detail. But in many cases the object of such investigations is not to discover the anatomy of a whole animal, but to describe the fine structure of some one organ, such as an eye or ear, elucidating the arrangement of the cells of which it is composed. For such studies the term histology (*q.v.*) has been introduced. They only acquire significance when they are linked up with concurrent physiological investigations, so that an attempt can be made to relate the observed structures with the function that they subserve during the animal's life.

From histology has sprung the science of cytology (*q.v.*), which is devoted to the discovery and elucidation of the visible structures within cells themselves. These researches have proved to be of such great significance for zoology in general that they will be referred to in later portions of this article.

It very soon became clear, largely, in all probability, through the investigations of the anatomy of man, that, within certain limits, the structure of all individuals of any particular kind of animal was the same. It thus became possible to compare the structures of different animals with one another, and thus to gain an understanding of the nature of their differences.

Comparative anatomy has gradually led zoologists to the conclusion that the variations in structure which occur amongst animals are not haphazard in their nature, but that they are systematic, so that every animal conforms to one of a very limited number of fundamental plans of structure. There is, for example, a single pattern underlying the structure of two animals differing superficially so greatly as a fish and a bird, or a sea cucumber and a starfish. On this fundamental basis all kinds of variations may be imposed, so that the animals which exhibit them may be fitted for life under most varied conditions.

CLASSIFICATION BY STRUCTURE

Thus it is possible to draw up a classification of the animal kingdom based entirely on resemblances of structure. But any such process involves a deliberate choice from the great number of separate characters visible in an animal of certain structures as those on which weight shall be placed in judging its position in the classification. This process involves extended comparisons between widely differing animals, structures which are widely distributed through the animal kingdom being used for the discrimination of the more fundamental groups, whilst those which are less widely spread serve for the establishment of smaller divisions. Though very simple in principle, this process of zoological classification is difficult in practice, requiring much judgment in those who are devoted to it.

The difficulties are of many different kinds; they may arise from the necessity of drawing arbitrary lines of division in nearly continuous series of forms, or they may depend on the existence of gaps in the series so large that the structures of the animals that they separate may differ so greatly that there is a real difficulty in discovering whether or not a comparison is possible.

It was to meet difficulties of the latter type that the science of morphology (*q.v.*) came into existence.

The classifications of the animal kingdom drawn up by zoologists before 1859 endeavoured to give a strictly objective representation of the facts of animal structure and of the structural relationships of animals to one another. The resulting series of groups, each included in others of higher order, was devoid of all symmetry and of all evidence of plan. It was unintelligible to men who believed that the whole system, in all its detail and complexity, had arisen at the fiat of a Creator. But the real nature of this classification at once became clear with the resuscitation by Darwin of the theory of evolution (*q.v.*) and its universal acceptance. The natural classification of animals, though founded on the resemblances in structure, is really of the nature of a genealogical tree, expressing the actual blood relationships between animals, a tree imperfect, not only from failure of analysis of the available evidence, but also from the gaps and breaks which necessarily exist in it from the fragmentary nature of our knowledge of extinct animals.

Thus a classification drawn up on evolutionary lines necessarily takes account of time; it cannot be expressed by a linear arrangement, or even on a surface, but involves at least a third dimension.

This tree, representing as it does the branching out of the animal kingdom during the long course of evolution, itself dependent not only on the intrinsic properties of living matter but also on the local peculiarities of the inorganic environment, is necessarily devoid of obvious symmetry; it includes branches tentatively put forth which, after a longer or shorter period, proved unsuccessful, as well as those which survive to-day.

This conception altered the whole meaning of the classificatory groups; instead of regarding them as having a real existence, as permanent and sharply marked categories, zoologists realized that they were of human origin, representing little more than a convenient mode of expressing definite conceptions of relationships.

The group names which are now in use are in order of ascending scope, species, genus, family, super-family, sub-order, order, class and phylum. It is believed by many zoologists that the smallest group, the species (*q.v.*), differs somewhat in its nature from the others. A species may be defined as a group of individual animals, whether alive or dead, which agree with one another in their structure, within close but variable limits, and are capable of breeding together. In the nature of the case it is impossible to give any general quantitative expression to the permissible amount of variation, and, in practice, the determination of the limits of a species depends on the judgment of the taxonomist. The second part of the definition, the possibility of breeding from any two individuals of the species of different sexes, cannot be extensively used because many animals will not, in fact, breed in captivity, although under natural conditions they would be fertile, and because the vast majority of species are only known from the dead specimens preserved in museums.

Darwin's conception of the mode of origin of species was that by some one or more of different processes, under the control of natural selection, a group of individuals of a species and their descendants gradually diverged from the normal type, until by the slow accumulation of changes they came to differ so greatly from it in their structure that they were, in most cases, no longer fertile with the original type of individual, and presented morphological characters sufficiently distinct to acquire specific status. On this hypothesis of its origin it is clear that a species is an artificial group, in that no two observers will draw the line which separates it from the parent species at the same point. At the same time, if only the living representatives of the new and the parent species be considered, the groups may appear completely discrete.

Modern work on genetics, the investigation of the nature of

heredity (*q.v.*), has suggested that the initiation of a new species may depend, not on a continuous process of change, in which the stages may be of infinitely small magnitude, but on a discontinuous variation, in which each change is a definite step, even if a very small one, and the individual which exhibits it differs from its parents in every cell of its body from the moment of its formation. Such definite steps may, in some cases, be found to depend on a modification, presumably of a chemical nature, in a particular structure, a gene, in a chromosome of one or both of the germ cells from whose fusion the new individual arose.

If such a view of the nature of evolution be true, it is clear that a species is a natural group, in that it begins at a definite place and time by a definite event; that, like Athena, it sprang fully developed from its parent.

What little evidence exists suggests, however, that few species are actually distinguished from their parent species by their possession of a single mutant character, that, in general, they must have arisen by the accumulation in one individual of a number of such mutations (*q.v.*). Indeed, in certain cases the differences between two species, although they may be supposed to arise from modification of the chromosomal mechanism, appear to depend, not on the change of individual genes, but on much grosser events, such as the fragmentation of the chromosomes themselves.

Genus.—The term genus indicates a sub-division of the animal kingdom which includes one or more species. Its limits, except in so far as they are made certain by the existence of a considerable morphological gap between one species and its neighbour, are entirely arbitrary, depending on the judgment of the writer.

It is evident that the doubt as to the real existence of genera is of the same character as that which occurs in the case of species; indeed, in this case it seems certain that the single term covers two quite independent classes of groups. It may imply that the group of species included within the genus have all arisen from a single species, which itself presented the generic characters, having, by evolution, come to differ in structure from its own parents and from sister species to a greater extent than species within a genus usually do. It is probably this conception which is usually present in the minds of taxonomists. But palaeontologists in general hold a very different view of the nature of a genus. It is widely believed by them that evolution has been to a large extent orthogenetic, that is, that all the species which fall within a small group pursue parallel evolutionary courses, so that, as time goes on, their members exhibit changes of structure which are of similar nature in all, although they have been independently acquired. To the group made artificially to include all the allied species which are in the same stage of evolutionary advance it is customary to apply the term genus. A group so defined differs from that which is ordinarily understood by the name, in that its members have not arisen from a single species, itself capable of inclusion within the genus.

The accepted scientific name of a species is a binomial phrase consisting of the generic name, which is placed first, and a trivial name proper to the species. The whole compound is the specific name. The terms employed should be formed from Latin or Greek roots, and the whole is regarded as Latin, so far as the termination, and agreement between the adjectival trivial and nominal generic name are concerned. (*See* ZOOLOGICAL NOMENCLATURE.)

The Sub-Family.—The next highest group, the sub-family, includes a group of genera, held together by structural resemblances. Its name is always made by adding to the root of the name of one of the genera included in it, the termination *-inae*.

Sub-families are grouped into families, whose names, formed as are those of sub-families, are characterized by the termination *-idae*.

Neither of these groups has a definite connotation, each, except in so far as it is bounded by morphological gaps between neighbouring genera, gaps which depend on our very incomplete knowledge of fossil forms, is of the nature of an artificially circumscribed assemblage.

Families.—Families are grouped into orders, and orders into classes, divisions of the animal kingdom which usually include large numbers of species, held together by the common possession of very fundamental structures.

The primary division of the animal kingdom is into *phyla*. Each phylum is sharply characterized by the possession of a plan of structure in the adult which is peculiar to it, differing from that proper to every other phylum in such ways that it is, in general, incapable of derivation from any other. As the adult structure of an animal represents a condition finally arrived at, at the end of a developmental history which begins with a single fertilized egg cell or zygote it necessarily follows that in certain fundamental features, at any rate, the modes of development of all the members of a phylum will agree with one another and differ from those of representatives of other phyla. This is indeed the case, but there do exist resemblances in the early development between members of different phyla which have led zoologists to discuss the possibility of relationship between one phylum and another of a kind which must have existed in the early stages of evolution, at a time when the first fundamental branching out of the animal kingdom took place.

Thus a study of animal development (*see* EMBRYOLOGY) is necessary for the establishment of a natural classification.

The labours of zoologists have now resulted in the establishment of a classification of animals, based entirely on morphology, which is unlikely to be seriously modified in its broad outlines by further work. The minor classification, into orders and smaller groups, is still disputed, although even here the differences between taxonomists lie more largely in the minor points of the grade to which a group belongs, or the position of its boundaries, than in a real clash of opinion as to mutual relationships.

This classification makes it possible for any competent zoologist to determine an animal, which is unknown to him, at any rate so far as its family or genus is concerned. It is thus of immense practical value, not only to the pure, academic zoologist, but also to those whose work has a direct economic bearing. The first thing which has to be done in an attempt to control an injurious insect is to discover its name, because only when this is known is it possible to find out whether the pest is imported or of local origin, and whether it is known and controlled in other parts of the world.

National museums exist in order that they may play the part of dictionaries, ensuring the accurate determination of all animals which may prove of interest either scientifically or commercially.

DIVISIONS OF THE ANIMAL KINGDOM

The primary division of the animal kingdom is into two groups, one including all those animals whose body is composed of a single cell, the other all those whose body is built up from many cells. (*See* CELL; CYTOLOGY.)

The first group, usually regarded as a phylum, the Protozoa (*q.v.*), may be defined as including all animals in which the body, when fully developed, consists of a single cell which carries out all the activities of a living animal; or of a colony of cells, exhibiting either no differentiation, or, in certain cases, distinguished from one another by the setting apart of one or more cells for reproductive purposes.

The group is very extensive, and the animals included within it vary extremely in size and in structure. The single cells which compose the entire bodies of most of its members may be far more elaborately organized than any of the cells of higher animals; they may contain one or many nuclei, and these nuclei may present a differentiation of function.

The cytoplasm may itself possess an elaborate structure, including contractile myonemes, fibrillae and neuroid fibrils which control locomotary activities. It may possess a definite food track and permanent contractile vacuoles for excretion and the control of the water content of the organism. Indeed, it is far from improbable that some Protozoa are the degenerate descendants of multicellular animals.

The life history of Protozoa is often very elaborate, and the group exhibits many stages in the development of a sexual mode of reproduction, from such simple cases as those in Ciliata, where

two identical feeding individuals come into association and exchange nuclei, to a fully developed sexuality where a large egg is fertilized by a small mobile spermatozoa as in the malarial parasite. It is, in fact, known that in some cases these gametes undergo a process of maturation of which the essential part is a halving of the number of chromosomes in the nucleus by a meiosis identical in principle with that which occurs in all multicellular animals.

The multicellular animals, or Metazoa, are distinguished from Protozoa by the fact that their bodies are composed of a number of cells, which are not equipotent, but differ from one another in structure, function and origin. Each of these cells is associated with others of the same kind so as to form a tissue, and the tissues fulfil definite functions in the life of the animal of which they form a part. A Metazoan animal is an individual, a unit whose cells are subordinated to the whole. Unlike the cells of Protozoa, they are not, in general, capable of a complete independent existence, and cannot, unless they be germ cells, reproduce the whole body of which they form a part.

Thus the Metazoan body exhibits a differentiation, its separate functions being performed by definite cells or congeries of cells, whilst the diverse functions of a Protozoan are carried out by differentiated portions of an undivided mass of cytoplasm.

It follows, as a necessary concomitant of the cellular differentiation of a Metazoan body, that all such animals must undergo a definite course of embryonic development whereby, by repeated cell division and differentiation of the cells so formed, the adult body arises from the single cell, the zygote or fertilized egg cell in which the individual begins its existence. With very rare exceptions, all clearly secondary, all Metazoa reproduce sexually, the male and female gametes, the spermatozoa and ova, being formed in definite organs, the gonads, and possessing markedly divergent characters. The ovum is always relatively large, possesses some food reserves, and is the only functional cell of four formed by the last two divisions of the process of maturation. The spermatozoan is a small cell, in which the cytoplasm is found only in very small amount, and the food reserve is only large enough to enable it to swim for the short period which is necessary to reach an ovum. It always possesses some locomotor apparatus and is usually of uniform and very characteristic structure.

The Metazoa fall into two divergent branches of very different importance. The group Parazoa includes only the sponges (*q.v.*), whilst the equivalent group of Enterozoa includes the remainder of the animal kingdom.

A Parazoan is an animal which, when adult, is permanently fixed to a substratum. Its body is composed of tissues which provide it with an external surface, and surround a cavity usually very complex and often irregular in shape, through which a current of water is caused to pass by the activity of the flagella borne by the cells which surround it. The cavity of a sponge, the canal system, is always in communication with the sea by inhalant and exhalant openings; the latter are oscula, the former differ in their morphological nature in different sponges.

Some part of the canal system is always lined by an epithelium composed of cells, choanocytes, which possess a single flagellum, whose base arises within a cup formed by an extremely delicate protoplasmic membrane which projects from the free surface of the cell. This collar can be retracted, and serves in some way, not yet understood, to affect the current of water caused by the lashing of the flagellum.

These collar cells are found only in Parazoa amongst the Metazoa, but identical cells form the bodies of a group of Protozoa, the Choanoflagellata. The collar cells not only serve to maintain the current of water, which, passing continuously through a sponge, brings to it its food and oxygen, but are the actual nutritive mechanism, engulfing food particles and digesting them. From them also arise the gametes. The remainder of a sponge consists of an external epithelium, protective in nature and an intervening mesoglosa containing cells of many different types and skeletal elements of varied nature.

During the development of a sponge the cells which, in the adult, are collar cells, form an external layer and serve for the locomotion of the free swimming embryo, whilst all the other cells of the body, including those which form the external surface of the adult, lie internal to them, often as a compact mass. (*See* INVERTEBRATE EMBRYOLOGY.)

The Enterozoa form a complete contrast to the Parazoa. They present many grades of structural complexity, of which the lowest is that presented by the members of the phylum Coelenterata (*q.v.*), from which all the others have ultimately been derived. The primitive Enterozoan has a body consisting of a sac, whose cavity, the archenteron, or primitive gut, opens to the exterior by a single aperture, through which food enters and the faeces are expelled; it thus combines the functions, and, indeed, probably gave origin to both mouth and anus.

The body-wall of a primitive Enterozoan consisted of two epithelia placed back to back, their cells being attached to a basement membrane common to both.

The epithelium which lines the single cavity is the endoderm; its cells are primitively concerned only with food, carrying out the processes of digestion, assimilation and food transport, and also giving rise to the germ cells.

The outer layer, the ectoderm, is that part of the animal which is brought into direct contact with the environment; it is responsible for protection, locomotion, the perception and capture of food, respiration and the excretion of nitrogenous waste products. In it arises the nervous system and sense organs which are necessary for the adjustment of the animal's behaviour to external circumstances. During the development of such an animal, the endoderm arises from cells which at no time lie external to those which compose the ectoderm.

The complexity of structure which may be built up on so simple a plan as that of a Coelenterate is very considerable, but cannot approach that which is, in fact, found amongst Metazoa. The first step in further evolution was the addition of a further layer of cells, the mesoderm, not necessarily epithelian in arrangement, between the ectoderm and endoderm.

In the majority of Coelenterates the basement membrane, which lies between these two primitive epithelia, becomes greatly thickened as a mesoglosa, into which cells wander chiefly, if not exclusively, from the ectoderm. In one living group of animals (the Ctenophora) this migration takes place precociously, so that a special mass of cells, derived from the embryonic ectoderm, is set apart as a mesoderm. From this the whole musculature of the adult arises.

All the Enterozoa we have so far considered possess no cavity other than the archenteron, the gonads being masses of cells, derived ultimately from the endoderm, which lie in pockets in free communication with the primitive gut. The next stage in development involves the separation of these pockets from the gut, either by an actual pinching off or by a migration of the cells which will form the gonad into the mesoderm and their subsequent arrangement into a vesicle. The independent cavity so formed is held to be the beginning of the coelom. This cavity, whatever its extent, is a morphological entity, independent of the enteron or true gut, and of the bloodspaces and of all other cavities, including that of the blastocoel, which is formed during early embryonic life by the separation of the first formed cells, or blastomeres. Part at least of the mesoderm arises from the walls of the coelom in all animals which possess that structure. (*See* EMBRYOLOGY.)

The presence of a coelom, even if it be no more extensive than the cavity of a gonad, thus enables us to divide all Enterozoa into two groups or grades, the Acoelomata and the Coelomata.

The establishment of the coelom, by isolating the gonads, and the increasing importance of the mesoderm, made the problem of the nutrition of the whole animal more difficult. In the Acoelomata food transport was carried out by the development of canals along which food particles could be transported by ciliary currents throughout the body. This mechanism is replaced in all higher animals by a blood vascular system, consisting of canals or spaces through which a fluid can be caused to travel to every

part of the animal. This fluid, in its passage through the vessels which lie on the wall of the gut, becomes charged with food substances in solution, and is capable of giving them up to any organ which requires them.

By its mere presence as a circulating fluid which passes through the whole body and is not itself actively metabolic, the blood must serve as a carrier of oxygen, even though a poor one. Its respiratory function becomes far more important in higher animals with the introduction of respiratory pigments, carried by the blood, capable of forming easily dissociated compounds with oxygen.

The same factors which led to the introduction of a vascular system were responsible for the initiation of a definite excretory system, at first in the form of a system of tubes, of ectodermal origin, ending blindly in a hollow cell with a bunch of cilia lying in the cavity. Subsequently, when the coelom became an extensive cavity surrounding the gut, these primitive tubes, the nephridia, became connected with it, usually through the intervention of other structures, the coelomoducts, whose primary function was the transmission of the gametes to the exterior.

The classification which results from the application of these and other criteria is as follows:—

ANIMALIA

Grade A. Phylum 1. Protozoa (*q.v.*)
- Class 1. Rhizopoda
  - Sub-class 1. Sarcodina
  - „ 2. Heliozoa
  - „ 3. Foraminifera
  - „ 4. Radiolaria
- Class 2. Mastigophora
  - Sub-class 1. Flagellata
  - „ 2. Choanoflagellata
  - „ 3. Dinoflagellata
  - „ 4. Cystoflagellata
- Class 3. Infusoria
  - Sub-class 1. Ciliata
  - „ 2. Suctoria
- Class 4. Sporozoa
  - Sub-class 1. Telosporidia
  - „ 2. Neosporidia

Grade B. Metazoa

Branch Parazoa

Phylum 2. Porifera (*see* SPONGES)
- Class 1. Hexactinellida
- „ 2. Calcarea
- „ 3. Tetraxonida
- „ 4. Myxospongida

Branch Enterozoa

Phylum 3. Coelenterata (*q.v.*)
- Class 1. Hydromedusae
- „ 2. Scyphomedusae
- „ 3. Anthozoa
  - Sub-class 1. Alcyonaria
  - „ 2. Zoantharia

Phylum 4. Ctenophora (*q.v.*)
- Sub-class 1. Tentaculata
- „ 2. Nuda

Phylum 5. Platyhelmia
- Class 1. Turbellaria
- „ 2. Trematoda (flukes)
- „ 3. Cestoda (tapeworms)
- „ 4. Temnocephaloida

Phylum 6. Nemertina (*q.v.*)

„ 7. Nemathelmia
- Class 1. Nematoda (*q.v.*) (round worms)
- „ 2. Chaetosomatida
- „ 3. Desmoscolecida
- „ 4. Nematomorpha (*q.v.*)

Phylum 8. Chaetognatha (*q.v.*)

„ 9. Acanthocephala (*q.v.*)

„ 10. Rotifera (wheels, animalcules)

„ 11. Chaetopoda (*see* ANNELIDA)
- Class 1. Archiannellida
- „ 2. Polychaeta
- „ 3. Oligochaeta (earthworms, etc.)
- „ 4. Hirudinae (leeches)
- „ 5. Myzostomida
- „ 6. Echiuroidea

Phylum 12. Arthropoda (*q.v.*)
- Class 1. Onychophora
- „ 2. Chilopoda
- „ 3. Diplopoda
- „ 4. Pauropoda
- „ 5. Symphyla
- „ 6. Hexapoda or Insecta (*see* INSECT, ENTOMOLOGY)
- „ 7. Arachnida (*q.v.*)
- „ 8. Trilobita
- „ 9. Crustacea (*q.v.*)
- „ 10. Tardigrada
- „ 11. Linguatulida

Phylum 13. Mollusca (*q.v.*)
- Class 1. Solenogestres
- „ 2. Amphineura (chitons, etc.)
- „ 3. Gastropoda (snails, etc.)
- „ 4. Scaphopoda (tusk shells)
- „ 5. Lamellibranchiata (bivalves)
- „ 6. Cephalopoda (squids, octopuses, etc.)

Phylum 14. Polyzoa (*q.v.*)
- Class 1. Endoprocta
- „ 2. Ectoprocta

Phylum 15. Phoronidea

„ 16. Gephyraea (*q.v.*)
- Class 1. Sipunculida
- „ 2. Priapuloida

Phylum 17. Brachiopoda (*q.v.*) (lamp shells)

Phylum 18. Echinoderma (*q.v.*)

Branch Pelmatozoa
- Class 1. Cystida
- „ 2. Blastoidea
- „ 3. Edrioasteroidea
- „ 4. Crinoidea (sea lilies)

Branch Eleutherozoa
- Class 1. Stelleroidea (starfish, brittle stars)
- „ 2. Echinoidea (sea urchins)
- „ 3. Holothuroidea (sea cucumbers)

Phylum 19. Chordata (Vertebrata)

Sub-phylum Hemichorda (*q.v.*)
- Class 1. Enteropneusta
- „ 2. Pterobrachiata

Sub-phylum. Urochorda
- Class Tunicata (*q.v.*) (sea squirts, etc.)

Sub-phylum. Cephalochorda (*see* AMPHIOXUS)
- Class Cephalochorda

Sub-phylum. Craniata
- Class 1. Cyclostomata (*q.v.*) (lampreys, hagfish, etc.)
  - Sub-class 1. Cephalaspidomorpha
  - „ 2. Pteraspidomorpha
- Class 2. Pisces (*see* FISHES)
  - Sub-class 1. Chondrichthyses (cartilaginous fish)
  - „ 2. Osteichthyses (bony fish)
- Class 3. Batrachia or Amphibia (*q.v.*)
- „ 4. Reptilia (*q.v.*)
- „ 5. Aves (*see* BIRD, ORNITHOLOGY)
- „ 6. Mammalia (*q.v.*)
  - Sub-class 1. Prototheria (Monotremata)
  - „ 2. Multituberculata
  - „ 3. Triconodonta
  - „ 4. Metatheria (Marsupialia)
  - „ 5. Eutheria (Placentalia)

The following small groups should perhaps be regarded as phyla:

Phylum 20. Archaeocyathea

„ 21. Mesozoa (*q.v.*)

„ 22. Gastrotricha (*q.v.*)

This classification of the animal kingdom is of importance because it establishes the possibility of an evolutionary explanation; it is, in fact, in its mixture of irregularity and system, exactly what would be expected if the animal kingdom owed its nature to a chain of contingencies stretching back to the beginning of life on the earth.

A zoological classification drawn up in the way which has been described, rests only on evidence of one kind, it depends on morphological resemblance alone, and no extension of observations to a consideration of new structures can materially contribute to its justification.

Palaeontology (*q.v.*), by bringing in the new element of time, affords a real confirmation of some parts of the classification, even though, in essence, the nature of the evidence it employs is the same as that used by taxonomists who work only with animals which are still extant.

MULLER'S THEORY AND ITS CONSEQUENCES

One principle, which, though no longer regarded as a satisfactory causal explanation of a great class of facts, has led to much invaluable zoological work, in the theory formulated by Fritz Müller, that every animal, in its growth from the egg to the adult condition, passes in turn through stages which recapitulate its evolution from a primitive form, or in other words, that ontogeny (the individual development) repeats phylogeny (the development of race).

The attempt to apply this principle led zoologists to investigate in great detail the embryology and later development of some one or more members of each of the greater groups, and to make especial efforts to obtain evidence about the life history of those animals, which were believed to be of exceptional interest because they stood near to the points of branching of the phylogenetic tree.

These studies, though they can scarcely be said to have been successful in their primary intention, formed the foundation of new developments in morphology, and provided a great mass of facts, which were in themselves of the highest interest, and in many cases have given information of great evolutionary importance. (*See* EMBRYOLOGY.) But embryology was already a separate branch of study before the formulation of the biogenetic law; it arose or was revived during the Renaissance, became of absorbing interest with the introduction and steady improvement of the microscope and of appropriate technical methods, and has entered on a new lease of life from the application to it of experimental methods.

Cytology (*q.v.*), the science which is concerned with cells, began with the microscopists of the late 17th and 18th centuries. Their work, and that of those who succeeded them, led zoologists to the conception that the bodies of all animals (and plants) are either composed of a single mass of living matter, or are composed of a great number of such units, each independent from, though influenced by its neighbours.

The fact that nearly every Metazoan is, when it first becomes an independent individual, a single cell, renders it certain that an investigation of the structure and other properties of cells must form the basis of any fundamental study of development.

The early recognition by the botanist, Robert Brown, that each cell contained a body, the nucleus, which had a definite shape, and was clearly marked off from the surrounding liquid substance of the cell, and the even earlier discovery of the existence of a streaming of cell substance in plants, and of the formation and migration of food vacuoles in Protozoa, led to attempts to investigate the morphology of cells. Such researches became much easier when methods of fixing (*i.e.*, killing by coagulating the proteins they contained) and staining cells were invented, and the vast majority of the many thousands of papers on cytology which exist are founded on materials which have been subjected to such treatment.

The greatest single discovery made by cytologists was that of mitosis or karyokinesis, an elaborate mode of multiplication of cells by division into two, which is found in very nearly the same form in all Metazoa and higher plants and in many Protista. Details of this process will be found in the article CYTOLOGY. Its importance lies in the fact that it ensures a qualitatively and quantitatively exact division of the nucleus between the two daughter cells. Mitosis commences with the formation within the nucleus of a long, tangled thread, along which are placed masses of a substance, chromatin, recognized by the intense stain it takes from such basic dyes as haematoxylin. This thread contracts and breaks up into short lengths, chromosomes, which are present in pairs, with the exception that one of them may either differ from its partner in appearance or lack one altogether.

Subsequently, the membrane which separates the nucleus from the surrounding cytoplasm disappears and the chromosomes are set free. Meanwhile, two small granules, the centrosomes, have placed themselves at opposite poles of the cell, and by their activities have altered the nature of the cytoplasm which surrounds them, so that it acquires a radially arranged structure. These rays, proceeding from the neighbourhood of the two centrosomes, meet and form a spindle of threads to which the chromosomes become attached. Each chromosome then splits longitudinally, the halves which result being drawn to the opposite poles of the spindle. From these two aggregates of half chromosomes, two new nuclei are formed and the cytoplasm of the cell is divided into two parts, one associated with each nucleus.

It is believed, on the strong though indirect evidence of genetics, and on the basis of certain experiments on developing animals (*see* EXPERIMENTAL EMBRYOLOGY), that by this process the daughter cells receive nuclei which are exactly identical with one another and with the parent nucleus.

As all the divisions by which the cells which compose the body of a Metazoan are of this kind, it follows that the nucleus of any one cell in such an animal is the exact equivalent of that of every other cell, and that the differences which actually exist between such cells depend either on the position which they hold in the body, that is to the influence of their neighbours, or of the outer environment, or to the character of the cytoplasm they received at some cell division.

This conception at once shows the importance of an examination of the cytoplasm. Examination of living cells taken from the body of a Metazoan seldom reveals any structures except drops of fat, yolk spheres and similar non-living substances stored in the cell for future use. But by the application of special methods of fixation and staining and a careful use of solvents, it is possible to find in all cells several classes of bodies whose behaviour suggests that they are actual portions of that mechanism on which the life of the cell depends. In a few fortunate cases these structures can actually be seen in living cells, and are thus probably not, as has been suggested, merely artificial products of the long process of preparation by which they are usually made visible. Thus the cytoplasm of a cell is so complex that it can possess a definite morphology, which might, in part, provide an explanation of the diversity of cells which have been derived from a single source.

It is clear that the most favourable material on which to test such a hypothesis is the segmenting egg of a marine Metazoan, because there the whole process of cell division, and of the gradual differentiation of cells can be watched under the microscope in living material.

In such animals as the sea urchin Echinus, the egg consists of a surface membrane, which surrounds a liquid cytoplasm within which the nucleus floats a little excentrically. In most cases there is no visible evidence that any part of the cytoplasm differs from any other part. This cell, after fertilization divides repeatedly, and the cells which are formed appear to be all exactly similar up to the time when 64 of them are present. At this stage the embryo is a sphere with a wall one cell thick surrounding a liquid-filled cavity. The arrangement of the cells is clearly haphazard, they owe their mutual positions to sliding movements, which, in other cases, can be shown to depend on the ordinary laws of surface tension. But in time this sphere of cells exhibits polarity, one end of it tucks itself within the other, and the animal acquires anterior and posterior ends. Is this polarity the result of an invisible polarity present in the egg or not?

The egg of a mollusc or of a polychaet worm usually presents as little evidence of structure as that of an Echinoid, but its development is of very different type. In either case the first division produces two cells which may differ from one another visibly. The second cleavage divides each of these into equal parts, whilst the third is unequal, separating small micromeres from the poles of the large megameres. These cells do not lie in tiers, the quartette of micromeres is so disposed that each one lies in the groove between two megameres. Although this position is that which would naturally be reached by sliding of cells under the forces of surface tension, it does not, in fact, arise in that way, but is predetermined by the direction of the axes of the spindles which bring about the mitoses of the third cleavage.

Thus, in this case it is certain that something within the egg determines both the character and position of the individual blastomeres. Indeed, the fate of each cell in such an embryo is ab-

solutely determined; it will form a definite structure or part of a structure in the adult.

The fact that, in certain cases at any rate, the fate of a blastomere may be determined from the time of its origin, led to attempts to discover the mechanism which lies hidden in its parent cell. Such a mechanism may involve a localization of definite substances, recognizable by chemical means. If substances which determine the fate of a blastomere be present in definite parts of its parent, it should be possible to remove them artificially, and thus inhibit the development of those characters for whose appearance they are responsible.

The simplest case is that of a separation of the first two blastomeres; if this be done each will develop independently of the other. In some cases a complete embryo of half the normal size will develop from each, in others a complete half-sized embryo from one, and one incomplete by the absence of certain parts from the other, whilst, in a few cases, half an embryo arises from each, the individual blastomeres segmenting as if the other were actually present.

Thus it seems certain that the cytoplasm of a fertilized egg may actually possess a structure which determines the course of its further development. But this predetermination of the fate of a cell by its structure can only be partial; it can be tested by experiments on regeneration (*q.v.*).

If, for example, the leg of a newt be amputated, the cut end of the stump rapidly heads over, and a small white conical accumulation of cells appears at its extremity; this grows in such a way that it eventually attains exactly the size and structure of the part of the leg which was originally cut off. In such a case it is clear that cells which, in an unmutilated animal, would never have formed part of a limb, have not only been stimulated to grow out, either by the effect of the wound or by the removal of the inhibiting influence of a complete leg, but have been compelled by a control exercised by some structure or structures in the rest of the animal, to do so in such a way as to acquire a definite structure.

Regeneration experiments, suitably designed, may throw much light on the whole problem of the control of development; but allied to them are others in which, instead of allowing normal regeneration to take place, part of the animal is transplanted to a new situation, where it is exposed to the control of a new environment, and should, if capable of modification, take on a structure appropriate to its new position.

Of these experiments the most important are those which have been carried out on the embryos and larvae of Amphibia. It has been discovered that fragments of one amphibian embryo implanted in another will grow even if the two belong to different species or even genera. This fact enables implants of a larva whose cells appear black to be grafted on to larvae whose cells are white. In this way it is possible to follow with great certainty the fate of the implanted fragment. These experiments have shown that the greater part of the surface of a newt's gastrula is indifferent, a set of cells which, if left in their natural position, would become part of the skin covering an external gill, may, if transplanted, become part of the brain or form the retina of an eye. Continued exploration by this method has shown that only one small region, that of the dorsal lip of the blastopore, has its fate determined; it is an organizer, which, if introduced into any Urodele blastula into which it becomes incorporated, will determine the establishment of an embryo whose parts stand in a definite relation to it. (*See* EXPERIMENTAL EMBRYOLOGY.)

But this organizer can be seen to arise from a particular part of the cytoplasm of the fertilized egg, the grey crescent, a structure which appears at fertilization at a point immediately opposite to that at which the spermatozoan enters.

It has then to be considered whether it is the entrance of the spermatozoan which establishes a structure in the fertilized egg or whether such a localization exists in the unfertilized but ripe ovum. Evidence on this point may be sought by two methods: An attempt may be made to destroy any structure the unfertilized ovum possesses by making use of the difference in specific gravity which exists between the cytoplasm and its inclusions, either by merely inverting the egg or by the more powerful forces which are available in a centrifuge. The eggs with their contents so rearranged may be fertilized immediately, and an attempt made to correlate any abnormalities presented by the embryos resulting from such fertilizations with the displacements which may be observed by cytological methods in eggs similarly treated. As a control, eggs which have been fertilized must be subjected to exactly the same treatment. An easier, though much more indirect mode of investigation is through genetics.

VARIATION

No two animals, even belonging to the same brood, are alike; whilst exhibiting a close similarity to their parents and to one another, each will differ from all others either to a small extent or even very considerably in one or many respects. The investigation of the nature and causes of these variations, and of the extent to which they are passed on from one generation to the next, forms a most important part of the science of zoology. It is clear, even on a cursory investigation, that variations may be either of such a kind that they form a continuous series connecting one extreme of structure within the species with the other, or may represent definite steps between which no intermediates can be found. This distinction between continuous and discontinuous variation is one of the greatest importance for a clear understanding of the problems at issue.

Very many discontinuous variations are meristic; the change in the number of rays in a fish's fin or of vertebrae in its vertebral column is necessarily carried out by steps between which there are no conceivable intermediates. But similar discontinuities may occur in characters which might be expected to vary continuously; there is, for example, no series of intermediates connecting the black coat of a melanic jaguar with the normal spotted pattern. It has long been known, from observation of domesticated animals, that such sports appear sporadically without obvious cause, and that they make their appearance fully developed. Precision has been added to these old observations by long-continued breeding experiments, notably those carried out with the fruit fly Drosophila. These have shown that discontinuous variations, mutations (*q.v.*), arise continuously, that the same mutation appears independently again and again and does so at a uniform rate, differing from that at which other mutations occur. The number of observed mutations in this form is very large; it already exceeds 400. These mutations, although they affect most profoundly some one structure, actually alter many apparently unassociated parts of the animal. They may produce such gross modifications of structure that the resulting mutant is non-viable and dies at some definite point of the life history, or they may have so small an effect that only long experience will enable an observer to recognize their existence. They may even produce no visible effect in individuals bred under normal conditions.

There are certain experiments which seem to show that the rate of appearance of mutations may be greatly increased by exposing the animals to X-rays.

Some of the mutations which appear in the species Drosophila melanogaster, which has been most fully investigated, are repeated in exactly the same form in the other species of the genus, and analogy with plants, and the character of the variations which exist in other groups of animals, such as the rodents and land snails, suggest that similar mutations must be capable of arising in all the species included within large groups such as families.

Furthermore, the same part of the animal may, in some cases, be caused to vary in the same direction by a number of independent mutations, whose effects may be cumulative when they are present together in a single individual. In such a case the extreme conditions may be connected by a series of intermediates, each a distinct step, which may be so small that an appearance of continuous variation may exist.

It is, therefore, most difficult to decide whether any apparently continuous variation is truly such, or whether it is not more justly interpreted as the result of a large series of small steps. This difficulty is increased by the fact that the external conditions

under which its development has taken place affect to some degree the character of every adult animal. That modifications in structure through use do take place is obvious. The highly-developed arm muscles of a blacksmith clearly owe their size to continuous exercise. But the influence of the environment may show itself in much more subtle ways. A single egg of a bee may develop either into a worker or a queen, castes which exhibit great morphological differences, according to the food that it is given and the size of the cell in which it is housed. The brine shrimp Artemia assumes very different forms if it is grown in water of different salinities.

The effect of such variations, which are induced by the action of the environment during the life of a single animal, will be to hide the clear-cut steps which theoretically exist in a series of variates differing by small mutations.

It is, therefore, impossible by mere inspection to decide whether or not an apparent case of continuous variations is truly such. It may represent congenital variation or it may merely depend on "acquired" variations. As the greater part of the variability which is observable in a population appears continuous, it is necessary to have methods which will allow its character to be recorded, so that it may be studied.

As the problem is one which is concerned with a population, this method must be statistical. The first step in any such investigation is to determine the character, the variation of which is to be recorded, and to decide how it is to be expressed in numerical terms. In such a case as the height of man, or the length of any of his parts, measurements in any units with a determined accuracy are possible, but if the character be a mental one, or is concerned with colour, the only possible procedure is to break up the whole range of variation into a series of arbitrary stages. The masses of figures which result from the measurement of a great number of individuals may then be arrayed by grouping together all those individuals who, in respect to the character under investigation, fall between two definite numerical points. If, now, the numbers of individuals within each of these groups be entered on a graph, whose coordinates are the number of individuals and the magnitude of the variant character, it will usually be found that these points lie in a curve, which has a maximum height at some definite value and reaches the base line at values which represent the extreme variations. Such a curve usually conforms to a definite shape, which can be expressed by an equation, and the whole of whose qualities can be determined from two expressions. The character of this curve, that of normal variation, implies that the variations which it records are due to chance events. If they be constrained in any way, either by external circumstances or by a tendency to division of the population into groups, the curve will be distorted and give evidence of the condition.

The statistical study of animal populations has become an independent discipline, biometry, of great value in the investigation, not only of such problems as those which are presented by fishery investigations, but also in relation to the government of human population.

The variations which occur within the limits of a species, defined as a mutually fertile group of animals, are of very great importance because they provide the raw material on which evolution is based. Only such variations as are heritable, that is, can be handed on from parent to offspring, can be of any value in bringing about the divergencies in structure on which evolution depends.

It is thus necessary to consider individually the possibility, and the mode, of inheritance of the three classes of variations which we have recognized.

LAMARCK'S THEORY

The problem of the "inheritance of acquired characters," that is, of the possibility or the reverse of the transmission to his offspring of a variation from the normal mode of a species which an individual owes, not to anything innate in the fertilized egg from which he himself arose, but to the influence of the environment, either directly exercised or represented by a reaction on the part of the animal, has claimed the attention of leading zoologists since Lamarck postulated it as an essential part of his theory of evolutionary mechanism.

This hypothesis was based on the belief that every animal tends to change its structure and habits during its individual existence in such ways that it becomes better fitted for life under the conditions to which it is subjected. If the characters so acquired be transmitted to its offspring, which in turn become adaptively modified, there will in time arise a group of individuals differing "specifically" from the original progenitor. Thus the acquired characters whose inheritance was postulated were of the special character of "direct adaptations" to definite environmental conditions, and represent special responses of the animal. Unfortunately, the reliable evidence in favour of such inheritance is extremely scanty, and no case is of exactly the nature required by Lamarck.

A number of zoologists have conducted experiments to test the possibility of the hereditary transmission of the results of injury. The vast numbers of experiments, made unintentionally by breeders, in the cropping of the ears and tails of dogs and other domestic animals, and the similar operations on man, have yielded negative results. Deliberate experiments of the same kind have been equally unsuccessful. But it may be argued that the reaction of the animals to such mutilation, involving merely the formation of a new skin over the wound, are not comparable to those which result in a direct adaptation.

Very few attempts have been made to alter the character of an animal by changing its environment, and to test the heritability of the modifications. Experiments on the desert mouse, Peromyscus, give no positive results, and a series of experiments claiming to establish such a transmission in the case of Amphibia and reptiles is under very grave suspicion, and has not yet been repeated.

The most satisfactory experiments are of an entirely different type. During the latter part of the 19th century it was observed that, in certain districts, South Lancashire, West Yorkshire, Northumberland, North Kent, in England, in some of the industrial districts of Germany, and near Pittsburgh, U.S.A., some moths were gradually changing their appearance. The change consisted in the occurrence of melanic individuals, in which the wing pattern became obscured by a nearly uniform black coloration. Such types were at first rare, but they gradually increased in number to such an extent that the original types of some of the species can no longer be found in some of these areas. It is quite certain that this occurrence of melanism is causally connected with the industrialization of the areas in which it is found, because, in country districts, the original wild type remains unaccompanied by the black forms. The change was formerly accounted for by a natural selection of the favoured melanics, but the origin of the variation was left unexplained.

Dr. Heslop Harrison has attempted to discover the cause of this melanism by a series of experiments based on the suggestion that it is induced by the direct action on the animal, or on its contained germ cells, of the mineral salts which are deposited from smoke on all the food plants in industrial areas. These experiments were carried out, in part, with a moth which had never been known in a melanic form, and consisted in feeding the caterpillars on clean food as a control, on plants collected in a smoky, "melanic" area, and on plants artificially infiltrated with manganese or lead salts. During the course of the experiments melanic individuals appeared amongst the moths resulting from the larvae which had been fed on the contaminated food, and their descendants, although fed on clean food, still exhibited the melanism whose inheritance conformed to the Mendelian type.

It is to be noted that this melanism was fully developed at its first appearance, and that, although it represents a reaction of the animal to the chemical agent applied, it has not been shown, and it is most improbable that this reaction is of any value to the individuals which present it. Thus the primary postulate of Lamarck is not met. Furthermore, it is not certain that this melanism is an "acquired character" in the ordinary meaning of that term. It is, perhaps, more probable that it results from a direct action of the metal ions on the germ cells, and that hence the original melanic individuals possessed that character from their initiation at fertilization, and would have displayed it even if they

had been fed throughout on untreated food.

Indeed, it is perhaps legitimate to regard this case as a parallel to the effect of X-rays in increasing the rate of production of mutations in Drosophila. These experiments, though they have every appearance of reliability, require confirmation, because the number of cases in which melanism has been induced is very small. There is, therefore, no single case in which an inheritance of an "acquired character" of the type which is required by a Lamarckian explanation of evolution can be proved to have occurred.

MENDELISM

Such variations as those which we have described as discontinuous, which arise fully formed by mutation, seem always to be heritable, and to be handed on from parents to offspring in accordance to definite laws, those of Mendelian or alternate inheritance. (*See* HEREDITY.) These laws were first formulated by Gregor Mendel, abbot of Brünn, in 1865, as the result of experiments in the hybridization of garden plants, but they remained unappreciated until 1900.

The typical Mendelian experiment involves the selection of two individuals which differ by a single definite character and are members of lines which breed true for this character. These individuals are then crossed and the character of all the resulting first hybrid generation (*f* 1) examined. It will in all cases be found that the whole *f* 1 generation is uniform with respect to the character under consideration, and that in nearly all cases it resembles one or other of the parents and does not exhibit a blend of their peculiarities. The character which appears in the first hybrid generation is said to be dominant, that which is hidden recessive. The whole of the individuals of the *f* 1 generation are allowed to mate at random, and the resulting second hybrid generation *f* 2 examined. It is found that the recessive character has reappeared in them, and that the individuals displaying it form one quarter of the whole. Thus the factor, whatever it be, which, when present in the fertilized egg, causes the appearance of the recessive character, must have been present in the individuals of the *f* 1 generation, uncontaminated by the simultaneous presence of that which causes the production of the dominant character. The complete fusion of the reproductive cells which occurs at fertilization, and the nature of the cell divisions which form part of the development of the animal, make it clear that all ordinary cells throughout the body of the hybrid will contain the factor for both dominant and recessive characters.

The nature of the phenomenon of segregation, the reappearance of both parental types in the second hybrid generation, can be investigated by breeding each member of that generation with its like. It is then found that recessive individuals bred together never produce dominants, rendering it clear that they do not contain the factor for the production of that character. The individuals which possess the dominant character are of two kinds; one-third of them, when bred with their like, produce only dominants, the other two-thirds produce dominants and recessives in a three to one proportion.

This occurrence receives a complete explanation if, in the process of formation of the gametes, each receives either the factor for the production of the dominant or that for the recessive character, but not both, that is, that the gametes are "pure" with respect to these characters.

The observed ratio of dominant to recessive individuals in the *f* 2 second hybrid generation can only occur if the original hybrids produce equal numbers of the two kinds of gametes, and the mating of these gametes is entirely haphazard.

It follows, therefore, that the individuals which are produced in the experiment are of two kinds, those which produce only one sort of gamete, either dominant producing or recessive, which are hence called homozygous, and those which produce equal numbers of the two types of gametes, the heterozygous form. Furthermore, the morphology of the individuals presenting the dominant character will not enable us to distinguish the homozygous from the heterozygous animals.

It is thus essential to distinguish between the phenotype, the appearance of an animal, and the genotype, its constitution, as determined by that of the gametes from whose fusion it arose. The simplicity of this explanation of the Mendelian ratio soon led zoologists to look for structures of the germ cells which would provide a suitable mechanism.

The fact that, in such a case as that which we have considered, it is immaterial which parent exhibits the dominant character, suggests that it is very improbable that this mechanism lies in the cytoplasm, because the amount of extra nuclear material contributed to the zygote by most Metazoan spermatozoa is extremely small in amount, although it seems to include a representation of most cell organs. Attention is thus directed to the nucleus. From the fact that the only permanent or more accurately, persistently recurring structures within the nucleus are the chromosomes, and that the number of these bodies is constant in all members of a species, it is clear that either the number of chromosomes in the nucleus of the gametes is half that in body cells, or that after fertilization the number in the zygote nucleus is in some way halved. In fact, in animals and plants both mechanisms may be found, but that which is universal in Metazoa is the reduction of the number in the gamete nucleus.

A full amount of the details of the process by which this result is reached will be found in the article CYTOLOGY; the fundamental phenomenon is that during the first stage of a division of a germ cell the chromosomes which compose a pair come together and lie side by side, so accurately adjusted to one another that they present the appearance of a single longitudinally split chromosome. In many cases the original chromosomes then split longitudinally, so that the nucleus appears to contain a number of threads, each composed of four chromosomes lying side by side. The number of such threads is necessarily half that of the chromosomes present during the division of an ordinary cell of the animal. (*See* CYTOLOGY.)

By two divisions which follow rapidly on one another, the four elements which build up each of these threads (paired chromosomes) become distributed into four cells, which, in the case of the male, are all functional spermatozoa, whilst in the female three are functionless, whilst the fourth is a mature or ripe ovum.

When fertilization takes place the nuclei of the ovum and spermatozoan swell up, become exactly similar in size and character, and chromosomes appear within them. From the nature of the process of maturation it is clear that each will contain only half the number present in the normal body cell. These nuclei then fuse, and the chromosomes present in them neither fuse, nor are they united in pairs, but each becomes attached to the spindle, splits longitudinally and is separated into two halves at the first cleavage division which immediately follows. Thus each cell of the new individual contains two complete sets of chromosomes, one derived from its female, the other from its male parent. The accuracy of this statement has been confirmed by observation of special cases in which one or more of the chromosomes of one of the parents is visibly different from the corresponding chromosome of the other.

When gametes come to be formed it is apparent that each will receive a single complete set of chromosomes, a haploid group, and that this group need not be purely maternal or paternal in nature, but will owe its constitution to chance, certain chromosomes coming from one and the rest from the other parent.

This process of gamete formation and fertilization obviously affords a mechanism which will completely account for the observed facts of a simple case of Mendelian heredity, if the factors which determine the development of the alternative characters lie in a chromosome.

Furthermore, it should follow that, in a cross involving two pairs of Mendelian characters, one of two things must happen. If the factors involved lie in the same chromosome the two characters will stick together in heredity, if they lie in different chromosomes, each should be inherited independently of the other, and the phenotypic nature of the individuals of the *f* 2 second hybrid generation will be determined by chance. Innumerable cases of each kind are now known.

In the case of Drosophila it has been shown that there are four groups of mutations, which are linked together in their inheritance.

These linkage groups differ very greatly in size. One includes only three mutant genes, two include about 80 each, whilst the fourth includes more than 200. If the linkage be dependent on the situation of the factors which produce these mutations in the same chromosome, it should follow that Drosophila should have a haploid number of four chromosomes. This is the case, and the individual chromosomes differ in length much as do the linkage groups.

Thus there is a very great probability that the factors which determine Mendelian heredity lie in the chromosomes. It remains to determine their distribution. It is clear from the fact that many mutations may co-exist in the same individual without interference, that the factors determining them are discrete entities; to them is given the name gene. It was observed first in Drosophila, and since in other animals and plants, that the linkage between genes which lie in the same chromosome is not absolute, that in a certain definite proportion, differing for every two mutations considered, a process which is called "crossing over" occurs; that is, genes which, as they lie in the same chromosome, should enter a single gamete, do not do so. This has been explained by a fracture of the chromosome involved between the two genes, and a reunion of its parts, not with each other, but with appropriate fragments of the homologous chromosome when the two lie side by side during the process of maturation. By arguments based on this hypothesis it has been shown that all the unexpected occurrences in the heredity of the mutations of Drosophila can be accounted for if the genes have a linear and fixed distribution along the chromosomes. Indeed, maps of the chromosomes of this animal, showing the location of each gene have been published.

The genes whose existence has been established in this way have many peculiar properties. They are extremely small bodies; their centres need be no more than four protein molecules apart, so that they must be composed of so small a number of molecules that the ordinary laws of physics and chemistry, which are statistical statements applicable only to bodies containing great numbers of molecules, need not necessarily be accurately followed by them.

The genes are clearly capable of growth and division, because many hundreds or thousands of cell divisions lie between the original zygote nucleus and the gametes which ultimately arise from it. They are individual, and extremely stable because they must persist throughout long evolutionary chains. Nevertheless, they must be capable of such modification as is necessary to cause the appearance of a mutation. It is possible that they owe this power to their minuteness. Thus genes present many of the characters of living organisms, in at least as high a degree as cells themselves. It has, in fact, been suggested that they are similar to the elements of the viruses which are responsible for many diseases.

It now remains to consider the possibility of a hereditary transmission of continuous variations. We have already seen that it is not certain that any such exist, and a consideration of the nature of any conceivable hereditary mechanism rather suggests that they do not. It is certain that the whole mechanism which determines the course of development exists in the fertilized egg, in part in the nucleus, in part certainly in the cytoplasm. Any congenital variation must result from some change in this mechanism, and such change must, in the end, be of a "chemical nature," including under that head all modifications of the relationship of the molecules with each other. But such changes must, in an ultimate analysis, be definite steps, not connected with one another by intermediates. Thus it is difficult to believe in the existence of true heritable continuous variations.

The only possible mode of investigating the inheritance of an apparently continuous variation is a statistical one. Two individuals which differ from one another are crossed and their offspring bred together, either with or without selective mating. The character under investigation is measured in the original parents and in all their descendants, and by an appropriate technique mathematical expressions of their resemblance to the original parents and to each other can be established. The results so obtained may be of very great value in discussions of the probable course of change of a population, which is the basis of evolution. But the mode by which these results are obtained is such that they can tell us nothing about individuals; they are applicable only to population. (*See* BIOMETRY.)

These results are probably not much less valuable for their special purpose if the variation considered be indeed dependent on a large number of genes, each exhibiting a Mendelian inheritance, and not truly continuous. The existence of this condition may be suggested by the fact that, if it obtains, the first hybrid generation will exhibit a smaller range of variation than that of the population of which the original parents were members, and that a long-continued course of inbreeding will much reduce the variability of the resulting population.

ANIMAL ECOLOGY

The aspects of zoology which we have so far considered are morphological in their outlook; in them it is form and not function which is the centre of interest. Even the development of genetics has led to the explanation of observed differences of structure by an inferred structure in chromosomes. But from the very beginning of zoology a different point of view has been adopted by some investigators. To the common man the activities of an animal are far more interesting than its structure, and professional zoologists, after an interval of half a century, are recognizing the justification for his belief. Thus a steadily increasing, though still small proportion of zoological research is devoted to physiology (*q.v.*), to the study of animal function. Such studies may, as in the recent remarkable developments of muscle physiology, be carried out without any reference to observed structural parts, but sooner or later, and in most cases from their beginning, they have to be brought into relation with morphology.

Animals are alive, and they live in a world presenting a wide range of variation of conditions, both inorganic and organic. The study of the relations between an animal and its environment, which is called bionomics or ecology (*q.v.*), is that proper to the field naturalist; it must be based on observation of natural conditions, interpreted by experiments designed to eliminate or evaluate the many factors which are involved. Such studies were first made an integral part of the science of zoology by Darwin. It is curious and unfortunate, though understandable, that whilst the reactions of Darwin's work on morphology and taxonomy were immediate and salutary, those studies which formed the main part of his life work were neglected by professed zoologists in general, and their further developments rapidly became fantastic because little or no attempt was made to test the validity of the innumerable hypothetical explanations of "observed" facts which were enunciated.

It has always been known that the distribution of animals over the world is not uniform; every schoolboy is aware that kangaroos are found only in Australia, and that the sea coast is inhabited by many birds which are seldom or never found inland. Study of this irregular distribution can be carried out in two ways; the fauna of some one natural area may be compared with that of others, or the detailed distribution of the animals within a small area may be discussed.

The results of the first type of investigation are fully treated in the article ZOOLOGICAL REGIONS. They are of interest from the light that they shed on the course of evolution, especially in regard to the migrations of animals and the existence of evolutionary centres. The value of these conclusions depends entirely on the extent to which the taxonomic divisions which are recognized, and the relationship of animals which are implied in them, are true representations of fact.

It is apparent that the existing distribution of animals cannot be accounted for on a basis of the geography of to-day, and a study of zoo-geographical regions necessarily leads the student into the perilous fields of palaeogeography. The results reached by an investigation of the distribution of the larger groups of animals must be shown to be consistent with one another; and with the distribution of land, water and mountain chains in past time which may be inferred from geological evidence. The only method of controlling the accuracy of the conclusions which are reached lies in palaeontological evidence, which gives definite information, even although partial, about the distribution of many

animals in the various periods of geological time.

Bionomics, or ecology (*q.v.*), is a study of a very different kind, still largely undeveloped, but capable of becoming of the highest importance, not only to theoretical zoology, but to those who are engaged in the commercial exploitation of animals and plants, and to all men who are exposed to the risk of infection by animal-borne diseases.

It is obvious that every animal is so far fitted for life that it is capable of maintaining itself under certain conditions. The field naturalists of the period before Darwin had observed that many structures of animals, even if very grotesque, played a definite part in their lives, and they reached the conclusion that every part and peculiarity of an animal had a definite function, being designed by the Creator to render service to the animal in that state of life in which it lived. This belief was at once seized on by theologians, as evidence of the existence of a beneficent Creator. Lamarck and Darwin both accepted the zoological aspect of these views, and the latter brought to their support a vast mass of observations drawn either from his own world-wide observations or from the reports of other writers. (*See* EVOLUTION; ADAPTATION.) But both Lamarck and Darwin rejected the idea that these "adaptations," whereby an animal was specially fitted for life in a definite environmental niche, were the result of deliberate design; each put forward a theory which purported to explain how they could here arise under the action of intelligible forces during the course of evolution.

The Lamarckian explanation, which has already been referred to, requires an inheritance of acquired characters of a kind which cannot be proved to occur, and has never met with any general acceptance.

Darwin's theory of natural selection provides, at the least, a complete formal explanation of all, or nearly all, evolution. But it still rests on an insecure basis. Darwin was the first zoologist to realize that an incredibly small proportion of all the animals which are born on the globe survive to maturity. The world population of herrings has probably been sensibly constant for a very long period, although each individual female herring lays many millions of eggs during its lifetime. Of these millions only a few individuals reach maturity and breed in their turn. The remainder die at some early stage, most of them serving as food for other animals. Darwin enquired whether the animals which survived were in any way different from those which perished; appealing to the facts of variation, which he collected for the first time, he claimed that it is obvious that, in general, the survivors will owe their escape to the fact that they were better fitted in some way or ways for life under the conditions to which they were subjected. That this view expresses a general truth can scarcely be doubted, but it is unsatisfactory that only very few (about 17) attempts have ever been made to establish its truth in individual cases, and to measure the intensity of the selection which is so exercised.

Having established the existence of a natural selection, Darwin proceeded to discuss whether or not the variations which secured the survival of the selected individuals would be inherited by their offspring. He appealed to the experience of breeders of domesticated animals, and thus, for the first time, brought the study of heredity into zoological science.

The evidence of breeders, imperfect though it was, justified Darwin in claiming that the favourable variations of the animals spared by natural selection would be passed on to their descendants. If, then, these in turn varied and new favourable variations were selected, the process would be repeated, with the result that after many generations the stock under consideration would have changed so as to become much better adapted to the conditions under which it lived. The knowledge of heredity which we now possess shows nothing which invalidates Darwin's postulates, and his doctrine is still available.

Darwin and his followers applied this conception to the explanation of a vast series of curious structures in animals and plants, and introduced subsidiary hypotheses such as that of sexual selection (*q.v.*) to explain special groups of cases. But only in very few of these many cases was any attempt made to show by direct observation and experiment that a structure did, in fact, fulfil the function for which it was supposed to be adapted. In many cases the suggested explanation became so far fetched as to be grotesque, with the result that a number of living zoologists have come to disbelieve in the existence of adaptation as an important phenomenon, and to have a contempt for those who still discuss it. Nevertheless, the existence of such evolutionary series as those of the horse and many others shows that a steady improvement of the mechanism of limbs has taken place as an adaptation to some special type of locomotion. And no zoologist who has any extended acquaintance with animals under their natural conditions can doubt that each is, in fact, very well fitted for the life it leads. Of late years the pendulum of opinion has been swinging back towards an essentially Darwinian position.

It is clear that any study of the relations existing between an animal and its environment must begin with an evaluation of the properties of the latter. Many circumstances make it more easy to express the conditions of a body of water, and especially of the sea, in figures, than those of a land area, and it is hence not surprising that the science of oceanography (*q.v.*—*see* also FISHERIES) was founded and has been developed by zoologists.

The earliest studies of the sea from this special standpoint by Edward Forbes showed that in the temperate zone the sea floor could be divided into regions on a basis of depth, and that each of these zones was inhabited by a characteristic group of animals. Forbes's zones, the littoral, laminarian, continental shelf, continental slope and abyssal regions, have been further subdivided by later work, and on them has been superposed a subsidiary grouping according to animal communities, which depends ultimately on the nature of the bottom. But in all these investigations the character of the sea water itself has been supposed to be constant. In fact, it varies in nature from season to season, and in some regions from day to day, even locally from hour to hour.

The more important qualities of the sea from a biological standpoint are its mean temperature and the daily and seasonal range in temperature; the amount of suspended matter and its chemical nature and physical state; the concentration of salts in solution, the amount and relative proportions of the ions of calcium, magnesium, potassium and sodium present; the concentration of hydrogen ions and the extent to which changes of such concentration is hindered by buffering; the absolute amounts of phosphates, nitrates, silica, and perhaps other substances present; the amount and the character of absorption of light which it effects; its viscosity and the amount of oxygen and carbon-dioxide in solution. All these qualities can be determined by physical and chemical measurements and definitely recorded in figures. They have been so studied, intensively and at regular intervals in those areas such as the seas off the west European coast and some of those off Canada and the United States where fisheries are important, and more generally by the great series of expeditions, of which the first and greatest was that of H.M.S. "Challenger," devoted to the study of the ocean and its life all over the world.

Variations in these qualities may affect animals either directly or through the plants, diatoms and peridinians, which form the basis of all marine life. Plants require for their growth carbon-dioxide, water, phosphates and nitrates, in addition to other elements which are always present in the sea in adequate amount; from these materials they can form the living protoplasm of their bodies and build up reserve stores of food. This process involves an expenditure of energy which plants, and plants alone, can obtain from sunlight. Thus variation in light intensity and duration will directly alter the amount of plant growth and thus determine the amount of animal life which can exist in any body of sea. But in British waters the total amount of plant life is determined, not by an insufficiency of daylight, but by the exhaustion of the stock of phosphates and nitrates in solution in the sea.

The penetration of light through sea water is so poor that no effective growth of plants is possible at a greater depth than some 40 fathoms. Thus all animal life below this depth is dependent on food which is carried down from the surface layers of the ocean. This transference is effected either by animals which migrate through a definite belt of water or by the slow descent of dead animals and plants.

But variations in the quality of sea water may affect animals much more directly. Temperature seems to be the limiting factor for very many animals; it may act in many ways. A high temperature may produce irreversible changes in the physical state of the protoplasm, either of some one organ or of an animal as a whole, or it may disorganize its controlling mechanism. Low temperatures may slow down the rate of living to such an extent that growth becomes impossible. These effects may be exerted on any part of the life history; reproduction may become impossible at a temperature at which the adult lives successfully.

Any change of the concentration of salts in the sea, by altering the osmotic pressure it exerts, directly affects all animals whose surface has the properties of a semi-permeable membrane, because changes in it lead either to abstraction of water from the animal or absorption of water by it at a rate which may become too great to be coped with. The efficiency of such changes as a bar to dispersion is shown by the very small fauna of brackish water.

Variations in the concentration of metallic ions may affect animals by destroying the physico-chemical mechanism on which the maintenance of its surface depends, or by rendering the processes of fertilization and cleavage impossible. The hydrogen ion concentration produces similar, though more intense effects. Variations in the amount of oxygen available clearly modify the activities of all animals, because the whole of their metabolism is based on a series of oxidizations and reductions. The real nature of the relationship between any animal and its environment can only be discovered by experiment. The factors involved are so numerous that it is evident that the problem can never be solved by observation of the natural occurrence of the species. Only by varying the conditions of the medium, one at a time, and observing the effects of these changes, not only on the whole animal at each stage of its life history, but also on its isolated organs, will it become possible to appreciate the real nature of the correlation which undoubtedly exists between the organism and its surroundings.

One of the most fundamental parts of this relationship is that which concerns food. Although every animal is ultimately dependent on plants for its nutrition, it may feed on other animals and be connected only by a food-chain with the basal source. The first step is thus to trace as fully as possible the series of forms involved in this chain, which can only be done by long-continued observation. The next is to work out the action of the feeding mechanism, so as to determine to what extent the animal is restricted to food of definite size or nature. Then it becomes important to investigate how far the food which actually enters the mouth can be made useful, which involves a study of the digestive enzymes, and of the conditions under which they will act. Finally, the problems of absorption and transport of food must be considered. The next stage is to add precision to the facts so learnt by determining the amount of food which can be collected and digested under definite conditions, and, so far as is possible, the mode of its utilization, whether for maintenance, general activities or for growth.

The respiratory mechanisms of the animal are necessarily involved in such studies; they may be dealt with in the form of the gross requirements of the animal over a period, or the detailed use of oxygen varying with such circumstances as exposure during an intertidal period may be determined.

The mode of transport of oxygen, its storage and the power that an animal possesses of incurring an oxygen debt, all form parts of such investigations. Indeed, the physiology of the chosen animal must be studied as a whole. When this has been done, not for one but for many animals, a science of comparative physiology will become possible; it will be parallel to comparative anatomy, based on evolution, and devoted to an understanding of the changes which have taken place in physiological activities, changes which must always have been such that the animals in which they were exhibited were workable wholes at every stage. Even with our present exceedingly scanty knowledge, the possibility of such a comparative physiology has become clear.

The chemical relationship which exists between many respiratory pigments, including haemoglobin, the colouring matter of red blood, and cytochrome, a respiratory pigment found in all cells of all plants and animals, points the way to many further investigations. But physiological investigations of a different kind are equally valuable. Cells, whether they compose the whole body of a Protozoan or are units in that of a Metazoan, have a physiology some parts of which can be determined. As cells come into contact with one another and with their surroundings only through their surface, it is evident that any knowledge of the nature and peculiarities of that surface will be of value in the solution of such problems as those presented by the process of cleavage and of histogenesis. The factors which are involved in the ordinary process of cell division, those which determine the position of the spindle and the movements of the chromosomes can clearly only be investigated by physiological methods.

An understanding of the mechanism which underlies the attainment of a definite structure at the end of development involves chemical and physical researches. Only certain special parts of this story have so far proved attackable. Fertilization (*q.v.*), the most fundamental point in all Metazoan development, can be analysed. Its effects are twofold; it causes the first of a great series of cell divisions to take place, and it brings together in a single individual, qualities which have existed separately in two.

It is certain, from the morphological studies of cytologists and geneticists, that the second effect is brought about by the fusion of the cytoplasms and nuclei of the two gametes, and the resulting regainment of a diploid set of chromosomes. It might be supposed that the last occurrence was responsible for the initiation of cleavage, but it has been shown that it is possible to cause cleavage to begin, and even to continue to maturity, by a variety of chemical and physical treatments, and that the artificially parthenogenetic individuals so formed may retain a haploid number of chromosomes. (*See* PARTHENOGENESIS.)

Thus the way is cleared for an investigation of the first effect in isolation; by physiological investigations it can be shown to involve a change in the character of the cell membrane which makes it permeable, and begins an active metabolism, and other changes in the cytoplasm which lead to the development of asters and a spindle.

Thus fertilization is multifold; some of its effects can be brought about by non-living agents, whilst others require a living cell. It will clearly be possible to investigate the mode of action of genes, and thus to gain a new line of attack on the problems of development. The most promising point for such an attack is on the determination of sex, which has been shown to be controlled in normal cases by a balance between the actions of one special pair of chromosomes, and the remainder. But in a few cases the sex of an animal may be changed long after the nuclear character has been fixed at fertilization. The physiological mechanisms which are involved are still unknown, though clearly open to investigation.

Finally, the ductless glands, and especially the thyroid, have been shown to exercise a control over the development of an animal. Unless their secretions be present at the right time and in adequate amount, the whole process of development may stop or be diverted, the remainder of the mechanism failing to act.

Thus physiological investigations are those which seem likely to add most to the content of zoology in the future. They will, however, do so not in isolation, but when brought into contact with morphology and ecology and with a study of the natural conditions of life of the animals on which they are carried out. One particular group of such studies, those of "Animal behaviour" (*see* PSYCHOLOGY, COMPARATIVE) is of the greatest potential value, not only because its subject is of vital importance in all bionomics, but also because of its great influence on psychology.

It seems evident that the success of such animals as the sparrow and starling, the rabbit and grey squirrel, which, introduced by man into new localities, have there developed into pests, is due as much to their "mental" characters, to morale, as to any special favourable qualities of their structure and general physiology.

ECONOMIC IMPORTANCE OF ZOOLOGY

Finally, it is necessary to say a few words about the economic importance of zoology. The breeding of domestic animals is a

great industry, after the rearing of food plants, the largest and most widespread that there is. It has been extraordinarily successful in producing breeds of sheep, cattle and horses, fitted for all conditions and uses. But its methods have been purely empirical, and consequently thus necessarily slow and wasteful in application.

It is certain that the application of modern genetics to animal breeding will lead to advances as great as those which have already been effected in the establishment of new races of cultivated plants. (*See* ANIMAL BREEDING, BREEDS AND BREEDING.)

The damage that animal pests, especially insects, do to crops, amounts perhaps to more than a hundred million pounds a year. These ravages can only be controlled by methods laid down by zoologists. The establishment of these methods depends on a full investigation of the life history and habits of the pest, and of all the factors in its surroundings which influence it. Climatic conditions, distance from water, alternative sources of food, the efficiency and mode of application of poisons, parasites and diseases of the pest, and animals that prey on it, have all to be investigated by the ordinary methods of bionomical research. (*See* ENTOMOLOGY: *Economic Entomology.*)

Fisheries (*q.v.*) present many problems, variations of the catch from season to season, the extent to which the breeding stock is becoming depleted, new fishing grounds, the possibility of artificial culture are all problems of the greatest complexity which fall within the province of the zoologist.

The control of insect-borne diseases of man must rest on measures determined by zoologists, and their work may touch human affairs even more directly. (*See* PARASITOLOGY.) The results of a differential fertility of different sections of a nation's population, and of a mixing of races are things of the greatest importance to Governments, and should receive their attention to a much greater extent than they in fact do. But they can only be investigated by men who include zoology in their equipment, whether they be biometricians or followers of some other school. (*See* BIOMETRICS; EUGENICS; POPULATION.)

The purpose of this article is to indicate, very imperfectly, the interrelationships of the various types of study which are included under the wide heading of zoology. Each is more fully explained in a separate article, to which reference should be made.

The more important of these are:—The articles dealing with the separate phyla and other groups; PROTOZOA; SPONGES; COELENTERATA; PLATYHELMIA; NEMERTINA; NEMATODA; ANNELIDA; ARTHROPODA; MOLLUSCA; POLYZOA; BRACHIOPODA; VERTEBRATA; CYTOLOGY; HISTOLOGY; EMBRYOLOGY; HEREDITY; EVOLUTION; PALAEONTOLOGY; ZOOLOGICAL REGIONS; ECOLOGY; MORPHOLOGY; BIOMETRY; PHYSIOLOGY; PSYCHOLOGY; ANIMAL BEHAVIOUR.

ZORILLA, the name of several African carnivorous mammals, allied to the badger (*Taxidea*), but lightly built and long tailed, superficially resembling skunks. They comprise the genera *Ictonyx* and *Poecilictis*. (*See* CARNIVORA.)

ZORN, ANDERS (1860–1920), Swedish artist, was born at Mora, in the province of Dalecarlia, Sweden, on Feb. 18, 1860. He began his artistic career as a water-colourist, adopting the style and tastes of Egron Lundgren under whom he studied. He became well-known in Sweden through the exhibition in 1880 of a small girl's head, entitled "Mourning," now in the National Museum, Stockholm. An increasing reputation brought him orders for many portraits and he earned the means to travel. His first trip to Spain greatly advanced his work through contact with vivid colourings in nature and in life. In the three years following he maintained a studio in London and afterwards travelled in eastern Europe and in Algiers. These years saw the best of his water-colours, such as "Our Daily Bread," "Gipsy Forge," "Caique Rower," "Algiers Harbour," "Lapping of the Waves," "En première," "The Fish Market at St. Ives" and "Rositi Mauri." From 1887 to 1893 he lived chiefly in Paris, though making long visits to Sweden in the summer. In these years he took up oil painting. Also he abandoned the realist manner and became primarily an impressionist and colourist. In 1893 he made his first visit to the United States as Swedish commissioner accompanying that country's art exhibit at the Columbian Exposition in Chicago. He made six subsequent trips, and painted portraits of many American millionaires as well as of Cleveland, Taft, Roosevelt, Hanna, Hay and others. After 1896 he began to spend more of his time in Mora, where he loved and encouraged the Dalecarlian peasant life and customs. He died there on Aug. 22, 1920.

As a painter Zorn is an excellent example of the matured impressionistic group. He won renown for his characteristic and picturesque portraits in which, owing to his sensitive study of values, he gives proper play to light and half-tones. In addition to millionaires, international celebrities, and members of royal families, he painted red-cheeked Swedish girls, country peasant women, and old artisans at their work, and some of his best pictures, such as the studies of his mother in "Mona," of the watchmaker "Djos Mats," the smith "Bosl Anders," and the fiddler "Hins Anders," belong in the latter categories. He loved the nude, especially the play of water on or around the body. "Naked," "After Bathing," "En première," "Renaissance," "By Lake Siljan," "Improvised Bath," and "Mother and Daughter" are among the best of these. In later years he turned more and more to Dalecarlian peasant subjects of which should be mentioned "Midsummer Dance," "Dance at Gopsmor," "Vallkulla," "Early Christmas Service" and "Watering the Horses."

Zorn's status as an etcher is still in controversy between those who would rank him among the masters and those who feel he has been over-rated. He learned the art from his fellow-countryman, Axel Haig, in 1882, but did not do important work in the medium until 1889. At his best, especially in the series of etched portraits of Renan, Anatole France, Proust, Rodin and Verlaine in France, of the Scandinavians Strindberg and Carl Larsson, of Grover Cleveland, Henry Marquand and Senator Mason in America, of the old artisans of Mora in "Djos Mats," "An Old Soldier," and "Vicke," and in "Mona" and "The Toast," he shows genius of the highest sort. Of his nudes "Early Morning," "My Model and My Boat," "Edö," "Precipice," "Wet," "Sappho," all enjoyed favour, but he pursued the theme until it became monotonous, and many of his later plates were quite common in conception. Zorn also won fame as a sculptor, one of his most popular pieces in Sweden being the statute of Gustavus Vasa at Mora (1901). The "Faun and Nymph," "Morning Bath" and "Broken Pitcher" also show his high ability in this field.

Asplund, *Anders Zorn: his Life and Work* (1921); *The Etchings of Anders Zorn*, introduction and notes by E. M. Lang (1923); *Anders Zorn* (1925) in Modern Masters of Etching series.

ZORNDORF, a village of Prussia, in the Oder valley, north-east of Cüstrin. It is famous as the scene of a battle in which the Prussians under Frederick the Great defeated the Russians under Fermor, on Aug. 25, 1758 (*see* SEVEN YEARS' WAR).

ZOROASTER, the founder of the national religion of the Iranian people from the time of the Achaemenidae to the close of the Sassanian period. The name (Ζωροάστρης) is the corrupt Greek form of the Iranian *Zarathustra* (new Persian, *Zardushi*). Its signification is obscure. Zoroaster was famous in antiquity as the founder of the wisdom of the Magi. His name occurs first in a fragment of Xanthus (29), and in the *Alcibiades* of Plato (i. p. 122), who calls him the son of Oromazdes. Occidental writers sometimes call him a Bactrian, sometimes a Median or

Persian (*cf.* Jackson, *Zoroaster,* 186). According to Pliny (*Nat. Hist.* vii. 15), he laughed on the very day of his birth—a statement found also in the *Zardusht-Nāma*—and lived in the wilderness upon cheese (xi. 97). Plutarch speaks of his intercourse with the deity, and compares him with Lycurgus and Numa (*Numa,* 4). Dio Chrysostom, Plutarch's contemporary, declares that neither Homer nor Hesiod sang of the chariot and horses of Zeus so worthily as Zoroaster, of whom the Persians tell that, out of love to wisdom and righteousness, he withdrew himself from men, and lived in solitude upon a mountain. The mountain was consumed by fire, but Zoroaster escaped uninjured and spoke to the multitude (vol. ii. p. 60). Plutarch, drawing partly on Theopompus, speaks of his religion in his *Isis and Osiris* (cc. 46–47). He gives a faithful sketch of the doctrines, mythology and dualistic system of the Magian Zoroaster.

Agathias remarks (ii. 24), with truth, that it is no longer possible to determine with any certainty when he lived and legislated. "The Persians," he adds, "say that Zoroaster lived under Hystaspes, but do not make it clear whether by this name they mean the father of Darius or another Hystaspes. But, whatever his date, he was their teacher and instructor in the Magian religion, modified their former religious customs, and introduced a variegated and composite belief."

He is nowhere mentioned in the cuneiform inscriptions of the Achaemenidae, although Darius and his successors were Zoroastrians. The Avesta, our principal source for the doctrine of Zoroaster, is comparatively reticent; on the subject of his person and his life with regard to his date it is, naturally enough, absolutely silent. The 13th section, or *Spend Nask*, which was mainly consecrated to the description of his life, has perished; while the biographies founded upon it in the 7th book of the *Dinkard* (9th century A.D.), the *Shāh-Nāma,* and the *Zardusht-Nāma* (13th century) are full of wonders and fabulous histories and miraculous deliverances.

The personality of Zoroaster is historic, but in the later Avesta, and in writings of more recent date, he is presented in a legendary light and endowed with superhuman powers. At his appearing all nature rejoices (*Yasht,* 13, 93); he enters into conflict with the demons and rids the earth of their presence (*Yasht,* 17, 19); Satan approaches him as tempter to make him renounce his faith (*Vendidad,* 19, 6).

The Gāthās alone within the Avesta claim to be the *ipsissima verba* of the prophet, and are expressly called "the Gāthās of the holy Zoroaster" (*Yasna,* 57, 8), his actual expressions in presence of the assembled congregation, the last genuine survivals of the doctrinal discourses with which—as the promulgator of a new religion—he appeared at the court of King Vīshtāspa.

The person of the Zoroaster in these hymns is a mere man, standing always on the solid ground of reality, whose only arms are trust in his God and the protection of his powerful allies. He had to face forms of outward opposition, the unbelief and lukewarmness of adherents, even his own misgivings as to the truth and final victory of his cause. The range of the emotions which find their immediate expression in these hymns is wide and the whole breathes originality, is psychologically accurate and just, so that in the Gāthāṣ we have the beginnings of the Zoroastrian religion. They give no historical account of the life and teaching of their prophet, but are general admonitions, asseverations, solemn prophecies, directed to the faithful or to the princes, and are generally dialogues with God and the arch-angels, whom he repeatedly invokes as witnesses to his veracity with many allusions to personal events which later generations have forgotten. Their extent is limited and their meaning is frequently dubious and obscure.

The Person of the Prophet.—As to his birthplace the testimonies are conflicting. According to the Avesta (*Yasna,* 9, 17), Airyanem Vaējō, on the river Dāitya, the old sacred country of the gods, was the home of Zoroaster. There on the river Dāreja, if the passage (*Vend.*, 19, 4) is correctly interpreted, stood the house of his father; and the *Bundahish* (20, 32 and 24, 15) says expressly that the river Dāreja lay in Airan Vej, on its bank was the dwelling of his father, and that there Zoroaster was born. According to the *Bundahish* (29, 12), Airan Vej was situated in the direction of Atropatēne, and consequently Airyanem Vaējō is generally identified with the district of Arrān on the river Aras (Araxes), close by the north-western frontier of Media. Other traditions make him a native of Rai (Ragha, Ῥάγαι). According to *Yasna,* 19, 18, the *zarathushtrōtema,* or supreme head of the Zoroastrian priesthood lived in Sassanian times, in Ragha. The Arabic writer Shahrastānī endeavours to reconcile the two traditions by the theory that his father lived at Atropatēne, while the mother was from Rai. In his home he is said to have enjoyed the celestial visions and the conversations with the arch-angels and Ormazd mentioned in the Gāthās. There, too, according to *Yasht,* 5, 105, he prayed that he might convert King Vīshtāspa. He then appears to have quitted his native district. On this point the Avesta is wholly silent; an obscure passage (*Vasna,* 53, 9) intimates that he found an ill reception in Rai. Finally, in the person of Vīshtāspa, a prince resident in east Iran, he gained the powerful protector and faithful disciple of the new religion whom he desired—after almost superhuman dangers and difficulties, which the later books depict in lively colours. In the epic legend, Vīshtāspa was king of Bactria; in the later Avesta he became a half-mythical figure, the last in the series of heroes of east Iranian legend. In the Gāthās he appears as a quite historical personage; to his power and good example the prophet is indebted for his success. In *Yasna,* 53, 2, he is spoken of as a pioneer of the doctrine revealed by Ormazd. In the relation between Zoroaster and Vīshtāspa lies the germ of the state church which afterwards became subservient to the dynasty and sought its protection from it.

Among the grandees of the court of Vīshtāspa were two brothers, Frashaoshtra and Jāmāspa, both, according to the later legend, vizirs of Vīshtāspa. Zoroaster's wife, Hvōvi, was the daughter of Frashaoshtra, and the husband of his daughter, Pourucista, was Jāmāspa. The rôle of intermediary was played by the pious queen Hutaosa. Apart from this, the new prophet relies especially upon his own kindred (*hvaētush*). His first disciple, Maidhyōimāongha, was his cousin: his father was, according to the later Avesta, Pourushaspa, his mother Dughdōvā, his great-grandfather Haēcataspa, and the ancestor of the whole family Spitama, for which reason Zarathushtra usually bears this surname. His sons and daughters are repeatedly spoken of. His death is nowhere mentioned in the Avesta; in the *Shāh-Nāma* he is said to have been murdered at the altar by the Turanians in the storming of Balkh.

As to the date of Zoroaster; King Vīshtāspa has no place in any historical chronology, and the Gāthās give no hint on the subject. According to the Arda Vīrāf, 1, 2, Zoroaster taught some 300 years before the invasion of Alexander. Assyrian inscriptions relegate him to a more ancient period. Eduard Meyer (see *Ancient Persia*), conjecturally puts the date of Zoroaster at 1000 B.C., with Duncker (*Geschichte des Altertums,* 4, 78). This may be too high: but, in any case, Zoroaster belongs to a prehistoric era. Probably he belonged to the old school of Median Magi, and appeared first in Media as the prophet of a new faith, but met with sacerdotal opposition, and turned his steps eastward. In the east of Iran the novel creed first acquired a solid footing, and subsequently reacted with success upon the West.

Zoroastrianism.—Zoroaster taught a new religion rooted in the old Iranian—or Aryan—folk-religion, of which we can form some representation by comparison with the religion of the Veda. The Aryan folk-religion was polytheistic. Worship was paid to popular divinities, such as the war-god and dragon-slayer Indra, to natural forces and elements such as fire, but the Aryans also believed in the ruling of moral powers and of an eternal law in nature. On solemn occasions the inspiring drink soma (*haoma*) was consumed by the devout. Numerous coincidences with the Indian religion survive in Zoroastrianism, side by side with astonishing diversities.

In the Avesta the evil spirits are called *daēva* (Modern Persian *dīv*), while the Aryans of India gave the name of *dēva* to their good spirits, the spirits of light. An alternative designation for deity in the *Rig-Veda* is *asura*. In the later hymns of the *Rig-*

Veda and in later India, only *evil* spirits are called *asuras*, while in Iran the corresponding word *ahura* was, and is, the designation of God the Lord. *Ahura* indicates the more sublime and awful divine character, for which man entertains reverence and fear: *daēva* denotes the kind gods of light, the anthropomorphic deities. Zoroaster elevated the conception of the *Ahura*, and he degraded the daivas (*daēvas*) to the rank of malicious powers and devils. In one *Ahura*, he concentrated the whole of the divine character, and conferred upon it the epithet of "the wise" (*mazdāo*). The Wise Lord (*Ahurō Mazdāo*—later *Ormazd*) is the primaeval spiritual being, the All-father, who was existent before ever the world arose. From him that world has emanated, and its course is governed by his foreseeing eye. His guiding spirit is the Holy Spirit, which wills the good: yet it is not free, but restricted, in this temporal epoch, by its antagonist and own twin-brother (*Yasna*, 30, 3), the Evil Spirit (*angrō mainyush, Ahriman*), who in the beginning was banished by the Good Spirit by means of the famous ban contained in *Yasna*, 45, 2, and since then drags out his existence in the darkness of Hell as the principle of ill. In the Gāthās the Good Spirit of Mazda and the Evil Spirit are the two great opposing forces in the world, and Ormazd himself is to a certain extent placed above them both. Later the Holy Spirit is made directly equivalent to Ormazd; and then the great watch-word is: "Here Ormazd, there Ahriman!" The very *daēvas* are only the inferior instruments, the corrupted children of Ahriman, from whom come all that is evil in the world. The *daēvas*, attacked by Zoroaster as the enemies of mankind, are still, in the Gāthās, the perfectly definite gods of old popular belief—the idols of the people. Zoroaster regarded them as spurious deities, and their priests and votaries as idolaters and heretics. In the later, developed, system the *daēvas* are the evil spirits in general, and their number has increased to millions. Some have names; and among them the old Aryan divinities emerge here and there, *e.g.*, Indra and Nāonhaitya. With some, of course, such as the god of fire—the connection with the good deity was indissoluble. Other powers of light, such as Mitra the god of day (Iranian *Mithra*), survived in popular belief till the later system incorporated them in the angelic body. The authentic doctrine of the Gāthās had no room either for the cult of Mithra or for that of the Haoma. Beyond the Lord and his Fire, the Gāthās only recognize the archangels and certain ministers of Ormazd, who are personifications of abstract ideas. The essence of Ormazd is Truth and Law (*asha* = Vedic *rta*): this quality he embodies, and its personification (though conceived as sexless) is always his constant companion. The essence of the wicked spirit is falsehood: and falsehood, as the embodiment of the evil principle, is more frequently mentioned in the Gāthās than Ahriman himself.

Zoroaster says that he had received from God a commission to purify religion (*Yasna*, 44, 9) from the grossly sensual elements of *daēva* worship. This self-contained theory of the universe and logical dualistic principle were destined to terminate in monotheism. Later sects sought to rise from it to a higher unity in other ways. Thus the Zarvanites represented Ormazd and Ahriman as twin sons proceeding from the fundamental principle of all—*Zrvana Akarana*, or limitless time.

Ethically, too, the new doctrine stands on a higher plane, and represents, in its moral laws, a superior civilization. It is the religion of the settled grazier and the peasant, while the ruder *daēva*-cult holds its ground among the uncivilized nomadic tribes, who sacrificed the cow, the gift of Ormazd to man, a sacred animal.

The Doctrine of Zoroaster may be summarized as follows:—

At the beginning of things there existed the two spirits who represented good and evil (*Yasna*, 30, 3). Both spirits possess creative power, which manifests itself positively in the one and negatively in the other. Ormazd is light and life, and creates all that is pure and good—in the ethical world of law, order and truth. His antithesis is darkness, filth, death and produces all that is evil in the world. Until then the two spirits had counterbalanced one another. The ultimate triumph of the good spirit is an ethical demand of the religious consciousness and the quintessence of Zoroaster's religion.

The evil spirit with his wicked hosts appears in the Gāthās much less endowed with the attributes of personality and individuality than does Ahura Mazda. Within the world of the good Ormazd is Lord and God alone. In this sense Zoroastrianism is often referred to as the faith of Ormazd or as Mazdaism. Ormazd in his exalted majesty, the ideal figure of an Oriental king, has in conjunction with himself a number of genii—for the most part personifications of ethical ideas. These are his creatures, his instruments, servants and assistants. They are comprehended under the general name of *ameshā spentā* ("immortal holy ones") and are the prototypes of the seven *amshaspands* of a later date. These are—(1) Vohu Manō (εὔνοια), good sense, *i.e.*, the good principle, the idea of the good, the principle that works in man inclining him to what is good; (2) Ashem, afterwards Ashem Vahishtem (Plutarch's ἀλήθεια), the genius of truth and the embodiment of all that is true, good and right, upright law and rule—ideas practically identical for Zoroaster; (3) Khshathrem, afterwards Khshathrem Vairīm (εὐνομία), the power and kingdom of Ormazd, which have subsisted from the first but not in integral completeness, the evil having crept in like tares among the wheat: the time is yet to come when it shall be fully manifested in all its unclouded majesty; (4) Ārmaiti (θοψία), due reverence for the divine, *verecundia*, spoken of as daughter of Ormazd and regarded as having her abode upon the earth; (5) Haurvatāt (πλοῦτος), perfection; (6) Ameretāt, immortality. Other ministering angels are Gēush Urvan ("the genius and defender of animals"), and Sraosha, the genius of obedience.

As soon as the two separate spirits (cf. *Bundahish*, 1, 4) encounter one another, their creative activity and at the same time their permanent conflict begin. The history of this conflict is the history of the world. All creation divides itself into that which is Ahura's and that which is Ahriman's.

In the soul of man is the object of the war. Man is a creation of Ormazd, who therefore has the right to call him to account. But Ormazd created him free in his determinations and in his actions, wherefore he is accessible to the influences of the evil powers. Man takes part in this conflict by all his life and activity in the world. By a true confession of faith, by every good deed, word and thought, by continually keeping pure his body and his soul, he impairs the power of Satan and strengthens the might of goodness, and establishes a claim for reward upon Ormazd; by a false confession, by every evil deed, word and thought and defilement, he increases the evil and renders service to Satan.

The life of man falls into two parts—its earthly portion and that which is lived after death. The lot assigned to him after death is the result and consequence of his life upon earth. On the works of men here below a strict reckoning will be held in heaven (according to later representations, by Rashnu, the genius of justice, and Mithra). All the thoughts, words and deeds of each are entered in the book of life as separate items—all the evil works, etc., as debts. Wicked actions cannot be undone, but in the heavenly account can be counterbalanced by a surplus of good works. Only in this sense can an evil deed be atoned for by a good deed. Of a real remission of sins the old doctrine of Zoroaster knows nothing, whilst the later Zoroastrian Church admits repentance, expiation and remission. After death the soul arrives at the *cinvatō peretu*, or accountant's bridge, over which lies the way to heaven. Here the statement of his life account is made out. If he has a balance of good works in his favour, he passes forthwith into paradise (*Garō demāna*) and the blessed life. If his evil works outweigh his good, he falls finally under the power of Satan, and the pains of hell are his portion for ever. Should the evil and the good be equally balanced, the soul passes into an intermediary stage of existence (the *Hamēstakāns* of the Pahlavi books) and its final lot is not decided until the last judgment. This court of reckoning is called *ākā*. The course of law cannot be turned aside by sacrifice, nor by the grace of God.

In the Gāthās Zoroaster speaks usually in general terms of the divine commands and of good and evil works, of the renunciation of Satan, adoration of Ormazd, purity of soul and body, and care of the cow. Ceremonial worship is hardly mentioned. The Gāthās contain revelations concerning the last things and the future lot, whether bliss or woe, of human souls, promises

for true believers, threatenings for misbelievers, and Zoroaster's firm confidence as to the future triumph of the good.

Zoroaster believed that the calling of a prophet took place precisely when it did with special reason. It was, he held, the final appeal of Ormazd to mankind at large. The fulness of time was near, the kingdom of heaven was at hand. Through the whole of the Gāthās runs the pious hope that the end of the present world is not far distant. He himself hopes, with his followers, to live to see the decisive turn of things, the dawn of the new and better aeon. Ormazd will summon together all his powers for a final decisive struggle and break the power of evil for ever; by his help the faithful will achieve the victory over their detested enemies, the *daēva* worshippers. Thereupon Ormazd will hold a general ordeal. Forthwith begins the one undivided kingdom of God in heaven and on earth. This is called, sometimes the good kingdom, sometimes simply the kingdom. Here the sun will for ever shine, and all the pious and faithful will live a happy life, which no evil power can disturb, in the eternal fellowship of Ormazd and his angels. Every believer will receive as his guerdon the inexhaustible cow and the gracious gifts of the Vohu Manō.

Later Development.—For most of the people Zoroaster's doctrine was too abstract. In the later Avesta are Mithra and popular divinities like the angel of victory, Verethraghna, Anāhita (Anāitis), the goddess of the water, Tishrya (Sirius), and other heavenly bodies, invoked with special preference. The Gāthās know nothing of the belief in the *Fravashi*, or guardian angels of the faithful. *Fravashi* properly means "confession of faith," and when personified comes to be regarded as a protecting spirit.

With the new teaching arose a widely spread priesthood (*āthravanō*) who systematized its doctrines, organized and carried on its worship, and laid down the minutely elaborate laws of the Vendidad for the purifying and keeping clean of soul and body, such as the numerous ablutions, bodily chastisements, love of truth, beneficial works, support of comrades in the faith, alms, chastity, improvement of the land, arboriculture, breeding of cattle, agriculture, protection of useful animals, as the dog, the destruction of noxious animals, and the prohibition either to burn or to bury the dead. These are to be left on the appointed places (*dakhmas*) and exposed to the vultures and wild dogs. In the worship the drink prepared from the *haoma* (Indian *soma*) plant had a prominent place. Worship in the Zoroastrian Church was devoid of pomp; it was independent of temples. Its centre was the holy fire on the altar. The fire altars afterwards developed to fire temples. In the sanctuary of these temples the various sacrifices and high and low masses were celebrated. As offerings meat, milk, show-bread, fruits, flowers and consecrated water were used. The priests were the privileged keepers and teachers of religion. They only performed the sacrifices (Herodotus, i. 132), educated the young clergy, imposed the penances; they in person executed the ceremonies of purification and exercised a spiritual guardianship and pastoral care of the laymen. Every young believer in Mazda, after having been received into the religious community by being girt with the holy lace, chose a spiritual guide (*ratu*).

In eschatology a change took place. The last things and the end of the world are relegated to the close of a long period of time (3,000 years after Zoroaster), when a new Saoshyant is to be born of the seed of the prophet, the dead come to life, and a new incorruptible world begins.

Zoroastrianism was the national religion of Iran, and was professed by Turanians as well. The worship of the Persian gods spread to Armenia and Cappadocia and over the whole of the Near East (Strabo, xv. 3, 14; xi. 8, 4; 14, 76). Of the Zoroastrian Church under the Achaemenides and Aeracides little is known. After the overthrow of the dynasty of the Achaemenides a period of decay set in. Yet the Aeracides and the Indo-Scythian kings as well as the Achaemenides were believers in Mazda. The national restoration of the Sassanides brought new life to the Zoroastrian religion and long-lasting sway to the Church. Protected by this dynasty, the priesthood developed into a completely organized state church, which employed the power of the state in enforcing strict compliance with the religious law-book hitherto enjoined by their unaided efforts only. The head of the Church (Zarathushtrōtema) had his seat at Rai in Media and was the first person in the state next to the king. The formation of sects was at this period not infrequent (*cf.* MANICHAEISM). The Mohammedan invasion (636), with the persecutions of the following centuries, was the death-blow of Zoroastrianism. In Persia itself only a few followers of Zoroaster are now found (in Kerman and Yezd). The PARSEES (*q.v.*) in and around Bombay hold by Zoroaster as their prophet and by the ancient religious usages, but their doctrine is a pure monotheism.

ZORRILLA, JOSÉ (1817–1893), Spanish poet and dramatist, was born at Valladolid and read law at the University of Toledo, but after a year of idleness there, he fled to Madrid and started a paper which was suppressed by the Government. He then fell into great poverty, but was brought into notice by an elegiac poem, declaimed at Larra's funeral in Feb. 1837. His *Cantos del trovador* (1841), a collection of national legends versified with infinite spirit, secured for the author the place next to Espronceda in popular esteem. National legends also supply the themes of his dramas, though in this department Zorrilla somewhat compromised his reputation for originality by adapting older plays which had fallen out of fashion. For example, in *El Zapatero y el Rey* he recasts *El montañés Juan Pascual* by Juan de la Hoz y Mota; in *Don Juan Tenorio* he adapts from Zamora's *No hay deuda que no se pague, y Convidado de piedra*, and from the elder Dumas's *Don Juan de Marana* (which itself derives from *Les âmes du purgatoire* of Prosper Mérimée). But his rearrangements usually contain original elements, and in *Sancho Garcia, El Rey loco*, and *El Alcalde Ronquillo* he apparently owes little to any predecessor. In 1855 he emigrated to Mexico where he was protected by the Emperor Maximilian. He returned in 1866 to find himself a half-forgotten classic. His old fertility was gone, and new standards of taste were coming into fashion. He was always poor, and for some 12 years after 1871 he was in the direst straits. A small pension secured him from actual want in his old age, and the reaction in his favour became an apotheosis. In 1889 he was publicly crowned at Granada as the national laureate.

ZOSIMUS, bishop of Rome from March 18, 417 to Dec. 26, 418, succeeded Innocent I. and was followed by Boniface I. For his attitude in the Pelagian controversy, *see* PELAGIUS. He took a decided part in the protracted dispute in Gaul as to the jurisdiction of the see of Arles over that of Vienne, but without settling the controversy.

ZOSTEROPS, a genus of birds inhabiting various parts of the Old World and especially common in Australia and New Zealand. In New Zealand, the most familiar species (*Z. caerulescens*) is called white-eye or blight-bird, the last an allusion to its clearing the fruit-trees from blight.

ZOUAVE, the name given to certain infantry regiments in the French Army. The corps was first raised in Algeria in 1831 with one and later two battalions, and recruited solely from the Zouaves, a tribe of Berbers, dwelling in the mountains of the Jurjura range (*see* KABYLES). In 1838 a third battalion was raised and the regiment thus formed was commanded by Lamoricière. Shortly afterwards the formation of the *Tirailleurs algériens*, the Turcos, as the corps for natives, changed the enlistment for the Zouave battalions, and they became, as they

now remain, a purely French body. Three regiments were formed in 1852, and a fourth, the Zouaves of the Imperial Guard, in 1854. The Crimean War was the first service which the regiments saw outside Algeria. There are now six regiments, of three battalions each, stationed in North Africa.

The Papal Zouaves were formed in defence of the Papal states by Lamoricière in 1860. After the occupation of Rome by Victor Emmanuel in 1870, the Papal Zouaves served the government of national defence in France during the Franco-Prussian War, and were disbanded during the siege of Paris.

ZOUTPANSBERG, a district forming part of the Low Veld of the northern Transvaal. It is, for the most part, low-lying undulating country, bounded on the north by the Limpopo river. The principal hills are the Zoutpansberg, which consist of three parallel ranges, which are due to the dislocation of Waterberg rocks with strike faults. Copper is mined at Messina, near the Limpopo, and gold has been found at several places. Owing to its isolation and malaria, the district has been little developed, and the population was regarded as typical "backveld Boers." A railway has been built, linking Messina with the Transvaal system, and with Lourenço Marques.

ZUCCARELLI, FRANCESCO (1702–1788), Italian painter, was born at Pitigliano in Tuscany, and studied in Rome under Morandi, and Nelli. He was a foundation member of the Royal Academy and had the patronage of royalty and of many wealthy English collectors, for whom he executed his principal works—generally landscapes with classic ruins and small figures. A large number of them are at Windsor Castle.

ZUCCARO, the name of two Italian painters.

I. Taddeo Zuccaro (1529–1566), one of the most popular painters of the so-called Roman mannerist school, was the son of Ottaviano Zuccaro, an almost unknown painter at St. Angelo in Vado, where he was born in 1529. He was employed by popes Julius III. and Paul IV., by Della Rovere, duke of Urbino, and other patrons. His best frescoes were a historical series painted on the walls of a palace at Caprarola, built for Cardinal Alessandro Farnese, for which Taddeo also designed rich decorations in stucco relief after the style of Giulio Romano and other pupils of Raphael. Nearly all his paintings were in fresco, very large in scale, and often in *chiaroscuro*. He died in Rome in 1566.

II. Federigo Zuccaro (*c.* 1539–1609) was in 1550 placed under his brother Taddeo's charge in Rome, and worked as his assistant; he completed the Caprarola frescoes. Federigo was perhaps the most popular artist of his generation. Probably no other painter has ever produced so many enormous frescoes crowded with figures on the most colossal scale, extravagant in attitude. His first work of this sort was the completion of the painting of the dome of the cathedral at Florence in 1579; the work had been begun by Vasari but left unfinished at his death. Federigo was recalled to Rome by Gregory XIII. to continue in the Pauline chapel of the Vatican the scheme of decoration begun by Michelangelo during his failing years, but he left Italy owing to a quarrel with members of the papal court. He visited Brussels, and there made a series of cartoons for the tapestry-weavers. In 1574 he went to England, where he received commissions to paint the portraits of Queen Elizabeth, Mary, queen of Scots, Sir Nicholas Bacon, Sir Francis Walsingham, Lord High Admiral Howard and others. Federigo was soon recalled to Rome to finish his work on the vault of the Pauline chapel. In 1585 he accepted an offer by Philip II. of Spain to decorate the new Escorial at a yearly salary of 2,000 crowns. He returned to Rome in 1588 and there founded in 1595, under a charter confirmed by Sixtus V., the Academy of St. Luke, of which he was the first president. Its organization suggested to Sir Joshua Reynolds the plan for the English Royal Academy.

He also wrote on art, see *L'Idea de' Pittori, Scultori, ed Architetti* (Turin, 1607), and two volumes (Bologna 1608) describing his visit to Parma and a journey through central Italy. He died at Ancona in 1609.

ZUG, the smallest undivided canton of Switzerland, is centrally situated. Of its 92·6 sq.m., 83·6% are productive, forests covering 20·1 sq. miles. Of the unproductive area, 12·6 sq.m. are covered by lakes, 2·8 by the Aegeri See (wholly within the canton), and the balance by part of the Lake of Zug. The pear-shaped Rossberg mass, with its central summit (Wildspitz, 5,193 ft.) thrusts its pointed end (Zugerberg, 3,261 ft.) north-north-west into the canton. Its steep western flanks fall to the Lake of Zug, the less steep eastern slopes descend to the basin and waters of the Aegeri See. Still eastwards, the land rises to the Hohe Rone mass (4,055 ft.) near its eastern boundary. From Aegeri a gorge carries the river Lorze to the low land at the north end of the Zugerberg, round which it curves to enter the lower end of the Lake of Zug. The Lorze leaves this lake slightly west of its point of entrance and flows north-north-west, over fertile lowlands, to its junction with the river Reuss—the latter stream forming the north-west boundary of the canton. Zug thus holds a strategical position at the entrance to the higher land. Railways connect the capital both with Lucerne and with Zürich, while lines running along the shores of the Lake of Zug join at the Arth-Goldau station of the St. Gotthard railway. (*See* Schwyz.) An electric railway connects Zug and Oberaegeri; 2¾ m. distant, on the south-east of the lake, is Morgarten, the site of the great victory of the Confederates over the Habsburgs (1315). In 1920 the total population was 31,569, of whom 30,262 were German-speaking, 949 Italian-speaking, and 246 French-speaking, while 27,579 were Catholics, 3,841 Protestants and 29 Jews. Since 1828 the canton has formed part of the diocese of Basle. All towns are small. Zug (pop. 9,500) is the largest; north of it is Baar, and west-north-west is Cham, which, though next in order of size, are merely large villages. The canton forms a single administrative district and contains 11 communes. By the Constitution of 1814 the "Landsgemeinde," or primitive democratic assembly, which had existed since 1376, became an electoral body to choose a cantonal council. In 1848 the remaining functions of the Landsgemeinde were abolished. The 1873–76 Cantonal Constitution was largely replaced by the present one in 1894. The legislature (*Kantonsrat*) of 79 deputies has one member to every 400 inhabitants, and the seven members of the executive (*Regierungsrat*) are elected directly by popular vote.

The earlier history of the canton is closely linked with that of its capital, Zug (*see* below); subsequently violent disputes about the distribution of the French pensions took place (1728–38). In 1798 its inhabitants opposed the French, and during the period of the Helvetia republic it was one of the districts of the huge canton of the Waldstätten, but became a separate canton again on the fall of the republic (1803). As one of the six Catholic cantons, it joined the Sonderbund (1845) and shared in the war of 1847. In 1848, and again in 1874, it voted against the acceptance of the proposed Federal Constitution.

ZUG, capital of the Swiss canton of that name, a picturesque little town at the N.E. corner of the lake of Zug, and at the foot of the Zugerberg (3,255 ft.), which rises gradually, its lower slopes thickly covered with fruit trees. Pop. (1920), 9,499, mainly German-speaking and Roman Catholics.

The town, first mentioned in 1240, is called an *oppidum* in 1242, and a *castrum* in 1255. In 1273 it was bought by Rudolph of Habsburg from Anna, the heiress of Kyburg. After this it was governed by a bailiff, appointed by the Habsburgs, and a council, and was much favoured by that family. Several country districts (Baar, Menzingen, and Aegeri) had each its own "Landsgemeinde" but were governed by one bailiff, also appointed by the Habsburgs; these were known as the "Aeusser Amt," and were always favourably disposed to the Confederates. On the 27th of June 1352 both the town of Zug and the Aeusser Amt entered the Swiss Confederation; but in September, 1352, Zug had to acknowledge its own lords again, and in 1355 to break off its connection with the league. About 1364 the town and the Aeusser Amt were recovered for the league by the men of Schwyz, and from this time Zug took part as a full member in all the acts of the league. In 1379 the German king Wenceslaus exempted Zug from all external jurisdictions, and in 1389 the Habsburgs renounced their claims, reserving only an annual payment of twenty silver marks, and this came to an end in 1415. In 1385 Zug joined the league of the Swabian cities against Leopold of Habsburg,

and shared in the victory of Sempach. Between 1379 (Walchwil) and 1477 (Cham) Zug had acquired various districts in her own neighbourhood, principally to the north and the west, which were ruled till 1798 by the town alone as subject lands. At the time of the Reformation Zug clung to the old faith and was a member of the "Christliche Vereinigung" of 1529. In 1586 it became a member of the Golden League.

ZUG, LAKE OF, one of the minor Swiss lakes, north of that of Lucerne. It is formed by the Aa, which enters the southern extremity of the lake. The Lorze enters at its northern end, but 1¼ m. further W. issues from the lake to pursue its course towards the Reuss. The lake has an area of about 15 sq.m., is about 9 m. long, 2½ m. wide, and has a maximum depth of 650 ft., while its surface is 1,368 ft. above sea-level. Most of the lake is in the canton of Zug, but 3¼ sq.m. at the southern end is in Schwyz, while ¾ sq.m., to the N. of Immensee is in Lucerne.

ZUHAIR [Zuhair ibn Abī Sulmā Rabī' a ul-Muzanī] (6th century), one of the six great Arabian pre-Islamic poets. Of his life practically nothing is known save that he belonged to a family of poetic power; his stepfather, Aus ibn Hajar, his sister, Khansā, and his son, Ka'b ibn Zuhair, were all poets of eminence. He is said to have lived long, and at the age of one hundred to have met Mohammed. His home was in the land of the Banī Ghatafān. His poems are characterized by their peaceful nature and a sententious moralizing. One of them is contained in the *Moallakāt*.

As a whole his poems have been published by W. Ahlwardt in his *The Diwans of the six Ancient Arabic Poets* (London, 1870); and with the commentary of al-A'lam (died 1083) by Count Landberg in his *Primeurs arabes* (Leiden, 1889). (G. W. T.)

ZUIDER ZEE (Zoi'dŭr zā), a shallow gulf, penetrating far into the northern Netherlands, communicating with the North Sea but almost cut off from it at low water by the Frisian islands (Texel, etc.) and the sandbanks of the Wadden Zee. It is probable that in the middle ages the coast line to the north of the Zuider Zee was an almost continuous series of dunes, but, before the 14th century the Zuider Zee acquired something of its present form. The greater part of the water-covered area has a depth of less than 15ft. at low water. An area of over 12,000ac. of rich land was reclaimed from Lake Y in the neighbourhood of Amsterdam, at the time of the building of the North Sea ship canal in the middle of the 19th century, by the construction of a sea-dike and locks cutting off Amsterdam from the Zuider Zee. The earliest plans for reclaiming the Zuider Zee date from the 17th century but it was not until 1918 that the sanction of the Netherlands legislature was obtained to the carrying out of a vast scheme of reclamation commenced in 1920. (*See* COAST PROTECTION AND LAND RECLAMATION; HOLLAND.) (N. G. G.)

The Zuider Zee at present covers an area of about 3,570 square kilometres. When drained, there will remain a fresh-water lake covering 1,450 square kilometres. The reclaimed land, divided into four polders by the new lake (to be called Yssel Lake), and the mouths of the Amstel and the Yssel, will cover an area of almost 2,112 square kilometres. Of this land, 1,950 sq.km., will consist of exceedingly fertile soil. To render this drainage possible, the Zuider Zee must be separated from the North Sea by a dike to be completed in 1934. The length of the dike will be 29·3 kilometres and the height (presumably) six metres above the water level. The top will be only two metres in width. On the inside berm, however, there will be room for a road 17 metres wide, over which a double-track railway will run. The dike will be equipped with 30 discharge sluices, each 10 metres wide and five metres deep. Further, there will be two locks, respectively 10 and six metres wide. These sluices and locks will maintain communication between the Yssel Lake and the North Sea. It is hoped that the north-western polder, covering an area of 220 sq. km., will be completed at the same time as the dike and that all four polders will be in exploitation by 1958.

ZULA, a small town near the head of Annesley Bay on the African coast of the Red Sea. Ruins in its vicinity are supposed to mark the site of the ancient emporium of Adulis (Ἀδουλίς, Ἀδουλεί), the port of Axum (*q.v.*) and chief outlet in the early centuries of the Christian era for the ivory, hides, slaves and other exports of the interior. Cosmas Indicopleustes saw here an inscription of Ptolemy Euergetes (247–222 B.C.); and it is conjectured that the town may have been the Berenice Panchrysus of the Ptolemies.

In 1857 an agreement was entered into by Dejaj Negusye, a chief of Tigré, in revolt against the Negus Theodore of Abyssinia, to cede Zula to the French. Negusye was defeated by Theodore, and the commander of a French cruiser sent to Annesley Bay in 1859 found the country in a state of anarchy. No further steps were taken by France to assert its sovereignty, and Zula, with the neighbouring coast, passed nominally to Egypt in 1866. Zula was the place where the British expedition of 1867–68 against Theodore disembarked. Annesley Bay affording safe and ample anchorage for the largest ocean-going vessels. The road made by the British from Zula to Senafé on the Abyssinian plateau is still in use. The authority of Egypt having lapsed, an Italian protectorate over the district of Zula was proclaimed in 1888, and in 1890 it was incorporated in the colony of Eritrea (*q.v.*).

ZULOAGA, IGNACIO (1870–), Spanish painter, was born at Eibar in the Basque country on July 26, 1870, the son of the metal-worker and damascener Placido Zuloaga, and grandson of the organizer and director of the royal armoury in Madrid. He was intended for an architect, and to this end was sent to Rome, where he at once followed his strong impulse to become a painter. After six months' work he completed his first picture, which was exhibited at the Paris Salon of 1890. Continuing his studies in Paris, he was strongly influenced by Gauguin and Toulouse-Lautrec. But his true style developed after his return to Spain, when he had studied the work of Velazquez, Zurbaran, El Greco and Goya. His own country was slow in acknowledging the young artist whose strong, decorative, rugged style was the very negation of the aims of such well-known modern Spanish artists as Fortuny, Madrazo and Benlliure. It was in Paris, and then in Brussels and other continental art centres, that Zuloaga was first hailed by the reformers as the regenerator of Spanish national art and as the leader of a school. He is now represented in almost every great continental gallery.

Two of his canvases are at the Luxembourg, one at the Brussels Museum ("Avant la Corrida"), and one ("The Poet Don Miguel") at the Vienna Gallery. The Pau Museum owns an interesting portrait of a lady, the Barcelona Municipal Museum the important group "Amies," the Venice Gallery, "Madame Louise"; the Berlin Gallery, "The Topers." Other examples are in the Budapest, Stuttgart, Ghent and Posen galleries and in many important private collections.

A fully illustrated account of the artist and his work, by M. Utrillo, was published in a special number of *Forma* (Barcelona, 1907).

ZULULAND, a country of south-east Africa, forming the north-eastern part of the province of Natal, in the Union of South Africa. The "Province of Zululand," as it was known from 1898 to 1910, lies between 26° 50′ and 29° 15′ S. and 30° 40′ and 33° E. The country has an area of 10,427 sq.m., and in 1921 the natives numbered 250,829 and the white inhabitants 3,985. Zululand includes, in the north, the country of the Ama Tonga, Zaambauland and other small territories not part of the former Zulu kingdom, and stretches north from the lower Tugela to the southern frontier of Portuguese East Africa. It is bounded on the south-east by the Indian ocean, on the north and north-west by the Utrecht and Vryheid districts of Natal, and by Swaziland. For an account of the physical features, geology, climate, flora, fauna and general geography *see* under NATAL and SOUTH AFRICA, UNION OF.

Although incorporated in Natal, most of Zululand is held as native reserves. With the exception of the townships and a small region occupied by Boer farmers, all the land is vested in the Crown, and very little has been parted with to Europeans. These Crown lands are, in effect, native reserves. European influence has, however, modified native life, but the tribal organization continues, with its elaborate system of laws regulating the inheritance of personal property (which consists chiefly of cattle). Complexity arises from the practice of polygamy and the exchange of cattle made upon marriage. The social organization is almost patriarchal. (X.)

HISTORY

At what period the Zulu (one of a number of closely allied septs) first reached the country to which they have given their name is uncertain; they were probably settled in the valley of the White Umfolosi river at the beginning of the 17th century, and they take their name from a chief who flourished about that time. By certain shipwrecked Europeans they were described as very proud and haughty, careful in the preparation of food, very cleanly in person and keeping strict watch over their women. That was in 1756. At the close of the 18th century the Zulu were an unimportant tribe, numbering a few thousands only. At that time the most powerful of the neighbouring tribes was the Umtetwa (mTetwa or Aba-Tetwa), which dwelt in the country north-east of the Tugela. Its ruler was a chief who had had in early life an adventurous career and was known as Dingiswayo (the Wanderer). He divided the young men of his tribe into *impis* (regiments), and the Umtetwa became a formidable military power. In 1805 he was joined by Chaka (Tshaka, born *c.* 1783), the son of the Zulu chief Senzangokona; on the latter's death in 1810 Chaka, through the influence of Dingiswayo, was chosen as ruler of the Ama-Zulu, though not the rightful heir. About 1812 Dingiswayo was captured and put to death by Zwide, chief of the Undwandwe clan.

Chaka and Dingaan.—After Dingiswayo's death the Umtetwa army then placed themselves under Chaka, who not long afterwards conquered the Undwandwe. By the incorporation of these tribes Chaka made the Zulu a powerful nation. He strengthened the regimental system adopted by Dingiswayo and perfected the discipline of his army. A new order of battle was adopted—the troops being massed in crescent formation, with a reserve in the shape of a parallelogram ready to strengthen the weakest point. This order of battle was not, however, entirely new to the Bantu and probably Chaka's greatest innovation was the introduction of the stabbing assegai. At the same time the size of the shield was increased, the more completely to cover the body of the warrior. Military kraals were formed for the warriors.

Chaka had but two ways of dealing with the tribes with whom he came in contact; either they received permission to be incorporated in the Zulu nation or they were attacked. In the latter case the only persons spared were young girls and growing lads. About 1820, after the Zulu had conquered Natal, Mosilikatze (properly Umsilikazi), a general in the Zulu army, having incurred Chaka's wrath by keeping back part of the booty taken in an expedition, fled with a large following across the Drakenberg. Mosilikatze was not of the Zulu tribe proper, and he and his followers became known as the Matabele. Chaka's own dominions coincided almost exactly with the limits of Zululand and Natal.

Chaka seems to have first come into contact with Europeans in 1824, when he was visited by F. G. Farewell and a few companions. To them he made a grant of the district of Port Natal. Chaka, who was cured of a wound by the skill of one of Farewell's companions, showed himself friendly to Europeans. He wished to send an embassy to England, but the Cape Government turned back his envoy. Again Chaka sent chiefs to Cape Town, but before their arrival he had been murdered (Sept. 23, 1828) at a kraal on the Umvote, about 50 miles from Port Natal. Chaka was a victim to a conspiracy by his half-brothers Dingaan and Umthlangana, while a short time afterwards Dingaan murdered Umthlangana and made himself king.

Bloodstained as had been Chaka's rule, that of Dingaan appears to have exceeded it in wanton cruelty. In 1835 Dingaan permitted the British settlers at Port Natal to establish missionary stations in the country in return for a promise made by the settlers not to harbour fugitives from his dominions. In 1836 American missionaries were also allowed to open stations; in Nov. 1837 Dingaan received Pieter Retief, the leader of the first party of Boer immigrants to enter Natal. The story of Retief's mission, the massacre of the Boer leader and the fighting which followed is told in the article NATAL. In the result Dingaan's army was totally defeated on Dec. 16, 1838 ("Dingaan's Day"), by a Boer force under Andries Pretorius. A year later he was overthrown, the Boers in Natal (Jan. 1840) supporting his brother Mpande (usually called Panda) in rebellion against him. Dingaan passed into Swaziland in advance of his retreating forces, and was there murdered, while Panda was crowned king of Zululand by the Boers.

Panda and Cetewayo.—When in 1843 the British succeeded the Boers as masters of Natal they entered into a treaty with Panda, who gave up to the British the country between the upper Tugela and the Buffalo rivers, and also the district of St. Lucia bay (which, however, was not then occupied). Less war-like than Chaka and Dingaan, Panda remained throughout at peace with the Government of Natal. Bishop Schreuder, a Norwegian missionary long resident in Zululand, gave Sir Bartle Frere the following estimate of the three brothers who successively reigned over the Zulu:—"Chaka was a really great man, cruel and unscrupulous, but with many great qualities. Dingaan was simply a beast on two legs. Panda was a weaker and less able man, but kindly and really grateful, a very rare quality among Zulus. He used to kill sometimes, but never wantonly or continuously." In 1856 war broke out between two of Panda's son, Cetewayo and Umbulazi, who were rival claimants for the succession. A battle was fought between them on the banks of the Tugela in Dec. 1856, in which Umbulazi and many of his followers were slain. The Government of Natal in 1861 obtained the formal nomination of a successor to Panda; and Cetewayo was appointed. Panda died in Oct. 1872 and Cetewayo succeeded in 1873.

Border disputes with the Transvaal Boers were fairly frequent during Panda's reign. The Boers had obtained from Panda in 1854 a cession of the Utrecht district; in 1860 they tried to get from the king a road to the sea at St. Lucia bay. In 1861 a quarrel arose between Cetewayo and another of his brothers, Umtonga (who had been originally designated by Panda as his successor). Umtonga fled to Utrecht; Cetewayo offered the Boers a strip of land if they would surrender his brother. This they did on condition that Umtonga's life was spared. The Boers got their strip of land and beaconed it off in 1864. When, however, in 1865 Umtonga fled to Natal, Cetewayo declared that he had lost his part of the bargain, for he feared that Umtonga might be used to supplant him. He thereupon caused the boundary beacons to be removed and put forward a claim to certain lands north of the Pongola, ceded by the Swazi to the Lyndenburg Boers in 1855, on the ground that the Swazi were the vassals of the Zulu and had no right to part with any of their territory.

Cetewayo's Rule.—Such was the position when by his father's death Cetewayo (*q.v.*) became absolute ruler of the Zulu. As far as possible he revived the military methods of his uncle Chaka. His rule over his own people was tyrannous. By Bishop Schreuder he was described as "an able man, but for cold, selfish pride, cruelty and untruthfulness worse than any of his predecessors." The tension between Cetewayo and the Transvaal over border disputes continued and when in 1877 Great Britain annexed the Transvaal the disputes were transferred to the new owners of the country. A commission appointed by the lieutenant-governor of Natal reported in July 1878, and found almost entirely in favour of the Zulu on the boundary disputes. Sir Bartle Frere, then high commissioner, thought the award "one-sided and unfair to the Boers" (Martineau, *Life of Frere*, ii. xix.). Frere, moreover, was convinced that it was necessary in the interests of South Africa that the power of Cetewayo be curtailed. In furtherance of this general plan a British resident was to be accepted. These demands were made to Zulu deputies on Dec. 11, 1878, a definite reply being required by the 31st of that month.

The Zulu War.—Cetewayo returned no answer, and in Jan. 1879 a British force under Gen. Thesiger (Lord Chelmsford) invaded Zululand. Chelmsford had a force of 5,000 Europeans and 8,200 natives; Cetewayo an army of fully 40,000 men. Chelmsford divided his force into three columns—their entry was unopposed—which were to converge on Ulundi, the royal kraal. On Jan. 22 the centre column (1,600 Europeans, 2,500 natives), which had advanced from Rorke's Drift, was encamped near Isandhlwana; on the morning of that day Chelmsford moved out with a small force to support a reconnoitring party. After he had left, the camp, in charge of Col. Durnford, was surprised by a Zulu army nearly 10,000 strong. The British were overwhelmed and almost every man killed, the casualties being 806 Europeans (more

than half belonging to the 24th regiment) and 471 natives. The reconnoitring party returned to find the camp deserted; next day they retreated to Rorke's Drift, which had been the scene of an heroic and successful defence. After the victory at Isandhlwana several impis of the Zulu army had moved to the Drift. The garrison stationed there, under Lieuts. Chard and Bromhead, numbered about 80 men of the 24th regiment, and they had in hospital between 30 and 40 men. Late in the afternoon they were attacked by about 4,000 Zulu. On six occasions the Zulu got within the entrenchments, to be driven back each time at the bayonet's point. At dawn the Zulu withdrew, leaving 350 dead. The British loss was 17 killed and 10 wounded.

In the meantime the right column under Col. Pearson had reached Eshowe from the Tugela; on receipt of the news of Isandhlwana most of the mounted men and the native troops were sent back to Natal, leaving at Eshowe a garrison of 1,300 Europeans and 65 natives. This force was hemmed in by the enemy. The left column under Col. Evelyn Wood, which had advanced from Utrecht, found itself obliged to act on the defensive.

News of Isandhlwana reached England on Feb. 11 and on the same day about 10,000 men were ordered to South Africa. The first troops arrived at Durban on March 17. On the 29th a column under Chelmsford, consisting of 3,400 Europeans and 2,300 natives, marched to the relief of Eshowe, entrenched camps being formed each night. On April 2 the camp was attacked at Ginginhlovo, the Zulu being repulsed. Their loss was estimated at 1,200, while the British had only two killed and 52 wounded. The next day Eshowe was relieved. Wood, who had been given leave to make a diversion in northern Zululand, on March 28 occupied Hlobane (Inhlobane) mountain. The force was, however, compelled to retreat owing to the unexpected appearance of the main Zulu army, which nearly outflanked the British. There were 100 casualties among the 400 Europeans engaged. At midday next day the Zulu army made a desperate attack, lasting over four hours, on Wood's camp at Kambula; the enemy—over 20,000 strong—was driven off, losing fully 1,000 men, while the British casualties were 18 killed and 65 wounded.

By the middle of April nearly all the reinforcements had reached Natal, and Chelmsford reorganized his forces. The 1st division, under Maj.-gen. Crealock, advanced along the coast belt and was destined to act as a support to the 2nd division, under Maj.-gen. Newdigate, which, with Wood's flying column, an independent unit, was to march on Ulundi from Rorke's Drift and Kambula. Owing to difficulties of transport it was June before Newdigate was ready to advance. On the 1st of that month the prince imperial of France (Louis Napoleon), who had been allowed to accompany the British troops, was killed while out with a reconnoitring party. On July 1 Newdigate and Wood had reached the White Umfolosi, in the heart of the enemy's country. On the 4th they crossed the river, the force numbering 4,200 Europeans and 1,000 natives. Within a mile of Ulundi the British force, formed in a hollow square, was attacked by a Zulu army numbering 12,000 to 15,000. The battle ended in a decisive victory for the British, whose losses were about 100, while of the Zulu some 1,500 men were killed (*see* ULUNDI). Sir Garnet Wolseley had been sent out to supersede Chelmsford and reached headquarters on July 7.

Cetewayo's Downfall.—After Ulundi the Zulu army dispersed, most of the leading chiefs tendered their submission, and Cetewayo became a fugitive. On Aug. 27 the king was captured and sent to Cape Town. His deposition was formally announced to the Zulu, and Wolseley drew up a new scheme for the government of the country. The Chaka dynasty was deposed and the Zulu country portioned among 11 Zulu chiefs, John Dunn, a white adventurer, and Hlubi, a Basuto chief, who had done good service in the war. A resident was appointed who was to be the channel of communication between the chiefs and the British Government. This arrangement was productive of much bloodshed and disturbance, and in 1882 the British Government determined to restore Cetewayo to power. In the meantime, however, blood feuds had been engendered between two chiefs of the royal house, Usibepu (Zibebu) and Hamu, and the tribes who supported the ex-king and his family. Cetewayo's party (who became known as Usutus) suffered severely at the hands of the two chiefs, who were aided by a band of white freebooters. When Cetewayo was restored Usibepu was left in possession of his territory, while Dunn's land and that of the Basuto chief (the country between the Tugela and the Umhalatuzi, *i.e.*, adjoining Natal) was constituted a reserve. Before very long this new arrangement proved as futile as had Wolseley's. A collision soon took place; Usibepu's forces were victorious and, on July 22, 1883, led by a troop of mounted whites, he made a sudden descent upon Cetewayo's kraal at Ulundi, which he destroyed, massacring such of the inmates of both sexes as could not save themselves by flight. The king escaped, though wounded, into the reserve; he died in Feb. 1884.

Cetewayo left a son, Dinizulu, who sought the assistance of some of the Transvaal Boers against Usibepu, who was defeated and driven into the reserve. These Boers, led by Lukas Meyer, claimed as a reward for their services the greater and more valuable part of central Zululand. On May 21 the Boer adventurers had proclaimed Dinizulu king of Zululand; in August following they founded the "New Republic," carved out of Zululand. The British Government intervened, and in Dec. 1884 took formal possession of St. Lucia bay, caused the Boers to reduce their territorial demands, and in its truncated form recognized the New Republic—which was in 1888 incorporated in the Transvaal and has since 1903 formed the Vryheid division of Natal.

Zululand Annexed.—Seeing that peace could be maintained between the Zulu chiefs only by the direct exercise of authority the British Government annexed Zululand in 1887 and placed it under a commissioner responsible to the governor of Natal. In the following year Dinizulu rebelled. After a sharp campaign (June–Aug. 1888), the Usutu losing 300 killed in one encounter, Dinizulu fled into the Transvaal. He surrendered to the British in November; in April 1889 he and two of his uncles were found guilty of high treason and were exiled to St. Helena.

Under the administration of Sir Melmoth Osborn, the commissioner, and his successor Sir Marshal Clarke, and the district magistrates, the Zulu became reconciled to British rule.

At the close of 1897 Zululand, in which Tongaland had been incorporated, was handed over by the imperial Government to Natal. In 1898 Dinizulu was allowed to return and was made a "government induna." Officially one of several chiefs he was, in fact, regarded by most of the Zulu as the head of their nation.

In 1905 a poll tax of £1 on all adult males was imposed by the Natal legislature; this tax was the ostensible cause of a revolt in 1906 among the natives of Natal. Bambaata, the leader of the revolt, fled to Zululand. After a hard campaign the rebellion was crushed by July 1906. In all some 3,500 Zulus were killed and about 3,000 taken prisoners, the majority of them being released in 1907. (*See* further, NATAL: *History.*) Zululand remained, however, in a disturbed condition, and a number of white traders and officials were murdered. Dinizulu had been accused of harbouring Bambaata, and in Dec. 1907 the Natal Government felt justified in charging him with high treason, murder and other crimes. A military force entered Zululand and Dinizulu surrendered without opposition. He was brought to trial in Nov. 1908 and in March 1909 was found guilty of harbouring rebels. The more serious charges against him were not proved. Sentenced to four years' imprisonment, he was released on the establishment of the Union in 1910 by Gen. Botha, who had in his early days been one of the founders of the "New Republic." Dinizulu was settled on a farm in the Transvaal, where he died in Oct. 1913.

There had been no disturbance of public order since 1907 and European influence gradually modified native life. In 1905 the coast belt had been opened up to white planters for the cultivation of sugar cane and from 1922 onward the cultivation of cotton was also undertaken. Most of the country remained, however, a native reserve and the tribal system continued. The Zulu sense of nationality remained strong, and though the rivalry between the Usutu and Usibepu parties continued most of the Zulu desired a paramount chief of the house of Chaka—and in the view of competent European residents in Zululand the appointment of such a chief would have been for the benefit of the people. Zulu opinion was shown at a great indaba held at Eshowe in June,

1925, in honour of the prince of Wales when 40,000 Zulus assembled. On that occasion Dinizulu's son Solomon, though officially of no higher rank than the other chiefs, was selected to address the prince as the spokesman of the nation.

ZUMALACÁRREGUI, TOMÁS (1788–1835), Spanish Carlist general, born at Ormaiztegui, Navarre, Dec. 29, 1788. In his youth he served under Gaspar de Jauregui, one of the minor guerrillero leaders. He then entered the army, but was disgraced for his support of Don Carlos.

Appointed commander-in-chief in Navarre by Don Carlos, he escaped from Pamplona on the night of Oct. 29, 1833, and took command the next day in the Val de Araquil of the few hundred ill-armed and dispirited guerrilleros that constituted his whole force. In a few months Zumalacárregui had organized the Carlist forces into a regular army. Whether as a guerrillero leader, or as a general conducting regular war in the mountains, he proved unconquerable. By July 1834, he had made it safe for Don Carlos to join his headquarters. The pretender, bigoted and narrow-minded, was afraid of Zumalacárregui's personal influence with the soldiers, and Zumalacárregui was hampered by the intrigues of the court. Yet by June 1835 he had made the Carlist cause triumphant to the north of the Ebro: had he been allowed to march on Madrid, he might well have put Don Carlos in possession of the capital. He reluctantly obeyed the order to besiege Bilbao, was wounded in the leg on June 14, 1835, attended by Don Carlos's physicians, and died on June 24, 1835—not without suspicion of poison.

ZUMPT, the name of two German classical scholars. KARL GOTTLOB ZUMPT (1792–1849) was born on April 1, 1792 in Berlin, and died at Karlsbad on June 25, 1849. He was professor of Latin literature at Berlin University. His chief work was his *Lateinische Grammatik* (1818). He edited Quintilian's *Institutio oratoria* (1831), Cicero's *Verrines* and *De officiis* (1837), and Curtius. He also published *Annales veterum regnorum et populorum* (3rd ed. 1862), a work in chronology down to A.D. 476, and other antiquarian studies. His nephew, AUGUST WILHELM ZUMPT (1815–1877), was born on Dec. 4, 1815, at Königsberg, and died on April 22, 1877, and was professor in the Friedrich Wilhelm Gymnasium. He is known chiefly in connection with Latin epigraphy, his papers on which (collected in *Commentationes epigraphicae*, 2 vols., 1850–54) brought him into conflict with Mommsen. His works include *Monumentum Ancyranum* (with Franck, 1847) and *De monumento Ancyrano supplendo* (1869); *Studia Romana* (1859); *Das Kriminalrecht der röm. Republik* (1865–69); *Der Kriminalprozess der röm. Republik* (1871); editions of Namatianus (1840), Cicero's *Pro Murena* (1859) and *De lege agraria* (1861). Ihne incorporated materials left by him in the 7th and 8th vols. of his *Römische Geschichte* (1840).

ZUÑI, a native town on the Zuñi river, an affluent of the Little Colorado, in western New Mexico, sole remnant of a Pueblo population of wholly distinct speech and unknown origin. First seen by Niza in 1539; the then seven Zuñi towns were entered by Coronado in 1540 after the storming of Hawikuh, one of the chief of them. A mission was established in 1629; in 1670 Hawikuh was destroyed by the Apache; in 1680, on the outbreak of the Pueblo rebellion, only three towns remained, at one of which, Halonawa, the reconquered Zuñi population was concentrated around a mission, now in ruins. About this rose the congested pueblo in tiers up to four and five storeys of masonry. The population has been stationary around 1,600 for more than a century. Next to the Hopi, the Zuñi have best preserved the aboriginal Pueblo customs and religion. Their concentration in a single town has made this the largest of all the pueblos and led to a somewhat more systematic organization of their institutions, which, however, remain theocratic. The greatest Zuñi ritual is the Shalako.

See M. C. Stevenson, *Bur. Am. Ethn. Rep.*, vol. xxiii. (1904); F. H. Cushing, *idem*, vols. ii., iv., xiii. (1883–96), *Zuñi Folk Tales*, 1901, *Zuñi Breadstuff* (Indian Notes and Monographs, vol. viii., 1920); A. L. Kroeber, *Am. Mus. Nat. Hist. Anthr. Pap.*, vol. xviii. (1917); E. C. Parsons, *Am. Anthr. Ass. Mem.*, vol. iv. (1917).

ZUNZ, LEOPOLD (1794–1886), Jewish scholar, was born at Detmold in 1794, and died in Berlin in 1886. He was the founder of what has been termed the "science of Judaism," the critical investigation of Jewish literature, hymnology and ritual. His *Gottesdienstliche Vorträge der Juden, i.e.*, lays down principles for the investigation of the Rabbinic exegesis (Midrash, *q.v.*) and of the prayer-book of the synagogue.

Zunz's other principal works are *Synagogale Poesie des Mittelalters* (1855); and *Literaturgeschichte der Synagogalen Poesie* (1865, supp. vol. 1867).

ZURBARAN, FRANCISCO DE (1598–?1669), Spanish painter, was born at Fuente de Cantos in Estremadura, and baptized on Nov. 7, 1598. His parents belonged to the agricultural labouring class, but, discovering their son's talent, sent him at the age of 16 to study under a painter called Diego Perez Villanueva; he then worked under Juan de Roélas at Seville. He soon developed an independent realistic style, with solid modelling, and strongly contrasted light and shade, and acquired the name of the "Spanish Caravaggio." A series of "Scenes from the life of St. Peter" and a great altarpiece painted for the cathedral at Seville in 1625 established his reputation and in 1629 he was nominated town painter of Seville. Other important works of the early period are four pictures representing "Scenes from the Life of St. Buenaventura" now in the Louvre, Berlin, and Dresden museums; "the Vision of Alonso Rodriguez" (1630 in the Academy, Madrid) which is, perhaps, his masterpiece; the grand altarpiece representing "the Apotheosis of St. Thomas of Aquinas" (1631, Seville museum); to the year 1629 belong the series of pictures out of the Merced Calzada, representing scenes from the life of S. Pedro Molaxo (Seville Cathedral and Prado Madrid). The paintings in the monastery of Guadelupe were executed ten years later. Through his friendship with Velasquez he was nominated "Painter to the king" in 1638. It was, however, not until 1650, that he moved to the capital where he was commissioned to decorate a room of the palace of Buenretiro with the "Labours of Hercules." Of this series only four panels (now in the Prado) were completed. The date of Zurbaran's death is unknown. He was still alive on Feb. 28, 1664, when he was called upon to value some paintings at Madrid. Other important works of the master are at Seville, Cadiz, Jerez and in the museums of Budapest, London, in the Gardner collection, Boston, and with the Hispanic Society, New York, and elsewhere.

Zurbaran's principal pupils were Martinez de Granadille, Bernabe de Ayala, and the brothers Polanco. In the 19th century Courbet, who, like Zurbaran, was a son of the soil, professed a great admiration for the Spaniard's works in the Louvre and, to some extent, formed his style thereon.

See Narcisso Sentenach y Cabanas, *Painters of the School of Seville* (Eng. trans., 1911); José Cascales y Munoz, *Francesco de Zurbaran* (Madrid, 1911); C. Justi, *Diego Velazquez und sein Jahrhundert* (Bonn, 1903). (I. A. R.)

ZÜRICH, the canton of north-eastern Switzerland and which ranks officially first in the Confederation. Its total area is 667·4 sq.m., of which the high proportion of 90·4% is reckoned as "productive" (forests, 184·9 sq.m., and vineyards 4·6 sq.m., the latter showing a rapid decrease during the 20th century, and now ranking much below Valais [*q.v.*]). Of the rest, 27·8 sq.m. are occupied by lake waters, chiefly part of the Lake of Zürich, but wholly within the canton are the Lakes of Greifen (3¼ sq.m.) and Pfäffikon (1¼ sq.m.). The canton, though not one of the ancient three, joined the Confederation in 1351. Its irregularity of shape arises from its continued growth, up to 1803, by the additions of acquisitions made by the capital. As far back as 1362 the

whole of the lower part of the lake was added, and by the purchase of Winterthur (1467) from the Habsburgs, it reached the Rhine. To-day it extends from its enclave in Baden, on the right bank of the Rhine (above the Thur junction to below the Töss junction) to some 8 m. S.W. of Pfäffikon See. It consists essentially of shallow river valleys draining Rhinewards and separated from one another by north-west to south-east ridges. The most important valley is that of the Linth, which expands into the Lake of Zürich and is continued as the Limmat; the ridge to the east is low and then successively eastwards are the valley of the river Aa-Glatt, which flows through the Greifen See; a higher ridge separating it from the more gorge-like Töss valley, and finally the highest ridge along the east boundary separating the Töss from the Toggenburg (*q.v.*). On the last ridge, Hornli reaches 3,727 feet. West of the Lake of Zürich is the strikingly parallel valley of the Sihl, bounded farther west by the Albis range, with Albishorn (3,012 ft.) as its highest point. All the valleys are occupied by railway lines and the Limmat (Zürich to Baden) carried the first line opened (1847) in Switzerland. From the town of Zürich standard lines and mountain railways radiate in all directions; of the latter, one (south-west) is for Uetliberg (2,864 ft.) the north buttress of the Albis range and one (north-east) is for Zürichberg (2,285 ft.), on the ridge between the Limmat and the Glatt.

In 1920 the population was 538,602, of whom 512,247 were German-speaking, 14,323 Italian-speaking, 6,806 French-speaking, and 1,024 Romansch-speaking, while there were 410,027 Protestants, 113,357 Catholics, and 7,028 Jews. The capital of the canton is Zürich (est. pop. 1925, 210,720), but Winterthur (51,950) is the only other considerable town. Uster (9,000) east of Greifen See, is an industrial town, while Thalwil (7,500), Horgen (8,480) and Wadenswil (9,300), all on the western shore of the Lake of Zürich, are of note as industrial centres. Though the land is highly cultivated, yet the canton is essentially a great manufacturing area, especially of machinery and railway rolling-stock. Silk weaving and cotton weaving are widely spread, and the products of the former industry have a large foreign market. The canton is divided into 11 administrative districts containing 186 communes. In 1869 the cantonal Constitution was revised, and no material changes have been made since. There is an executive (*Regierungsrat*) of seven members and a legislature (*Kantonsrat*) of 220 deputies (distributed amongst the electoral circles on a population basis, which varies from census to census). Each body holds office for three years, and is elected by a method making use of the principle of proportional representation. The compulsory referendum exists, and all laws and all financial decisions involving a total sum over 250,000 frcs., or an annual sum of 20,000 frcs., must be submitted to a popular vote. Any 5,000 voters can employ the "initiative" to force the Government to submit to the people any legislative or constitutional matter. Both members of the Federal *Ständerat* and the 27 members of the Federal *Nationalrat* are elected simultaneously by a popular vote, and hold office for three years. (*See* SWITZERLAND.) (W. E. WH.)

ZÜRICH, the capital of the Swiss canton of the same name (Fr. *Zurich;* Ital. *Zurigo;* Lat. *Turicum*). It is the most populous, the most important, and on the whole the finest town in Switzerland, and till 1848 was practically the capital of the Swiss Confederation. In 1920 it had 207,161 inhabitants, while in Jan., 1928, its estimated population was 217,750, and with the suburbs, over 250,000. Of these 134,580 were Protestants, 60,116 Roman Catholics, and 6,662 Jews, while 191,234 were German-speaking, 4,641 French-speaking, 7,160 Italian-speaking, and 600 Romansch-speaking.

Zürich is built on both banks of the Limmat as it issues from the lake of Zürich, and also of its tributary, the Sihl. That portion of the town which lies on the right bank of the Limmat is called the "Grosse Stadt" and that on the left bank the "Kleine Stadt." Till 1893 the central portion of the town on either bank of the Limmat formed the "city" and ruled the outlying communes or townships that had sprung up around it. But at that time the eleven outer districts (including Aussersihl, the workmen's quarter on the left bank of the Sihl) were incorporated with the town. Much land has been rescued from the lake, and is the site of fine quays, stately public buildings, such as the Civic Theatre and the Concert Hall, and splendid private villas. The older quarters are still crowded; but the newer quarters which stretch up the slope of the Zürichberg (above the right bank of the Limmat) have broad streets and fine buildings.

There were numerous pile dwellings on the sides of the lake and Zürich was a pre-Roman settlement, probably an "oppidum." About the middle of the first century A.D. a Roman "castellum" and customs station existed on the Lindenhof.

Of the old buildings the finest and most important is the Gross Münster (or Propstei), on the right bank of the Limmat. This was originally the church of the king's tenants, and in one of the chapels the bodies of Felix, Regula and Exuperantius, the patron saints of the city, were buried. The present building was erected at two periods (*c.* 1090–1150 and *c.* 1225–1300), the high altar having been consecrated in 1278. The towers were first raised above the roof at the end of the 15th century and took their present form in 1779. The chapter consisted of twenty-four secular canons; it was reorganized at the Reformation (1526), and suppressed in 1832. On the site of the canons' houses stands a girls' school (opened 1853), but the fine Romanesque cloisters (12th and 13th centuries) still remain. There is a curious figure of Charlemagne in a niche on one of the towers; to him is attributed the founding or reform of the chapter. On the left bank of the Limmat stands the other great church of Zürich, the Frau Münster (or Abtei), founded for nuns in 853, by Louis the German. The high altar was consecrated in 1170; but the greater part of the buildings are of the 13th and 14th centuries.

Of the other old churches may be mentioned St. Peter's, the oldest parish church, though the present buildings date in part from the 13th century only (much altered in the early 18th century), and formerly the meeting-place of the citizens; the Dominican church or Predigerkirche (13th century), in the choir of which the cantonal library was stored after 1873; the church of the Austin friars (14th century), now used by the Old Catholics, and the Wasserkirche. The last-named church is on the site of a pagan holy place, where the patron saints of the city were martyred; after 1631 it housed the Town Library. In 1916 the various libraries were united into a central library of some 700,000 books, 12,000 mss. including letters of Zwingli, of Bullinger and his friend Lady Jane Grey, of Schiller, etc. This is near the Predigerkirche which is now the repository of the archives of Zürich. The building itself was erected from 1479 to 1484, and near it is a statue of Zwingli, erected in 1885. The existing town hall dates from 1698, while the gild houses were mostly rebuilt in the 18th century. One of the most magnificent of the newer buildings is the Swiss National Museum, which was opened in 1898, and contains a wonderful collection of Swiss antiquities of all periods and art treasures of all kinds.

The town is noted for its numerous clubs and societies, and is the intellectual capital of German-speaking Switzerland. The University of Zürich (*see* below) has students of many nations and has recently been housed in new buildings with several outlying institutes. It was opened in 1833, no doubt as a successor to the ancient chapter school at the Gross Münster, said to date back to Charlemagne's time, and hence called the Carolinum, which was reorganized at the Reformation, and suppressed in 1832. The Federal Polytechnic School, opened in 1855, is one of the best known institutions of its type and has over 1,500 students. Near it is the observatory (1,542 ft.). There are excellent primary and secondary schools, and many institutions for special branches of education, *e.g.*, music, silk-weaving, etc. The Pestalozzium, which contains educational exhibits and Pestalozzi's study, occupies a new building near the Urania bridge.

The position of Zürich as a meeting-point of international trade gives it a cosmopolitan character. Cotton spinning, furniture-making, the manufacture of machinery, the electrical industry and the silk industry are leading activities. The silk-weaving industry flourished in Zürich in the 12th and 13th centuries, but disappeared about 1420; it was revived by the Protestant exiles from Locarno (1555) and by the Huguenot refugees from France (1682 and 1685). Zürich is the banking centre of Switzerland.

History.—The earliest inhabitants of the future site of Zürich were the lake dwellers. Later, the Helvetii (a Celtic tribe) had a settlement on the Lindenhof, where the Romans established a custom station. The Romans called it Turicum. The district was later occupied by the Alamanni.

The beginnings of the mediaeval town of Zürich date from the 9th and 10th centuries. In the 13th century Zürich was already an important imperial city; in the 16th century she became the centre of the Swiss Reformation and in modern times, though she lost the dominion over the country-side, she remained the capital of the canton and developed as a commercial, industrial intellectual and educational centre of the first importance.

Three stages in the constitutional development of the town may be distinguished. First comes the city's fight for freedom from foreign powers. The burghers were originally under the rule of a *Reichsvogt*, the representative of the emperor (who had a castle on the Lindenhof), but they obeyed also the orders of the abbess of the Fraumünster, a Benedictine convent (endowed in 853 by the Emperor Louis the Pious) which had acquired extensive rights and privileges over the people who had settled round about it. When the council of the abbess, which was composed of the noblemen and rich merchants of the town, became the trusted representation of the townspeople, power actually passed from the abbey to the town (13th century). The *Reichsvogtei*, which had been in the hands of the most powerful dynasty in the country, was in the same period entrusted to some nobleman of the town and was later (1400) bought off altogether from the emperor. Thus the city had acquired independence.

The second stage is characterized by the struggle for admittance of the craft guilds to a share with the patricians in the government of the town. Naturally, in the age of industrial development and of democratic tendencies in the towns, the guilds tried to secure for themselves a share in the city's councils. They found a leader in Rudolf Brun, a nobleman, who after being elected burgomaster introduced a new constitution (1336) which divided the functions of government between the patricians (the *Constafel*) and the representatives of the 13 guilds. The *Constafel* still retained a privileged position; the head of the *Constafel* was to be the burgomaster, and in the Little Council the *Constafel* members alone were invested with the functions of government.

In 1393, however, power passed from the Little Council into the hands of the Great Council (about 200 members) and the guild members got the majority on the Little Council with a title to have the burgomaster chosen out of their own ranks. From the 13th to the 15th century Zürich fought for the possession of a considerable dominion—the Zürich country district (which later became the canton). For a long time the town hesitated between a pro-Habsburg and a pro-Swiss policy. Brun had induced his followers to join in the Swiss League, which was then (1353) only beginning to develop. When, by purchase or right of succession, Zürich had become the ruler of the adjoining lake district, she came in conflict with the territorial aspirations of Schwyz. The "Old Zürich War" (1436–50) broke out between Zürich and all the other members of the Swiss League; Zürich, however, had the assistance of Austria, the old enemy of the League. The war ended with the defeat of Zürich who gave up the Austrian alliance. The authority of the Swiss League was much strengthened. In 1467 Zürich enlarged her dominion by acquiring from the Habsburgs the town of Winterthur. Zürich gained the military leadership in the League under her great burgomaster Hans Waldmann, who led the Swiss to victory in the Burgundian war at Morat (1476). He also fought with the gild masters against the *Constafel* party. A true adventurer by nature, he was a great reformer, did much to strengthen the administration of the town against the Church and the country districts, and helped to make Zürich a great commercial centre.

Another great figure, but of an entirely opposite character, was Huldreich Zwingli (*q.v.*), the leader in the Swiss Reformation. He obtained quite an exceptional influence over the decisions of the council. Zürich was later to become the capital of a reformed Swiss League and for the realization of this aim he renewed the fight against the conservative Forest districts of the Swiss League. This war ended again with defeat for Zürich and it deprived the whole Evangelical party in Switzerland for nearly two centuries of its preponderant position.

The fight of the country districts for the grant of equal political rights with the burghers of the ruling class marks the third stage in the history of Zürich. Originally the people in the country had retained a number of political privileges, which had been confirmed by the town herself and in the Reformation period were even enlarged. In the 17th and 18th centuries, however, there was a tendency to limit the privileges of burghership to the actual holders. The reserved rights of the country population were disregarded, the administration centralized, the country ruled solely by deputies from the town. The Great Council came to be mainly chosen by a small committee of members actually sitting in the Council and each gild had the right to fill by itself the seats becoming vacant by decease of its members. Trade was a privilege of the burghers alone. A country man was not allowed to have a business of his own; he could only work in the pay of a burgher as his employee. Some particular crafts were altogether reserved to the townspeople; an attempt was even made to deprive the town of Winterthur of its flourishing silk trade.

Occasional opposition from the country folk was severely punished. In 1794 some inhabitants of Stäfa (a rich village on the lake) claimed the restoration of their old privileges (Stäfner articles), but it was not until 1798, when the Helvetic Republic was founded, that political and economical liberty was extended to the country districts. In 1803 certain privileges of the town were restored by giving the town proportionally a much larger representation in the new council than the country. Under the cantonal constitution of 1814 matters became even worse, for the town with about 10,000 inhabitants had 130 representatives in the Great Council, while the country districts with about 200,000 inhabitants had only 82. Reaction lasted till 1830, when a great popular meeting at Uster proposed a radical reform to abolish inequality between town and country. The democratic reform was accepted by the majority of the voters. The following period has rightly been called the "Regeneration Period"; administration was completely reorganized, the school-system reformed and crowned by the establishment of a cantonal university. The last great change in the cantonal constitution occurred in 1867–69, when the rights of the legislative council were reduced in favour of a more truly democratic system. The cantonal Government was to be elected by the people, the power of parliament was reduced by the people's privilege of referendum (*i.e.* the right to accept or reject bills proposed by parliament) and initiative (*i.e.* the right to propose bills of its own).

A particular task fell yet on the city proper: the assimilation of the new population which—owing to the rapid development of the town—had by far outgrown the number of the old privileged class and had partly settled in the outlying districts. The town began to open her schools to the newcomers and then facilitated the entrance into burghership. The work was crowned by the incorporation into the town of 11 outlying districts in 1893. A scheme under revision in 1928 proposed to incorporate a great number of other suburbs. This would bring the city's area within the size of some of the biggest European cities.

(M. Si.)

Zürich University (*see* UNIVERSITIES) was founded in 1833. Its buildings are nearly all new, with modern equipment, among the most outstanding being its central university library, and its clinics for diseases of the eye, ear and throat. The language of the university is German, and there are faculties of evangelical theology, law and political sciences, medicine and dentistry, veterinary medicine, science and letters. It has made important developments in bacteriology and hygiene, and in the study of living oriental languages and in the thought and history of Islam. Though during the World War and immediately afterwards its numbers fluctuated considerably, its usual attendance is about 1,600 regular students and 700 non-matriculated. In 1919 it received 1,274,052 fr. for the Julius Claus Foundation for social anthropology racial hygiene. (A. L. Wi.)

ZÜRICH, LAKE OF, a Swiss lake, extending south-east of the town of Zürich. Its basin was formed by glacial erosion and it shows interesting phases of damming by moraines. The river Linth flows into it and the Limmat out of it. Its area is about 34 sq.m., extreme length 25 m., greatest breadth 2½ m., greatest depth 469 ft., surface 1,342 ft. above sea level. The greater portion is in the canton of Zürich, but 8¾ sq.m. S.E. is in Schwyz, and 4 sq.m. N.E. in St. Gall. The great dam of masonry, carrying the railway line and motor road from Rapperswil to Pfäffikon, cuts off the extreme eastern part of the lake and is passed only by small boats; steamers do not go beyond the dam, as the part beyond is shallow. West of this dam is the island of Ufenau, where in 1523 Ulrich von Hutten took refuge and died. Zürich stands at the north end of the lake. On the west shore are Thalwil, Horgen, Wädenswil, Richterswil, Pfäffikon, and Lachen. On the opposite shore are Meilen (near which the first lake dwellings were discovered in 1853–54), Stäfa, and Rapperswil, the castle of which shelters a Polish museum. Schmerikon and Uznach are near the eastern end.

ZUTPHEN or ZUTFEN, a picturesque old town in the province of Gelderland, Holland, on the right bank of the Ysel at the influx of the Berkel, and a junction station 18 m. N.N.E. of Arnhem by rail. Pop. (1927), 19,586.

In the middle ages Zutphen was the seat of a line of counts, which became extinct in the 12th century. Having been fortified, the town stood several sieges, specially during the wars of freedom waged by the Dutch, the most celebrated fight under its walls being the one in September 1586 when Sir Philip Sidney was mortally wounded. Taken by the Spaniards in 1587, Zutphen was recovered by Maurice, prince of Orange, in 1591, and except for two short periods, one in 1672 and the other during the French Revolutionary Wars, it has since then remained a part of the United Netherlands. Its fortifications were dismantled in 1874.

The most important building is the *Groote Kerk* of St. Walpurgis, which dates from the 12th century and contains monuments of the former counts of Zutphen, and other objects of interest. The chapter-house contains a pre-Reformation library which includes some valuable mss. and *incunabula*. There are some remains of the old town walls. The place has an active trade, especially in grain and in the timber floated down from the Black forest by the Rhine and the Ysel; the industries include tanning, weaving, and oil and paper manufactures. About 3 m. to the north of Zutphen is the agricultural colony of Nederlandsch-Mettray, founded by a private benefactor for the education of poor friendless boys in 1851, and since that date largely extended.

ZUTUHIL, an Indian tribe inhabiting the territory south of Lake Atitlan in Guatemala. Their tongue, one of the "metropolitan" Maya dialects, is spoken to-day in Atitlan, San Pedro la Laguna, San Lucas Tolimán, and San Antonio Suchitepéquez. They number about 14,000.

The part the Zutuhil played in the wars with the Quiché and Cakchiquel is described in the annals of those tribes, which make it clear that the Zutuhil were only slightly less powerful than these enemy neighbours, and they appear never to have been completely subdued. The Zutuhil capital was picturesquely located above Lake Atitlan. Near by stood a strongly fortified position, reduced by the Spaniards under Pedro de Alvarado in 1525 only with the greatest difficulty. To-day the Zutuhil work, often under a system of peonage, on the big coffee estates. Their costumes, of local cotton covered with embroidery, are noted for their brilliant colours.

ZWEIBRÜCKEN, a town of Germany, in the Palatinate, on the Schwarzbach, and on the railway between Germersheim and Saarbrücken. Pop. (1925) 15,783. The town was the capital of the former duchy of Zweibrücken. The ducal castle is now occupied by the chief court of the Palatinate.

Zweibrücken ("two bridges") is the Latin *Bipontinum;* it appears in early documents also as *Geminus Pons*, and was called by the French *Deux-Ponts*. The independent territory was at first a countship, half of which Count Eberhard sold in 1385 to the count palatine of the Rhine, holding the other half as his feudatory. Louis (d. 1489) founded the line of the dukes of Zweibrücken which became extinct in 1731, when the duchy passed to the Birkenfeld branch. At the peace of Lunéville Zweibrücken was ceded to France; on its reunion with Germany in 1814 the greater part of the territory was given to Bavaria, the remainder to Oldenburg and Prussia.

ZWICKAU, a town of Germany, in the republic of Saxony, situated on the left bank of the Zwickauer Mulde, 41 m. S. of Leipzig and 20 m. S.W. of Chemnitz on the main line of railway Dresden-Hof and at the junction of several other lines. Pop. (1925) 80,358.

Zwickau is of Slavonic origin, and is mentioned in 1118 as a trading place. Zwickau was an imperial possession, but was pledged to Henry the Illustrious, margrave of Meissen. It passed to the electors of Saxony, as successors of the margraves of Meissen. The discovery of silver in the Schneeberg in 1470 brought it much wealth. The Anabaptist movement of 1525 began at Zwickau under the inspiration of the "Zwickau prophets." Robert Schumann (*q.v.*) was born here.

Among the nine churches, the Gothic church of St. Mary (1451–1536 and restored 1885–91), is remarkable. Other noteworthy buildings are the town-hall of 1581, with the municipal archives, including documents dating back to the 13th century and an autograph ms. of the works of Hans Sachs, and the late Gothic *Gewandhaus* (cloth merchants' hall), built 1522–24 and now in part converted into a theatre. The manufactures of Zwickau include spinning and weaving, machinery, chemicals, porcelain, paper, glass, dyestuffs, wire goods, aluminium, lacquer, embroidery, stockings and curtains. The adjacent coalfield has only been actively worked since 1823, during which time the population has increased more than tenfold.

ZWINGLI, HULDREICH (1484–1531), Swiss reformer, was born on Jan. 1, 1484, at Wildhaus in the Toggenburg valley, St. Gall, Switzerland. He came of a free peasant stock, his father being *amtmann* of the village; his mother, Margaret Meili, was the sister of the abbot of Fischingen in Thurgau. His uncle, Bartholomew Zwingli, afterwards *dekan* or *superintendent* of Wesen, had been elected parish priest of Wildhaus. He went to school at Wesen, then at Basle, and finally at Berne, where his master, Heinrich Wölflin, inspired him with an enthusiasm for the classics. In 1500 he was sent to the university of Vienna to study philosophy. He then returned to Basle, where he graduated in the university and taught classics in the school of St. Martin's church. At twenty-two Zwingli was ordained by the bishop of Constance and elected parish priest of Glarus. The ten years which Zwingli spent at Glarus laid the foundations of his work as a reformer. He there began the study of Greek that he might "learn the teaching of Christ from the original sources," and gave some attention to Hebrew. He read also the older Church Fathers and his skill in

the classics led his friends to hail him as "the undoubted Cicero of our age." He entered into correspondence with Erasmus, and received a somewhat chilling patronage; whilst the brilliant humanist, Pico della Mirandola (1463–94), taught him to criticize Catholic doctrine. His first publications, which appeared as rhymed allegories, were political rather than religious; they were directed against the Swiss practice of hiring out mercenaries in the European wars. In 1521 he prevailed upon the authorities of the canton of Zürich to renounce the practice altogether. Especially did he oppose alliances with France; but the French party in Glarus was strong, and it retaliated so fiercely that in 1516 Zwingli was glad to accept the post of people's priest at Einsiedeln. He dated his arrival at evangelical truth from the three years (1516–19) which he spent in this place. There he studied the New Testament in the editions of Erasmus and began to found his preaching on "the Gospel," which he declared to be simple and easy to understand.

Reform Propaganda.—Zwingli began to preach "the Gospel" in 1516, but a contemporary says that he did it so cunningly (*listiglich*) that none could suspect his drift. He began his work without saying much about corruptions in the Roman Church, and it was his political denunciation of the fratricidal wars into which the pope, not less than others, was drawing his fellow-countrymen, that first led to rupture with the papal see. Three visits which he had paid to Italy as army chaplain opened his eyes to the worldly character of the papal rule, and he began to attack at Einsiedeln the superstitions which attended the great pilgrimages made to that place. Zwingli denounced the publication of plenary indulgence to all visitors to the shrine. When in August 1518 the Franciscan monk Bernardin Samson appeared in Switzerland with a commission to sell indulgences, Zwingli persuaded the council to forbid his entrance into Zürich.

Zwingli now became (1518) people's priest at the Great Minster of Zürich. In the beginning of 1519 he began a series of discourses on St. Matthew's Gospel, the Acts of the Apostles, and the Pauline epistles; and with these it may be said that the Reformation was fairly begun in Zürich. His correspondence of this year shows him jealous of the growing influence of Luther. He claimed to have discovered the Gospel before ever Luther was heard of in Switzerland. Towards the end of September he fell ill with the plague; his illness sobered his spirit and brought into his message a deeper note than that merely moral and common-sense one with which, as a polite humanist, he had hitherto been content. He began to preach against fasting, saint worship and the celibacy of priests. People were found eating flesh in Lent, and the bishop of Constance accused them before the council of Zürich. Zwingli was heard in their defence and the accusation was abandoned. His first Reformation tract, April 1522, dealt with this subject: *Von Erkiesen und Fryheit der Spysen.* The matter of the celibacy of the clergy was more serious. Zwingli had joined in an address to the bishop of Constance calling on him no longer to endure the scandal of harlotry, but to allow the priests to marry wives, or, at least, to wink at their marriages. Pope Adrian VI. interfered and asked the Zürichers to abandon Zwingli, but the reformer persuaded the council to allow a public disputation (1523), when he produced sixty-seven theses and vindicated his position so strongly that the council decided to uphold their preacher and to separate the canton from the bishopric of Constance. Thus legal sanction was given in Zürich to the Reformation. In 1522 Zwingli produced his first considerable writing, the *Architeles,* "the beginning and the end," in which he sought by a single blow to win his spiritual freedom from the control of the bishops, and in a sermon of that year he contended that only the Holy Spirit is requisite to make the Word intelligible, and that there is no need of Church, council, or pope in the matter.

Victory of Reform.—There was a strong opposition to the Reformation, especially in the five Forest Cantons: Lucerne, Zug, Schwyz, Uri and Unterwalden; and the Zürichers felt it necessary to form a league in its defence. They were especially anxious to gain Berne, and Zwingli challenged the Romanists to a public disputation in that city. The pleadings began on Jan. 2, 1523 and lasted nineteen days. Zwingli and his companions undertook to defend the following propositions:—

(1) That the Holy Christian Church, of which Christ is the only Head, is born of the Word of God, abides therein, and does not listen to the voice of a stranger; (2) that this Church imposes no laws on the conscience of people without the sanction of the Word of God, and that the laws of the Church are binding only in so far as they agree with the Word; (3) that Christ alone is our righteousness and our salvation, and that to trust to any other merit or satisfaction is to deny Him; (4) that it cannot be proved from the Holy Scripture that the body and blood of Christ are corporeally present in the bread and in the wine of the Lord's Supper; (5) that the mass, in which Christ is offered to God the Father for the sins of the living and of the dead, is contrary to Scripture and a gross affront to the sacrifice and death of the Saviour; (6) that we should not pray to dead mediators and intercessors, but to Jesus Christ alone; (7) that there is no trace of purgatory in Scripture; (8) that to set up pictures and to adore them is also contrary to Scripture, and that images and pictures ought to be destroyed where there is danger of giving them adoration; (9) that marriage is lawful to all, to the clergy as well as to the laity; (10) that shameful living is more disgraceful among the clergy than among the laity.

The result of the discussion was that Berne was won over to the side of the reformer. He had maintained that the congregation, and not the hierarchy, was the representative of the Church; and he sought to reorganize the Swiss constitution on the principles of representative democracy so as to reduce the disproportionate voting power of the Forest Cantons.

On April 2, 1524 the marriage of Zwingli with Anna Reinhard was publicly celebrated in the cathedral. In August of that year Zwingli printed a pamphlet in which he set forth his views of the Eucharist. They proved the occasion of a conflict with Luther which was never settled, but more attention was attracted by Zwingli's denunciation of the worship of images and of the Roman doctrine of the mass. These points were discussed at a fresh congress where about 900 persons were present, and where Vadian (Joachim von Watt, the reformer of St. Gall) presided. It was decided that images are forbidden by Scripture and that the mass is not a sacrifice. Images were removed from the churches, and many ceremonies and festivals were abolished. Zürich was threatened with exclusion from the union, and she began to make preparations for war.

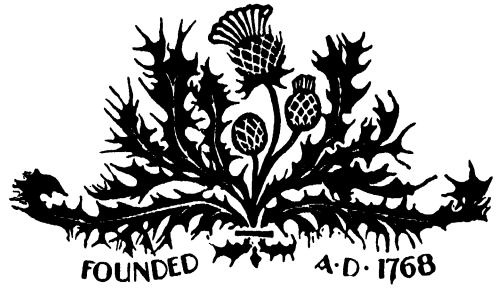
Divergence from Luther.—At this point the controversy between Luther and Zwingli became more serious. In March 1525 Zwingli brought out his *Commentary on the True and False Religion.* He declined to accept Luther's teaching that Christ's words of institution required the belief that the real flesh and blood of Christ co-exist in and with the natural elements. He declared that Luther was in a fog, and that Christ had proclaimed that by faith alone could His presence be received in a feast which He designed to be commemorative and symbolical. The landgrave of Hesse brought the two Reformers together in vain at Marburg in October 1529, and the whole Protestant movement broke into two camps. At home the long-felt strain between opposing cantons led at last to civil war. In February 1531 Zwingli himself urged the Evangelical Swiss to attack the Five Cantons, and on Oct. 10 there was fought at Kappel a battle, disastrous to the Protestant cause and fatal to its leader. Zwingli, who as chaplain was carrying the banner, was struck to the ground, and was later despatched in cold blood. His corpse was quartered by the public hangman, and burnt with dung by the soldiers. A great boulder, roughly squared, standing a little way off the road, marks the place where Zwingli fell. It is inscribed, "'They may kill the body but not the soul': so spoke on this spot Ulrich Zwingli, who for truth and the freedom of the Christian Church died a hero's death, Oct. 11, 1531."

Zwingli's theological views are expressed succinctly in the sixty-seven theses published at Zürich in 1523, and at greater length in the *First Helvetic Confession,* compiled in 1536 by a number of his disciples[1]. They contain the elements of Reformed as distinguished from Lutheran doctrine. As opposed to Luther, Zwingli insisted more firmly on the supreme authority of Scripture, and broke more thoroughly and radically with the mediaeval Church. Luther was content with changes in one or two fundamental doctrines; Zwingli aimed at a reformation of government

[1] P. Schaff, *Creeds of the Evangelical Protestant Churches,* p. 211.

and discipline as well as of theology. Zwingli held that there should be no government in the Church separate from the civil government which ruled the commonwealth. All rules and regulations about the public worship, doctrines and discipline of the Church were made in Zwingli's time, and with his consent, by the council of Zürich, the supreme civil authority in the State. This was the ground of his quarrel with the Swiss Anabaptists, for the main idea in the minds of these greatly maligned men was the modern thought of a free Church in a free State. Like all the Reformers, he was strictly Augustinian in theology, but he dwelt chiefly on the positive side of predestination—the election to salvation—and he insisted upon the salvation of infants and of the pious heathen. His most distinctive doctrine is perhaps his theory of the sacrament, which involved him and his followers in a long and, on Luther's part, an acrimonious dispute. He held that the Eucharist was not the *repetition* of the sacrifice of Christ, but the faithful *remembrance* that that sacrifice had been made once for all. His theological opinions were set aside in Switzerland for the somewhat profounder views of Calvin. The publication of the Zürich Consensus (*Consensus Tigurinus*) in 1549 marks the adherence of the Swiss to Calvinist theology.

Zwingli's most important writings are—*Von Erkiesen und Fryheit der Spysen* (April 1522); *De Canone Missae Epichiresis* (September 1523); *Commentarius de Vera et Falsa Religione* (1525); *Vom Touf, vom Wiedertouf, und vom Kindertouf* (1525); *Ein klare Unterrichtung vom Nachtmal Christi* (1526); *De Providentia Dei* (1530); and *Christianae Fidei Expositio* (1531). For a full bibliography *see* G. Finsler, *Zwingli-Bibliographie* (Zürich, 1897).



Works.—Collected editions, 4 vols. (Zürich, 1545, 1581); by M. Schuler and Joh. Schulthess, 8 vols. (Zürich, 1828–42, with "supplementorum fasciculus," 1861); by E. Egli and G. Finsler in "Corpus Reformatorum" (Berlin, 1905 *sqq.*).

Lives.—O. Myconius (1532); H. Bullinger's *Reformationsgeschichte* (ed. Hottinger and Voegli, 1838); J. M. Schuler (1818); R. Christoffel (1857, Eng. tr. by J. Cochran, Edinburgh, 1858); J. C. Möriköfer, 2 vols. (Leipzig, 1867–69); R. Stähelin, 2 vols. (Basle, 1895–97); S. M. Jackson in *Heroes of the Reformation* (New York and London, 1901); Prof. Egli's articles in Hauck-Herzog's *Realencyklopädie für prot. Theologie u. Kirche*, and *Zwingliana*, published twice a year since 1897 at Zürich. S. M. Jackson's book gives a chapter on Zwingli's Theology by Prof. F. H. Foster, and full details of further information on the subject, together with a list of modern English translations of Zwingli's works.

ZWOLLE, the capital of the province of Overysel, Holland, on the Zwarte Water, and a junction station 24½ m. N.E. of Harderwyk. Pop. (1927), 39,004. It is the centre of the whole northern and eastern canal systems, and by means of the short canal, the Willemsvaart, which joins the Zwarte Water and the Ysel, has regular steamboat communication with Kampen and Amsterdam. Three miles from Zwolle, on the Agnietenberg, once stood the Augustinian convent in which Thomas à Kempis spent the greatest part of his life. Zwolle has a considerable trade by river, a large fish market and the most important cattle market in Holland after Rotterdam.

ZYGADENUS, a genus of plants of the lily family (Liliaceae, *q.v.*), containing about 12 species, all North American except one found in Siberia. They are smooth perennial herbs, springing mostly from coated bulbs, with erect stems, usually ½ ft. to 4 ft. high, very narrow leaves and conspicuous flowers in terminal clusters. Some 10 species occur in the United States and Canada. The smooth zygadene (*Z. elegans*), with greenish flowers, is found from New Brunswick to Alaska and southward to New Mexico. The poisonous zygadene or death camas (*Z. venenosus*) with yellow flowers, occurs in the north-western and Pacific States.

ZYGOTE, the biological term for the fertilized egg or ovum. (*See* FERTILIZATION; EMBRYOLOGY.)
